Airman's INFORMATION MANUAL

SECTION I

BASIC FLIGHT MANUAL

DECEMBER 1964

INTRODUCTION

Section I—BASIC FLIGHT MANUAL

Section I, Basic Flight Manual, contains, in layman's language, educational, instructional and training information. This information is assembled and presented in a systematic format, categorized by subject matter, providing the novice pilot, as well as the more experienced pilot, with the information to orient or update himself on the basic fundamentals of aeronautical knowledge required to fly in the National Airspace System. The Basic Flight Manual serves as an official medium for documentation and interpretation of aeronautical knowledge for the general aviation pilot.

In addition to the above type of information, adverse factors affecting the safe operation of an aircraft, either on the ground or in the air, and health and medical facts of interest to the pilot are presented.

The section concludes with a list of supplementary aeronautical publications of general operational interest to pilots, providing the latest publication date, the cost and where they may be obtained.

GOOD OPERATING PRACTICES

It should be remembered that adherence to air traffic rules does not eliminate the need for good judgment on the part of the pilot. Compliance with the following Good Operating Practices will greatly enhance the safety of every flight.

Alertness

Be alert at all times, especially when the weather is good. Most pilots pay attention to business when they are operating in full IFR weather conditions, but strangely, air collisions almost invariably have occurred under ideal weather conditions. Unlimited visibility appears to encourage a sense of security which is not at all justified.

Judgment in VFR Flight

Use reasonable restraint in exercising the prerogative of VFR flight, especially in terminal areas. The weather minimums and distances from clouds are minimums. Giving yourself a greater margin in specific instances is just good judgment.

Conducting a VFR operation in a Control Zone when the official visibility is 3 or 4 miles is not prohibited, but good judgment would dictate that you keep out of the approach area.

It has always been recognized that precipitation reduces forward visibility. Consequently, although again it may be perfectly legal to cancel your IFR flight plan at any time you can proceed VFR, it is good practice, when precipitation is occuring, to continue IFR operation into a terminal area until you are reasonably close to your destination.

In conducting simulated instrument flights, be sure that the weather is good enough to compensate for the restricted visibility of the safety pilot or your greater concentration on your flight instruments. Give yourself a little greater margin when your flight plan lies in or near a busy airway or close to an airport.

Giving Way

If you think another aircraft is too close to you, give way instead of waiting for the other pilot to respect the right-of-way to which you may be entitled. It is a lot safer to pursue the right-of-way angle after you have completed your flight.

Use the Federal Airways

The establishment of the Federal Airways system costs the Government millions of dollars annually. The operation and maintenance of the system costs additional millions every year. Sure, you can stay off the airways most of the time during certain flights by electing to fly "direct" but why ignore the additional safety available in controlled airways?

Use of Victor Airways

Pilots not operating on an IFR flight plan, and when in level cruising flight, are cautioned to conform with VFR cruising altitudes appropriate to direction of flight. During climb or descent, pilots are encouraged to fly to the right side of the center line of the radial forming the airway in order to avoid IFR and VFR cruising traffic operating along the center line of the airway.

Traffic Patterns

At most airports and military air buses, traffic pattern altitudes for propeller driven aircraft generally extend from 600 feet to as high as 1500 feet above the ground. Also traffic pattern altitudes for military turbojet aircraft sometimes extend up to 2000 feet above the ground. Therefore, pilots of en route aircraft should be constantly on the alert for other aircraft in traffic patterns and avoid these areas whenever possible.

Follow IFR Procedures Even When Operating VFR

You don't have to follow IFR procedures if you are conducting VFR operations, but you cannot maintain instrument proficiency without practicing at every opportunity. Use all the navigational aids available and make accurate position reports.

Report

On a VFR flight, when making initial radio contact with a control tower or a Flight Service Station providing Airport Advisory Service, report position and altitude. This will make it easier for ground facility personnel and other pilots to locate your aircraft.

Record ATC Clearance

When conducting an IFR operation, make a written record of your ATC clearance. The specified conditions which are a part of your air traffic clearance may be

Record ATC Clearance (Con't)

somewhat different from those included in your flight plan. Additionally, Air Traffic Control may find it necessary to ADD conditions, such as a particular departure route. The very fact that Air Traffic Control specifies different or additional conditions means that other aircraft are involved in the traffic situation.

Recognize Equipment Capabilities

Until planned receiving equipment can be installed at remote VOR transmitting sites, pilots should remember that while they may be hearing the station "loud and clear" through the voice facility of the VOR to which they are tuned, the receivers being used by the station they are calling may be some distance away, rather than at the transmitter site. In the case of flights conducted at fairly low altitudes, this may make it difficult for the station to receive signals from the aircraft and should be taken into account when trying to establish two-way communication.

Use Proper Frequency Channels

When asking for weather reports and other flight information, ask that the station transmit such information on the voice channel of a navigation aid. This will assist in alleviating the congestion on standard communications frequencies.

Decrease Frequency Congestion

At busy terminal airports where current procedures do not require that initial radio call by ALL inbound aircraft be made on the appropriate approach control frequency, the pilot, by adopting the following practice, will decrease frequency congestion and thereby increase safety: monitor the tower local frequency for a sufficient length of time prior to reaching normal call-up point to determine wind and runway information. When initial call is made to tower the following information will suffice—identification, position, and the fact that wind and runway information has been received. Adc tionally, if appropriate VFR reporting point for the ru way in use is known, advise tower you will report ov that point.

Communications Guard on VFR Flights

On VFR flights, guard the voice channel of VORs f broadcasts and calls from FAA Flight Service Statio

Avoid Flight Beneath Unmanned Balloons

The majority of unmanned free balloons current being operated have, extending below them, either suspension device to which the payload or instrume package is attached, or a trailing wire antenna, or bo In many instances these balloon subsystems may be visible to the pilot until his aircraft is close to the b loon, thereby creating a potentially dangerous situatic Therefore, good judgment on the part of the pilot d tates that aircraft should remain well clear of all u manned free balloons and flight below them should avoided at all times.

Student Pilots Radio Identification

The FAA desires to help the student pilot in acquiri sufficient practical experience in the environment which he will be required to operate. To receive adc tional assistance while operating in areas of concentrat air traffic, a student pilot need only identify himself a student pilot during his initial call to an FAA rad facility. For instance, "Dayton Tower, this is Fleetwi 1234, Student Pilot, over." This special identificati will alert FAA air traffic control personnel and enat them to provide the student pilot with such extra assi ance or consideration as he may need. This procedu is not mandatory.

Conformance with the above Good Operating Practices is not simple as it sounds. It requires constant attention to innumera details and a deep-seated realization that additional hazards ir dent to flight operations exist whenever vigilance is relaxed.

AIR NAVIGATION RADIO AIDS

GENERAL

Various types of air navigation aids are in use today, each serving a special purpose in our system of air navigation.

These aids have varied owners and operators namely: the Federal Aviation Agency, the military services, private organizations; and individual states and foreign governments.

The Federal Aviation Agency has statutory responsibility for the operation and maintenance of any of these aids which are, in whole or in part, used by the general public for air navigation in federally controlled airspace.

LOW/MEDIUM-FREQUENCY (L/MF) RADIO RANGE

1. These ranges are classified by their type of antenna and power. Two types of low-frequency ranges are in use; Loop range (L) and Adcock range (A). Their normal power output is divided into three power classifications.

   Over 150 watts (R)
   50 to 150 watts (MR)
   Under 50 watts (M)

2. It is a popular misconception that loop ranges should not be used for homing. The dual-frequency or "simultaneous" type loop range transmits a nondirectional signal that can be used quite satisfactorily for this purpose.

3. Low-frequency radio range courses are subject to disturbances that result in multiple courses, signal fades and surges over rough country. Pilots flying over unfamiliar routes are cautioned to be on the alert to detect these vagaries, particularly over mountainous terrain.

4. In the near future, all but approximately 87 of the L/MF radio ranges will be decommissioned. Those remaining will be converted to nondirectional radio beacons.

RADIO BEACON

1. A low or medium-frequency radio beacon transmits nondirectional signals whereby the pilot of an aircraft equipped with a loop antenna can determine his bearing and "home" on the station. These facilities normally operate in the frequency band of 200 to 1,750 kc and transmit a continuous carrier with 1,020-cycle modulation keyed to provide identification except during voice transmission.

2. The operational purpose for which the facility is installed generally determines the power output and the name classification. The facilities are classified as follows:

   Compass Locators: Power output less than 25 watts. (15 miles)

   MH Facility: Power output less than 50 watts. (25 miles)

   H Facility: Power output greater than 50 watts but less than 2,000 watts. (50 miles)

   HH Facility: Power output greater than 2,000 watts. (75 miles)

3. When a LF nondirectional homing beacon is used in conjunction with the Instrument Landing System markers, it is called a Compass Locator.

4. All radio beacons except the compass locators transmit a continuous three-letter identification in code except during voice transmissions. Compass locators transmit a continuous two-letter identification in code. The first and second letters of the three-letter location identifier are assigned to the front course outer marker compass locator (LOM), and the second and third letters are assigned to the front course middle marker compass locator (LMM).

   Example:
   ATLANTA, ATL, LOM-AT, LMM-TL.

5. Voice transmissions are made on radio beacons unless the letter "W" (without voice) is included in the class designator (HW).

VHF OMNIDIRECTIONAL RANGE (VOR)

1. Omniranges operate within the 108–118 mc frequency band and have a power output of approximately 200 watts. The equipment is VHF, thus, it is subject to line-of-sight restriction, and its range varies proportionally to the altitude of the receiving equipment. There is some "spill over," however, and reception at an altitude of 1000 feet is about 40 to 45 miles. This distance increases with altitude.

2. There is voice transmission on the omni-frequency, and all information broadcast over L/MF ranges is also available over the VOR's.

3. The effectiveness of the VOR depends upon proper use and adjustment of both ground and airborne equipment.

   a. **Accuracy:** The accuracy of course alignment of the omnirange is excellent, being generally plus or minus 1°.

VHF OMNIDIRECTIONAL RANGE (VOR) (Con't)

b. Roughness: On some VORs, minor course roughness may be observed, evidenced by course needle or brief flag alarm activity (some receivers are more subject to these irregularities than others). At a few stations, usually in mountainous terrain, the pilot may occasionally observe a brief course needle oscillation, similar to the indication of "approaching station." Pilots flying over unfamiliar routes are cautioned to be on the alert for these vagaries, and in particular ,to use the "to-from" indicator to determine positive station passage.

(1) Certain propeller RPM settings can cause the VOR Course Deviation Indicator to fluctuate as much as ±6°. Slight changes to the RPM setting will normally smooth out this roughness. Helicopter rotor speeds may also cause VOR course disturbances. Pilots are urged to check for this propeller modulation phenomenon prior to reporting a VOR station or aircraft equipment for unsatisfactory operation.

4. The only positive method of identifying an omnirange is by its Morse Code identification or by the recorded automatic voice identification which is always indicated by use of the word "VOR" following the range's name. Reliance on determining the identification of an omnirange should never be placed on listening to voice transmissions by the Flight Service Station (FSS) (or approach control facility) involved. Many FSS remotely operate several omniranges which have different names from each other and in some cases none have the name of the "parent" FSS. (During periods of maintenance the coded identification is removed. See MAINTENANCE OF FAA NAVAIDS)

5. Voice identification has been added to numerous VHF omniranges. The transmission consists of a voice announcement, "AIRVILLE VOR" (VORTAC) alternating with the usual Morse Code identification. If no air/ground communications facility is associated with the omnirange, "AIRVILLE UNATTENDED VOR" (VORTAC) will be heard.

6. Part 91.25 of the Federal Aviation Regulations provides for certain VOR equipment accuracy checks prior to flight under instrument flight rules. To comply with this requirement and to ensure satisfactory operation of the airborne system, the FAA has provided pilots with the following means of checking VOR receiver accuracy: (1) VOR test facility (VOT), (2) certified airborne check points, and (3) certified check points on the airport surface.

7. The VOR test facility (VOT) transmits a test signal for VOR receivers which provides users of VOR a convenient and accurate means to determine the operational status of their receivers. The facility is designed to provide a means of checking the accura of a VOR receiver while the aircraft is on the groun The radiated test signal is used by tuning the receiv to the published frequency of the test facility. Wi the Flight Path Deviation Indicator (FPDI) center the omnibearing selector should read 0° with the t from indication being "from" or the omnibearii selector should read 180° with the to-from indicati reading "to." Should the VOR receiver be of t automatic indicating type, the indication should 180°. Two means of identification are used with t VOR radiated test signal. In some cases a continuo series of dots is used while in others a continuous 10 cycle tone will identify the test signal. Informati concerning an individual test signal can be obtain from the local Flight Service Station.

8. Airborne and ground check points consist of certifi radials that should be received at specific points the airport surface, or over specific landmarks wh airborne in the immediate vicinity of the airpo

9. Should an error in excess of ±4° be indicated throu use of the ground check, or ±6° using the airbor check, IFR flight shall not be attempted withc first correcting the source of the error. CAUTIO no correction other than the "correction card" figu supplied by the manufacturer should be applied making these VOR receiver checks.

10. The list of radiated test signals, airborne che points, and ground check points is published Section II, page 49.

TACTICAL AIR NAVIGATION (TACAN)

1. For reasons peculiar to military or naval operatic (unusual siting conditions, the pitching and rolli of a naval vessel, etc.) the civil VOR–DME system air navigation was considered unsuitable for milit or naval use. A new navigational system, Tac cal Air Navigation (TACAN), was therefore dev oped by the military and naval forces to more read lend itself to military and naval requirements. A result, the FAA has been in the process of integ ing TACAN facilities with the civil VOR-DME p gram. Although the theoretical, or technical pr ciples of operation of TACAN equipment are qu different from those of VOR-DME facilities, the result, as far as the navigating pilot is concerned the same. These integrated facilities are cal VORTAC's.

2. TACAN ground equipment consists of either a fi or mobile transmitting unit. The airborne unit conjunction with the ground unit reduces the tra mitted signal to a visual presentation of both azim and distance information. TACAN is a pulse syst and operates in the UHF band of frequencies. Its requires TACAN airborne equipment and does operate through conventional VOR equipment.

VHF OMNIDIRECTIONAL RANGE/TACTICAL AIR NAVIGATION (VORTAC)

1. VORTAC is a facility consisting of two components, VOR and TACAN, which provides three individual services: VOR azimuth, TACAN azimuth and TACAN distance (DME) at one site. Although consisting of more than one component, incorporating more than one operating frequency, and using more than one antenna system, a VORTAC is considered to be a unified navigational aid. Both components of a VORTAC are envisioned as operating simultaneously and providing the three services at all times. Areas of coverage for each type of service should be essentially the same; however, in some cases, the coverage of the VOR and TACAN components will differ significantly.

. Transmitted signals of VOR and TACAN are each identified by three-letter code transmission and are interlocked so that pilots using VOR azimuth with TACAN distance can be assured that both signals being received are definitely from the same ground station. A supplementary automatic voice identification is being added to the VOR. The frequency channels of the VOR and the TACAN at each VORTAC facility are "paired" in accordance with a national plan to simplify airborne operation.

DISTANCE MEASURING EQUIPMENT (DME)

1. In the operation of DME, paired pulses at a specific spacing are sent out from the aircraft (this is the interrogation) and are received at the ground station. The ground station (transponder) then transmits paired pulses back to the aircraft at a different pulse spacing and on a different frequency. The time required for the round trip of this signal exchange is measured in the airborne DME unit and is translated into distance (Nautical Miles) from the aircraft to the ground station.

   Operating on the line-of-sight principle, DME furnishes distance information with a very high degree of accuracy. Reliable signals may be received at distances up to 199 NM at line-of-sight altitude with an accuracy of better than ¼ mile or 2% of the distance, whichever is greater. Distance information received from DME equipment is SLANT RANGE distance and not actual distance. Therefore, the altitude of the aircraft will have a direct bearing on the distance information shown on the indicator.

   DME operates on frequencies in the UHF spectrum between 962 mc and 1213 mc. Aircraft equipped with TACAN equipment will receive distance information from a VORTAC automatically, while aircraft equipped with VOR must have a separate DME airborne unit.

   VOR/DME and VORTAC navigation facilities established by the FAA provide azimuth and distance information from co-located components under a frequency pairing plan. Frequency pairing allows the use of a single receiver tuning selector capable of simultaneously selecting a paired VOR and TACAN (DME) receiver frequency.

5. The importance of positive VOR identification cannot be overemphasized. See page I–4, paragraph 4.
6. Aircraft receiving equipment which provides for automatic DME selection assures reception of azimuth and distance information from a common source whenever VOR/DME and VORTAC navigation facilities are selected. Pilots are cautioned to disregard any distance displays from automatically selected DME equipment whenever VOR only or ILS facilities are being used for position determination.

VOR OPERATIONAL LIMITATIONS

1. The term VOR is, operationally, a general term covering the VHF omni-directional bearing type of facility without regard to the fact that the power, the frequency-protected service volume, the equipment configuration, and operational requirements may vary between facilities at different locations.
2. The table below lists the intended interference-free service volume of the various categories of VORs. Use of these facilities outside the service volume is not intended, and such use may therefore result in undependable or inadequate indications.

Class of VOR VORTAC or TACAN	Normally Anticipated Altitude Service	Normally Anticipated Interference-free Dist. Service
H	Up to 45,000 Ft MSL	149.75 SM (130 NM)
	Above 45,000 Ft MSL	115.20 SM (100 NM)
L	Up to 18,000 Ft MSL	46.06 SM (40 NM)
T	Up to 12,000 Ft MSL	28.79 SM (25 NM)

NOTE: H = High L = Low T = Terminal

		117.9	126

NOTE.—TACAN channels assigned to ILS localizer frequencies (108.1–111.9) are for programmed ILS/DME installations.

MARKER BEACON

1. Marker beacons serve to identify a particular location in space along an airway or on the approach to an instrument runway. This is done by means of a 75-mc transmitter which transmits a directional signal to be received by aircraft flying overhead. These markers are generally used in conjunction with L Frequency Radio Ranges and the Instrument Land System as point designators. Four classes of mark are now in general use: FM, LFM, station locat or Z-Markers, and the ILS marker beacons.
2. FM and LFM fan markers are keyed to indicate which radio range course they are located. The ra range courses are numbered clockwise beginning true north. Fan markers located on course num one are keyed to emit single dashes, those on cou two, two dashes, etc. When two fan markers located on the same radio range course, the identif tion of the outer most marker is preceded by t dots; thus the identification of the outermost mar on a number one course is two dots and one dash.
3. The class FM fan markers are used to provide positive identification of positions at definite poi along the airways. The transmitters have a pov output of approximately 100 watts. Two types antenna array are used with class FM fan mark The first type used, and generally referred to as standard type, produces an elliptical-shaped patte which at an elevation of 1000 feet above the stat is about four miles wide and 12 miles long. 10,000 feet the pattern widens to about 12 miles w and 35 miles long. (The long axis lies across the way or radio range.)
4. The second array produces a dumbbell or bonesha pattern, which, at the "handle" is about three m wide at 1000 feet. The boneshaped marker is p ferred at approach control locations where "tim approaches are used.
5. The class LFM or low-powered fan markers hav rated power output of 5 watts and are usually loca within 5 miles of the radio range stations with wh they are associated. The antenna array produce circular pattern which appears elongated at ri angles to the airway due to the directional ch acteristics of the aircraft receiving antenna.
6. The Station Location, or Z-Marker, was developed meet the need for a positive position indicator aircraft operating under instrument flying conditi to show the pilot when he was passing directly c a Low Frequency Radio Range Station. The mar consists of a 5-watt transmitter and a directive tenna array which is located on the range plot tween the towers or the loop antennas.
7. ILS marker beacon information is included ur "ILS."

INSTRUMENT LANDING SYSTEM (ILS)

1. GENERAL

a. The instrument landing system is designed to p vide an approach path for exact alignment descent of an aircraft on final approach to a r way.

b. The ground equipment consists of two highly rectional transmitters and, along the approa three (or fewer) marker beacons. The directio

INSTRUMENT LANDING SYSTEM (ILS) (Con't)

transmitters are known as the localizer and glide path transmitters.

c. The system may be divided functionally into three parts:

Localizer—course information
Glide Path—descent information
Marker beacons—range information

d. Compass Locators and Approach Light Lanes supplement these major components.

2. LOCALIZER

a. The localizer transmitter, located at the far end of the runway, transmits signals which enable the pilot to steer the required course to the runway. The transmitter, operating on one of twelve channels within the range of 108.1 mc to 111.9 mc, emits two patterns, one modulated at 150, and the other at 90 cycles per second. These two signal patterns overlap along a line formed by an elongation of the runway. The aircraft receiving equipment finds this line by finding the area of equal signal strength between the two patterns, just as the course of a radio range is the area of equal strength between two quadrants. The course formed by the localizer signals has an over-all width of 5°. It spreads from a width of approximately 70 feet at the touchdown point to a width of approximately one mile at a distance of 10 miles from the transmitter.

b. For the purpose of reference, the 150-cycle area to the right of the approaching aircraft is called the Blue area, and the 90-cycle area to the left of the approaching aircraft is called the Yellow area. The approach course of the localizer is called the front course.

c. The course along the centerline of the runway in the opposite direction is called the back course. The localizer transmitter has a range of approximately 40 miles at an altitude of 5,000 feet, and 80 miles at 10,000 feet. It can carry voice transmissions.

d. Identification consists of three-letter signals preceded by an I(..) transmitted on the localizer frequency.

3. GLIDE PATH

a. The UHF glide path transmitter is located approximately 750 feet from the approach end of the runway and approximately 400 feet from the center line and transmits a glide path beam 0.8° wide.

b. Unlike the localizer, the glide path transmitter emits its signals in the direction of the final approach and sends practically no signals toward the far end of the runway. The glide path transmitter, operating on one of 20 channels, transmits patterns modulated at 90 cycles and 150 cycles. The location of the glide path is determined by finding the area of equal signal strength between the patterns.

c. The glide path projection angle is normally adjusted to 2.5 degrees to 3 degrees above horizontal so that it intersects the middle marker at about 200 feet and the outer marker at about 1400 feet above the runway elevation.

d. In addition to the desired path, false course, reversal in sensing, will occur at vertical angles considerably greater than the usable path.

Example:

For a glide angle setting of 3 degrees, null reference equipment has a false course 9 degrees above horizontal. Nulls also occur above the path which cause the needle to center and the flag to show, indicating the absence of signal.

e. The proper use of the glide path requires that the pilot maintain alertness as the glide path intersection is approached and interpret correctly the "fly-up" and "fly-down" instrument indications to avoid the possibility of attempting to follow one of the higher angle courses.

f. Provided that procedures are correctly followed and pilots are properly indoctrinated in glide path instrumentation, the fact that these high angle courses exist should cause no difficulty in the glide path navigation since they will not normally be encountered.

g. Extreme caution should be used when flying the glide path where the indicator shows the position of the aircraft to be under the glide path. The suggested limits are not to exceed three dot deviation up to the middle marker and to allow no "fly-up" condition from the middle marker to completion of landing.

h. FAA glide slope facilities are intended to provide reliable glide slope signals for use in conjunction with the front course of the ILS localizer. Glide slope signals may be received in other azimuths (because of stray radiation from the antennas and reflections from nearby objects) which may in some cases be sufficient to activate the airborne warning flag. Any glide slope needle activity in these other azimuths should be disregarded.

i. Pilots are particularly cautioned to ignore glide slope indications when making back course localizer approaches. All FAA approved procedures for back course approaches are limited to use of the localizer portion of the ILS. Any attempt to fly spurious glide slope indications on such back course approaches could result in hazardous operations.

j. Modification of null reference glide slope facilities will result in glide slope flare at about thirty (30) feet above runway. Caution is advised on automatic approaches continued past runway threshold.

4. MARKER BEACON

a. There are ordinarily two marker beacons, the outer and middle, but there are exceptions at some loca-

INSTRUMENT LANDING SYSTEM (ILS) (Con't)

tions. Frequently the Z-marker of a radio range station located along the localizer beam serves as the outer marker in place of the regular fan-type marker.

b. The outer marker is approximately 4 to 7 miles from the approach end of the runway and within 250 feet of an extended center line of the runway. Its signal is keyed at two dashes per second.

c. The middle marker is located 3500 feet plus or minus 250 feet from the runway and within 50 feet of the center line extended. It transmits a series of alternate dots and dashes.

5. COMPASS LOCATOR

a. Compass locator transmitters are often situated at the middle and outer marker sites. The transmitters have a power output of 25 watts, a range of 15 miles, and operate between 200 and 400 kc.

b. Compass locators transmit two-letter identification groups. The outer locator transmits the first two letters of the localizer identification group, and the middle locator transmits the last two letters of the localizer identification group.

6. PARALLEL ILS

a. A parallel ILS approach system permitting simultaneous ILS approaches has been implemented at Chicago O'Hare International Airport. Similar systems are being planned for other airports having parallel runways with minimum spacing of 5000 feet between centerlines.

7. ILS MINIMA

a. ILS minima with all components operative are usually 200–½. Minima of 300–¾ may be authorized with any one component inoperative except the localizer. If 300 feet of obstruction clearance in the approach area cannot be provided with the glide slope inoperative, a note indicating the minima which does provide 300 feet obstruction clearance will be added to the approach chart.

Example:

"400–¾ required with glide slope inop."

b. Straight-in minima of 300–1 are authorized with only the outer marker or compass locator operative if 300 feet of obstruction clearance is provided in the approach area.

c. Circling minima are authorized with only the localizer and the outer marker or compass locator operative.

8. ILS CHANNEL/FREQUENCY

a. ILSs are being commissioned utilizing all 20 channels allotted to ILS by ICAO in Aeronautical Telecommunications Annex 10. Aircraft equipment should be checked to assure the receiving capability of all channels.

Sequence or Channel Number	Localizer Mc/s	Glide Path Mc/s	Sequence or Channel Number	Localizer Mc/s	Glide Path Mc/s
1	110.3	335.0	11	108.1	3
2	109.9	333.8	12	108.3	3
3	109.5	332.6	13	108.5	3
4	110.1	334.4	14	108.7	3
5	109.7	333.2	15	108.9	3
6	109.3	332.0	16	111.1	3
7	109.1	331.4	17	111.3	3
8	110.9	330.8	18	111.5	3
9	110.7	330.2	19	111.7	3
10	110.5	329.6	20	111.9	3

RADIO RANGES REQUIRING FLIGHT CHECK

1. Air navigation facilities must provide maximum sistance to the users with uniform quality of ir mation. A periodic physical check of the facilit conducted by FAA flight check to assure contir accurate operation.

2. When a flight check of a radio range is require NOTAM will be issued advising that the rang ground checked only, awaiting flight check, and following will apply with regard to operation and of the range:

   a. If the radio range is a very high frequency t (108.2 through 117.9 mc) range, the entire r range (consisting of the navigational, voice, identification features) will be shut down.

   b. If the radio range is a low frequency type through 400 kc) nonsimultaneous range, the r gational feature will be shut down, and no uti tion for navigational purposes will be author

   c. If the radio range is a low frequency type through 400 kc) simultaneous range, it may used as a homing facility only.

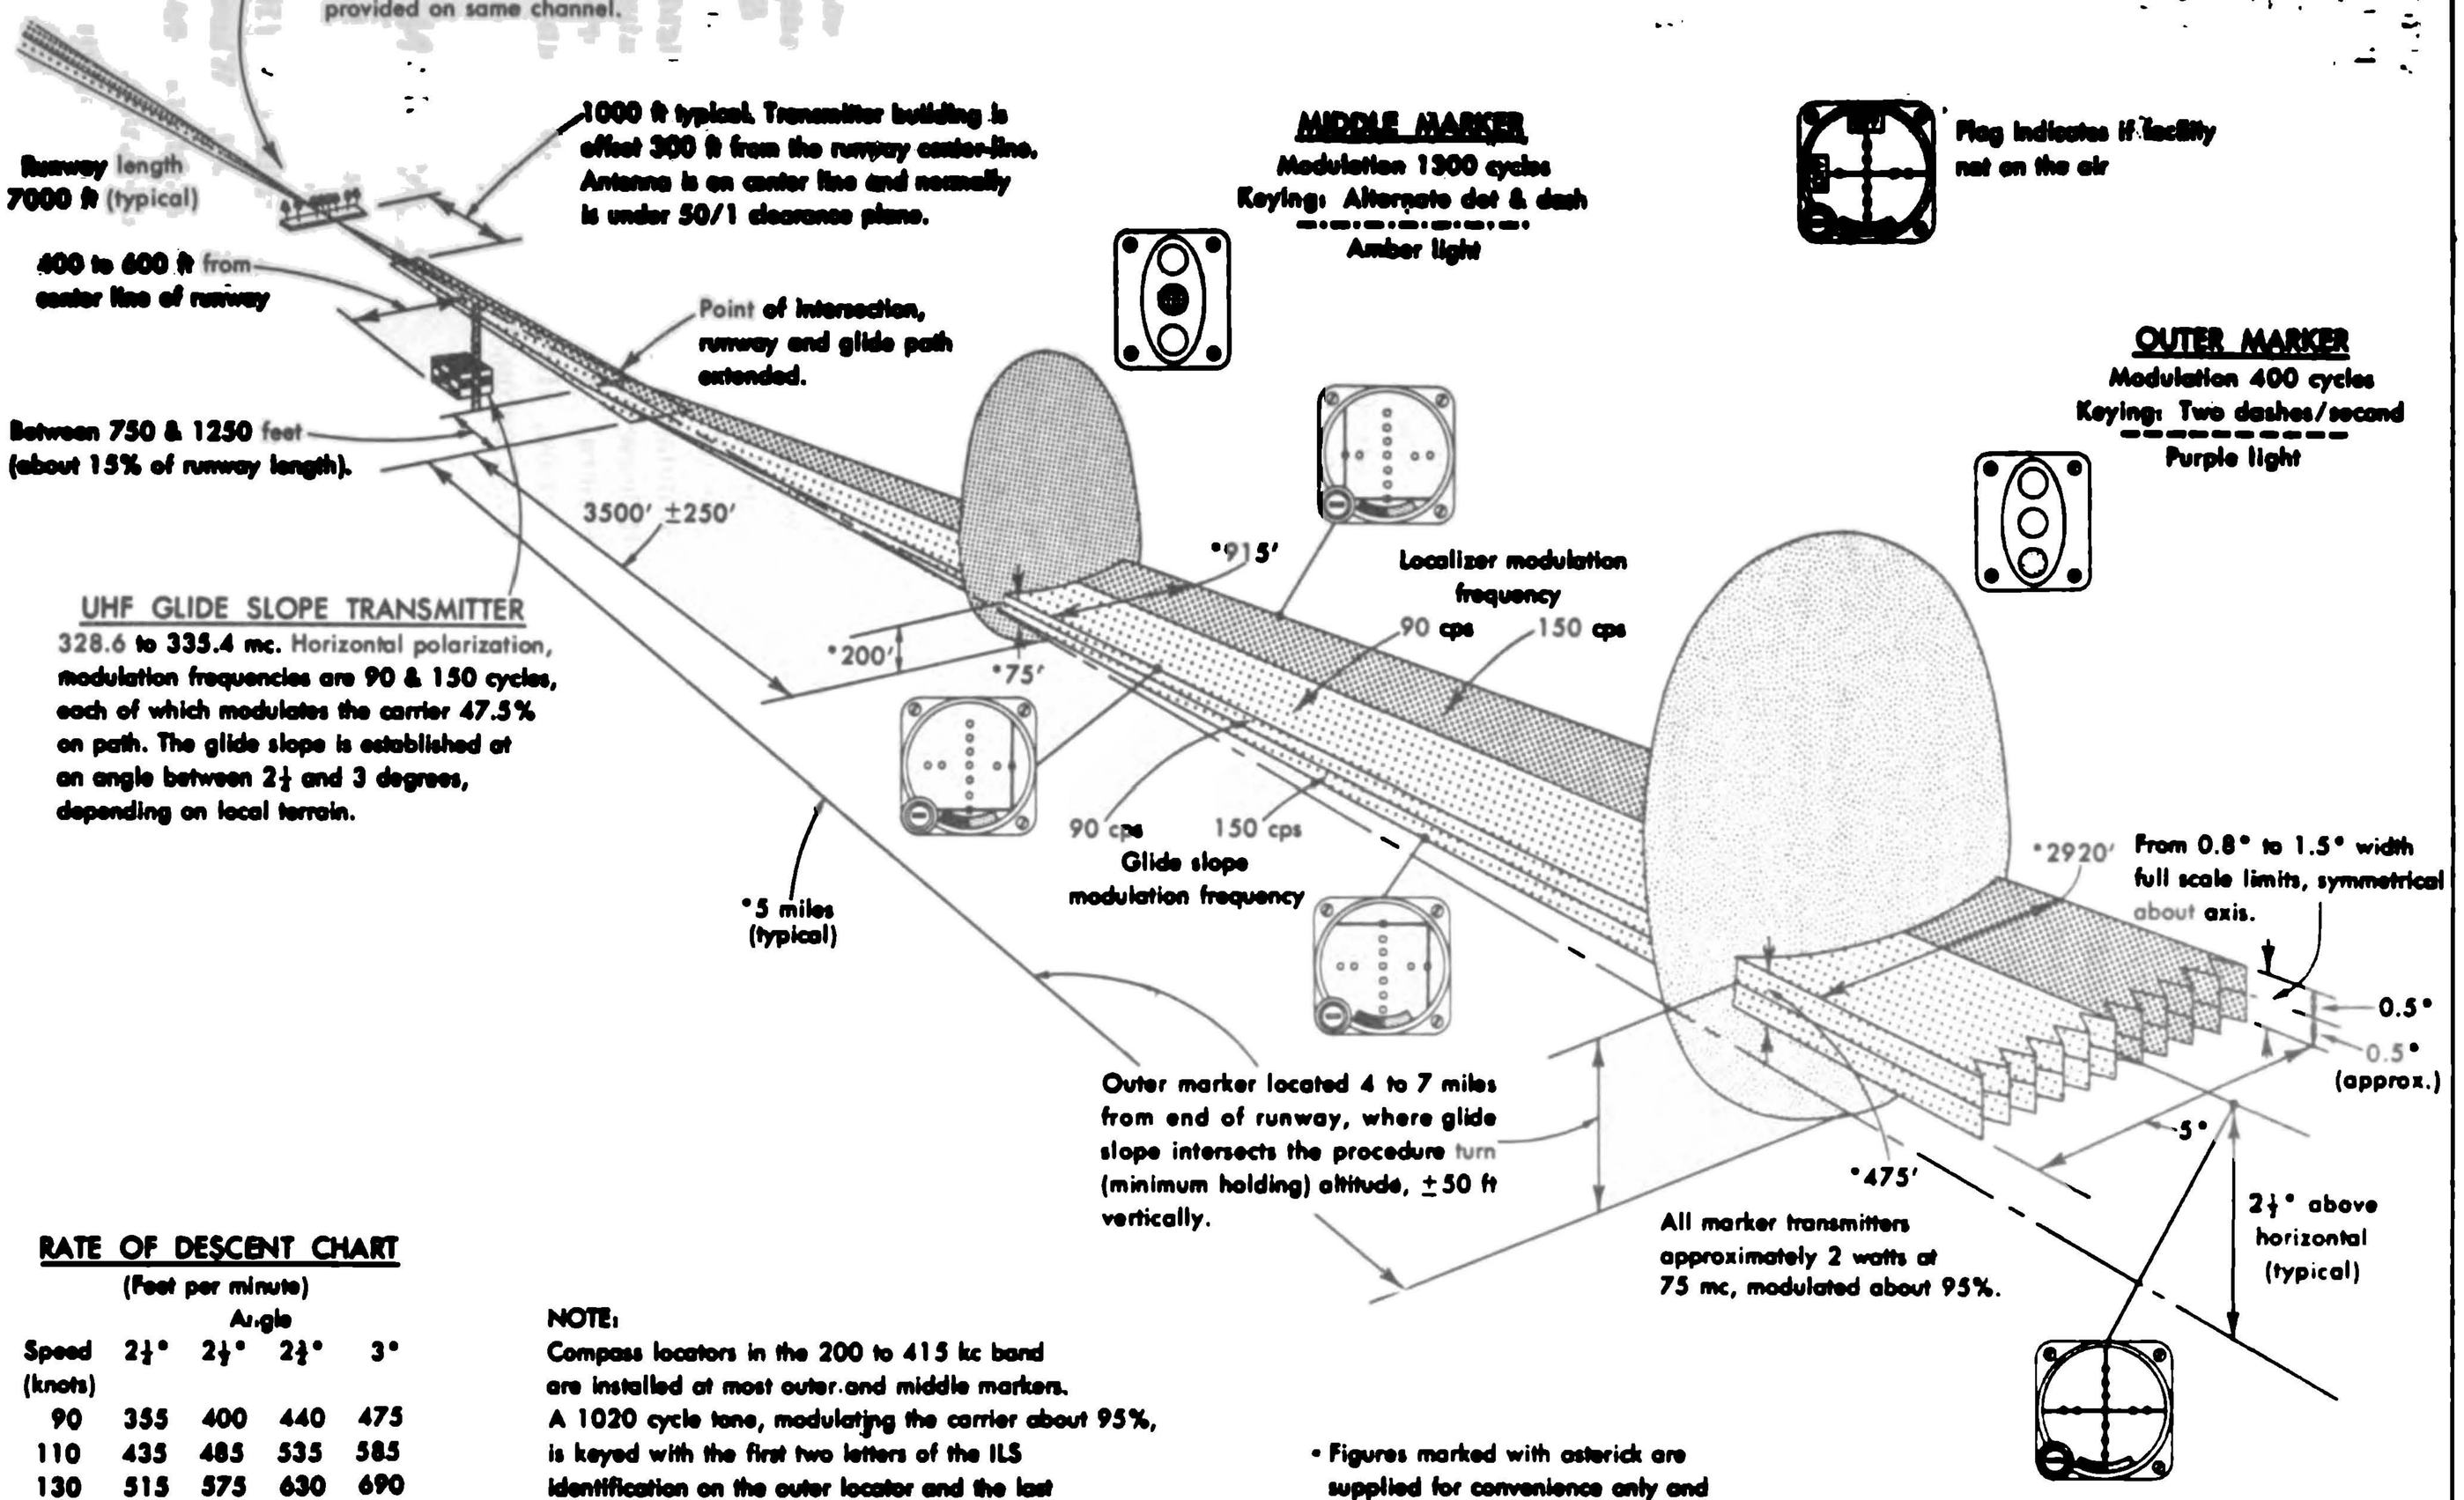
      (1) In addition, this type of radio range ma used as an ADF approach aid by sched air carriers, provided that their operat specifications authorize an ADF instrui approach to the airport concerned.

      (2) Irregular air carriers and other operators use this type of radio range as an ADF in ment approach aid if an ADF procedure the airport concerned is prescribed by Administrator, or if an approach is condu using the same course for an ADF trac that specified in the approved range proce and with identical altitudes as used in range approach.

   d. If the radio range is a VORTAC or TACAN, TACAN portion cannot be "ground check Therefore, the TACAN will be reported "ou service" and will be shutdown until restore normal operation by flight check.

ILS
(FAA Instrument Landing System)
STANDARD CHARACTERISTICS AND TERMINOLOGY

ILS approach charts should be consulted to obtain variations of individual systems.



RATE OF DESCENT CHART
(Feet per minute)

Speed (knots)	Angle 2½°	2¾°	3°	3¼°	3½°
90	355	400	440	475	515
110	435	485	535	585	630
130	515	575	630	690	745
150	595	665	730	795	860
160	637	707	778	849	920

NOTE:
Compass locators in the 200 to 415 kc band are installed at most outer and middle markers. A 1020 cycle tone, modulating the carrier about 95%, is keyed with the first two letters of the ILS identification on the outer locator and the last two letters on the middle locator.

• Figures marked with asterick are supplied for convenience only and are not necessarily standard.

Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

MAINTENANCE OF FAA NAVAIDS

1. During periods of routine or emergency maintenance, the coded identification (or code and voice, where applicable) will be removed from certain FAA Navaids, namely, ILS localizers, VHF ranges and L/MF ranges but not from "H" facilities, compass locators or 75 mc marker beacons. The removal of identification serves as warning to pilots that the facility has been officially taken over by "Maintenance" for tune-up or repair and may be unreliable even though on the air intermittently or constantly.

NAVAIDS WITH VOICE

1. Voice equipped en route radio navigational aids are under the operational control of an FAA Flight Service Station (FSS), or an approach control facility. Most are remotely operated.
2. Unless otherwise noted on the chart, all radio navigation aids operate continuously except during interruptions for voice transmissions on the same frequencies where simultaneous transmission is not available, and during shutdowns for maintenance purposes. Hours of operation of those facilities not operating continuously are annotated on the charts.

SIMULTANEOUS VOICE TRANSMISSIONS FROM A SINGLE LOCATION

1. At several FAA facilities, simultaneous voice transmissions are made from a single location. For example, the New York FSS controls the transmitters at Kennedy, Hampton, Riverhead, Deer Park, Hempstead L/MF and VOR facilities.
2. To provide a uniformly brief announcement, generally for broadcast purposes, the name of the controlling facility, followed by the word AREA will be used, e.g., THIS IS NEW YORK AREA RADIO, etc.
3. Call from aircraft will be answered using the name of the station as stated by the pilot, e.g., a pilot calling "Riverhead Radio" will be answered by the New York FSS, "THIS IS RIVERHEAD RADIO, etc."
4. The word "AREA" signifies that the transmission from the named (controlling) location is emanating simultaneously from two or more remotely controlled facilities, having a different name or names.

FREQUENCY UTILIZATION PLAN

AIR NAVIGATION AIDS

108.1–111.9 mc: ILS localizer with simultaneous radio-telephone channel operating on odd-tenth decimal frequencies (108.1, 108.3 etc.).

108.2–111.8 mc: VOR's operating on even-tenth decimal frequencies (108.2, 108.4 etc.).

112.0–117.9 mc: Airway track guidance. (VORs)

COMMUNICATIONS

118.0–121.4 mc: AIR TRAFFIC CONTROL COMMUNICATIONS

121.5 mc: EMERGENCY (WORLD-WIDE)

121.6–121.95 mc: AIRPORT UTILITY

122.1, 122.2 mc: PRIVATE AIRCRAFT ENRO

122.5, 122.7, 122.6, 122.4 mc: PRIVATE AIRCR TO TOWERS

122.8, 123.0 mc: AERONAUTICAL ADVIS STATIONS (UNICOM)

122.9 mc: AERONAUTICAL MULTICOM STATI

123.1–123.55 mc: FLIGHT TEST AND FLY SCHOOLS

123.6–128.8 mc: AIR TRAFFIC CONTROL MUNICATIONS

126.7 mc: FLIGHT SERVICE STATIONS

128.85–132.0 mc: AERONAUTICAL ENROUTE TIONS (AIR CARRIER)

132.05–135.95 mc: AIR TRAFFIC CONTROL MUNICATIONS

135.9 mc: FLIGHT SERVICE STATIONS

RADIO INTERFERENCE

1. You can do your part toward reducing radio i ference to aeronautical services from nonaeronat sources which may be noted during flight if such ported promptly to an FAA facility (preferably landing) or to an FCC field office. Reports sl state the frequency or channel affected, descripti the interference, and the geographical area wher interference was observed. If known, reports sl give the apparent cause of the interference suc radio stations, call letters when such can be ident industrial plants, diathermy machines, power l television receivers, etc. Do not report interfe caused by normal frequency congestion, i.e., si; from other aircraft using the frequency.
2. In complex aircraft radio installations involving than one receiver, there are many combinatio possible interference between units. This interfe can cause either erronous navigation indicatio complete or partial blanking out of the commu tions. Pilots should be familiar enough with the installation of particular airplanes they fly to r nize this type of interference. Explanations of type of interference are contained in Bureau of F Standards Release 436 and Flight Standards S Release 450. Copies can be obtained by writing t Federal Aviation Agency, Correspondence In Section, HQ 440, Publishing and Graphics Div Washington, D.C., 20553.

CONSOLAN

1. Consolan is a long-range navigation aid operati the low/medium frequency band.
2. A receiver equipped with CW (BFO) position out AVC should be used. When a loop anten used, best results are obtained by placing the lo the maximum signal position.
3. Three stations are now operating within the U States—Nantucket (TUK) 194 kc, San Fra (SFI) 192 kc, and Miami (MMF) 190 kc.

CONSOLAN (Con't)

4. A range of 1000–1400 nautical miles or more is to be expected. Greatest range is found over sea-water. The range depends on the receiver, noise, ground conductivity, ionospheric conditions, frequency, and transmitter power. With experience, operators can obtain accurate bearings through considerable noise. Narrow band receivers provide a high operational range. The systems are not usable within 25 miles of the station.

. Operating details and the necessary tables are included in the International Flight Information Manual.

VHF/UHF DIRECTION FINDER

. The VHF/UHF Direction Finder (VHF/UHF/DF) is one of the Common System equipments that helps the pilot without his being aware of its operation. The VHF/UHF/DF is a ground-based radio receiver used by the operator of the ground station where it is located.

2. The equipment consists of a directional antenna system, a VHF and a UHF radio receiver. At a radar-equipped tower or center, the cathode-ray tube indications may be superimposed on the radarscope.

3. The VHF/UHF/DF display indicates the magnetic direction of the station from the aircraft each time the aircraft transmits. Where DF equipment is tied into radar, a strobe of light is flashed from the center of the radarscope in the direction of the transmitting aircraft.

4. DF equipment is of particular value in locating lost aircraft and in helping to identify aircraft on radar.

RADAR

GENERAL

1. FAA radar units operate continuously at the locations shown in the Airport/Facility Directory and their services are available to all pilots, both civil and military. Contact the associated FAA control tower or ARTCC on any frequency guarded for initial instructions, or in an emergency, any FAA facility for information on the nearest radar service.
2. Radar Traffic Information Service Procedures, Expanded Radar Service for Arriving and Departing Flights in Terminal Areas Procedures, and Terminal Radar Service Procedures are published under "ARRIVAL."

SURVEILLANCE RADAR

1. Surveillance radars are divided into two general categories: Airport Surveillance Radar and Air Route Surveillance Radar. Airport Surveillance Radar (ASR) is designed to provide relatively short range coverage in the general vicinity of an airport and to serve as an expeditious means of handling terminal area traffic through observation of precise aircraft locations on a radarscope. The ASR can also be used as an instrument approach aid. Air Route Surveillance Radar (ARSR) is a long-range radar system designed primarily to provide a display of aircraft locations over large areas. It will not normally be used as the basis for instrument approaches, nor to provide traffic separation in terminal areas at low altitudes.
2. Surveillance radars scan through 360° of azimuth and present target information on a radar display located in a tower or center. This information is used independently or in conjunction with other navigational aids in the control of air traffic.

RADAR CONTROLLED APPROACHES (FAA RADAR FACILITIES ONLY)

1. The only airborne radio equipment required for radar controlled approaches is a functioning radio transmitter and receiver. By means of radar, the controller closely follows the flight path of aircraft and issues instructions to align these with the center line of the runway, and keep them on course until the pilot can complete his approach and landing by visual reference to the surface.
2. Radar approaches will be given upon request and may be suggested to pilots of aircraft in distress or to expedite traffic. Acceptance of a precision or surveillance approach by a pilot does not waive the prescribed weather minimums for the airport or for the particular aircraft operator concerned. The de to make a radar controlled approach when t ported weather is below the established mini rests with the pilot.
3. Precision and surveillance approach minimum published on separate pages in the C & GS App and Landing Chart Manuals.
   a. **A PRECISION APPROACH** is one in which controller provides highly accurate naviga guidance in azimuth and elevation to a Pilots are given headings to fly, to direct the and keep their aircraft aligned with, the ext center line of the landing runway. They ar to anticipate glide slope interception approxi ly 15 to 30 seconds before it occurs, when to descent, and they may be given a rate of de based on the glide slope angle and the app speed of the aircraft. If the aircraft is obs to deviate above or below the glide slope, the is given the amount of deviation and ask adjust his rate of descent to return to the slope. Range from touchdown is given at once each mile. If an aircraft is observed t ceed outside of specified safety zone limits i muth and/or elevation and continue to o outside these prescribed limits, the pilot w directed to climb to a specified altitude and a specified course if he is not navigating by reference to the surface. Navigational gui in azimuth and elevation is provided to the until the aircraft passes over the approac of the runway, at which point he is advised deviation from the runway center line and ed to take over visually and complete his la
   b. **A SURVEILLANCE APPROACH** is one in whic controller provides navigational guidanc azimuth only. The pilot is furnished he to fly to align his aircraft with the ext center line of the landing runway, but sin radar information used for a surveillanc proach is considerably less precise than tha for a precision approach, the accuracy of t proach will not be as great and higher w minimums will apply. Guidance in elevat not possible, but the pilot will be given a p which to start a rate of descent based on a able glide angle and the speed of the aircra concerned. In addition, the pilot will be advi his distance from the end of the runway eac on final and concurrently recommended alt (mean sea level) above/to the published

RADAR CONTROLLED APPROACHES (FAA) (Con't)

minimum will be furnished at each mile. No recommended altitudes will be furnished at other than whole mile distances or when such altitudes are below the ceiling minimum published for the approach being made. A pilot may be guided to any runway having an approved surveillance approach. Navigational guidance is provided until the aircraft reaches a point one mile from the approach end of the runway. At the point, he is given his distance from the runway and directed to execute a missed approach if he does not have runway in sight at landing minimums.

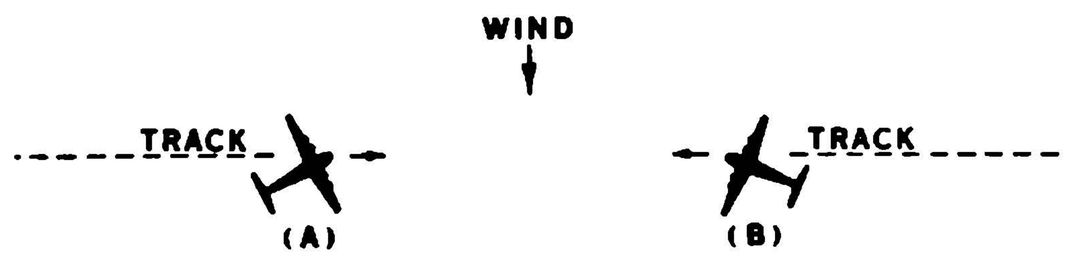
c. **A NO-GYRO APPROACH** is available to a pilot under radar control who experiences circumstances wherein his directional gyro or other stabilized compass is inoperative or inaccurate. When this occurs, he should so advise air traffic control and request a No-Gyro vector or approach. Pilots of aircraft not equipped with a directional gyro or other stabilized compass who desire radar handling may also request a No-Gyro vector or approach. Prior to commencing such vector/approach the pilot will be advised to make all turns at standard rate, and that turn instructions should be executed immediately upon receipt. For example, "TURN RIGHT," "STOP TURN." When a surveillance or precision approach is made, the pilot will be advised after his aircraft has been turned onto final approach to make turns at half standard rate.

AIR TRAFFIC CONTROL RADAR BEACON SYSTEM (ATCRBS)

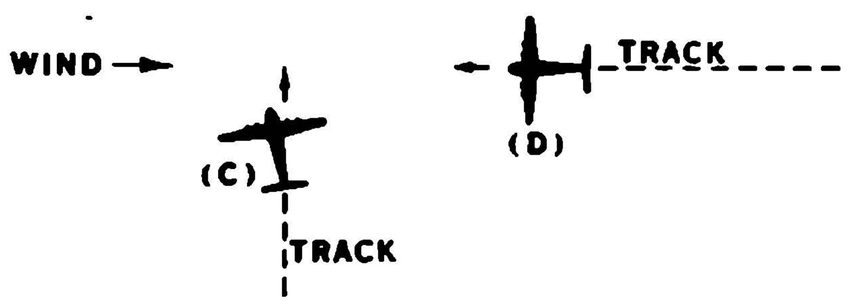
Airborne transponders and ground interrogators, making up the air traffic control radar beacon system, give controllers a positive radar return, overcoming the difficulty experienced with some aircraft that have poor reflecting characteristics. The primary functions of the radar beacon system are to provide reinforcement of radar replies, permitting the aircraft to be tracked reliably through heavy ground clutter and precipitation and a positive means of identifying aircraft to the air traffic controller. Radar beacons are frequently referred to as "secondary radars." Radar beacon procedures are published in Section II.

RADAR TRAFFIC INFORMATION

1. Radar traffic information is issued by air traffic controllers as a clock position with relation to the track of an aircraft. The examples depicted below point out the possible error in the position of this traffic when it is necessary for a pilot to apply drift correction to maintain this track. This error could also occur in the event a change in course is made at the time radar traffic information is issued.



In above example traffic information would be issued to the pilot of aircraft "A" as 12 o'clock. The actual position of the traffic as seen by the pilot of aircraft "A" would be one o'clock. Traffic information issued to aircraft "B" would also be given as 12 o'clock, but in this case, the pilot of "B" would see his traffic at 11 o'clock.



In above example traffic information would be issued to the pilot of aircraft "C" as two o'clock. The actual position of the traffic as seen by the pilot of aircraft "C" would be three o'clock. Traffic information issued to aircraft "D" would be at an 11 o'clock position. Since it is not necessary for the pilot of aircraft "D" to apply wind correction (crab) to make good his track, the actual position of the traffic issued would be correct. Since the radar controller can only observe aircraft track on his radar display, he must issue traffic advisories accordingly, and pilots should give due consideration to this fact when looking for reported traffic.

AIRPORT, AIR NAVIGATION LIGHTING AND MARKING AIDS

AERONAUTICAL (LIGHT) BEACONS

1. The aeronautical beacon is a visual navaid displaying flashes of white and/or colored light, which is used to indicate the location of airports, landmarks, and certain points of the Federal airways in mountainous terrain and to mark hazards. The principal light so used is a rotating beacon of relatively high intensity, which is often supplemented by nonrotating flashing lights of lesser intensity. (Reference FAA Technical Standard Order TSO–N7a.)
2. The color or color combination displayed by a particular beacon and/or its supplementary lights tells whether the beacon is indicating a landing place, landmark, point of the Federal airways, or hazard. Coded flashes of the supplementary lights, if employed, further identify the beacon site. •

ROTATING BEACON

1. The rotating beacon has a vertical light distribution such as to make it most effective at angles of one to three degrees above the horizontal from its site; however, it can be seen well above and below this peak spread. Rotation is in clockwise direction when viewed from above. It is always rotated at a constant speed which produces the visual effect of flashes at regular intervals. Flashes may be one or two colors alternately. The total number of flashes are:

   12 to 15 per minute for beacons marking airports, landmarks, and points on Federal airways.

   12 to 40 per minute for hazard beacons.

AUXILIARY LIGHTS

1. The auxiliary lights are of two general kinds: code beacons and course lights. The code beacon, which can be seen from all directions, is used to identify airports and landmarks and to mark hazards. The number of code beacon flashes are:
   a. **Green coded flashes** not exceeding 40 flashes or character elements per minute, or constant flashes 12 to 15 per minute, for identifying land airports.
   b. **Yellow coded flashes** not exceeding 40 flashes or character elements per minute, or constant flashes 12 to 15 per minute, for identifying water airports.
   c. **Red flashes,** constant rate, 12 to 40 flashes per minute, for marking hazards.
2. The course light, which can be seen clearly from only one direction, is used only with rotating beacons of the Federal Airway System; two course lights, back to back, direct coded flashing beams of light in either direction along the course of airway (see "Airway Beacons" below).

COLOR

1. The colors and color combinations of rotating bea and supplementary lights are basically:

White and Green ---	Lighted land airport
*Green alone -------	Lighted land airport
White and Yellow --	Lighted water airport
*Yellow alone ------	Lighted water airport
White and Red -----	Landmark or navigati point
White alone -------	Unlighted land airport (rare installation)
Red alone ----------	Hazard

*Green alone or yellow alone is used only in nection with a not far distant white-and- or white-and-yellow beacon display, respecti

LIGHTED LAND AIRPORTS (WHITE AND GREEN)

1. Alternating white and green flashes indicate the ence of a lighted land airport or intermediate at, or not very far from, the beacon site.
   a. **Alternating white and green flashes** from a r ing beacon indicate that the beacon is at, or in 2 miles of, a lighted airport or interme landing field. (This is the installation us seen).
   b. **A white and green combination** from a rot beacon flashing white only, accompanied by green flashes from directional course lights, n that the beacon is on a Federal airway and an intermediate field or airport (usually sma within 2 miles. (This installation is relat rare.)
   c. **Green flashes alone,** usually coded, from a code con used by itself, means that the code beac located at or beside a lighted airport. (Whe rotating beacon facility showing alternate and green is located more than 5000 feet the airport or landing field, the green-flashing beacon is used to show more exactly the loc of the landing area.)

LIGHTED WATER AIRPORTS (WHITE AND YELLOW)

1. White and yellow flashes indicate the presence lighted water airport at, or not very far from beacon site.
   a. **Alternating white and yellow flashes** from a r ing beacon indicate that the beacon is at, or in 2 miles of, a lighted water airport.

LIGHTED WATER AIRPORTS (Con't)

b. **Yellow flashes alone,** usually coded, from a code beacon used by itself, means that the code beacon is located at, or beside a lighted water airport—when there is a white and yellow flashing beacon within 2 miles. (When the rotating beacon showing alternate white and yellow is located more than 5000 feet from the water airport, the yellow flashing code beacon is used to show more exactly the location of the landing area.)

LANDMARKS (WHITE AND RED)

White and red flashes indicate the location of a natural or man-made landmark or a point on the Federal airways.

a. **Alternating white and red flashes** from a rotating beacon may be either a landmark or a site on the Federal airways.

b. **A white and red combination** from a rotating beacon flashing white only, accompanied by coded red flashes from directional course lights, means that the beacon marks a point on the Federal airways near which there is no landing area.

HAZARDS (RED ALONE)

Red flashes only from a rotating beacon or a code beacon mean the presence of an obstruction or obstructions to air navigation or an area on the ground used for purposes hazardous to air navigation. (Reference *"Obstruction Marking and Lighting Manual"* issued by the Federal Aviation Agency).

Steady burning red lights are employed near airports to mark obstructions and are also used to supplement flashing lights in marking en route obstructions.

MILITARY AIRPORTS

Military airport beacons flash alternately white and green, but are differentiated from civil beacons by dual-peaked (two quick) white flashes between the green flashes.

DAYLIGHT BEACON OPERATION

Operation of an airport rotating beacon during the hours of daylight, means that the ground visibility in the control zone is less than three miles and/or the ceiling is less than 1000 feet and that a traffic clearance is required for landings, take-offs, and flight in the traffic pattern.

AIRPORT IDENTIFYING CODE

Where airport identification is required, the code beacon for land or water airports may be assigned an exclusive code characteristic, which is printed on Sectional Aeronautical Charts.

AIRWAY BEACONS

Airway beacons are remnants of the "lighted" airways which antedated the present electronically equipped Federal Airway System. The lighted airways are delineated by rotating beacons spaced from 10 to 15 miles apart along the airway between airports, with an intermediate landing field at about every third beacon. Usually mounted on a tower with the rotating beacon were two directional flashing auxiliary lights, trained in either direction along the course of an airway, hence called course lights.

2. Each beacon site is numbered, and course lights when employed, flash an identifying code. Both the beacon site number and the corresponding code flash are printed on the Sectional Aeronautical Charts. The numbering bears a direct relation to the distance from the beacon to the city where the airway originates.

3. Federal airways are considered to extend from south to north and from west to east. For beacon numbering purposes, each airway is divided into ten-mile "blocks". A beacon is numbered according to block, or the distance it is located along the airway. For example, the course lights of the Number 3 beacon on the Salt Lake City-Great Falls airway, flashes a special code indicating "Site 3". This flashing code tells the pilot that he is about 30 miles north of Salt Lake City.

4. Occasionally two beacon sites fall within the same ten-mile block, in which case, they flash the same code number. This special code, numbering from 1 to 10, repeats itself along the airway. Accordingly, Sites 3, 13, 23, etc., will each flash the special code "3"; but this repetition should not be confusing because there will be 100 miles between the same code flash. Pilots should note that the block system of numbering and the decommissioning of certain beacons, often result in successive beacons not being in consecutive numerical order.

5. The special course light code, with a means of remembering it, is:

Directional Course Light Code

Beacon Number	1	2	3	4	5
Code Flashes	●▬	●●▬	●●●▬	●●●●	●▬●
International Code	When	Undertaking	Very	Hard	Routes
	6	7	8	9	10
	▬●▬	▬●●	▬●●●	▬▬●	▬▬
	Keep	Directions	By	Good	Methods

ROTATING BEACON VS CODE BEACON OR COURSE LIGHT

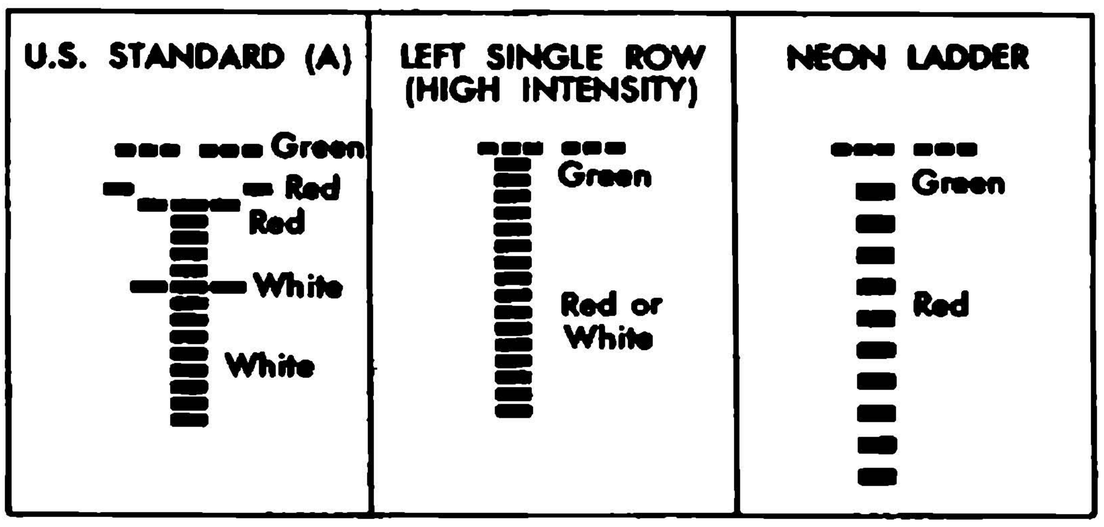
1. The flash of rotating beacons is produced by the revolving motion without change in light intensity and is therefore a sharp well-defined flash. The flash of code beacons and course lights is produced by making and breaking the electric circuit and the resulting heating and cooling of the lamp filament causes the light to rise perceptibly to a peak intensity and then fade. This provides one means for the pilot to tell them apart.

DEVIATIONS FROM STANDARDS

1. The foregoing outlines the intended installation and interpretation of aeronautical light beacons in accordance with agreed standards to which the beacons are required to conform in basic characteristics. However, pilots are alerted to the existence of occasional minor deviations from the exact installations described, and advised to make allowances for inconsistencies.

INSTRUMENT APPROACH LIGHT SYSTEMS

1. Instrument approach light systems provide the basic means for transition from instrument flight using electronic approach aids to visual flight and landing. Inadequate knowledge results in an increased probability of missed approaches during minimum weather conditions, imposing a greater burden on air traffic control facilities and delaying other aircraft.
2. Configuration "A" Centerline Approach Lighting System has been adopted as the U.S. National Standard One hundred and ninety-four of these systems have been commissioned to date with a total of 220 currently programmed. Although configuration "A" has been adopted as the U.S. Standard, the Neon Ladder and the Left Single Row configurations can still be found at a few civil airports. Approach and Landing Charts depict the approach light configuration at each airport.



3. Condenser-Discharge Sequenced Flashing Light Systems are installed at airports which have U.S. Standard "A" approach lights as a further aid to pilots making instrument approaches. The system consists of a series of brilliant blue-white bursts of light flashing in sequence along the approach lights. It gives the effect of a ball of light traveling towards the runway. An impression of the system as a pilot first observes the flashing lights when making an approach is that of large tracer shells rapidly fired from a point in space toward the runway. These light sources provide vital information to pilots approaching a runway under instrument conditions. They penetrate severe atmospheric conditions, attracting the pilot's eyes to the location of the approach lighting system.

VISUAL APPROACH SLOPE INDICATO (VASI)

1. VASI is designed to provide by visual referenc same information that the glide slope unit of an provides electronically. It provides a visual path within the approach zone, at a fixed plan clined 2½° to 4° from horizontal which an appr ing pilot can see and utilize for descent guidance ing an approach to a landing. The element of c guidance is obtained from reference to the ru lights.
2. Standard installation of the complete system co of 12 light source units arranged in light bars three units placed on each side of the runwa posite the 600-foot mark (threshold) and thr each side of the runway at the 1,300-foot mark. are the downwind and upwind bars respect The Visual Glide Slope reference point is mi between the upwind and downwind bars.
3. Provision is made for controlling the intensity lights and adjustments can be made at pilot re The VASI can normally be seen at the approx range of the outer marker (4–5 miles) and at gr distances at night. Under sunlight or snow tions the range is decreased to about 3.5 na miles.
4. The following is offered to pilots as yet unfa with the principles and operation of this systen the pilot technique required. The basic principle VASI is that of color differentiation between re white. Each light unit projects a beam of having a white color in the upper part and color in the lower part. The light units are arr so that the pilot of an aircraft during approac see the following:

(a) Above glide slope:	white white	white white
(b) On glide slope:	red white	red white
(c) Below glide slope:	red red	red red

5. When on the proper glide, the pilot is in effect shooting the bars nearer the threshold and shooting the bars farther down. Thus he wi the downwind bars as white and the upwind b red. A position below the glide path will caus bars to be red, and a high position will caus bars to be white. Impending departure from the path is indicated to the pilot by a transition in from red through pink to white or vice vers movement to the high side will cause the u bars to change from red through pink to whi descent below the glide path will change the wind bars from white through pink to red.

VISUAL APPROACH SLOPE INDICATOR (VASI) (Con't)

the pilot is below the glide path the pair of red bars visible on each side of the runway will tend to merge into one bold red signal on each side of the runway if descent continues to be excessive and takes the pilot well below the glide path.

6. In haze and dust conditions or when an approach is made into the sun, the white bars of the system may appear yellowish. This is also true at night when the VASI system is operated at a low intensity. Certain atmospheric debris may give the white lights an orange or brownish tint; however, the red lights are not affected and the principle of color differentiation is still applicable.

IN-RUNWAY LIGHTING

1. Touchdown zone lighting and runway centerline lighting are installed on some precision approach runways to facilitate landing under adverse visibility conditions. Taxiway turnoff lights may be added to expedite movement of aircraft from the runway.
   a. **Touchdown Zone Lighting**—two rows of transverse light bars disposed symmetrically about the runway centerline in the runway touchdown zone. The system generally extends from 75 to 125 feet of the landing threshold to 3000 feet down the runway.
   b. **Runway Centerline Lighting**—flush centerline lights spaced at 25-foot intervals beginning 75 feet from the landing threshold and extending to within 75 feet of the opposite end of the runway.
   c. **Taxiway turnoff lights**—flush lights spaced at 12½-foot intervals, defining the curved path of aircraft travel from the runway centerline to a point on the taxiway.

RUNWAY END IDENTIFIER LIGHTS (REIL)

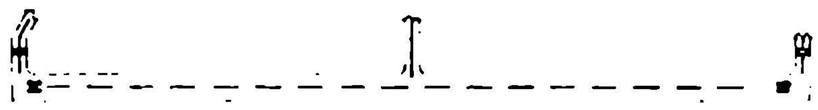
1. Runway End Identifier Lights are installed at many airfields to provide rapid and positive identification of the approach end of a particular runway. The system consists of a pair of synchronized flashing lights, one of which is located laterally on each side of the runway threshold facing the approach area. They are effective for:
   a. Identification of a runway surrounded by a preponderance of other lighting.
   b. Identification of a runway which lacks contrast with surrounding terrain.
   c. Identification of a runway during reduced visibility.

MARKING

1. In the interest of safety, regularity, or efficiency of aircraft operations, the FAA has recommended for the guidance of the public the following airport marking.
   Runway numbers and letters are determined from the approach direction. The number is the whole number nearest one-tenth the magnetic azimuth of the centerline of the runway, measured clockwise from the magnetic north.) The letter or letters differentiate between parallel runways:

   For two parallel runways "L" "R"
   For three parallel runways "L" "C" "R"

   a. **Basic Runway Marking**—markings used for operations under Visual Flight Rules: centerline marking and runway direction numbers.

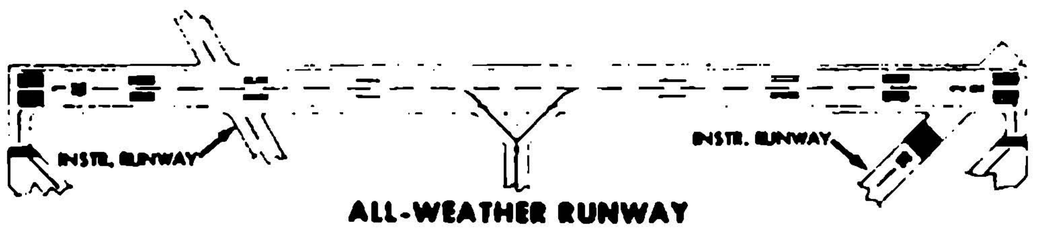


BASIC RUNWAY

   b. **Instrument Runway Marking**—markings on runways served by a nonvisual navigation aid and intended for landings under instrument weather conditions: basic runway markings plus threshold marking.

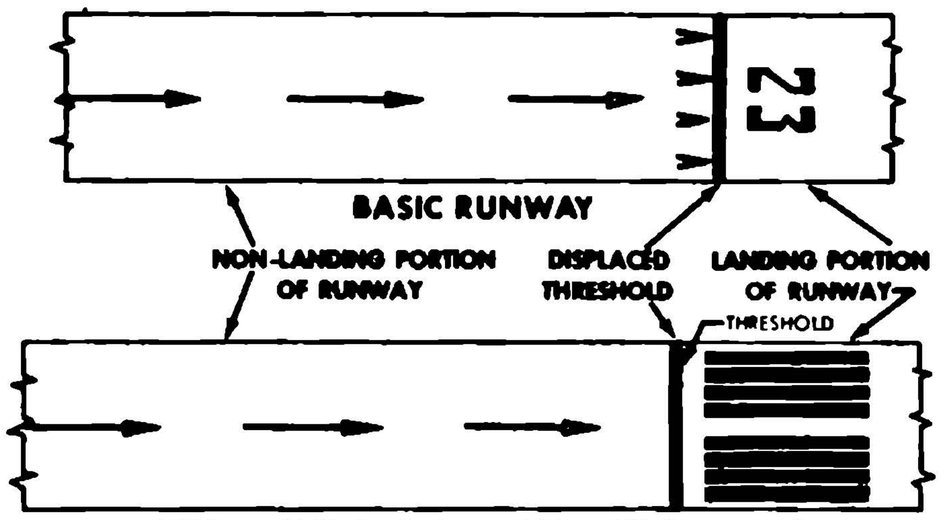
INSTRUMENT RUNWAY

   c. **All-Weather Runway Marking**—markings on runways served by non-visual precision approach aids and on runways having special operational requirements: instrument runway marking, landing zone marking, plus side stripes.



ALL-WEATHER RUNWAY

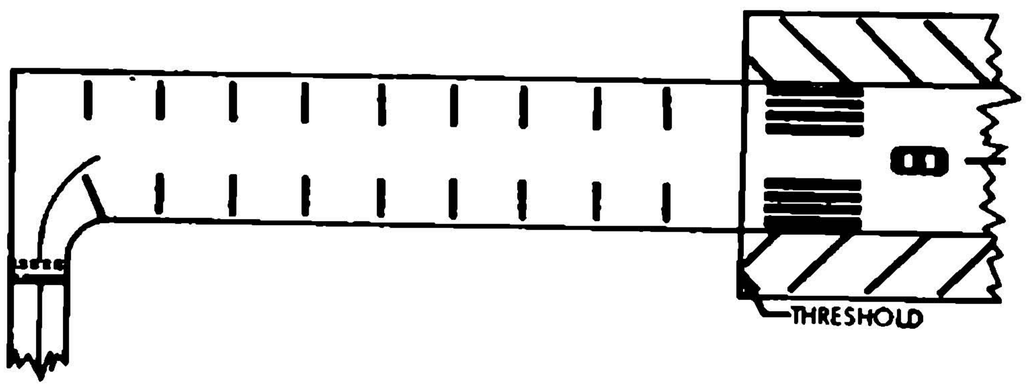
   d. **Threshold**—A line perpendicular to the runway centerline designating the beginning of that portion of a runway usable for landing.
   e. **Displaced Threshold**—A threshold that is not at the beginning of the full strength runway pavement.



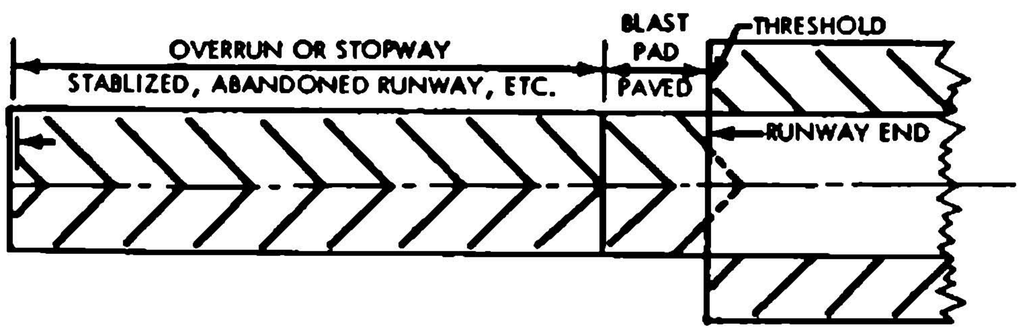
INSTRUMENT AND ALL-WEATHER RUNWAY

MARKING (Con't)

f. **Deceptive Area**—Any surface or area which appears usable but which, due to the nature of its structure, is not intended for normal operational use by aircraft.



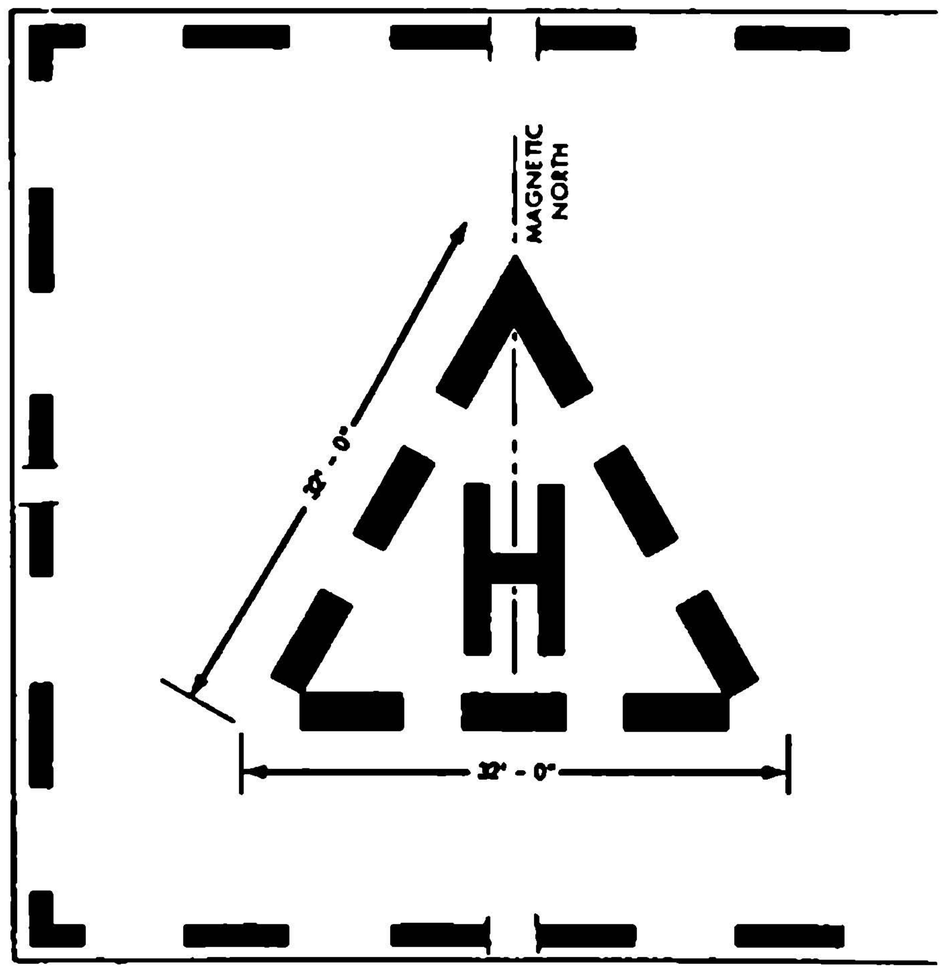
g. **Overrun/Stopway Area Marking**—A surface extending beyond the runway, used for decelerating an airplane during an aborted takeoff.



h. **Closed Runway or Taxiway.**

i. **Detailed Airport Marking information is published FAA Advisory Circulars 150/5340–1 "Marking of Serv able Runways and Taxiways" and 150/5340–7 "M ing of Deceptive, Closed, and Hazardous Areas on . ports.**

HELICOPTER LANDING AREA



RADIOTELEPHONE PHRASEOLOGY AND TECHNIQUES

AIRCRAFT CALL SIGNS

1. During the initial contact with a ground station, the complete aircraft call sign is used. Civil itinerant aircraft pilots should use the make or type name of their aircraft, followed by the complete certification number.

   Example:

   "CESSNA ONE THREE FIVE SIX TWO YANKEE."

2. Air carrier aircraft pilots may utilize their company name or abbreviated name, followed by their trip number in group form.

   Example:

   "UNITED TWENTY-FIVE."

3. Military aircraft pilots may use whichever of the following is applicable:

   a. The service name or designated prefix followed by the last 5 digits of the serial number.

   Example:

   "AIR FORCE ('JET' when appropriate) FOUR FOUR NINER THREE TWO" or "MATS FOUR FOUR NINER THREE TWO."

   b. The service name or designation followed by the word "RESCUE" and the 5 digits of the serial number.

   c. Assigned voice call signs consisting of a selected authorized code word followed by a two-digit flight number.

   Example:

   "ANDY TWO ZERO."

   d. Assigned double-letter, two-digit flight numbers.

   Example:

   "ALPHA KILO ONE FIVE."

4. After radio contact has been established, and when conditions warrant, the call signs of itinerants may be reduced to the prefix followed by not less than the last three digits or letters of the full call sign.

   Example:

   "CESSNA SIX TWO YANKEE."

GROUND STATION CALL SIGNS

1. Ground station call signs shall comprise the name of the location or airport, followed by the appropriate indication of the type of station:

   OAKLAND TOWER (airport traffic control tower);
   MIAMI GROUND CONTROL (ground control position in tower);
   DALLAS CLEARANCE DELIVERY (IFR clearance delivery position);
   IDLEWILD APPROACH CONTROL (tower radar or nonradar approach control position);
   ST. LOUIS DEPARTURE CONTROL (tower radar departure control position);
   WASHINGTON RADIO (FAA Flight Service Station);
   NEW YORK CENTER (FAA Air Route Traffic Control center).

CONTACT PROCEDURE

1. Each contact generally comprises four parts as follows:

   a. **The Call-up,** consisting of the call sign of the station being called, the words "THIS IS", the call sign of the caller, and the word "OVER."

   b. **The Reply,** consisting of the call sign of the station being replied to, the words "THIS IS", the call sign of the replying station, and the word "OVER."

   c. **The Message,** is that portion of the contact which conveys information or requests same.

   d. **The Acknowledgement and Ending,** consisting of the aircraft call sign (regardless of whether the acknowledgment is being made by an aircraft or ground station) the word "ROGER" and, if the contact is to be closed, the word "OUT."

2. Radiotelephone contacts may be abbreviated by omitting the words "THIS IS", "OVER" and "OUT" during periods of high radio activity and when no confusion or misunderstanding is liable to occur. When a message is short or when it is probable that the call-up will be heard without difficulty, the message may be transmitted following the call-up without waiting for a reply or invitation to go ahead.

3. In the folowing example the words which may be omitted under abbreviated procedures are enclosed within parentheses:

   Aircraft—CLEVELAND TOWER (THIS IS) BEECHCRAFT ONE EIGHT FOUR ONE, OVER.

   Tower—BEECHCRAFT ONE EIGHT FOUR ONE (THIS IS) CLEVELAND TOWER, (OVER).

   Aircraft—(CLEVELAND TOWER) (THIS IS) BEECHCRAFT (ONE) EIGHT FOUR ONE, FOUR MILES SOUTH (AT) ONE THOUSAND, LANDING AT CLEVELAND, OVER.

   Tower—BEECHCRAFT EIGHT FOUR ONE, FOUR MILES SOUTH (AT) ONE THOUSAND (CLEARED TO ENTER TRAFFIC PATTERN) RUNWAY ONE EIGHT, WIND SOUTH ONE TWO, OVER.

CONTACT PROCEDURE (Con't)

Aircraft—BEECHCRAFT EIGHT FOUR ONE (ROGER) (OUT).

Tower—(CLEVELAND TOWER, OUT).

4. After contact has been definitely established, it may be continued without further call-up or identification.

MICROPHONE TECHNIQUE

1. Proper microphone technique is important in radiotelephone communications. Transmissions should be concise and in a normal conversational tone.

NOTE.—Identification of Aircraft—Pilots are requested to exercise care that the identification of their aircraft is clearly transmitted in each contact with an ATC facility. Also pilots should be certain that their aircraft are clearly identified in ATC transmissions before taking action on an ATC clearance. Garbled aircraft identifications in radiotelephone transmissions should never be taken for granted but should always be checked.

2. When originating a radiotelephone call-up to any air-ground facility, indicate the channel on which reply is expected, if other than normal.
3. Keep your contacts as brief as possible. Pilots should not read back altimeter setting, taxi instructions, wind and runway information to towers except for verification or clarification of instructions. Other pilots are waiting to use the channel.
4. Contact the nearest Flight Service Station. Don't continually attempt to see how far your transmitter will reach.
5. Avoid calling stations at 15 and 45 minutes past the hour, because of interference with scheduled weather broadcasts.
6. When making a position report, pilots should in all cases state the name of the reporting point over which, or in relation to which, they are reporting. The phrase "OVER YOUR STATION" should not be used.

PROCEDURE WORDS AND PHRASES

1. The following words and phrases should be used where practicable in radiophone communications:

Word or Phrase	Meaning
ACKNOWLEDGE	"Let me know that you have received and understood this message."
AFFIRMATIVE	"Yes."
CORRECTION	"An error has been made in this transmission. The correct version is . . ."
GO AHEAD	"Proceed with your message."
HOW DO YOU HEAR ME?	Self-explanatory.
I SAY AGAIN	Self-explanatory.
NEGATIVE	"That is not correct."
OUT	"This conversation is ended ar no response is expected."
OVER	"My transmission is ended ar I expect a response from you
READ BACK	"Repeat all of this message ba to me."
ROGER	"I have received all of your la transmission." (To acknov edge receipt, shall not be us for other purposes.)
SAY AGAIN	Self-explanatory.
SPEAK SLOWER	Self-explanatory.
STAND BY	"If used by itself means 'I mu pause for a few seconds.' the pause is longer than a fe seconds, or if 'STAND BY' used to prevent another st tion from transmitting, must be followed by the en ing 'OUT'."
THAT IS CORRECT	Self-explanatory.
VERIFY	"Check with originator."
WORDS TWICE	(a) As a request: "Communic tion is difficult. Please s every phrase twice." (b) As information: "Since co munication is difficult, eve phrase in this message will spoken twice."

TIME

1. The Federal Aviation Agency utilizes Greenwi Mean Time (GMT or "Z") for all operational pu poses. Pilots are encouraged also to use GMT i aeronautical operational purposes; however, FA facilities will accept local time if the pilot so desir

To Convert From:	To Greenwich Mean Time:
Eastern Standard Time	Add 5 hours
Eastern Daylight Time	Add 4 hours
Central Standard Time	Add 6 hours
Central Daylight Time	Add 5 hours
Mountain Standard Time	Add 7 hours
Mountain Daylight Time	Add 6 hours
Pacific Standard Time	Add 8 hours
Pacific Daylight Time	Add 7 hours

2. The 24-hour clock system is used in radiotelepho transmissions. The hour is indicated by the first t figures and the minutes by the last two figures.

Examples:

0000 ZERO ZERO ZERO ZE
0920 ZERO NINER TWO ZE

3. Time may be stated in minutes only (two figures) radio telephone communications when no misund standing is likely to occur.

TIME (Con't)

4. Current time in use at a station is stated in the nearest quarter minute in order that pilots may use this information for time checks. Fractions of a quarter minute less than eight seconds are stated as the preceding quarter minute; fractions of a quarter minute of eight seconds or more are stated as the succeeding quarter minute.

Examples:

Time	
0929:05	____TIME, ZERO NINER TWO NINER
0929:10	____TIME, ZERO NINER TWO NINER AND ONE-QUARTER
0929:28	____TIME, ZERO NINER TWO NINER AND ONE-HALF

FIGURES

1. Figures indicating hundreds and thousands in round numbers, as for ceiling heights, and upper wind levels up to 9900 shall be spoken in accordance with the following examples:

500	_____FIVE HUNDRED
1300	_____ONE THOUSAND THREE HUNDRED
4500	_____FOUR THOUSAND FIVE HUNDRED
9900	_____NINER THOUSAND NINER HUNDRED

2. Numbers above 9900 shall be spoken by separating the digits preceding the word "thousand." Examples:

10000	_____ONE ZERO THOUSAND
13000	_____ONE THREE THOUSAND
18500	__ONE EIGHT THOUSAND FIVE HUNDRED
27000	_____TWO SEVEN THOUSAND

3. All other numbers shall be transmitted by pronouncing each digit.

Examples:

10	_____ONE ZERO
75	_____SEVEN FIVE
583	_____FIVE EIGHT THREE
1850	_____ONE EIGHT FIVE ZERO
18143	_____ONE EIGHT ONE FOUR THREE
26075	_____TWO SIX ZERO SEVEN FIVE

The digit "9" shall be spoken "NINER".

4. When a radio frequency contains a decimal point, the decimal point is spoken as "POINT."

Examples:

122.1	_____ONE TWO TWO POINT ONE
126.7	_____ONE TWO SIX POINT SEVEN

(ICAO Procedures require the decimal point be spoken as "DECIMAL" and FAA will honor such usage by military aircraft and all other aircraft required to use ICAO Procedures.)

FLIGHT ALTITUDES

1. Up to but not including 18,000′ MSL—by stating the separate rate digits of the thousands, plus the hundreds, if appropriate.

Examples:

12,000	_____ONE TWO THOUSAND
12,500	___ONE TWO THOUSAND FIVE HUNDRED

2. At and above 18,000′ MSL (FL 180) by stating the words "flight level" followed by the separate digits of the flight level.

Examples:

190	_____FLIGHT LEVEL ONE NINER ZERO
275	_____FLIGHT LEVEL TWO SEVEN FIVE

PHONETIC ALPHABET

1. Phonetic letter equivalents are communications safety tools to be used only when receiving conditions are such that the information cannot be readily received without their use. Under such adverse communications, phonetic equivalents are employed for single letters, or to spell out groups of letters or difficult words.

2. The International Civil Aviation Organization (ICAO) phonetic alphabet is normally used by FAA personnel. However, different phonetic equivalents may be used by pilots, or, upon the pilot's request may be used by FAA during communciations with such pilots.

ALTIMETRY

GENERAL

1. The accuracy of aircraft altimeters is subject to the following factors: (a) nonstandard temperature of the atmosphere; (b) aircraft static pressure systems (position error); and (c) instrument error. Pilots should disregard the effect of nonstandard atmospheric temperatures except that low temperatures need to be considered for terrain clearance purposes.

NOTE.—Standard temperature at sea level is 15° C. (59° F.). The temperature gradient from sea level is 2° C. (3.5° F.) per 1000 feet. Pilots should apply corrections for static pressure systems and/or instruments, if appreciable errors exist.

2. Experience gained with the present volume of jet operations has led to the adoption of a standard altimeter setting for flights operating in the higher altitudes. A standard setting eliminates altitude conflicts caused by altimeter settings derived from different geographical sources. In addition, it eliminates station barometer errors and some of the altimeter instrument errors. The following outlines the current procedures in effect:

a. The cruising altitude or flight level of aircraft shall be maintained by reference to an altimeter which shall be set, when operating:

(1) **Below 18,000 feet MSL**—to the current reported altimeter setting of a station along the route and within 100 nautical miles of the aircraft; or, if there is no station within this area, to the current reported altimeter setting of an appropriate available station. In the case of an aircraft not equipped with a radio, set to the elevation of the departure airport or use an appropriate altimeter setting available prior to departure.

(2) **At or above 18,000 feet MSL (FL 180)**—to 29.92" Hg (standard setting).

NOTE.—The lowest usable flight level is determined by the atmospheric pressure in the area of operation, as shown in the following table:

Altimeter Setting (Current Reported)	Lowest usable flight level
29.92 or higher	180
29.91 to 29.42	185
29.41 to 28.92	190
28.91 to 28.42	195
28.41 to 27.92	200

(3) Where the minimum altitude, as prescribed in FAR Parts 91.79 and 91.119, is above 18,000 feet M.S.L. the lowest usable flight level shall be the flight level equivalent of the minimum altitude plus the number of feet specified the following table:

Altimeter Setting	Correction Factor
29.92 or higher	None
29.91 to 29.42	500 feet
29.41 to 28.92	1000 feet
28.91 to 28.42	1500 feet
28.41 to 27.92	2000 feet
27.91 to 27.42	2500 feet

NOTE.—For example, the minimum safe altitude of route is 19,000 feet MSL and the altitmeter setting is reported between 29.92 and 20.42 Hg., the lowest usal flight level will be 195, which is the flight level equivale of 19,500 feet M.S.L. (minimum altitude plus 500 feet).

ALTIMETER SETTING SERVICE

1. Aircraft on an IFR flight plan and in direct commun cation with the Air Route Traffic Control Cent (ARTCC) will be issued altimeter settings by t ARTCC as follows:

a. En route aircraft will be given the altimeter se ting for the weather reporting station associat with a navigational aid designated as a compu sory reporting point within the appropriate ce ter's area of jurisdiction, at the time the positi report is acknowledged.

b. Aircraft departing a terminal area are normal provided an altimeter setting prior to departu However, if such aircraft are required to rema in direct communication with a Center, they w be given altimeter settings in accordance wi paragraph a. above, when they are beyond 50 na tical miles of the point of departure.

c. Aircraft destined for a terminal within a Cente control area will be given the destination termin altimeter setting, if available, when approximate 50 nautical miles from destination. Thereaft additional altimeter setting service in accordan with paragraph a. above, normally will not be pr vided.

d. Pilots of aircraft operating below Flight Level 1 who have been advised to omit position repor will be furnished the appropriate altimeter setti when passing compulsory reporting points as o served by radar.

e. Available altimeter settings will be furnished f any other weather reporting stations within a Ce ter's control area if requested by a pilot. R quests for altimeter settings of stations outside a Center's control area will normally be referred the appropriate communications facility.

ALTIMETER SETTING SERVICE (Con't)

f. When providing altimeter setting service, Centers will use the following phraseology:

"THE (Time) (Station Location) ALTIMETER (Setting)"

Example:

"THE ONE FOUR ONE FIVE COLUMBUS ALTIMETER THREE ZERO ZERO ZERO."

g. Altimeter settings will not be furnished aircraft that are maintaining flight levels except:

(1) When requested by the pilot.

(2) When a descent clearance is issued from flight level to cruising altitude.

2. Airport traffic control towers provide current altimeter settings:

a. To departing aircraft (IFR or VFR) unless the pilot has other preferred means of securing the setting.

b. To all arriving aircraft operating on IFR flight plans (except non-approach control towers when the approach clearance has been issued through another source);

c. Upon specific request of pilots.

3. Flight Service Stations issue current altimeter settings:

a. In scheduled weather broadcasts (15 and 45 minutes past the hour);

b. In terminating communications with aircraft operating below 18,000'.

c. Upon specific request.

WEATHER

GENERAL

1. The U.S. Weather Bureau maintains a comprehensive surface and upper air weather observing program and a nation-wide aviation weather forecasting and pilot briefing service.
2. Weather observations are made each hour or more often at over 600 locations in the United States. These observations may be used to determine the present weather conditions for flight planning purposes.
3. Every six hours the Weather Bureau's Aviation Forecasting Centers prepare detailed flying weather forecasts for 12-hour periods for about 385 air terminals in the United States including Alaska and Hawaii. In addition, 24-hour terminal forecasts are provided for about 120 major airports throughout the country. Every six hours a detailed 12-hour area forecast is prepared for each of the 29 areas into which the continental United States has been divided for forecasting purposes. In Hawaii, forecasts are issued for the main traveled air routes instead of areas. Winds aloft forecasts are provided for about 150 locations in the United States including Alaska and Hawaii for flight operational purposes. All of the above flying weather forecasts are given wide distribution via teletypewriter circuits.
4. Available aviation weather reports and forecasts are displayed at each Weather Bureau Station and FAA Flight Service Station. Pilots should feel free to help themselves to this information or to ask the assistance of the duty employee.
5. When telephoning for information, use the following procedures:
   a. Identify yourself as a pilot and give aircraft identification if known. (Many persons calling WB stations want information for purposes other than flying.)
   b. State your intended route, destination, proposed departure time, and estimated time en route.
   c. Advise if prepared to fly IFR.
6. Direct pilot-to-weather briefer service is available by radio contact with any Flight Service Station operated by the FAA. Flight Service Specialists are qualified and certificated by the USWB as Pilot Weather Briefers. They are not authorized to make original forecasts but are authorized to adapt, translate and interpret available forecasts and reports directly into terms of the weather conditions which you can expect along your flight route and at destination. They also will assist you in selecting an altern course of action in the event adverse weather is countered. It is not necessary to be thoroughly miliar with the standard phraseologies and procedu for air/ground communications. A brief call stat your message in your own words will receive mediate attention.

TRANSCRIBED WEATHER BROADCASTS

1. Equipment is provided at selected FAA FSSs which meteorological and Notice to Airmen dat recorded on tapes and broadcast continuously o the low-frequency (200–400 kc) navigational (L/MF range or H facility).
2. Broadcasts are made from a series of individual t recordings. The first three tapes identify the stat give general weather forecast conditions in the a pilot reports (PIREP), radar reports when availa and winds aloft data. The remaining tapes cont weather at selected locations within a 400-mile rad of the central point. Changes, as they occur transcribed onto the tapes.

SCHEDULED WEATHER BROADCASTS

1. All Flight Service Stations having voice facilities continuously operated radio ranges or radio beac broadcast weather reports and other airway infor tion at 15 and 45-minutes past each hour. The minute past the hour broadcast is an "airway" bro cast consisting of weather reports from import terminals located on airways within approxima 400 miles of the broadcasting station. The 15-min past the hour broadcast is an "area" broadcast c sisting of weather reports from the stations wit approximately 150 miles of the broadcasting statio
2. At each station, the material broadcast on sched and the order in which it is broadcast follows:
   a. Alert notice announcement.
   b. SIGMET (Significant Meterology) or Advis for Light Aircraft (if available).
   c. Pilot report/s when available.
   d. Radar report/s if available.
   e. Aviation weather.
   f. Flight information—any non-meteorological in mation not a part of a weather report but wh requires broadcast.
   g. Additional special weather reports and some tice to Airmen data are broadcast off-sched upon receipt.

   NOTE.—Winds aloft forecast will be transmitted only pilot's request.

SCHEDULED WEATHER BROADCASTS (Con't)

3. The time of observation of weather reports included in a scheduled broadcast normally is 58 minutes past the hour preceding the broadcast. When the time of observation is otherwise, the observation time is given.

WEATHER BROADCAST FORMAT

1. SCHEDULED WEATHER BROADCASTS

a. Scheduled Weather Broadcast (15 and 45 minutes past each hour): Each broadcast begins with the announcement of the station name, the time the broadcast is started, spoken in two digits or two digits and a fraction, and the title "Aviation Weather."

Example:

This is (station name), time one five (or one five and one quarter; one five and one half, etc.), aviation weather.

b. The reporting location name is spoken twice; except in transcribed weather broadcasts the location name of selected weather reports is announced only once on recording tapes.

2. UNSCHEDULED BROADCASTS

a. The data being broadcast is identified immediately following the station name. The time is announced as specified above for scheduled broadcasts. The reporting location name is spoken twice, followed by the time of observation of special (SPL) weather reports stated in two digits indicating minutes only.

Examples:

This is (station name) time three niner, Special Weather Report (location name, spoken twice) three seven observation.

This is (station name) time two niner, Notice to Airmen (location name spoken twice).

IN-FLIGHT WEATHER SAFETY ADVISORIES

1. The Weather Bureau issues in-flight safety advisories in two categories—SIGMET (Significant Meteorology) and ADVISORY FOR LIGHT AIRCRAFT. The SIGMET category applies specifically (but not exclusively) to transport and military aircraft—the other is self-evident.

2. These safety advisories are issued in the 48 contiguous States.

3. The SIGMET category includes weather phenomena of particular significance to the safety of transport (multi-engine aircraft over 12,500 pounds gross) and other aircraft. The ADVISORY FOR LIGHT AIRCRAFT category includes weather phenomena of less severity than that covered by SIGMET but is important to the safety of light aircraft (single and twin-engine aircraft of 12,500 pounds gross and less). It is important to note that both SIGMET and ADVISORY FOR LIGHT AIRCRAFT messages apply to the operation of light aircraft.

4. SIGMET advisories cover:
   a. Tornadoes.
   b. Lines of thunderstorms (squall lines).
   c. Hail ¾" or more.
   d. Severe and extreme turbulence.
   e. Heavy icing.
   f. Widespread duststorms/sandstorms, lowering visibilities of less than two miles.

5. ADVISORIES FOR LIGHT AIRCRAFT cover
   a. Moderate icing.
   b. Moderate turbulence.
   c. The initial onset of phenomena producing extensive areas of visibilities less than two miles or ceilings less than 1000 feet, including mountain ridges and passes, and winds of 40 knots or more within 2000 feet of the surface.

6. The following are samples of the two types of advisories:
   a. CHICAGO SIGMET NO. 3. WISCONSIN SOUTH OF LINE FROM LA CROSSE TO GREEN BAY HEAVY ICING IN CLOUDS 4000 to 8000 FEET MSL. MEMPHIS ADVISORY FOR LIGHT AIRCRAFT NO. 1. TENNESSEE SOUTH OF LINE FROM DYERSBURG TO CROSSVILLE CONDITIONS LOWERING RAPIDLY IN RAIN AND FOG TO BELOW 800 FEET AND 2 MILES BY 1200C. HIGHER TERRAIN OBSCURED.
   b. KANSAS CITY SIGMET NO. 2. SOLID LINE THUNDERSTORMS 50 MILES WIDE FROM GRAND ISLAND TO HILL CITY TO GARDEN CITY AT 1400C MOVING EAST 35 KNOTS REACHING LINCOLN-SALINA-HUTCHINSON LINE BY 1800C. THUNDERSTORMS LOCALLY SEVERE WITH ¾-INCH HAIL AND SEVERE TO EXTREME TURBULENCE.
   c. WASHINGTON SIGMET NO. 1 SEVERE CLEAR AIR TURBULENCE EXTENDING FROM SOUTH CENTRAL VIRGINIA THROUGH DELAWARE AT 14,000 TO 24,000 FEET. ADDITIONAL ADVISORY FOR LIGHT AIRCRAFT. OVER EASTERN VIRGINIA, EASTERN MARYLAND, AND DELAWARE MODERATE ICING IN CLOUDS 2000 TO 8000 FEET DECREASING BUT WITH WINDS LOWER LEVELS BECOMING 40 TO 50 KNOTS SOON AFTER 0800E ACCOMPANIED BY MODERATE TURBULENCE.

7. FAA Flight Service Stations (FSS) broadcast SIGMETs and ADVISORIES FOR LIGHT AIRCRAFT, when they pertain to the area within 150 NM of the FSS, as follows:
   a. SIGMETs—At 15 minute intervals at H+00, H+15, H+30 and H+45; ADVISORIES FOR LIGHT AIRCRAFT—At half hourly intervals at H+15 and H+45. SIGMETs and ADVISORIES FOR LIGHT AIRCRAFT are broadcast during the valid period and are included in the regular scheduled broadcasts at H+15 and H+45.

8. When a SIGMET is issued, the ARTCC within whose area it applies, the en route control towers within

IN-FLIGHT WEATHER SAFETY ADVISORIES (Con't)

the area, and selected FSSs make the following announcement on en route air-ground channels:

a. FOR (name issuing Flight Advisory Weather Service) SIGMET (number of SIGMET) MONITOR VOR VOICE

9. Pilots hearing this announcement must not interrupt their guard of ATC channels (without prior permission of the ATC facility) but should use the audio of their VOR voice channel until SIGMET broadcast is intercepted.

10. The purpose of the SIGMET service is to make available to any aircraft in flight, information on weather which may be hazardous to the flight. Whether or not the weather condition described is potentially hazardous to a particular flight is for the pilot himself to evaluate on the basis of his own experience and qualifications and the operational limits of his aircraft.

PILOT WEATHER REPORTS (PIREPS)

1. Whenever ceilings at or below 5,000 feet, visibilities at or below five miles, or thunderstorms are reported or forecast, FAA Stations are required to solicit and collect PIREPS which describe conditions aloft. Pilots are urged to cooperate and volunteer reports of cloud tops, upper cloud layers, thunderstorms, ice, turbulence, strong winds, and other significant flight condition information. Such conditions observed between weather reporting stations are vitally needed. The PIREPS should be given to the FAA ground facility with which communication is established, i.e., FSS or Air Route Traffic Control Center. In addition to complete PIREPS, pilots can materially help round out the in-flight weather picture by adding to routine position reports, both VFR and IFR, the following phrases as appropriate:

ON TOP
BELOW OVERCAST
WEATHER CLEAR
MODERATE (or HEAVY) ICING
MODERATE, SEVERE, EXTREME TURBULENCE
FREEZING RAIN (or DRIZZLE)
THUNDERSTORM (location)
BETWEEN LAYERS
ON INSTRUMENTS
ON AND OFF INSTRUMENTS

2. If pilots are not able to make PIREPS by radio, reporting upon landing of the in-flight conditions encountered to the nearest Flight Service Station or Weather Bureau Airport Station will be helpful. Some of the uses made of the reports are:

a. The airport traffic control tower uses the reports to expedite the flow of air traffic in the vicinity of the field and also forwards reports to other interested offices.

b. The Flight Service Station uses the reports to brief other pilots.

c. The local Weather Bureau Office uses the rep in briefing other pilots and in forecasting.

d. The Air Route Traffic Control Center uses the ports to expedite the flow of en route traffic determine most favorable altitudes.

e. The Weather Bureau Flight Advisory Weat Service finds pilot reports very helpful in issu advisories of hazardous weather conditions. T office also uses the reports to brief other pil and in forecasting.

REPORTING OF CLOUD HEIGHTS

1. Ceiling, by definition in Part I Federal Aviation Re lations, and as used in Aviation Weather Reports Forecasts, is the height *above ground* (*or wat level* of the lowest layer of clouds or obscur phenomenon that is reported as "broken", "overca or "obscuration" and not classified as "thin" "partial". For example, a forecast which re "CIGS WILL BE GENLY 1 TO 2 THSD FE refers to heights *above ground level* (AGL). On other hand, a forecast which reads "BRKN TO O LYRS AT 8 TO 12 THSD MSL" states that height is *above mean sea level* (MSL).

2. Pilots usually report height values above mean level, since they determine heights by the altimet This is taken in account when disseminating a otherwise applying information received from pilo ("Ceilings" are always heights above ground leve In reports disseminated as PIREPS, height referen are given the same as received from pilots, that above mean sea level (MSL or ASL). In the follo ing example, however, a pilot report of the heig of the bases and tops of an overcast layer in t terminal area is used in two ways in a surface av tion weather report:

A12⊕2FK 132/49/47/0000/ØØ2/⊕23

3. In this example the weather station has convert the pilot's report of the height of base of the ov cast from the height (MSL) indicated on the pilo altimeter to height above ground and has shown the prefix "A" that the ceiling height was determi by an aircraft. The height of cloud tops shown remarks (⊕23) is *above mean sea level* (ASL MSL) as initially reported by the pilot.

4. In aerial forecasts (Regional, Area, or In-fli Advisories), ceilings are denoted by the prefix " when used with sky cover symbols as in "LWRG C5⊕1TRW", or by the contraction "CIG" before, the contraction "AGL" after, the forecast cloud hei value. When the cloud base is given in height ab mean sea level, it is so indicated by the contract "MSL" or "ASL" following the height value. T heights of cloud tops, freezing level, icing and t bulence are always given in heights above mean s level (ASL or MSL).

5. Attention is invited to the Weather Bureau publi tion "Key to Aviation Weather Reports and Fo casts." This is an easy-reference card which expla

REPORTING OF CLOUD HEIGHTS (Con't)

how to read aviation weather reports and forecasts and how ceiling and cloud heights are identified. This card can be obtained from the nearest USWB office or from the USWB, Washington, D.C. (See sample card on page I-30.)

VISIBILITY OBSERVATIONS

1. Recent advances in meteorological measuring and reporting techniques have resulted in the use of new terminology in presenting visibility. In an attempt to clarify the differences between the various terms currently in use, a brief synopsis of each is presented below.

   a. **Prevailing Visibility** is the greatest horizontal distance at which targets of known distance are visible over at least half of the horizon. It is normally determined by an observer on or close to the ground viewing buildings or other similar objects during the day and ordinary city lights at night. Under low visibility conditions the observations are usually made at the control tower. Visibility is reported in miles and fractions of miles in the Aviation Weather Report. If a single value does not adequately describe the visibility, additional information is reported in the "Remarks" section of the report.

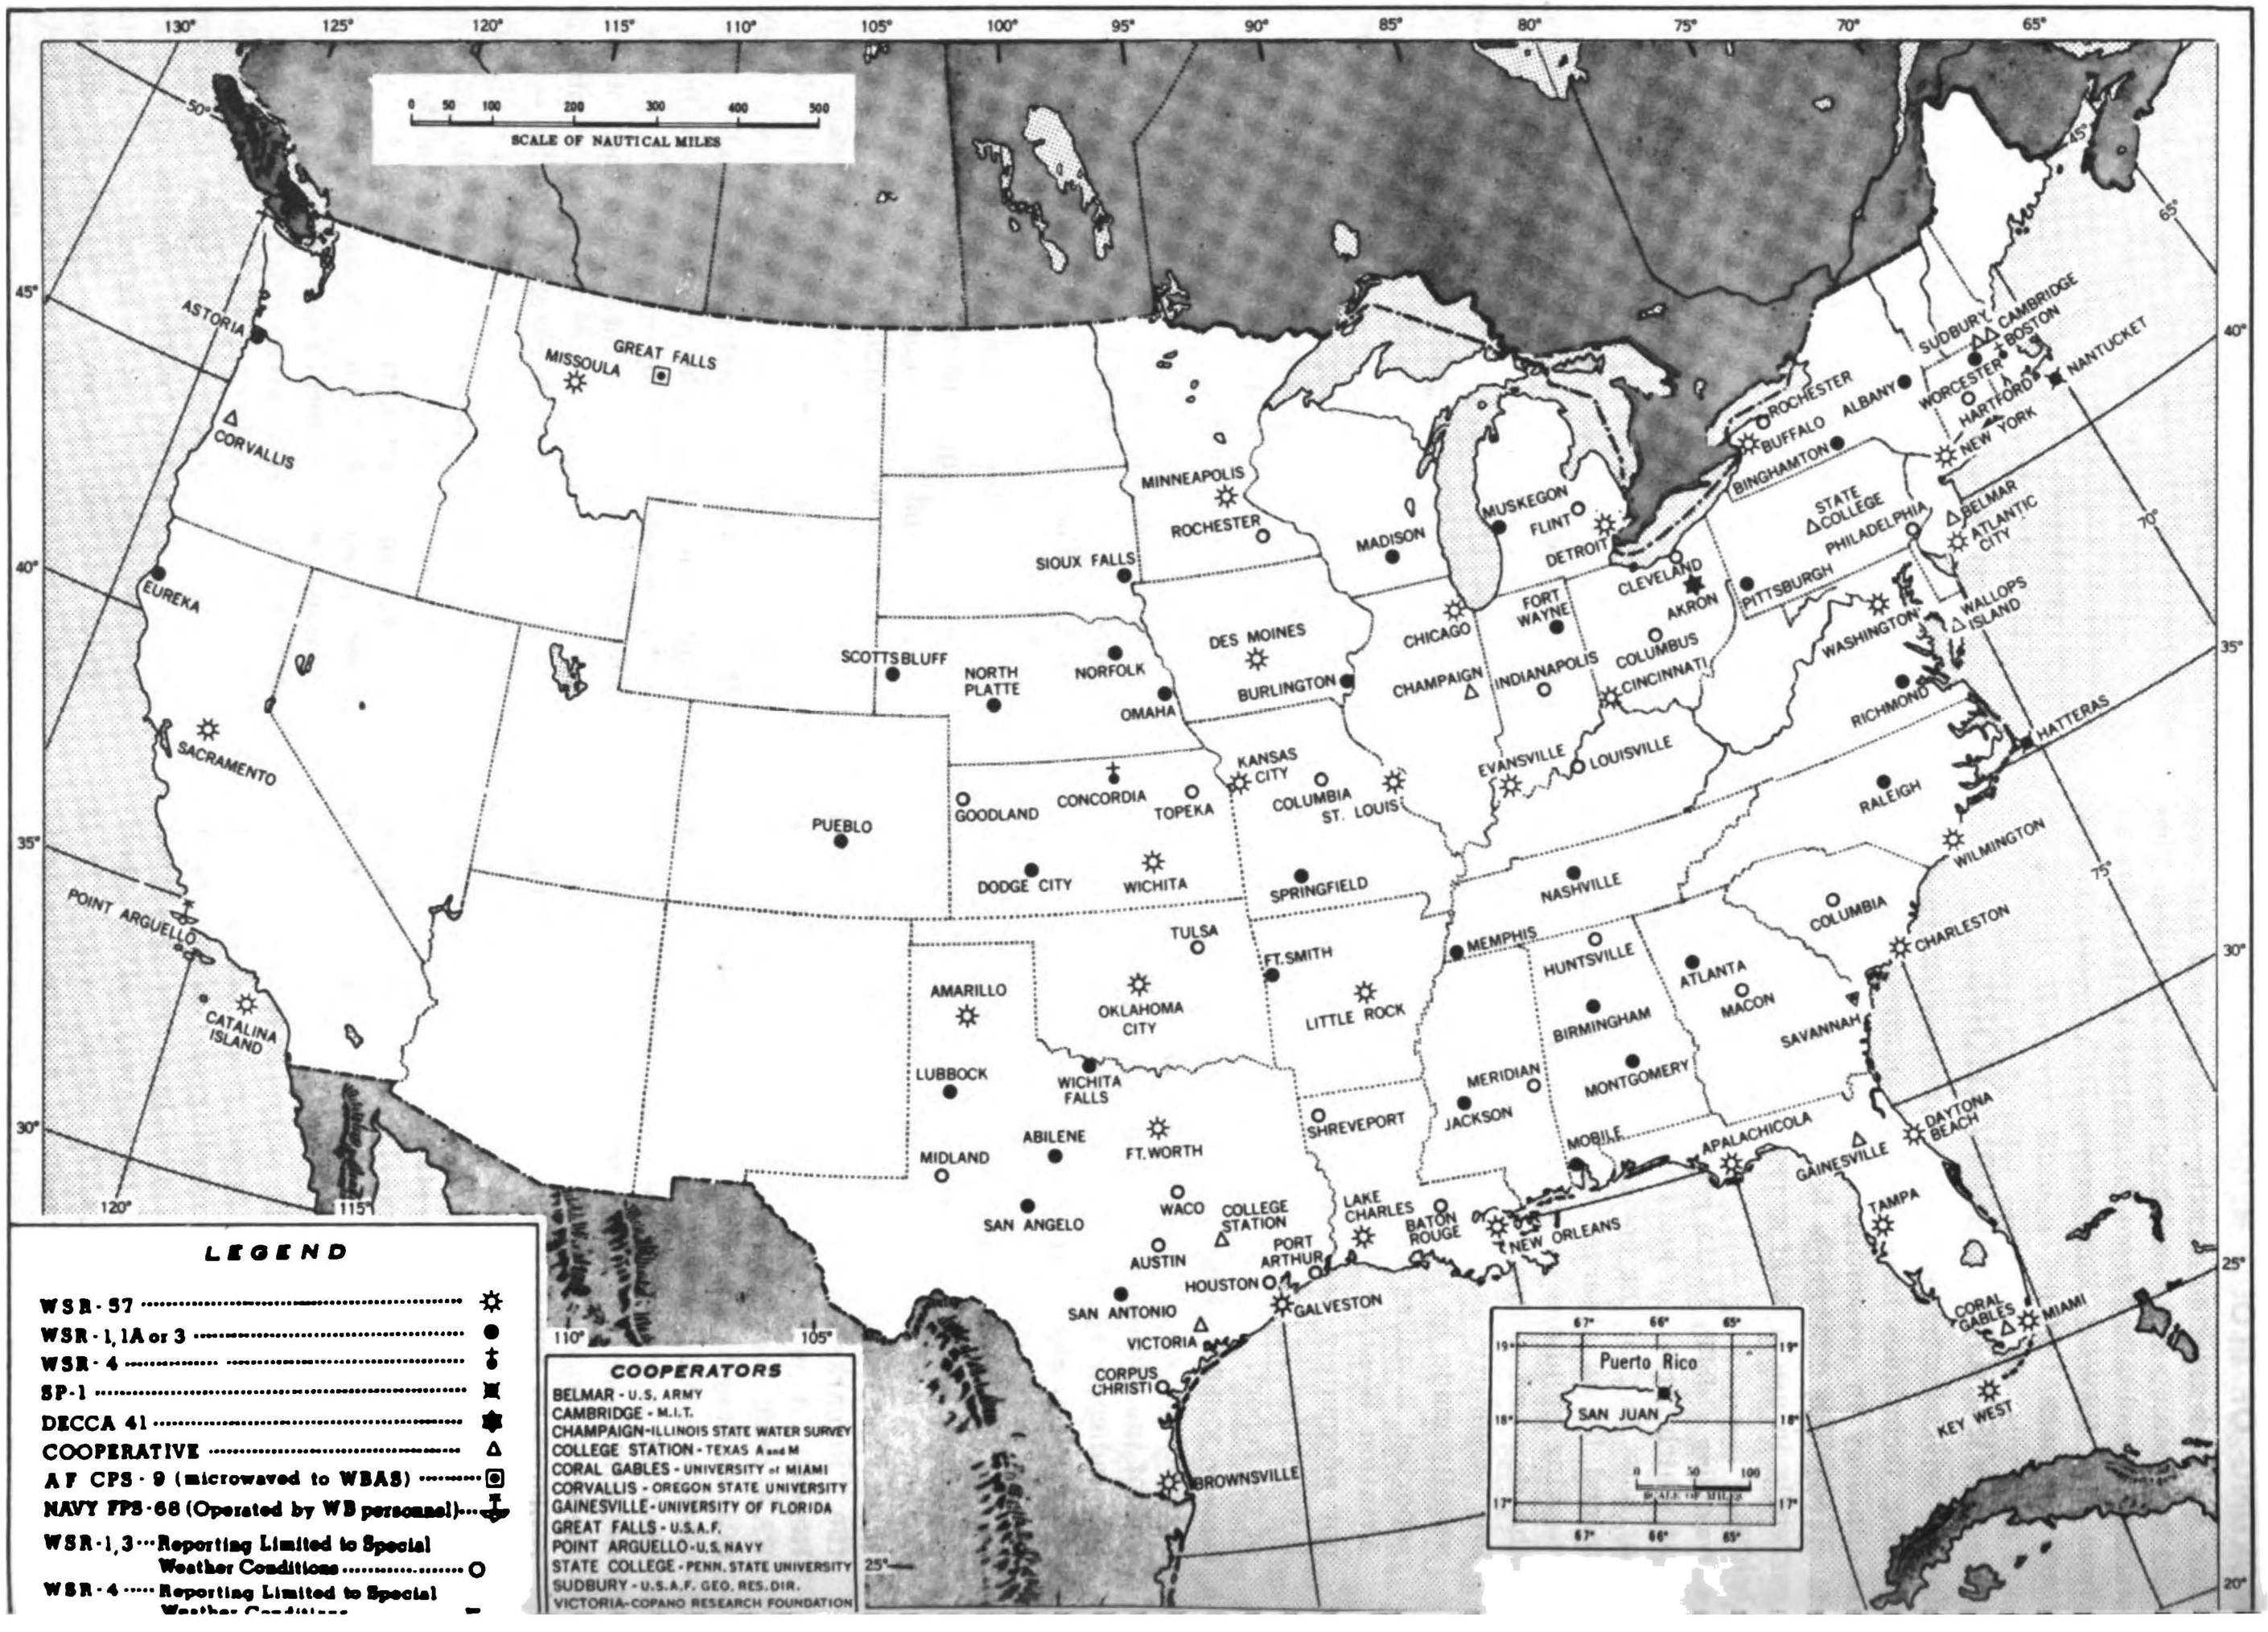
   b. **Runway Visibility (RVV)** is defined as the horizontal distance at which a stationary observer near the end of the runway can see an ordinary light (about 25 candlepower) at night or a dark object against the horizon sky in the day time. In practice the human observer is used very little for this observation. Instead runway visibility is normally determined by a transmissometer (a photoelectric device calibrated in terms of a human observer). It is reported in miles and fractions of miles in the "Remarks" section of the Aviation Weather Report. A meter in the control tower gives the FAA traffic controller a continuous indication of the runway visibility at transmissometer locations. Runway visibility, where available, may be used in place of prevailing visibility for the determination of minimums on the transmissometer runway. This program is gradually being replaced by Runway Visual Range at transmissometer locations.

   c. **Runway Visual Range** (RVR) is an instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end; it is based on the sighting of either high intensity runway lights or on the visual contrast of other targets—whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal, AND NOT SLANT, visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is reported in hundreds of feet. At the present time, RVR observations are automatically furnished to FAA tower controllers at approximately 40 locations from read-out equipment connected to the remote transmissometer installation. RVR provides an additional operating minimum at fields equipped with specified navigational aids. For example, at the present time the RVR minimum at Newark is 2000 feet (in combination with a minimum descent altitude of 218' MSL) for both takeoffs and landings regardless of the reported ceilings and visibility. Detailed explanatory information on runway visibility and runway visual range is published in FAA Advisory Circular AC 00-13.

WEATHER RADAR

1. The U.S. Weather Bureau operates a 97-station net work (see chart on page I-28) of weather radars which are operated continuously if any precipitation capable of being detected is present or expected. These stations are generally spaced in such a manner as to enable them to detect and identify the type (snow, rain) of most of the precipitation east of the Continental Divide.
2. If any weather is detected, a scheduled radar observation is taken at 45 minutes past each hour—more often if the characteristics (speed, intensity, etc.) of the detected echoes are changing rapidly, except as noted in the legend of the chart. These observations are transmitted to many Weather Bureau and FAA stations and are available for use in pre-flight and in-flight planning. In addition, an hourly plain language radar summary and a three-hourly radar summary facsimile chart are prepared by the Radar Analyses and Development Unit in Kansas City, Missouri. The hourly radar summary is transmitted on Service A teletypewriter to all Weather Bureau and Flight Service Stations, and the radar chart is available to all subscribers to the facsimile network.
3. Briefly, these observations are encoded in a self-evident code. The echo coverage (scattered, broken, etc.) is determined by a comparison of the relative amount of echo as compared to the total area outlined by the position groups. The number of tenths of coverage for each category is the same as those contained in Circular N for sky condition symbols (e.g., scattered means 1/10 to 5/10 coverage). Intensity of an echo is determined on the basis of returned signal strength and range of the echo. The more intense the echo, the more likely it is to be associated with severe weather. Location of salient points of echoes is given relative to the station. The azimuth is in degrees true, and the distance in nautical miles. Direction and speed of movement are given to 16 points of the compass and in knots, respectively, with direction referring the direction from which the echo is moving. Values of echo tops refer to the uppermost limit of precipitation that may be detected by radar and are not the actual tops

RADAR REPORTING NETWORK



WEATHER RADAR (Con't)

of visible clouds. "Hook" echoes are usually associated with tornadoes and "spiral bands" with hurricanes.

4. Many of the stations equipped with radar have a radar repeaterscope near the briefing display that is available for viewing. As a radar can provide a comprehensive area picture of the weather within its range, viewing this scope can help your flight planning. It can show the exact location and extent of storms and the briefer can give you the direction and speed of movement, as well as height and intensity of these echoes. Technical considerations prevent dependable determinations of echo intensity beyond 100 nautical miles although storms of considerable height and intensity can be seen at ranges greater than 100 nautical miles. In order to obtain optimum benefit from radar data, it is suggested that an interpretation of the radarscope be obtained from Weather Bureau personnel who are trained in radar operation and scope interpretation.

THUNDERSTORMS

1. Every thunderstorm has turbulence, sustained updrafts and downdrafts, precipitation and lightning. Icing conditions and hail can frequently be expected.
2. The chances of severe or extreme turbulence within thunderstorms are greater at higher altitudes. Most cases of severe turbulence are encountered between 8,000 and 15,000 feet above the terrain. Usually the least turbulence is found in flying at or just below the base of the main thunderstorm cloud.
3. The heaviest turbulence is found to be closely associated with the areas of highest liquid water content of the storm. This makes it possible for airborne radar to pick out areas of maximum turbulence.
4. The probability of lightning strikes occuring is greatest near or slightly above the freezing level.
5. Quite obviously, to avoid these hazards you avoid flying into the center of active thunderstorms. Some of these phenomena, however, exist beyond the confines of the cell itself and the pilot electing to circumnavigate thunderstorm activity should keep them in mind.
6. Turbulence, while not usually as severe as in the cell itself, can exist in the clear air around the buildup, as can rain and hail. Lightning can also strike an aircraft in the clear in the vicinity of a thunderstorm.

DETOURING THUNDERSTORMS

1. Whenever it becomes necessary for a pilot on an Instrument Flight Rules flight plan to deviate from his approved route or altitude/flight level, a problem immediately presents itself to the air traffic controller. The affected area must be studied and an attempt made to accommodate the aircraft for the proposed route of flight. Revision to estimates must be made and adjacent or converging airways or areas must be considered.
2. Therefore, it is important that the request for deviation from route be forwarded to Air Traffic Control as far in advance as possible. Delay in submitting the request, or inability to do so, may delay or even preclude ATC approval of the request, or require that additional restrictions be placed on the clearance.
3. A pilot on an Instrument Flight Rules flight plan must not deviate from route without proper clearance as this may place him in conflict with other air traffic. Strict adherence to traffic clearance is necessary to assure an adequate level of safety. In those instances where thunderstorm conditions encountered are of such severity that an immediate deviation from course is determined to be necessary and time will not permit approval by ATC, the pilot's emergency authority may be exercised.
4. Insofar as possible, the following information should be furnished to ATC when requesting clearance to detour around thunderstorm activity:
   a. Proposed point at which detour will commence.
   b. Proposed route and extent of detour (direction and distance)
   c. Altitude/s
   d. Point and estimated time where original route will be resumed.
   e. Flight conditions (IFR or VFR).
   f. Any further deviation that may become necessary as the flight progresses.
   g. Advise if the aircraft is equipped with functioning airborne radar.
5. When flying within the Continental Control Area, the proposed detour should be defined by appropriate navigational aids (however, not necessarily over or directly between such aids). When this is not possible and traffic exists at the desired altitude, ATC will be unable to approve the detour. In such cases, ATC may offer a clearance via the detour route at a different altitude. When an alternate altitude is not available, the pilot may elect to detour under his emergency authority.

KEY TO AVIATION WEATHER REPORTS

LOCATION IDENTIFIERS	SPECIAL REPORT	SKY AND CEILING	VISIBILITY WEATHER AND OBSTRUCTION TO VISION	SEA-LEVEL PRESSURE	TEMPERATURE AND DEW POINT	WIND	ALTIMETER SETTING	RUNWAY VISUAL RANGE	CODED PIREPS	REMARKS
MKC	S	15⊖M25⊕	4R-K	132	/58/56	/1807	/993/	VR32	/⊕55	RB05 ⊕V⊖

SKY AND CEILING

Sky cover symbols are in ascending order. Figures preceding symbols are heights in hundreds of feet above station.

Sky cover Symbols are:

○-Clear: Less than 0.1 sky cover.
⊖-Scattered: 0.1 to less than 0.6 sky cover.
⊜-Broken: 0.6 to 0.9 sky cover.
⊕-Overcast: More than 0.9 sky cover.
—-Thin (When prefixed to the above symbols.)
⊗-Partial Obscuration: 0.1 to less than 1.0 sky hidden by precipitation or obstruction to vision (bases at surface).
X-Obscuration: 1.0 sky hidden by precipitation or obstruction to vision (bases at surface).

Letter preceding height of layer identifies ceiling layer and indicates how ceiling height was obtained. Thus:

A Aircraft	E Estimated heights of convective clouds	/ Height of obscure ceiling layer unknown
B Balloon (Pilot or ceiling)	M Measured	"V" immediately following numerical value indicates a varying ceiling.
D Estimated height of obscure clouds on basis of pyrotechnics.	R Radiosonde balloon or Radar	
	W Indefinite	
	U Height of obscure ceiling layer unknown	

VISIBILITY

Reported in Statute Miles and Fractions. (V - Variable)

WEATHER SYMBOLS

A - Hail	L - Drizzle	SP - Snow Pellets
AP - Small Hail	R - Rain	SW - Snow Showers
E - Sleet	RW - Rain Showers	T - Thunderstorm
EW - Sleet Showers	S - Snow	ZL - Freezing Drizzle
IC - Ice Crystals	SG - Snow Grains	ZR - Freezing Rain

INTENSITIES are indicated thus:
-- Very Light — Light (no sign) Moderate + Heavy

OBSTRUCTION TO VISION SYMBOLS

D - Dust	H - Haze	BD - Blowing Dust
F - Fog	IF - Ice Fog	BN - Blowing Sand
GF - Ground Fog	K - Smoke	BS - Blowing Snow

WIND

Direction in tens of degrees from true north, speed in knots. 0000 indicates calm. G indicates gusty. Peak speed of gusts follows G or Q when equal is reported. The contraction SHIFT followed by local time group or remarks indicates wind shift and its time of occurrence.

EXAMPLES: 1877 180 Degrees, 77 Knots,
8127 810 Degrees, 77 Knots,
1077 100 Degrees, 77 Knots,
3577G49 350 Degrees, 77 Knots Peak speed in gusts 49 Knots

ALTIMETER SETTING

The first figure of the actual altimeter setting is always omitted from the report

RUNWAY VISUAL RANGE (RVR)

RVR is reported only from selected stations. The value reported is a 10-minute mean of the visual range in hundreds of feet.

CODED PIREPS

Pilot reports of clouds not available from ground are coded with height, height data preceding and or following sky cover symbol to indicate cloud bases and or tops, respectively

DECODED REPORT

Kansas City Special observation, 1200 feet measured clouds, measured ceiling 2500 feet overcast, visibility 4 miles, light rain, smoke, sea level pressure 1011 millibars, temperature 58°F, dewpoint 56°F, wind 180°, 7 knots, altimeter setting 29.93 inches, Runway Visual Range 1200 feet, pilot reports top of overcast 5500 - rain began 5 minutes past the hour, overcast variable broken.

+S indicates that report contains important change

SAFETY OF FLIGHT

WAKE TURBULENCE

1. For years turbulence generated by aircraft was attributed to "prop wash." Pilots, in making maneuvers such as steep 360° and 720° turns, would occasionally get caught in their own "prop wash." The "prop wash" behind other aircraft caused some pretty rough rides, "go-arounds", and accidents. With the advent of the large jet transport and helicopters, the so-called "prop wash" problems enlarged to include "jet wash" and helicopter "down wash" turbulence. By this time, however, the problems associated with aircraft wake turbulence had been broken down into two categories—"thrust stream turbulence" and "wing tip vortices."

2. What was once thought to be prop wash was in fact vortex turbulence. "Prop/jet wash," i.e., thrust stream turbulence, can be a hazard to aircraft operating on the ground and pilots should take normal precautions to avoid taxiing close behind larger aircraft making an engine runup or running up when other smaller aircraft are close behind them, as the case may be. At distances of 400–500 feet "prop" or "jet wash" normally will not constitute a serious hazard to other aircraft operating on the ground. Also, it should not be a hazard to aircraft in flight except possibly in the case of a take-off or landing in the immediate area of an aircraft making a ground runup. "Jet wash" velocity patterns will, of course, vary in shape and velocities with different aircraft and power settings, and will change when subjected to surface winds of differing relative directions and velocities.

3. VORTICES

A vortex core is the center of a trailing mass of disturbed air created by the wing of an aircraft as it produces lift. An aircraft creates two such vortices with rotational air movement. As a lift-producing air foil passes through the air it leaves a continuous sheet of unstable air behind the trailing edge. Due to spillage about the wing tips, the air rolls into two distinct vortices, one trailing behind each wing tip. The roll up process is normally complete at a distance equal to about two to four times the wing or rotor span of the aircraft. Thus, formation of vortices behind present commercial jet transport aircraft would be essentially complete at distances of approximately 200 to 600 feet, and, if visible would appear as shown in Figure 1. Vortices generated by the rotors of a helicopter are shed and trail along the

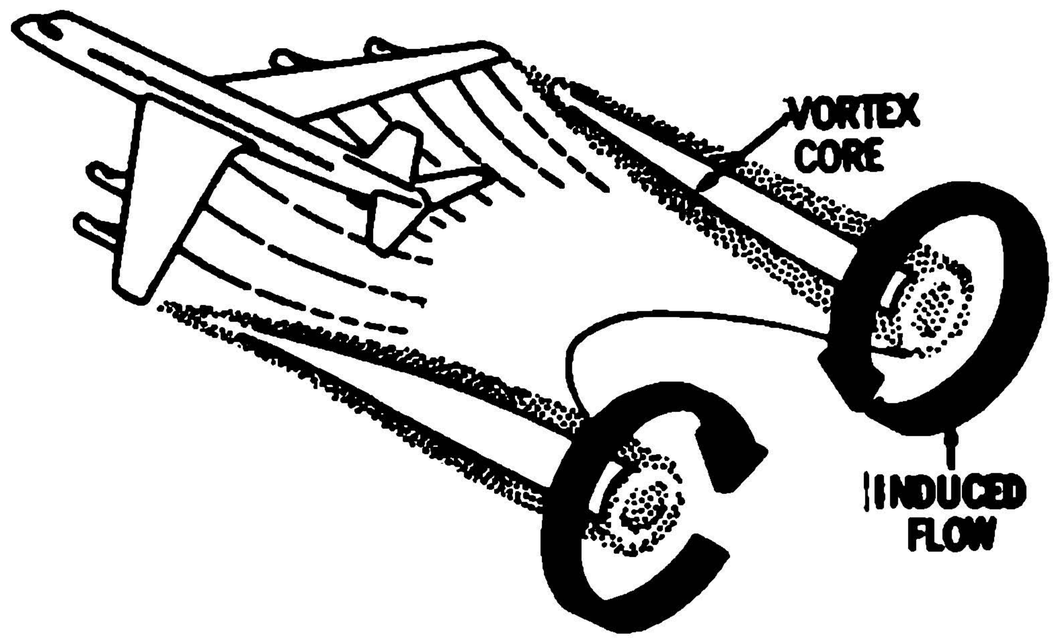


FIGURE 1. Trailing Vortex Sheet and Cores.

track behind the aircraft in the same manner as those generated by a fixed wing aircraft. These vortices have the same internal air circulation as those generated by fixed wing aircraft and have the same effect upon other aircraft.

4. VORTEX INTENSITY

When an air foil passes through a mass of air and creates lift, energy proportional to the weight being lifted is transmitted to the mass of air. Generally, the greater the lift, the greater the energy transmitted to the air mass in the form of turbulence. The turbulence is directly related to the weight, wing span and speed of the aircraft. Its intensity is directly proportional to the weight and inversely proportional to the wing span and speed of the aircraft. The heavier and slower the aircraft, the greater the intensity of the air circulation in the vortex cores. Thus, it can be seen that modern large transport aircraft will create vortices having maximum rotational velocities during take-off and landing at or near maximum gross weights.

5. VORTEX PERSISTENCY

There is no current practical knowledge that can be used as a yardstick to accurately measure the period of time vortices will be a hazard to other aircraft. Studies have been conducted and measurements made of the size of vortices and velocity of the air within them up to nearly three minutes after passage of large aircraft. Pilots have reported what they believed to be vortex turbulence five minutes and more after passage of another aircraft. No practical rule

WAKE TURBULENCE (Con't)

involving a time interval for one aircraft behind another will assure avoidance of the vortices generated by the first. However, other methods of avoiding the hazards associated with aircraft vortices are known and can be applied by pilots.

6. VORTEX DANGERS

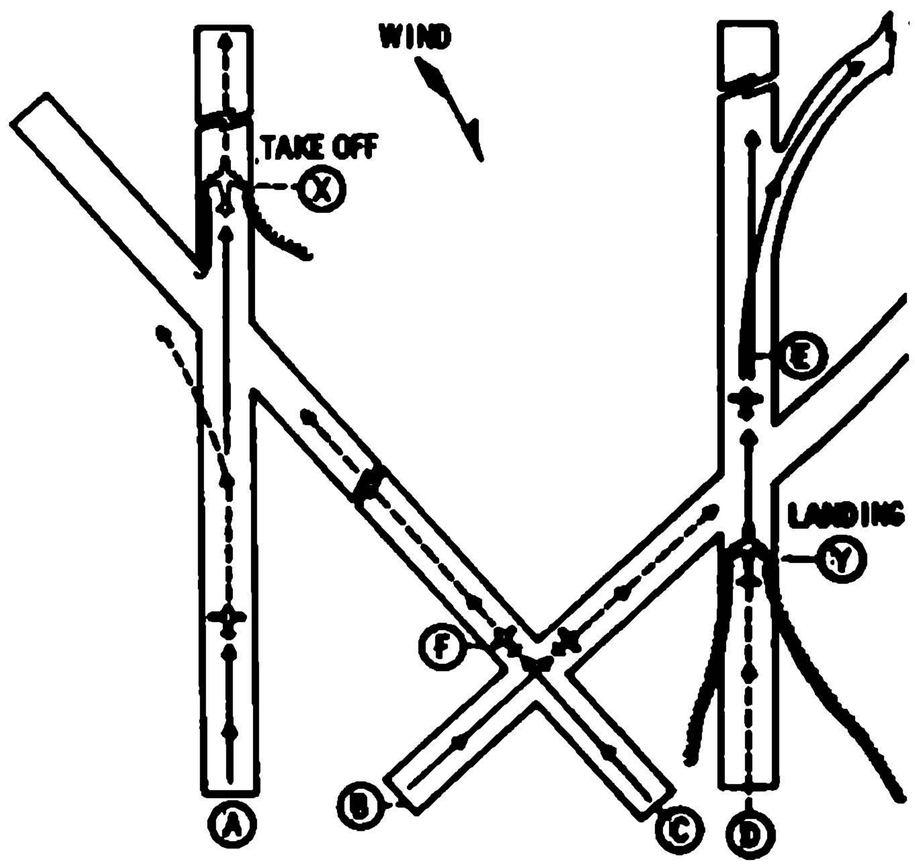
"Why should I avoid flying in or through the vortex turbulence behind large aircraft?" is a question that a pilot might ask if accustomed only to the turbulence created by light single and twin engine aircraft. Perhaps the best answer, and the most impressive one is that the aerodynamic forces applied upon the light aircraft by the circulation of air in the vortices and the pilot's attempt to counteract it could result in the airframe design limits being exceeded and possibly structural failure. And then there is the pilot who has always been able to control his aircraft through any "prop wash" he has encountered. His excellent ability may mean nothing because the forces he encounters behind a heavily loaded large aircraft could exceed the control capability of his aircraft. A roll, descent, or combination of the two could continue even though full control travel or power is applied. The forces of the air in wing tip vortices can well exceed the aileron control capability or the climb rate of some aircraft. For those who want figures, the air in a vortex core can produce a roll rate of about 80 degrees per second which is about twice the roll rate capability of some light aircraft when using full aileron deflection. If the light aircraft stayed directly between the center of the vortex cores from a heavy jet transport it could encounter a downward flow of air of about 1,500 feet per minute. A light aircraft with a continued climb capability of 1,000 to 1,200 feet per minute could go only in one direction—*down*. Caught in such a position the pilot who altered his course could get caught by the roll forces or a combination of downward and roll forces. These forces have been sufficient to cause aircraft to do one or more complete rolls, to force them into the ground and in some instances a combination of the two actions.

7. VORTEX LOCATION

The best way of avoiding the vortices hazards is to know where they are most likely to be encountered and act accordingly. Since vortices are not formed until lift is produced they will not be generated by an aircraft taking off until just before lift off—at the point where rotation is made. Vortices cease to be generated by a landing aircraft when its wing ceases to produce lift—when it has actually landed. However, remember that a large aircraft could have taken off and be out of sight, or landed and be on the ramp and the vortices turbulence could still be present near the runway. Another factor to remember is the vertical and lateral movements of vortices. Vortices generated more than 400 or 500 feet above the surface will drop nearly vertically in a no-wind condition until reaching a height equal to approximately one-half the wing span of the generating aircraft. At that point they start to curve outward and spread laterally away from the track of the aircraf There is one other thing that must be remembere that is—both the vertical and lateral movement the vortex cores, will be affected by and move wit the encompassing air mass. A cross wind will di place the vortices from the vertical in their dow ward travel and affect the lateral rate of trave A cross wind component of approximately four six knots, depending upon the lateral rate of vorte travel, is sufficient to cause one core to remain late ally stationary over a line on the surface while t opposite core will travel at its own lateral rate pl that of the effective cross wind.

8. SUGGESTED PILOT ACTION

Unfortunately, the best advice is not always the mo practical. In the case of vortex turbulence hazar avoidance, to insure 100% success would requi pilots, particularly those flying relatively small



→ — → — FLIGHT PATH
→ — → — GROUND PATH

Large Aircraft	*Small Aircraft* *Take-off**	*Small Aircraft* *Landing**
TAKE-OFF at X	B, D, C, A	D, C, B, A
LAND at Y	A, C, E, B	A, B, E, F

FIGURE 2. Example Take-off/Landing Alternative courses of action.

WAKE TURBULENCE (Con't)

aircraft, to refrain from operating in areas where the very large and heavy aircraft regularly operate. It would produce the desired result but would not be practical. What can you as a pilot do?

a. General Rule. When it is necessary to operate behind a large heavy aircraft try to remain above the flight path of that aircraft. Remember that vortices settle toward the surface and also that they are affected by the wind and move with the air mass down to within one hundred or so feet from the ground before spreading laterally away from each other and that the wind will continue to effect the vortex cores until dissipation occurs. Because of the infiinite number of different circumstances that can exist, it is not practical to establish a set of inflexible rules. Therefore, we have outlined several possible courses of action and included their depiction in preceding Figure 2, which, depending upon existing conditions, pilots may wish to consider.

b. Take-off/Take-off.

(1) *Same or parallel runway.* Start the take-off roll at the end of the runway so that your take-off will be before the point where the previous aircraft's take-off was made. Make a normal performance take-off and climb and you should be behind and above the settling vortices of the preceding aircraft. If possible, make a turn away from the runway heading and if there is any cross wind make that turn into the wind. Don't depend upon the wind to dissipate the vortex core circulation appreciably unless it is 10–15 knots or higher and even then it could take several minutes. Also, remember that the lateral movement of vortices, even in a no wind condition, may place a vortex core over a parallel runway. With a light cross wind one vortex can remain stationary over the ground for some time or even move upwind before dissipating to any significant degree.

(2) *Intersecting runways.* If the large aircraft was still on the ground until well past the intersection and your take-off will permit climb to approximately 100 feet or more before you pass the intersection you should not encountered either the vortices or any appreciable thrust stream turbulence. Remember the general rule and make certain that you cross above the flight path of larger aircraft. Also remember that the larger aircraft will probably have a high gross weight at take-off and thus will generate vortices of maximum intensity. Also, consider the lateral movement of vortices and the possible effect the wind wil lhave upon the movement.

c. Take-off/Landing.

(1) *Same or parallel runway.* When taking off after another aircraft has just landed, keep it on the ground until past the point where the other aircraft landed. Remember, while starting take-off from an intersection may keep you out of the vortices of an aircraft that has just landed, it could place you in the vortices shed by one that took off several minutes before on the same or a parallel runway.

(2) *Intersecting runways.* The precautions to heed when taking off after another aircraft has just landed on an intersecting runway are the same as those for a single or parallel runway. But don't forget the "heavy" that may have taken off from either your runway or the other one within the past several minutes.

d. Traffic Pattern. Don't fly below and behind a large aircraft in the traffic pattern. If practicable, plan your pattern to stay laterally separated from large aircraft by at least several hundred feet. When on the final approach, an above and behind position should keep you clear of the turbulence created by the preceding aircraft.

e. Landing/Landing. From the above and behind position on a final approach, the light aircraft pilot is in a good position to touch down beyond the point where a preceding large aircraft landed. If you are using ILS, remain on or slightly above the glide slope. If the runway has a visual approach slope indicator (VASI) system, a flight path in the "red and white" or with the top bar appearing a bit pink will keep you on or slightly above a normal glide slope and put you in a good position to touch down beyond the point where the previous aircraft was on the runway. A complete description of the VASI system which appears on page I-16.

f. Landing/Take-off. When landing after the take-off of a large aircraft, make a normal landing near the approach end of the runway and be solidly on the ground before reaching the point where the large aircraft took off. Although vortices from the departing aircraft will not be formed until the point of rotation, remember that the wind can cause the turbulence to move down the runway toward you.

9. SUMMARY

Thrust stream turbulence (prop/jet wash) should not be a hazard to aircraft in the air except in one possible instance. Take normal precautions when landing if a large aircraft is making a run-up near the approach end of the runway. Avoid flying close behind and below large aircraft—remain at least level or slightly above and, when practicable, laterally separated from the flight path of the large ones.

WAKE TURBULENCE (Con't)

When landing behind a big one that has just touched down—stay high and touch down beyond the point where he landed—if the length of the runway will permit. When landing behind a departing "heavy"—land before reaching the take-off point of the large aircraft. When making a take-off behind a large aircraft that has just departed—make it normal with a normal climb and stay above or deviate from the flight path of the other aircraft. Avoid an intersection take-off on the same runway behind a "heavy"—take-off from the approach end of the runway. Also, avoid taking off from a runway that crosses another from which a large aircraft has just taken off unless you can be well in the air at the intersection and the large aircraft was still on the runway at that point. When the tower controller advises you "caution wake turbulence," etc., he is merely warning you that it may exist because of an aircraft that has recently made a take-off or landing. When you receive such an advisory, don't hesitate to request further information that you believe will assist in analyzing the situation and determining the course of action you wish to take. Remember, even though a clearance for take-off or landing has been issued, it is only an authorization and the pilot may choose to wait, ask to use a different runway or in some other way delay his intended operation. Sometimes ,air traffic clearances include use of the word "immediately." For example, "CLEARED FOR IMMEDIATE TAKE-OFF." In such cases, the word is used for purposes of air traffic separation. The clearance may be refused if the pilot believes an alternate course of action would be better suited to his intended operation. The controller's primary job is to aid in the prevention of collisions between aircraft however, he will assist the pilot in any way he can while accomplishing his job.

NEAR MIDAIR COLLISION REPORTING

1. The agency is vitally interested in all near midai collision incidents. Each reported incident is thoroughly investigated by the Agency as soon as receive in accordance with the established procedures. I order to ensure expeditious handling, all airmen ai urged to report each incident immediately to.
   a. Nearest FAA Air Traffic Control facility or Fligl Service Station by radio.
   b. Telephone report at next point of landing to nea est FAA Air Traffic Control facility or Fligi Service Station.
   c. Written in lieu of a and b above to the nearest A Carrier District Office or General Aviation Distri Office.
2. The following information should be reported if ava able:
   a. Date and time (GMT) of incident.
   b. Location of incident and altitude.
   c. Identification and type of reporting aircraft; a crew destination; name and home base of pil
   d. Identification and type of other aircraft; aircre destination; name and home base of pilot.
   e. Type of flight plans; station altimeter setting use
   f. Detailed weather conditions at flight altitud level.
   g. Approximate courses of both aircraft; indicate one or both aircraft were climbing/descendir
   h. Reported separation in distance at first sightin proximity at closest point horizontally and ver cally; length of time in sight prior to evasi action.
   i. Degree of evasive action taken, if any (from bo aircraft, if possible); injuries, if any.
3. Any inquiry pertaining to the incident should be ma to the FAA General Aviation District Office where the incident occurred.

MEDICAL FACTS FOR PILOTS

GENERAL

Just as your aircraft is required to undergo regular hecks and maintenance, you are also required to under- o regular medical examinations to ensure your fitness to y. The physical standards you are required to meet re minimum standards. You do not have to be a super- an to fly. Many defects can be compensated for, as, r example, wearing glasses for visual defects. You ay be required to demonstrate by a medical flight test at you can compensate for any other defects of poten- al significance to flight safety.

Student pilots should visit a Designated Aviation fedical Examiner and determine if they meet the stand- rds before spending much money taking flying instruc- ions.

It should be recalled that humans are essentially arthbound creatures. However if we are aware of rtain aeromedical factors, and pay attention to these, e can leave the earth and fly safely. What follows ill not be one hard comprehensive lesson in aviation edicine. It will point out the more important factors ith which you should be familiar prior to flying.

Modern industry's record in providing reliable equip- ent is very good. When the pilot enters the aircraft, e becomes an integral part of the man-machine system. le is just as essential to a successful flight as the con- ol surfaces. To ignore the pilot in preflight planning ould be as senseless as failing to inspect the integrity the control surfaces or any other vital part of the achine. The pilot himself has the sole responsibility r determining his reliability prior to entering the ckpit for flight.

While piloting an aircraft, an individual should be ee of conditions which are harmful to alertness, ability make correct decisions, and rapid reaction times. Per- ns with conditions which are apt to produce sudden capacitation, such as epilepsy, serious heart trouble, ncontrolled diabetes mellitus or diabetes mellitus re- iring hypoglycemic agents, and certain other conditions azardous to flight, cannot be medically certified ac- rding to the Federal Aviation Regulations. Conditions ch as acute infections, anemias, and peptic ulcers, are mporarily disqualifying. Consult your Aviation Med- al Examiner when in doubt about any aspect of your alth status, just as you would consult a licensed viation mechanic when in doubt about the engine status. pecific aeromedical factors are herein explained. For dditional information on these or other aeromedical flight factors, write to : The Federal Air Surgeon, Federal Aviation Agency, Washington, D.C. 20553.

FATIGUE

Fatigue generally slows reaction times and causes foolish errors due to inattention. In addition to the most common cause of fatigue, insufficient rest and loss of sleep, the pressures of buiness, financial worries and family problems, can be important contributing factors. If your fatigue is marked prior to a given flight, don't fly. To prevent fatigue effects during long flights, keep active with respect to making ground checks, radio-navigation position plotting, and remaining mentally active.

HYPOXIA

Hypoxia in simple terms is a lack of sufficient oxygen to keep the brain and other body tissues functioning properly. Wide individual variation occurs with respect to susceptibility to hypoxia. In addition to progressively insufficient oxygen at higher altitudes, anything interfering with the blood's ability to carry oxygen can contribute to hypoxia (anemias, carbon monoxide, and certain drugs). Also, alcohol and various drugs decrease the brain's tolerance to hypoxia.

Your body has no built in alarm system to let you know when you are not getting enough oxygen. It is impossible to predict when or where hypoxia will occur during a given flight, or how it will manifest itself.

A major early symptom of hypoxia is an increased sense of well-being (referred to as euphoria). This progresses to slow reactions, impaired thinking ability, unusual fatigue, and dull headache feeling.

The symptoms are slow but progressive, insidious in onset, and are most marked at altitudes starting above ten thousand feet. Night vision, however, can be impaired starting at altitudes lower than ten thousand feet. Heavy smokers may also experience early symptoms of hypoxia at altitudes lower than is so with non-smokers.

If you observe the general rule of not flying above ten thousand feet without supplemental oxygen, you will not get into trouble.

ALCOHOL

Do not fly while under the influence of alcohol. An excellent rule is to allow twenty-four hours between the last drink and takeoff time. Even small amounts of alcohol in the system can adversely affect judgement and decision-making abilities.

ALCOHOL (Con't)

Remember that your body metabolizes alcohol at a fixed rate, and no amount of coffee or medication will alter this rate.

By all means, do not fly with a hangover, or a "masked hangover" (symptoms suppressed by aspirin or other medication).

DRUGS

Self-medication or taking medicine in any form when you are flying can be extremely hazardous. Even simple home or over-the-counter remedies and drugs such as aspirin, antihistamines, cold tablets, cough mixtures laxatives, tranquilizers and appetite suppressors, may seriously impair the judgment and coordination needed while flying. The safest rule is to take no medicine while flying, except on the advice of your Aviation Medical Examiner. It should also be remembered that the condition for which the drug is required, may of itself be very hazardous to flying, even when the symptoms are suppressed by the drug.

Certain specific drugs which have been associated with aircraft accidents in the recent past are: *Antihistamines* (widely prescribed for hay fever and other allergies); *Tranquillizers* (prescribed for nervous conditions, hypertension, and other conditions); *Reducing Drugs* (amphetamines and other appetite suppressing drugs can produce sensations of well-being which have an adverse affect on judgement); *Barbiturates, Nerve tonics or pills* (prescribed for digestive and other disorders, barbiturates produce a marked suppression on mental alertness).

VERTIGO

The word itself is hard to define. To earthbound individuals it usually means dizziness or swimming of the head. To a pilot it means, in simple terms, that he doesn't know which end is up. In fact, vertigo during flight can have very fatal consequences.

On the ground we know which way is up by the combined use of three senses:

1. **Vision**—We can *see* where we are in relation to fixed objects.
2. **Pressure**—Gravitational pull on muscles and joints tells us which way is down.
3. **Special Parts In Our Inner Ear**—The otoliths tells us which way is down by gravitational pull. It should be noted that accelerations of the body are detected by the fluid in the semi-circular canals of the inner ear, and this tells us when we change position. However, in the absence of a visual reference, such as flying into a cloud or overcast, the accelerations can be confusing, especially since their forces can be misinterpreted as gravitational pulls on the muscles and otoliths. The result is often disorientation and vertigo (or dizziness).

All pilots should have an instructor pilot produce maneuvers which will produce the sensation of vertigo. Once experienced, later unanticipated incidents of vertigo can be overcome. Closing the eyes for a second or two may help, as will watching the flight instrumer believing them, and controlling the airplane in acco ance with the information presented on the instrumer All pilots should obtain the minimum training rec mended by the FAA for attitude control of aircr solely by reference to the gyroscopic instruments.

Pilots are susceptible to experiencing vertigo at ni and in any flight condition when outside visibility reduced to the point that the horizon is obscured. additional type of vertigo is known as *flicker vert* Light, flickering at certain frequencies, from four twenty times per second, can produce unpleasant dangerous reactions in some persons. These reacti may include nausea, dizziness, unconsciousness, or e reactions similar to an epileptic fit. In a single en propeller airplane, heading into the sun, the prope may cut the sun to give this flashing effect, particul during landings when the engine is throttled back. Tl undesirable effects may be avoided by not staring rectly through the prop for more than a moment, by making frequent but small changes in RPM. flickering light traversing helicopter blades has known to cause this difficulty, as has the bounce-l from rotating beacons on aircraft which have penetr clouds. If the beacon is bothersome, shut it off dui these periods.

CARBON MONOXIDE

Carbon monoxide is a colorless, odorless, taste product of an internal combustion engine and is alw present in exhaust fumes. Even minute quantities carbon monoxide breathed over a long period of t may lead to dire consequences.

For biochemical reasons, carbon monoxide ha greater ability to combine with the hemoglobin of blood than oxygen. Furthermore, once carbon mono is absorbed in the blood, it sticks "like glue" to hemoglobin and actually prevents the oxygen from taching to the hemoglobin.

Most heaters in light aircraft work by air flo over the manifold. So if you have to use the heate wary if you smell exhaust fumes. The onset of s toms is insidious, with "blurred thinking", a pos feeling of uneasiness, and subsequent dizziness. I headache occurs. Immediately shut off the heater, the air ventilators, descend to lower altitudes, and at the nearest airfield. Consult an Aviation Me Examiner. It may take several days to fully rec and clear the body of the carbon monoxide.

VISION

On the ground, reduced or impaired vision can s times be dangerous depending on where you are and you are doing. In flying it is always dangerous.

On the ground or in the air, a number of factors as hypoxia, carbon monoxide, alcohol, drugs, fatigu even bright sunlight can affect your vision. In the these effects are critical.

Some good specific rules are: make use of sungl on bright days to avoid eye fatague; during night fl use red covers on the flashlights to avoid destroying

VISION (Con't)

lark adaptation; remember that drugs, alcohol, heavy smoking and the other factors mentioned above, have early effects on visual acuity.

MIDDLE EAR DISCOMFORT OR PAIN

Certain persons (whether pilots or passengers) have difficulty balancing the air loads on the ear drum while descending. This is particularly troublesome if a head cold or throat inflammation keeps the eustacian tube from opening properly. If this trouble occurs during descent, try swallowing, yawning, or holding the nose and mouth shut and forcibly exhaling. If no relief occurs, climb back up a few thousand feet to relieve the pressure on the outer drum. Then descend again, using these measures. A more gradual descent may be tried, and it may be necessary to go through several climbs and descents to "stair step" down. If a nasal inhaler is available, it may afford relief. If trouble persists several hours after landing, consult your Aviation Medical Examiner.

NOTE.—If you find yourself airborne with a head cold, you may possibly avoid trouble by using an inhaler kept as part of the flight kit.

PANIC

The development of panic in inexperienced pilots is a process which can get into a vicious circle with itself and lead to unwise and precipitous actions. If lost, or in some other predicament, forcibly take stock of yourself, and do not allow panic to mushroom. Panic can be controlled. Remember, *Prevent Panic to Think Straight.* Fear is a normal protective reaction, and occurs in normal individuals. Fear progression to panic is an abnormal development.

SCUBA DIVING

You may use your plane to fly to a sea resort or lake for a day's SCUBA diving, and then fly home, all within a few hours' time. This can be dangerous, particularly if you have been diving to depths for any length of time.

Under the increased pressure of the water, excess nitrogen is absorbed into your system. If sufficient time has not elapsed prior to takeoff for your system to rid itself of this excess gas, you may experience the bends at altitudes under 10,000 feet where most light planes fly.

AERONAUTICAL PUBLICATIONS

A list of publications of general operational interest to pilots is provided for your convenience. All are available from the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402, except those indicated by asterisks, which can be procured from the Director, U.S. Coast and Geodetic Survey, Washington, D.C.

SECTION II

ATC OPERATIONS AND PROCEDURES

DECEMBER 1964

75 - 2M (1) - 64 - II-1

INTRODUCTION

Section II—ATC OPERATIONS AND PROCEDURES

Section II, ATC Operations and Procedures, is designed to serve as an official means of disseminating pertinent air traffic control information of interest to pilots of varied experience levels. The material is presented in layman's language to lessen the ambiguity which sometimes results from individual interpretation of rules, regulations and proceedings.

The information published, governing flight operations, air traffic services and procedures with the conterminous United States is arranged and sequenced in accordance with that of a typical flight operation; i.e., preflight, departure, enroute, arrival and landing.

Supplemental to the sequenced flight operations, are supporting general and emergency information and procedures such as U.S. Entry and Departure Requirements, Air Defense Identification Zone (ADIZ) and SCATER procedures.

The Section concludes with Emergency Procedures. These procedures have been consolidated and placed last in the Section for quick and ready reference.

PREFLIGHT

GENERAL

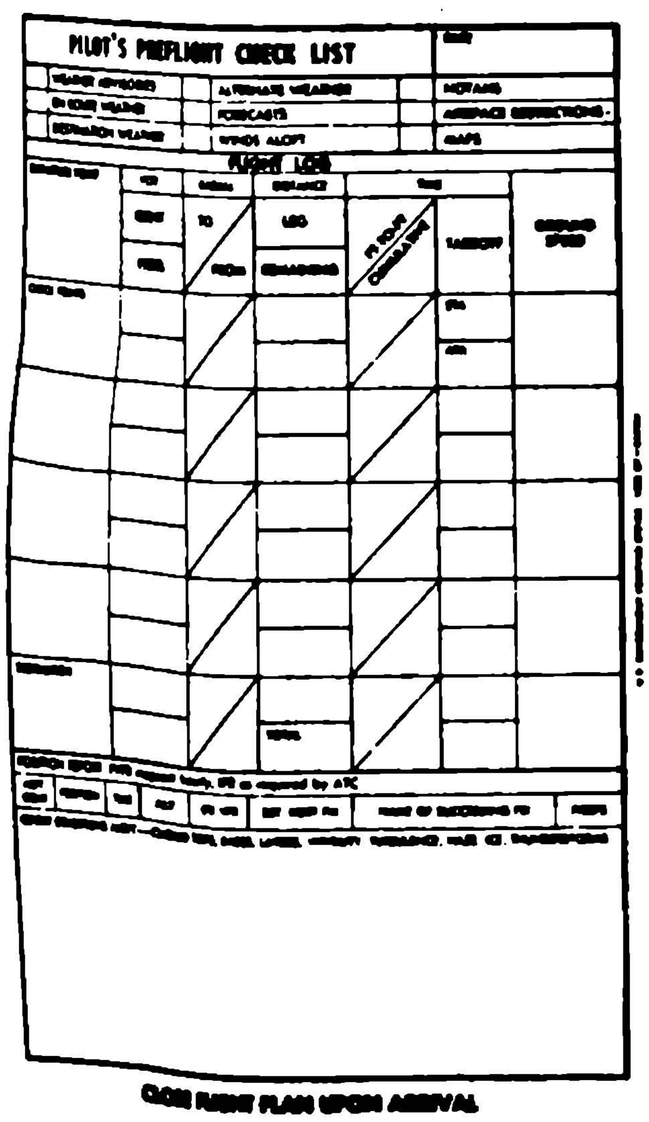
1. Every pilot is urged to receive a preflight briefing and to file a flight plan. This briefing would consist of weather, airport, and enroute navaid information. Briefing service may be obtained from a flight service station either by telephone/interphone, by radio when airborne, or by a personal visit to the Station.

WEATHER BRIEFING

1. Consult your local FAA Flight Service Station (FSS) or Weather Bureau Airport Station (WBAS) for preflight weather briefings.

2. When telephoning for information, use the following procedure:
   a. Identify yourself as a pilot. (Many persons calling WB stations want information for purposes other than flying.)
   b. State your intended route, destination, proposed departure time and estimated time en route.
   c. Advise if you intend to fly only VFR.
   d. When talking to an FSS, you will be asked your aircraft identification for activity record purposes.



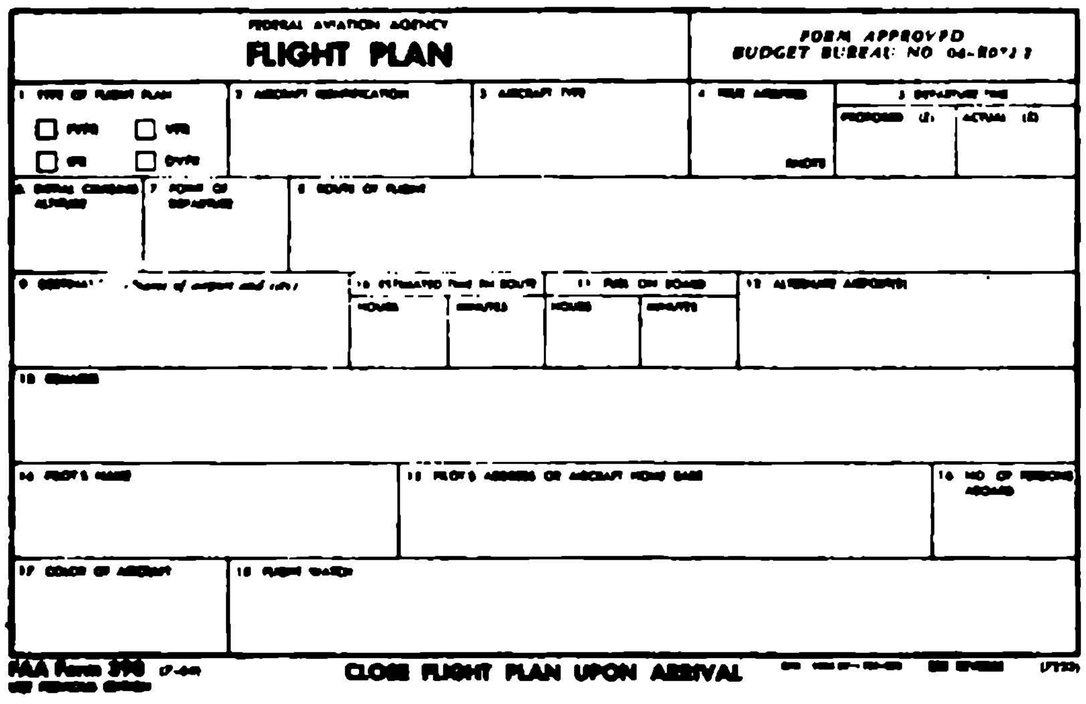
3. You are urged to use the Pilot's Preflight Check List which is on the reverse of the Flight Plan Form. The Check List is a reminder of items you should be aware of before beginning flight. Also provided beneath the Check List is a Flight Log for your use if desired.

FLIGHT PLAN—VFR

1. GENERAL

a. A flight plan is not required for VFR flight, however, it is strongly recommended that one be filed. This not only assures prompt search and rescue action in event you become overdue or missing, but it also permits en route stations and the destination station to render better service by having prior knowledge of your flight. All VFR flights, whether on a flight plan or not, should make regular position reports to FAA Flight Service Stations to receive altimeter settings and weather safety advisories.

b. Flight plan forms are available at all Flight Service Stations. A flight plan may be filed with the nearest Flight Service Station or airport traffic control tower, either in person or by telephone. Aircraft radio may be used to file if no other means are available. Some states operate aeronautical communications stations and most of these will accept flight plans which are then sent to FAA for further handling.



NOTE.—Although FAR 91.83 does not require the information in item 17 for domestic flight, nor that in item 18 for any flight, pilots are urged to furnish this information to assist search and rescue if SAR action is required.

FLIGHT PLAN—VFR (Con't)

2. DVFR (DEFENSE VFR FLIGHT PLAN)

Detailed ADIZ procedures are found under GENERAL, page II-O

3. COMPOSITE FLIGHT PLAN (VFR & IFR)

a. Flight plans which specify VFR operation for one portion of a flight, and IFR for another portion, will be accepted at the point of departure. If VFR flight is proposed for the first portion of the flight, the pilot should request IFR clearance from (1) the FSS nearest the location at which change from VFR to IFR is proposed; or if unable to contact the FSS, (2) any air traffic control facility. In either case, if a *VFR flight plan* was filed for the first portion of flight the pilot is responsible for notifying the FSS or air traffic control facility contacted to "CLOSE VFR FLIGHT PLAN." The pilot must remain in VFR weather conditions until operating in accordance with the IFR clearance.

b. When a flight plan indicates IFR for the first portion of flight and VFR for the latter portion, the pilot will normally be cleared to the point at which the change is proposed. Once the pilot has reported over the clearance limit and does not desire further IFR clearance, he should advise Air Traffic Control to cancel the IFR portion of his flight plan. Further clearance will not be necessary for VFR flight beyond that point. If the pilot desires to continue his IFR flight plan beyond the clearance limit, he should contact Air Traffic Control at least five minutes prior to the clearance limit and request further IFR clearance. If the requested clearance is not received prior to reaching the clearance limit fix, the pilot will be expected to establish himself in a standard holding pattern on the radial/course to the fix.

4. CLOSING (F.A.R.,PART 91.83(a))

a. VFR, FVFR, and DVFR flight plans must be closed (canceled), or an arrival report filed, within 30 minutes (15 minutes for jets) after the estimated time of arrival. To do this, merely notify the nearest Flight Service Station or air traffic control facility by radio or telephone. If a report is not received within this time, a communications search will be conducted by the FAA facilities along your route. If this search fails to locate your aircraft, a Rescue Coordination Center will be advised and an extensive, costly physical search for your aircraft will be initiated.

FLIGHT PLAN—IFR

1. GENERAL

a. Prior to departure from within, or prior to entering a control area or control zone, a pilot must submit a complete flight plan and receive an air traffic clearance. Instrument flight plans may be submitted to the nearest Flight Service Station or airport traffic control tower either in person or b telephone (or by radio if no other means are avai able). Pilots should file IFR flight plans at leas 30 minutes prior to estimated time of departur to preclude possible delay in receiving a departur clearance from ATC.

b. When filing a domestic IFR flight plan for flig in an aircraft equipped with a radar beacon tran ponder, DME equipment, or a combination of bot the pilot shall identify equipment capability b adding a suffix to the identification preceded b a slant, as follows:

AI2346/X (Transponder, no code)
V23457/T (Transponder, with code)
NI256/D (DME)
R39857/L (DME and transponder, no code)
AA409/B (DME and transponder with cod

NOTE.—The suffix is not to be transmitted by radio part of the aircraft identification.

2. AIRWAYS/JET ROUTES

a. It is vitally important that the route of flight b accurately determined and described in the flig plan to permit accurate plotting and planning b air traffic control. The issuance of air traffic co trol clearances governing IFR flight within co trolled airspace will be predicated on pilot co formance with applicable Federal Aviation Reg lations and adherence to route procedures. T simplify definition of route and to facilitate a traffic control, pilots are requested to file flig plans via VOR Airways or Jet Routes establish for use at the altitude/flight level planned.

(1) If flight is to be conducted via the designat airways or jet routes, the route may described by indicating the type and numb of the airway(s) or jet route(s) requeste Federal airways or jet routes, whichever appropriate, which cross or merge for sho distances with the airway or jet route request should not be indicated.

Example 1:
7000 MSP PRESCOTT V97 LAKEWOC ORD

Spelled Out: Requesting 7000 feet fr Minneapolis St. Paul Interation via Prescott Intersection, Victor to Lakewood Intersection, direct C cago O'Hare International.

Example 2:
FL 250 MSP J30 J16 ORD

Spelled Out: Requesting Flight Level 2 Minneapolis St. Paul Internation Jet Route 30, Jet Route 16, to Chic go O'Hare International.

(2) The route of flight may also be described b naming the reporting points over which t flight will pass, provided the points named a

FLIGHT PLAN—IFR (Con't)

established for use at the altitude/flight level planned (see DIRECT FLIGHT below).

Example:

3000 DCA RVD BAL

Spelled Out: Requesting 3000 feet from Washington National, via direct Riverdale Radio Beacon direct Baltimore Friendship International.

(3) When the route of flight is defined by named reporting points, whether alone or in combination with airways or jet routes, and the navigational aids (VOR, VORTAC, TACAN, LF, RBN) to be used for the flight are a combination of different types of aids, enough information should be included to clearly indicate the route requested.

Example:

FL 310 LAX J5 LKV J3 GEG QE FL 330 HL500 LR HL515 WG

Spelled Out: Requesting Flight Level 310 from Los Angeles International via Jet Route 5 Lakeview, Jet Route 3 Spokane, direct Kimberly, British Columbia Low Frequency Range, Flight Level 330 High Level Airway 500 to Langruth, Manitoba VOR, High Level Airway 515 to Winnepeg, Manitoba.

(4) When filing IFR, it is to the pilots' advantage to file a "preferred route."

3. DIRECT FLIGHTS

a. All or any portions of the route which will not be flown on the radials/courses of established airways or routes, e.g., direct route flights, must be defined by indicating the radio fixes over which the flight will pass. Fixes selected to define the route shall be those over which the position of the aircraft can be accurately determined. Such fixes automatically become compulsory reporting points for the flight, unless advised otherwise by ATC. Only those navigational aids established for use in a particular structure, i.e., in the Low or High structures, may be used to define the en route phase of a direct flight within that structure.

b. The azimuth feature of VOR aids, and the azimuth and distance (DME) features of VORTAC/TACAN aids, are assigned certain frequency protected areas of airspace for direct route flight. These areas of airspace are expressed in terms of cylindrical service volumes of specified dimensions called "class limits." To facilitate correct use of VOR/VORTAC/TACAN aids, consistent with their normal frequency protection limits, pilot use of such aids for defining a direct route of flight in controlled airspace should not exceed the following:

(1) Operations above Flight Level 450–use aids not more than 200 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey Flight Information Publication En Route High Altitude Chart–U.S.

(2) Operation off established routes from 18,000 feet M. S. L. to Flight Level 450–use aids not more than 260 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey, Flight Information Publication, En Route High Altitude Chart—U.S.

(3) Operation off established airways below 18,000 feet M. S. L.—use aids not more than 80 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey, Flight Information Publication, En Route, Low Altitude Chart —U.S.

c. Airway or jet route numbers, appropriate to the stratum in which operation will be conducted, may also be included to describe portions of the route to be flown.

Example:

140 MDW V6 V10 BRL STJ SLN GCK

Spelled Out: Requesting 14,000 feet Chicago Midway Airport Victor 6, Victor 10, Burlington, Iowa, direct St. Joseph, Missouri, direct Salina, Kansas, direct Garden City, Kansas.

NOTE.—When route of flight is described by radio fixes, the pilot will be expected to fly a direct course between the points named.

4. VFR OPERATIONS ON AN IFR FLIGHT PLAN (Ref. FAA EXAM-O-GRAM No. 6)

a. In preparation for IFR flight above an overcast or in an area of generally unlimited ceilings and visibility, pilots may request "VFR CONDITIONS ON TOP" to permit them to select an altitude, or altitudes of their choice, rather than specific ATC assigned altitudes.

b. Departing instrument-rated pilots who wish an IFR clearance only to climb through a layer of overcast or reduced visibility ,and then continue flight VFR may request ATC clearance "TO VFR CONDITIONS ON TOP". This request may be made through a Flight Service Station, by telephone to ATC, or by request to the Tower before taxiing out. The clearance, which authorizes IFR flight through the cloud layer, will contain a near-by clearance limit, routing, and a request to report reaching "VFR CONDITIONS ON TOP". When the pilot reaches "VFR CONDITIONS ON TOP" and desires to cancel the IFR portion of his flight, he should so state. This type of operation can be combined with a VFR Flight Plan to destination.

LIGHT PLAN—IFR (Con't)

c. No separation is provided. However, the pilot may expect to receive traffic information on known IFR traffic. Any time a pilot is flying "in the clear", whether at a specific assigned altitude or at an altitude assignment of "VFR CONDITIONS ON TOP", collision avoidance is the pilot's responsibility.

d. Remember that when flying on an IFR clearance with a VFR restriction, a pilot must comply with Instrument Flight Rules plus applicable Visual Flight Rules.

CANCELLING

a. IFR flight plans may be canceled any time by so notifying Air Traffic Control, provided the flight is operating in VFR weather conditions when such action is taken. Where conditions indicate that the remainder of the flight can be conducted in accordance with VFR, a pilot may avail himself o this procedure to remove any Air Traffic Contro restrictions which may have been issued affectin his flight.

b. An IFR flight plan may be cancelled by deliverin the following message to the controller or the air ground station with which the flight is in commun cation: "CANCEL MY IFR FLIGHT PLAN. Since Air Traffic Control cannot approve or disa prove cancellation of the IFR flight plan, a acknowledgement that the message has been r ceived is all that is required. If a flight plan ha been cancelled and subsequent IFR operation b comes necessary, a new IFR flight plan must b filed and a traffic clearance received before e countering IFR weather conditions.

NOTE.—Where a DVFR flight plan requirement exists will be the responsibility of the pilot to file this flight pla to replace the cancelled IFR flight plan.

DEPARTURE

COMMUNICATIONS

1. Pilots of departing aircraft should communicate with the control tower on the appropriate ground control frequency for taxi and clearance information and, unless otherwise advised, should remain on that frequency until they are ready to request take-off clearance. At that time, the pilot should communicate with the tower on the appropriate local control frequency.

2. The airport ground control frequencies 121.7 and 121.9 mc are normally provided to eliminate frequency congestion on the tower (local control) frequency. Provision of these frequencies for ground control and their use by aircraft and airport utility vehicles operated on the surface of the airport thus provides a clear VHF channel for arriving and departing aircraft. They are used for issuance of taxi information, clearances, and other necessary contacts between the tower and aircraft or other vehicles operated on the airport. Normally, only one of these ground control frequencies is assigned for use at an airport; however, at locations where the amount of traffic so warrants, both frequencies may be assigned with one or the other designated as a clearance delivery frequency.

3. Where the "ground control" frequency is not available (tower or aircraft), the tower normally will transmit to aircraft over an appropriae ground to air frequency.

4. Pilots of aircraft not equipped to transmit on a ground control frequency should transmit on the tower frequency and tune their receivers to the appropriate ground control frequency in accordance with the above.

NOTE.—See Airport Advisory Service (Non-Radar), under ARRIVAL, for communications procedures at airports not served by control towers.

LIGHT SIGNALS

1. The following procedures are used by airport traffic control towers in the control of aircraft not equipped with radio. These same procedures will be used to control aircraft equipped with radio if radio contact cannot be established. Airport traffic control personnel use a directive traffic control signal which emits an intense narrow beam of a selected color (either red, white, or green) when controlling traffic by light signals. Although the traffic signal light offers the advantage that some control may be exercised over non-radio equipped aircraft, all pilots should be cognizant of the disadvantages which are:

   a. The pilot may not be looking at the control tower at the time a signal is directed toward him.

   b. The directions transmitted by a light signal are very limited since only approval or disapproval of a pilot's anticipated actions may be transmitted. No supplementary or explanatory information may be transmitted except by the use of the "General Warning Signal" which advises the pilot to be on the alert.

2. Portable traffic control light signals:

Color and Type of Signal	On the Ground	In Flight
STEADY GREEN	Cleared for take-off	Cleared to land
FLASHING GREEN	Cleared to taxi	Return for landing (to be followed by steady green at proper time)
STEADY RED	Stop	Give way to other aircraft and continue circling
FLASHING RED	Taxi clear of landing area (runway) in use	Airport unsafe—do not land
FLASHING WHITE	Return to starting point on airport	
ALTERNATING RED & GREEN	General Warning Signal—Exercise Extreme Caution	

3. Between sunset and sunrise, a pilot wishing to attract the attention of the air traffic control tower operator should turn on a landing light and taxi the aircraft in position so that light is visible to the tower operator. The landing light should remain on until appropriate signals are received from the tower.

4. Pilots should acknowledge light signals by moving the ailerons or rudder during the hours of daylight or by blinking the landing or navigation lights during the hours of darkness.

LIGHT SIGNALS (Con't)

5. During the hours of daylight the lighting of the rotating beacon will mean that ground visibility is less than three miles and/or that the ceiling is less than 1000 feet. During the hours of darkness, flashing lights outlining the traffic direction indicator (tetrahedron, wind tee or other device) will mean that ground visibility is less than three miles and/or the ceiling is below 1000 feet. The lighting of either of these signals indicates that a clearance from Air Traffic Control is necessary for landing, take-off, or flight in the traffic pattern if the airport is within a control zone.

CLEARANCE

NOTE.—Refer to Airport Advisory Service (Nonradar), under ARRIVAL, for additional "clearance" information.

1. TAXI

a. A clearance must be obtained prior to taxiing on a runway, taking off or landing during the hours an airport traffic control tower is in operation. Authorization to taxi "to" a runway is authorization to cross runways that intersect the taxi route unless instructions to the contrary are received. Authorization to taxi "to" a runway does not constitute a clearance to taxi "on" that runway.

b. At those airports where the United States Government operates the control tower and ATC has authorized non-compliance with the requirement for two-way radio communications while operating within the airport traffic area, or at those airports where the United States Government does not operate the control tower and radio communications cannot be established, pilots shall obtain a clearance by visual light signal prior to taxiing on a runway and prior to take-off and landing. The following phraseologies and procedures are used in radio-telephone communications with aeronautical ground stations.

c. Aircraft identification, location, type of operation planned (VFR or IFR) and the point of first intended landing.

Example:

Aircraft: "WASHINGTON GROUND CONTROL, THIS IS BEECHCRAFT ONE THREE ONE FIVE NINER AT HANGAR EIGHT, READY TO TAXI, INSTRUMENT FLIGHT TO CHICAGO, OVER"

Tower: "BEECHCRAFT ONE THREE ONE FIVE NINER, RUNWAY THREE SIX, WIND ZERO THREE ZERO DEGREES AT TWO FIVE, ALTIMETER THREE ZERO ZERO FOUR, TIME ONE FOUR TWO SIX. GREENWICH, ZERO NINER TWO SIX EASTERN. TAXI SOUTH HOLD SHORT OF RUNWAY THREE." (Runways are numbered to correspond to their magnetic bearing. Runway 27, for example, has a bearing of 270°. Wind directions issued by control towers are also magnetic.)

Air route traffic control clearances are relay to pilots by airport traffic controllers in t following manner:

Example:

Tower: "ATC CLEARS BEECHCRAFT O THREE ONE FIVE NINER TO TI CHICAGO MIDWAY AIRPORT, V VICTOR EIGHT, MAINTAIN EIGI THOUSAND, OVER."

Aircraft: "BEECHCRAFT ONE THREE O FIVE NINER IS CLEARED TO TI CHICAGO MIDWAY AIRPORT, V VICTOR EIGHT, MAINTAIN EIGI THOUSAND, OVER."

NOTE.—Normally, an ATC IFR clearance is relayed t pilot by the ground controller. At busy locations, howe pilots may be instructed by the ground controller "CONTACT CLEARANCE DELIVERY" on a frequency ignated for this purpose. No surveillance or control o the movement of traffic is exercised by this position operation.

2. TAKEOFF

a. Withholding Take-Off Clearance

(1) Take-off clearance will be denied to the pi of any air carrier or commercial aircr carrying passengers or property for compen tion or hire whenever:

(a) The runway visual range (RVR) for departure runway is less than 2000 f at those locations which have runw visual range digital displays.

(b) If RVR is not available, runway visibil for the departure runway is less than quarter of a mile; or

(c) If neither RVR nor reported runway v bility is available, the prevailing visibil for the airport of departure is less t one quarter of a mile.

(2) If, upon being refused a take-off clearance pilot of an aircraft in the above categ advises he is not carrying passengers or pr erty for compensation or hire, for example business aircraft carrying company employ or an air carrier aircraft on a ferrying training flight, take-off clearance may authorized based on traffic conditions.

b. Air Traffic Clearance/Instruction

(1) When air traffic control issues a clearar pilots are expected to execute its provis after acceptance. Any clearance in which time of pilot execution is optional will state—"At pilot discretion."

(2) When air traffic control issues an instructi pilots are expected to comply with its p vision upon receipt. ATC, in certain sit tions, will include the word "IMME ATELY" in an instruction to impress urge of an imminent situation and expeditious c pliance by the pilot is expected and necess for safety.

CLEARANCE (Con't)

(3) Traffic clearances will only provide standard separation between IFR flights. *During the time an IFR flight is operating in VFR weather conditions, it is the direct responsibility of the pilot to avoid other aircraft, since VFR flights may be operating in the same area without the knowledge of ATC.*

(4) Air Traffic Control will not issue clearances specifying that climb or descent or any portion of the flight be conducted in "VFR conditions," to any IFR flight, regardless of altitude, except under emergency situations, or unless specifically requested by the pilot. When a VFR restriction is issued at the pilot's request, general traffic information will be issued to to the pilot of an aircraft operating with a clearance specifying a "VFR conditions" restriction for climb or descent.

(5) A traffic clearance originated by an ARTC Center and relayed to the pilot through a control or air/ground communication station will be prefixed by "ATC CLEARS." Other ATC messages which are originated by a center will be prefixed with "ATC REQUESTS" or "ATC ADVISES."

(6) The traffic clearance issued prior to departure will normally authorize flight to the airport of intended landing. Under certain conditions, at some locations a short range clearance procedure is utilized whereby a clearance is issued to a fix within or just outside of the terminal area and the pilot is advised of the frequency on which he will receive the long range clearance direct from the center controller.

(7) ATC facilities will use the phrase "VIA FLIGHT PLANNED ROUTE" in air traffic clearances to replace the lengthier detailed description of any portion of the route of flight that is identical to the route filed by the pilot. When used, the phrase will be preceeded by sufficient detailed route of flight information to establish the flight on the filed route. The *"VIA FLIGHT PLANNED ROUTE" phraseology does not include approval of altitudes filed in the flight plan. Specific altitude assignments will be issued in each clearance.* Approval of any change of altitude, whether such altitude is contained in the flight plan or is subsequently desired en route, should be requested prior to reaching the point at which it is desired to make the change. IFR flight plans filed by the pilots should contain the complete route of flight and should be relayed to Air Traffic Control unchanged. Pilots may request route verification when considered necessary and are requested to do so whenever a filed route has been changed prior to departure. If route verification is desired prior to departure, the request should be included with initial call for taxi clearance to avoid delay in receiving the information.

(8) Amendments to the initial clearance will be issued at any time an air traffic controller deems such action necessary to avoid possible confliction between aircraft. Clearances will require that a flight "hold" or change altitude prior to reaching the point where standard separation from other IFR traffic would no longer exist. Some pilots have questioned this action and requested "traffic information" and were at a loss when the reply indicated "no traffic reported." In such cases the controller has taken action to prevent a traffic confliction which would have occurred at a distant point.

(9) A pilot may wish an explanation of the handling of his flight at the time of occurrence; however, controllers are not able to take time from their immediate control duties nor can they afford to overload the ATC communications channels to furnish explanations. Pilots may obtain an explanation by directing a letter or telephone call to the chief controller of the facility involved.

(10) Clearances are normally issued for the altitude/flight level and route filed by the pilot. However, due to traffic conditions, it is frequently necessary for ATC to specify an altitude/flight level or route different from that requested by the pilot. In addition, flow patterns have been established in certain congested areas, or between congested areas, whereby traffic capacity is increased by routing all traffic on preferred routes. Information on these flow patterns is available in offices where pre-flight briefing is furnished or where flight plans are accepted.

(11) The pilot has the privilege of requesting a different clearance from that which has been issued by ATC if he feels that he has information which would make another course of action more practicable or if aircraft equipment limitations or company procedures forbid compliance with the clearance issued.

(12) Whenever an aircraft has been cleared to a point other than the destination airport, it is the responsibility of the ATC controller to furnish the pilot (or the air/ground communications facility concerned) with an additional clearance prior to the time the flight arrives at the clearance limit. This clearance may authorize flight beyond the clearance limit or contain holding instructions for the flight. However, when such clearance is not received by the time a flight is three minutes from the clearance limit the pilot is expected to effect speed reduction so as to cross the clearance limit initially at or below maximum holding

CLEARANCE (Con't)

speed (unless subsequent clearance prior to reaching the clearance limit permits flight beyond it); and when reaching the clearance limit, begin holding in a STANDARD HOLDING PATTERN ON THE COURSE ON WHICH HE APPROACHES THE FIX (disregarding any other pattern shown for the fix), maintaining the last assigned altitude/flight level and immediately request further clearance through the air/ground station. The altitude/flight level of the aircraft at this clearance limit will be protected so that separation will exist in the event the aircraft holds awaiting further clearance.

NOTE.—The foregoing should not be construed as being related in any way to the procedures which apply when a two-way radio failure occurs.

(13) Pilots should pay particular attention to the clearance and not assume that the route and altitude/flight level are the same as requested in the flight plan. It is suggested that pilots make a written record of clearances at the time they are received, and verify, by a repeat back, any portions that are complex or about which a doubt exists.

(14) The symbols and abbreviations listed below are used by FAA personnel in recording clearance information. They may also be used to advantage by pilots and other personnel receiving ATC clearances:

C	ATC CLEARS
R	CLEARED TO THE RANGE
A'	CLEARED TO THE AIRPORT OF DESTINATION
↓	DESCEND AND MAINTAIN ALTITUDE/FLIGHT LEVEL)
↑	CLIMB AND MAINTAIN (ALTITUDE/FLIGHT LEVEL)
→	CRUISE
X	CLEARED TO CROSS AIRWAY
M	MAINTAIN
H–NE	HOLD (Direction from fix)
OTP	MAINTAIN VFR ON TOP OF ALL: CLOUDS, HAZE, SMOKE OR FOG
RL	REPORT LEAVING Specified Altitude/s)
RR	REPORT REACHING (Specified Altitude/s)
RP	REPORT PASSING (Specified Fix) or RIGHT TRAFFIC PATTERN
LT	TURN LEFT AFTER TAKE-OFF
RT	TURN RIGHT AFTER TAKE-OFF
RS	RIGHT SIDE
LS	LEFT SIDE
EAC	EXPECT APPROACH CLEARANCE AT (Specified Time)

DLA INDFT (TIME)
DELAY INDEFINITE EXPECT APPROACH CLEARANCE NO LATER THAN (Specified Time

UFA	UNTIL FURTHER ADVISED
A/C	APPROACH CONTROL

Where the symbols and abbreviations are n sufficient to copy the complete message, u plain language so that no misunderstandi of the message will occur.

c. Special VFR Flight Clearance Procedur (F.A.R. Part 91.107)

(1) An Air Traffic Control clearance is necessa to avoid collision when operating under sp cial VFR weather minimums in a contr zone. When a control tower is located with the control zone, a clearance must obtain from the tower before entering the contr zone. If no control tower is located with the control zone, a clearance must be obtain from the nearest tower, center, or Flight Ser ice Station, prior to entering the control zon In this instance, clearance arrangements c be made by telephone.

(2) It is not necessary to file a complete flig plan with the request for clearance but t pilot should state his intentions in sufficie detail to permit air traffic control to fit h flight into the traffic flow. The clearance wi not contain a specific altitude as the pil must remain clear of clouds. The controll may require the pilot to fly at or below a ce tain altitude due to other traffic, but the alt tude specified will permit flight at or abo the minimum safe altitude. In addition, radar locations, flights may be vectored necessary for control purposes or on pil request.

3. STANDARD INSTRUMENT DEPARTURES (SIDS)

a. A Standard Instrument Departure (SID) is air traffic control coded departure routing whi has been established at certain airports to simpli clearance delivery procedures.

b. Pilots of air carrier or military aircraft operati under Instrument Flight Rules (IFR) at airpor for which SIDs have been published maybe issu clearances whenever ATC determines it is a propriate.

c. Pilots of other than air carrier or military ai craft operating under Instrument Flight Rul (IFR) at airports for which SIDs have be published will not be issued a SID clearance ATC unless requested by the pilot.

d. SIDs are published by the Coast & Geodetic Su vey as a part of the Flight Information Public tion package.

4. ADHERENCE TO AIR TRAFFIC CLEARANCE

a. When an air traffic clearance has been obtain under either the Visual or Instrument Flig Rules, the pilot in command of the aircraft sh not deviate from the provisions thereof unless

CLEARANCE (Con't)

amended clearance is obtained. The addition of a VFR or other restriction, i.e., climb/descent point or time, crossing altitude etc., does not authorize a pilot to deviate from the route of flight or any other provision of the air traffic control clearance.

b. The most important and guiding principal to remember is that the last ATC clearance has precedence over related portions of the previous ATC clearance. A clearance which amends an altitude of a previous clearance does not affect route of flight nor does a clearance which amends the route of flight affect the altitude portion of a previous clearance.

Example: A departure flight receives a clearance to destination airport to maintain Flight Level 290. The clearance incorporates a SID which has certain altitude crossing instructions. Shortly after take-off, the pilot receives a new clearance changing the maintaining Flight Level from 290 to 250. In this instance, altitude restrictions are automatically canceled and the pilot should commence an unrestrictive climb to Flight Level 250. If the controller had wished to retain the altitude restrictions, he would have either restated them or made it clear in the language of the clearance that only the final maintaining level was being changed.

c. In case emergency authority is used to deviate from provisions of an ATC clearance the pilot in command shall notify ATC as soon as possible and obtain an amended clearance. In an emergency situation which results in no deviation from the Rules prescribed in Part 91 but which requires air traffic control to give priority to an aircraft, the pilot of such aircraft shall make a report within 48 hours of such emergency situation to the nearest FAA Regional Office.

d. In addition to altitude/flight level destination and/or route changes, increasing or decreasing the speed of an aircraft constitutes a change in a flight plan. Therefore, at any time the average true airspeed at cruising altitude between reporting points varies or is expected to vary from that given in the flight plan by *plus or minus ten knots* air traffic control should be advised.

e. Air traffic clearances include data to assist pilots in identifying radio reporting points for where there is more than one type with the same name, for example: "Denver VOR." It is the responsibility of a pilot to notify air traffic control immediately if his radio equipment cannot receive the type of signals he must utilize to comply with his clearance.

f. The altitude/flight level instructions in an ATC clearance normally require that a pilot "MAINTAIN" the altitude/flight level at which the flight will operate when in controlled airspace. Altitude/flight level changes while en route should be requested prior to the time the change is desired.

g. The term "CRUISE" may be used instead of "MAINTAIN" to signify to the pilot that descent from cruising altitude may be commenced at his discretion without further clearance from ATC. "CRUISE" is normally used only for relatively short flights in uncongested areas and is authorization for the flight to proceed to, and make an approach at, destination.

5. SEPARATION STANDARDS

a. Air traffic control effects separation of aircraft vertically by assigning different altitudes; longitudinally by providing a minimum time separation between aircraft on the same courses; and laterally by assigning different flight paths.

b. Standard separation will be provided between all aircraft operating on IFR flight plans except: (1) when "VFR Conditions-On-Top" has been requested by a pilot and authorized by ATC in lieu of a specific cruising or holding altitude, and (2) when clearances specifying that climb or descent or any portion of the flight shall be conducted in "VFR Conditions" are issued.

DEPARTURE CONTROL

1. Departure Control is a tower function responsible for ensuring separation between departures. So as to expedite the handling of departures, Departure Control may suggest a take-off direction other than that which may normally have been used under VFR handling. Many times it is preferred to offer the pilot a runway that will require the fewest turns after take-off to place the pilot on his filed course or selected departure route as quickly as possible. At many locations particular attention is paid to the use of preferential runways for local noise abatement programs, and route departures away from congested areas.

2. Departure Control utilizing radar will normally clear aircraft out of the terminal area using standard instrument departures via radio navigation aids. When a departure is to be vectored immediately following take-off, the pilot will be advised prior to take-off of the initial heading to be flown. When given a vector taking his aircraft off a previously assigned nonradar route, the pilot will be advised briefly what the vector is to achieve. Thereafter, radar service will be provided until the aircraft has been re-established "on-course" using an appropriate navigation aid and the pilot has been advised of his position; or, a handoff is made to another radar controller with further surveillance capabilities.

3. Controllers will inform pilots of the departure control frequencies and, if appropriate, the transponder code before take-off. Pilots should not operate their transponder until ready to start the take-off roll or change to the departure control frequency until required.

ENROUTE

AIRWAYS/ROUTE SYSTEMS

1. Two route systems have been established for air navigational purposes in the continguous 48 states; the VOR and L/MF System and the Jet Route System.

   a. The VOR and L/MF Airway System consists of airways designated from 700 feet above the surface (or in some instances higher) to but not including 18,000 feet MSL and is designed to serve aircraft which operate at these altitudes. These airways are depicted on Coast and Geodetic Survey, Flight Information Publications, En Route Low Altitude Charts—U.S. Series L–1 through L–28.

   (1) The VOR airways are predicated solely on VOR/VORTAC navigation aids and are depicted on aeronautical charts by a "V" ("Victor") followed by the airway number, e.g., V 12. These airways are numbered similarly to U.S. highways. As in the highway numbering system, a segment of an airway which is common to two or more routes carries the numbers of all the airways which coincide for that segment. When such is the case a pilot in filing a flight plan needs to indicate only that airway number of the route which he is using. *Alternate Airways* are identified by their location with respect to the associated main airway. "Victor 9 West" indicates an alternate airway associated with, and lying to the west of Victor 9. As in the interstate highway system, major metropolitan areas, in many instances, are connected by *preferred routes* of flight which may include many numbered airway segments. To facilitate flight planning and to reduce phraseology, these preferred routes are assigned an 800 series airway number. Accordingly, a pilot in filing a flight plan need only to indicate the 800 series airway number assigned to the route he is using.

   (2) One of the major reasons for establishing a VOR airway system separate from the colored airway system (L/MF) is to facilitate route identification in flight plans and air traffic clearances. A pilot who intends to make an airway flight, using VOR facilities, will simply specify the appropriate "Victor" airway(s) in his flight plan. For example, if a flight is to be made from Chicago to New Orlea at 8000 feet, using omniranges only, the rou may be indicated as "Departing from Ch cago-Midway, cruising 8000 feet via Victor to Moisant International." If flight is to l conducted in part by means of L/MF nav gation aids and in part on omniranges, spec fications of the appropriate colored airwa and Victor airways in the flight plan will i dicate which types of facilities will be us along the described routes, and, for IF flight, permit ATC to issue a traffic clearan accordingly. As an example, route inform tion for a flight from Chicago to New Orlea using L/MF facilities to St. Louis and VOR to New Orleans would be given as "Departin Chicago-Midway cruising 8000 feet via Red 1 Amber 5 to St. Louis Victor 9 to Moisant I ternational." A route may also be describe by specifying the station over which the flig will pass, but in this case since many VOR and L/MF aids have the same name, the pil must be careful to indicate which aid wi be used at a particular location. This wi be indicated in the route of flight portion the flight plan by specifying the type of f cility to be used after the location name in t following manner: Newark L/MF, Allentow VOR.

   (3) With respect to position reporting, compulso reporting points are designated for VOR Ai way Systems. Flights using Victor Airwa will report over these points only, unless r quested otherwise by ATC to furnish ad tional position reports.

   (4) The L/MF airways are predicated sole on L/MF navigation aids and are depicted aeronautical charts by color and number; e. Amber One. Green and Red airways a plotted east and west. Amber and Blue a ways are plotted north and south. This c solete system, which is incompatible with t VOR system, is almost entirely replaced by t VOR airway system.

   b. The Jet Route System consists of jet routes esta lished from 18,000 feet MSL to FL 450 inclusi designed to serve aircraft which customarily op ate at these altitudes.

AIRWAYS/ROUTE SYSTEMS (Con't)

(1) Jet routes are based on VOR, VOR-DME and VORTAC facilities shown on high altitude charts. They are identified by the letter "J" followed by a number. This structure is depicted on Coast and Geodetic Survey Flight Information En Route High Altitude Charts—U.S. Series H–1 through H–4.

(2) Operation above FL 450 may be conducted on a point-to-point basis. Navigational guidance is provided on an area basis utilizing those facilities depicted on the Coast and Geodetic Survey, Flight Information Publication En Route High Altitude Charts—U.S. Series H–1 through H–4.

To the extent possible, these route systems have been aligned in an overlying manner to facilitate transition between each. To simplify definition of route and to facilitate air traffic control, pilots are requested to file via the airways/jet routes published for the altitude/flight level planned.

Pilots are cautioned when flying in Canadian airspace, to review Canadian Air Regulations. Special attention should be given to the parts which differ from U.S. Federal Aviation Regulations. For example, the Canadian airways "Block Airspace" restriction, which requires an ATC clearance when flying on airways between 9500′ and 23,000′ MSL east of longitude 114°W and between 12,500′ and 23,000′ MSL west of longitude 114°W. In addition, no person holding a commercial or private pilot license without an instrument rating shall operate an aircraft in VFR flight within block airspace unless he has successfully completed a written examination demonstrating his knowledge of radio navigation and of air traffic control procedures applicable to IFR flight including clearances and position reports and his license is endorsed to that effect by the Canadian Department of Transport.

CONTINENTAL CONTROL AREA

The Continental Control Area consists of the airspace of the 48 contiguous states and the District of Columbia at and above 14,500 feet MSL, but does not include:

a. The airspace less than 1500 feet above the surface of the earth; or

b. Prohibited and restricted areas, other than restricted area military climb corridors and the restricted areas listed in Subpart D of Part 71 of the F.A.R.

To alleviate the risk of collision between the high performance aircraft using this airspace, VFR minimums have been increased to: visibility, 5 miles; distance from clouds, 1000 feet under, 1000 over, and one mile horizontally.

713-135 O - 64 - II-2

POSITIVE CONTROL AREA

1. Airspace so designated wherein all aircraft are controlled. For operations within positive control areas, aircraft must be:

   a. Operated under IFR at specified altitude assigned by ATC.

   b. Equipped with instruments and equipment required for IFR operations and is flown by a pilot rated for instrument flight;

   c. Equipped with a coded radar beacon transponder, having a Mode A (military Mode 3) 64 code capability, reply to Mode 3/A interrogation with the code specified by ATC: and

   d. Radio equipped to provide direct pilot/controller communication on the frequency specified by ATC for the area concerned.

2. ATC may authorize deviations from the above requirements for operation in a positive control area. In the case of in-flight failure of a radar beacon transponder, ATC may immediately approve operation within a positive control area. In all other cases, requests for an authorization to deviate must be submitted at least four days before the proposed operation, in writing, to the ARTC Center having jurisdiction over the positive control area concerned. ATC may authorize deviations on a continuing basis or for an individual flight, as appropriate.

JET ADVISORY SERVICE

1. GENERAL

a. Jet Advisory Service has been established as a means of providing an increased degree of safety for civil air carrier turbojet and certain other civil flights. In radar jet advisory areas, this service is performed by selected radar equipped facilities and provides the pilots of civil air carrier turbojet and certain other civil flights with information intended to aid them to see and/or avoid other pertinent traffic. In nonradar jet advisory areas, civil air carrier turbojet and certain other civil flights receiving this service are afforded standard IFR separation from all other flights known by ATC to be operating within these areas. Although standard ATC separation is provided between aircraft receiving jet advisory service and all other aircraft within the nonradar jet advisory area, standard separation is not provided and may not exist between such aircraft and aircraft operating VFR or VFR conditions-on-top outside the area.

b. This service is provided to all civil air carrier turbojet flights. It is proffered by the appropriate ATC facility to other IFR civil flights, excluding those cleared to maintain "VFR conditions" or "VFR conditions-on-top," which are radar beacon

JET ADVISORY SERVICE (Con't)

equipped and cleared via jet routes along which jet advisory areas are prescribed; except that, jet advisory service is not provided to flights, other than civil air carrier turbojets, whose pilots have declined the service. Whenever workload will not permit provision of this service to all flights specified herein, it may be discontinued to flights other than civil air carrier turbojets. In such event, pilots of those flights affected will be so advised.

c. Except where positive control areas have been established, radar jet advisory areas consist of airspace prescribed not more than 16 statute miles on either side of specified jet routes, and in certain control areas and control area extensions, between Flight Levels 240 and 410 inclusive. Due to limited vertical radar coverage, however, the lower limits may be established above Flight Level 240 and therefore, may overlie nonradar jet advisory areas. When radar jet advisory areas are established above nonradar jet advisory areas, the nonradar jet advisory areas are limited to levels below the radar jet advisory areas.

2. DEFINITIONS

Jet advisory service—The service provided certain civil flights while operating within radar and nonradar jet advisory areas. Within radar jet advisory areas, civil flights receiving this service are provided radar flight following, radar traffic information and vectors around observed traffic. In nonradar jet advisory areas, civil flights receiving this service are afforded standard IFR separation from all other flights known to ATC to be operating within these areas.

Radar flight following—The radar tracking of identified aircraft targets and the observation of the progress of such flights sufficiently to perform a particular radar function.

Radar traffic information—Any aircraft observed on the radar scope which in the judgment of the controller appears to constitute a hazard to the operation of flight being provided jet advisory service.

NOTE.—Radar jet advisory areas and nonradar jet advisory areas and the flight levels comprising these areas are depicted on En Route-High Altitude Charts, U.S.

3. JET ADVISORY AREA PROCEDURES

a. F.A.R. Part 91.99 requires an aircraft equipped with a functioning Mode 3/A radar beacon transponder, to operate the transponder on the code specified by ATC. This regulation imposes no additional operational restriction, control or communications requirements on non-air carrier civil or military VFR flights or IFR flights cleared to climb or descend in VFR conditions or cleared to maintain VFR conditions-on-top when operating within radar jet advisory areas.

(1) To comply with the transponder requirements, transponders shall be adjusted as outlined in "Air Traffic Control Radar Beacon Sys (ATCRBS)."

NOTE.—Although charts may show radar jet advi areas overlapping restricted airspace, pilots of aircraft ducting authorized operations within such airspace are required to operate transponders during the time such space is being utilized for the purpose for which designa however, operation of transponders as described abo encouraged. Flights authorized by the air traffic co facility (controlling agency) to operate through or w such airspace, or flights leaving such airspace to ent radar jet advisory area are required to operate transpo as described above.

b. Pilots of aircraft not equipped with functio coded beacon transponders desiring to ope within radar jet advisory areas when operat VFR, or IFR when cleared to climb or descen VFR conditions or to maintain VFR condit on-top, must obtain specific authorization from appropriate ARTC Center prior to the tim entering such areas. ATC clearances specif climb or descent in VFR conditions or a cru level of VFR conditions-on-top, but not inclu specific authorization to operate within or ac radar jet advisory areas, do not constitute approval.

c. In the event of two-way communications fa which precludes obtaining authorization to ope within a radar jet advisory area, the flight n

(1) When IFR—operate within a radar jet visory area provided a specific altitude been assigned by ATC.

(2) When VFR—Operate within a radar jet visory area provided an appropriate cruising flight level is maintained.

4. SERVICE PROVIDED CIVIL AIR CARRIER TUR JET AND CERTAIN OTHER CIVIL FLIGHTS WI IN AREAS OF RADAR COVERAGE

a. Civil air carrier turbojet and certain other flights, as described in Paragraph 1.b above. provided service as follows:

(1) Within radar jet advisory areas, flights radar flight followed and furnished t information and vectors, subject to limita set forth below, to avoid traffic observed radar.

(2) Within positive control airspace, jet adv service is not provided and procedures scribed for control of traffic within such space apply.

(3) Outside radar jet advisory areas and pos control airspace, IFR flights are radar f followed and furnished radar traffic info tion at all altitudes and flight levels to maximum extent practicable consistent controller workload and limitations of radar equipment.

b. Primary radar is utilized at all times, unless cipitation or electronic countermeasure i ference or other conditions render it unus

JET ADVISORY SERVICE (Con't)

Radar beacon is utilized for identification, radar handoff and primary radar target reinforcement to the maximum extent practicable. In the event either the primary radar or the radar beacon system is unusable, service is continued with that system which is still usable, and pilots are advised accordingly.

NOTE—Due to the fact that coverage patterns obtained from primary radar and radar beacon may not be the same in all areas, even though their antennas are co-located, it is possible that this service will be provided in areas from which only primary radar or radar beacon returns are being received. If both systems are operating normally the pilot will not be advised of these circumstances.

c. Radar handoff of flights receiving this service is effected at all times above Flight Level 240 within overlapping radar coverage, unless the controller is prevented from doing so by circumstances beyond his control. Radar handoff of these flights below Flight Level 240 is effected to the extent permitted by equipment, trained personnel and traffic conditions.

d. Traffic information furnished flights receiving this service includes, to the extent practicable, information as to whether observed radar traffic is seen with radar beacon, and if the type aircraft is unknown, by the use of the words "fast" or "slow," advice on the relative speed of the observed radar traffic.

e. Whenever, in the opinion of the jet advisory controller, an observed primary radar or beacon aircraft target is on a course which is likely to cause it to merge with or touch the target of the flight receiving this service, that flight is vectored to avoid the observed traffic, insofar as possible, whether or not the pilot requests vectoring, except that:

(1) Whenever feasible, flights not receiving this service, but radar identified and in communication with the jet advisory controller, may be vectored to avoid the flight being provided the service.

(2) If the pilot of the flight being provided this service advises that he does not desire vectoring, the controller does not provide radar vectors but will continue to provide traffic information.

(3) If the pilot of the flight being provided this service advises that he has the potentially conflicting traffic in sight, radar vectors are not given.

(4) Flights receiving this service are not vectored to avoid nonbeacon targets which are judged by the controller to be slow moving, unless specifically requested by the pilot; however, traffic information regarding such flights is furnished.

(5) Flights receiving this service are not vectored to avoid other IFR flights that are in communication with the jet advisory controller; are radar identified; and are being afforded nonradar IFR separation from these flights. When such flights are operating at assigned flight levels which differ by 2,000 feet or less from the assigned flight level of the flight being provided this service and the radar flight paths of these aircraft are such that, in the opinion of the controller, a vector would be necessary if altitude separation did not exist, the controller will issue traffic information, including assigned flight levels, to both aircraft concerned.

(6) When a concentration of targets is observed by the jet advisory controller which precludes vectoring to avoid individual targets, pilots of flights receiving this service are advised of the traffic, and that vectors cannot be given from individual targets. They are also told the extent of vectoring that would be necessary to avoid the area in which said traffic exists. Should a pilot request to be vectored around that area, the request will be complied with, provided it is within usable radar coverage. Should he not request vectoring around the area, he will be advised when his aircraft is clear of the area and vectoring from individual targets is being resumed.

f. When a civil flight, as specified in Paragraph 1.b., is operating VFR in a terminal area, the terminal air traffic control facility provides radar traffic information or, in lieu thereof, visual surveillance and advice regarding traffic to the maximum extent practicable consistent with workload, traffic conditions, weather, etc. Insofar as is possible, radar surveillance is maintained until visual surveillance is established.

5. RADIO OR RADAR FAILURE PROCEDURES APPLICABLE TO FLIGHTS BEING PROVIDED RADAR JET ADVISORY SERVICE

a. In the event of a ground radar failure the pilot is expected to continue in accordance with his last received ATC clearance remaining on the radar facility's radio frequency until further advised. If the radar failure will be prolonged, the pilot may be advised to change to an appropriate ARTC Center frequency until radar service can be resumed.

b. In the event of loss of communication with the jet advisory controller on the last assigned control frequency, the pilot should attempt to re-establish communication with the controller as specified in "COMMUNICATIONS". If it has been determined that only the aircraft transmitting capabilities have failed, the pilot should be alert for advice on the last assigned control frequency or 121.5 mc to acknowledge instructions by actuating the radar beacon IDENT features or by executing specific code changes.

JET ADVISORY SERVICE (Con't)

6. VFR FLIGHT REQUIREMENTS FOR NONRADAR JET ADVISORY AREAS

a. These areas consist of airspace prescribed from Flight Level 270 thru 310 inclusive, and from Flight Level 370 thru 410 inclusive, along segments of specified jet routes where radar traffic information cannot be provided due to lack of radar coverage. Their width is not more than 16 statute miles on either side of such jet routes as specified in Federal Aviation Regulations, Part 75.

b. Air Route Traffic Control Centers provide IFR separation between civil flights receiving this service and all other aircraft known to ATC operating within nonradar jet advisory areas, including VFR and IFR flights cleared to maintain VFR conditions-on-top or to climb or descend in VFR conditions, which are authorized to transit nonradar jet advisory areas. The following operational procedures apply to pilots of all aircraft operating VFR, as well as those cleared by ATC to climb or descend in VFR conditions or cleared to maintain VFR conditions-on-top which desire to fly across or within those areas designated as nonradar jet advisory areas.

(1) Specific authorization must be obtained from the appropriate ARTC Center prior to entering these designated areas. When an ATC clearance specifies climb or descent in VFR conditions or a cruising level of VFR conditions-on-top and does not include specific authorization to transit these areas, the pilot must obtain such authorization prior to entering a nonradar jet advisory area.

c. Request for specific authorization to proceed VFR or VFR conditions-on-top, across or within these areas must include a position report, type of aircraft and estimated time of entry and exit from these segments. Unrestricted authorization will be granted, except that when conflict with a civil flight receiving this service is indicated, aircraft operating VFR or IFR maintaining VFR conditions-on-top will be advised of the civil flight and said approval will restrict operation to specific flight level(s), time or locality, as appropriate, to preclude conflict with the civil flight.

d. No ATC separation is provided between VFR traffic or between VFR and IFR traffic other than civil flights receiving this service; however, traffic information is issued as appropriate.

7. The above procedures are applicable to those areas designated in Part 75 of Federal Aviation Regulations.

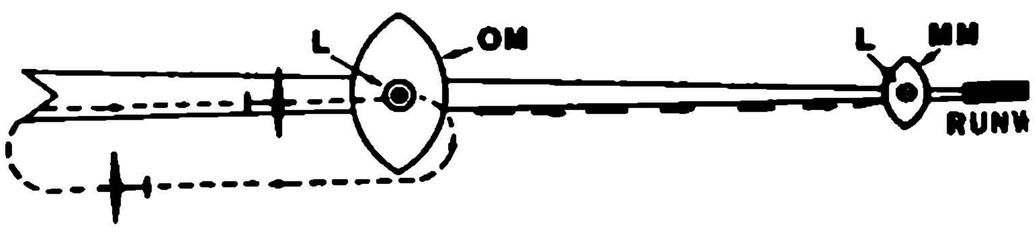
HOLDING

1. When holding at a VOR station pilots should begin the turn to the outbound leg at the time of the first complete reversal of the "to-from" indicator.
2. The direction to hold with relation to the holding fix will be specified as one of eight general points of the compass; i.e., North, Northeast, East, etc.
3. Pilots are always expected to hold in a stand right turn pattern unless specifically advised otl wise by ATC. When it is necessary that a r standard pattern be flown, the ATC clearance s specify "left turns."
4. ATC clearance requiring that an aircraft be hel a holding point will include the following infor tion:

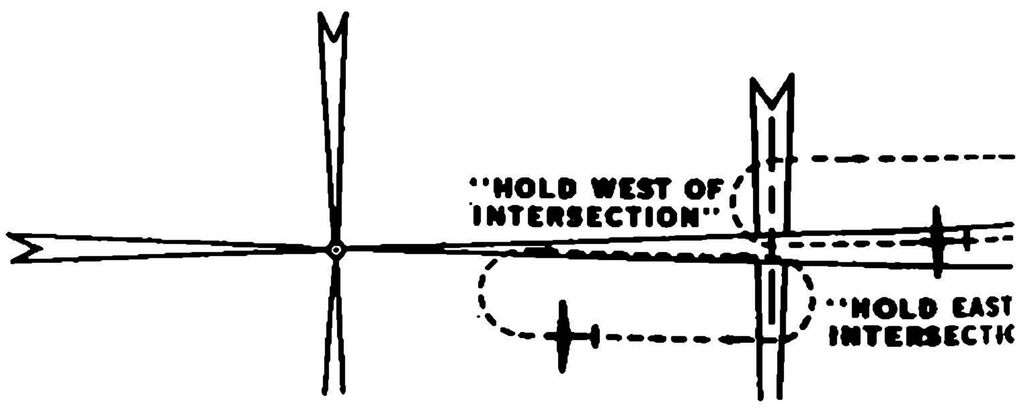
a. To hold in a Standard or Nonstandard Pattern.
(1) The direction to hold from holding point;
(2) Holding fix;
(3) On (specified) radial, course, magnetic b ing, airway number or jet route;
(4) Outbound leg length in nautical miles if D is to be used;
(5) Left turns, if nonstandard pattern is to used;
(6) Time to expect further clearance, or tim expect approach clearance.

b. Detailed holding instructions: Same as a (1), and (3) above with following additions to (4) (5):
(4), or minute/s if DME is not to be used.
(5), or right turns if standard pattern is to be u

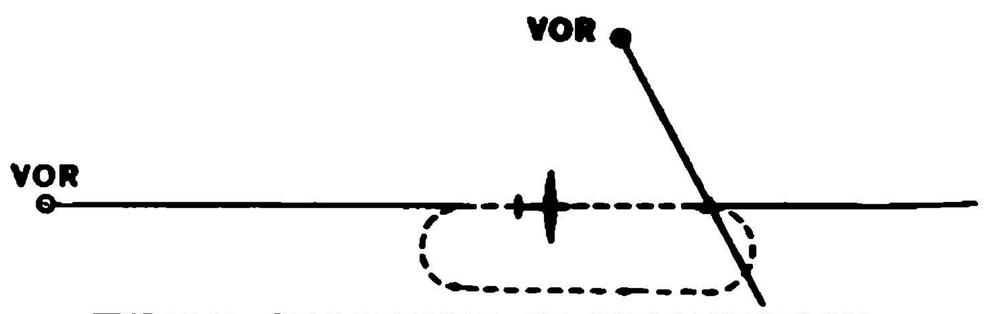
EXAMPLES OF HOLDING



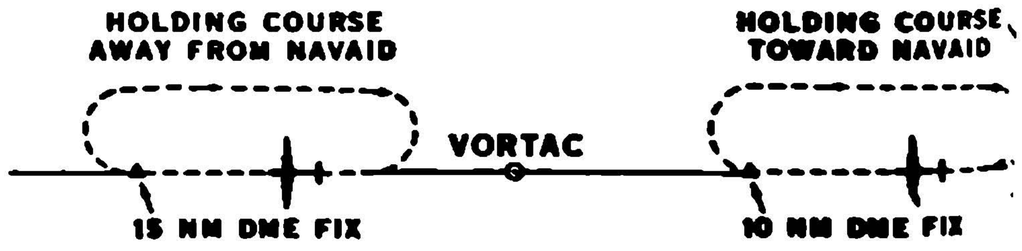
TYPICAL PROCEDURE ON AN ILS OUTER MARKER



TYPICAL PROCEDURE AT INTERSECTION OF RADIO RANGE COURSES



TYPICAL PROCEDURE AT INTERSECTION OF VOR RADIALS



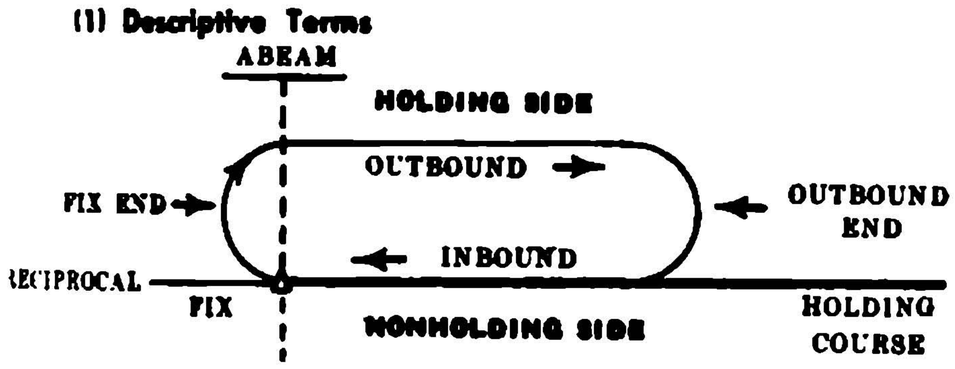
TYPICAL PROCEDURE AT DME FIX

HOLDING (Con't)

i. Holding pattern airspace protection is based on the following procedures. They are the only procedures for entry and holding recommended by FAA.

a. Entry Procedures

(1) Descriptive Terms



Standard Pattern : Right turns (illustrated)
Nonstandard Pattern: Left turns

(2) AIRSPEEDS (MAXIMUM)

(a) Propeller-driven ---------- 175K IAS

(b) Civil turbojet

1. MHA through 6,000 feet -- 200K IAS
2. Above 6,000 feet through 14,000 feet ---------- 210K IAS
3. Aboue 14,000 feet -------- 230K IAS

(c) Military turbojet

1. All-except aircraft listed below in (2) and (3) ------- 230 IAS
2. F-84F, F-100[1], F-102, F-104, F-106, T-38, F-4, F-8, F-11, A-5 ---------- 265K IAS
3. F-100[1], F/RF-101, F-105, B-58 ---------- 310K IAS

[1] F-100 holding speed depends upon weight and drag configuration.

(d). Turboprop aircraft may operate at normal climb IAS while climbing in a holding pattern and turbojet aircraft may operate at 310K IAS or less while climbing in a holding pattern.

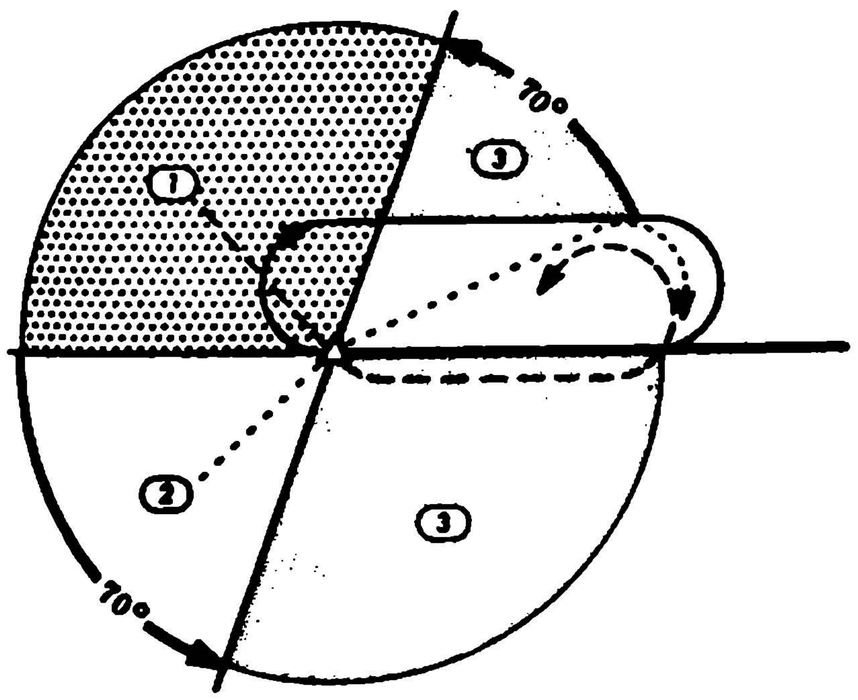
(3) ENTRY

(a) Parallel Procedure—Parallel holding course, turn left, and return to holding fix or intercept holding course.

(b) Teardrop Procedure—Proceed on outbound track of 30° (or less) to holding course, turn right to intercept holding course.

(c) Direct Entry Procedure—Turn right and fly the pattern.

STANDARD PATTERN



(4) TIMING

(a)	At or below 14,000 ft. MSL	Above 14,000 ft. MSL
INBOUND leg*	1 min.	1½ min.

*NOTE.—The *initial* outbound leg should be flown for 1 min. or 1½ min. (appropriate to altitude). Timing for subsequent outbound legs should be adjusted as necessary to achieve proper inbound leg time.

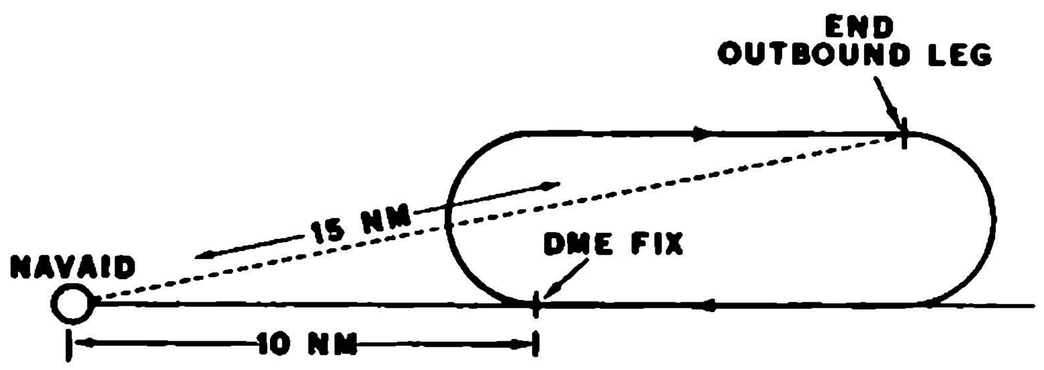
(b) Outbound timing begins *over* or *abeam* the fix, whichever occurs later. If the *abeam* position cannot be determined, start timing when turn to outbound is completed.

(5) DISTANCE MEASURING EQUIPMENT (DME)

(a) DME holding is subject to the same entry and holding procedures except that distances (nautical miles) are used in lieu of time values. The *outbound course* of a DME holding pattern is called the outbound leg of the pattern. The length of the outbound leg will be specified by the controller. The end of the outbound leg is determined by the odometer reading.

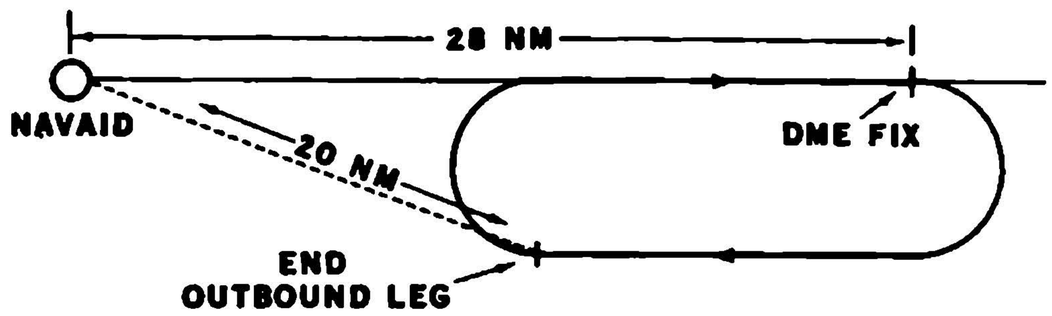
Example:

When the inbound course is *toward* the navaid and the fix distance is 10 NM, and the leg length is 5 NM, then the end of the outbound leg will be reached when the odometer reads 15 NM.



Example:

When the inbound course is *away* from the navaid and the fix distance is 28 NM and the leg length is 8NM, then the end of the outbound leg will be reached when the odometer reads 20 NM.



(6) PILOT ACTION

(a) Cross holding fix initially at or below maximum holding airspeed. Effect speed reduction within 3 minutes prior to estimated initial time over the holding fix.

HOLDING (Con't)

(b) Make all turns during entry and while holding at : (1) 3° per second, or (2) 30° bank angle, or (3) 25° bank angle provided a flight director system is used; whichever requires the least bank angle.

(c) Compensate for known effect of wind, except when turning.

(d) Determine entry turn from aircraft heading upon arrival at the holding fix. Plus or minus 5° in heading is considered to be within allowable good operating limits for determining entry.

(e) Advise ATC immediately if any increased airspeed is necessary due to turbulence or if unable to accomplish any part of the holding procedures.

(7) **NONSTANDARD HOLDING PATTERN**

Fix end and outbound end turns are made to the left. Entry procedures to a nonstandard pattern are oriented in relation to the 70° line on the holding side just as in the standard pattern.

6. When holding at a fix and instructions are received specifying the time of departure from the fix, the pilot should adjust his flight path within the limits of the established holding pattern in order to leave the fix at the exact time specified. After departing the holding fix, normal speed is to be resumed with respect to other governing speed requirements such as terminal area speed limits, specific ATC requests, etc. When the fix is associated with an instrument approach ,a procedure turn need not be executed since aircraft holding may proceed inbound on final approach directly from the holding pattern when approach clearance is received.

7. RADAR SURVEILLANCE

a. Whenever aircraft are held at an arrival holding pattern which is within an ATC facility's radar coverage, radar surveillance of the holding pattern airspace area, as depicted on the radar display, will usually be provided.

b. The purpose of this service is that ATC will attempt to detect holding aircraft that may stray from the protected holding pattern airspace and those detected will be assisted to return to the holding pattern.

c. It is to be noted that many factors could prevent ATC from providing this additional service, such as workload, number of radar targets, precipitation, ground clutter and radar system capability. These circumstances may make it unfeasible to maintain aircraft radar identification or detect aircraft straying from the holding pattern airspace area. Therefore, the provision of this service is entirely dependent upon whether ATC believes it is in a position to provide it and does not relieve pilots of their responsibilities of adhering to an accepted ATC clearance.

AIR TRAFFIC CONTROL RADAR BEACO SYSTEM (ATCRBS)

1. GENERAL

a. Air Traffic Control Radar Beacon Syst (ATCRBS) is similar to and compatible w military coded radar beacon equipment (Mark (SIF)). Civil Mode A is identical to milit Mode 3.

b. Civil and military transponders except Basic M X, should be adjusted to the "on" or normal o ating position as late as practicable prior to t off and to "off" or "standby" as soon as practic after completing landing roll unless the cha to "standby" has been accomplished previo at the request of ATC.

c. Basic Mark X (IFF) equipment should not operated except in emergency or at ATC requ ATC will not normally request Basic Mark (IFF) transponder operation.

d. When filing a domestic IFR flight plan for fl in an aircraft equipped with a radar beacon tr ponder, DME equipment, or a combination of b the pilot shall identify equipment capability adding a suffix to the identification, preceded a slant, i.e.:

A12346/X (Transponder, no code)
V23457/T (Transponder, with code)
N1256/D (DME)
R39851/L (DME and transponder, no code)
AA409/B (DME and transponder, with cod

NOTE.—The suffix is not to be transmitted by radi part of the aircraft identification.

e. If entering a U.S. domestic control area from side the U.S., the pilot should advise on first r contact with a U.S. air traffic control center such equipment is available by adding "trans der" or "no code transponder" as appropriate the aircraft identification.

f. The pilot of a military flight operating on a M other than Mode A/3 should adjust his trans der to reply simultaneously on the appropr Mode A/3 code as set forth herein.

g. Under no circumstances should the pilot of a aircraft operate his transponder on Code 00.

2. INSTRUMENT FLIGHT RULES (IFR) FLIGHT PL

a. Adjust transponder to reply on the Mode code specified by ATC. The transponder shal operated only as specifically directed by A Except as may be required in an emergency, para. 5) when a flight has been assigned a c it should remain on that code until further vised by ATC or until landing roll is complete destination, at which time the transponder sh be placed in "standby" position.

b. If the pilot cancels his IFR flight plan prio reaching the terminal area of his destination

ATC RADAR BEACON SYSTEM (ATCRBS) (Con't)

should adjust his transponder to Code 06 or 07 according to the instructions below for VFR flight.

3. VISUAL FLIGHT RULES (VFR)

a. Adjust transponder to reply on the appropriate Mode A/3 code as indicated below, unless otherwise advised by ATC.

(1) Code 06—for operation below Flight Level 240.

(2) Code 07—for operation at or above Flight Level 240.

NOTE.—Code 06 should be used when climbing to Flight Level 240 or above until leaving 23,000 feet MSL. Code 07 should then be dialed in. When descending from Flight Level 240 or above, Code 06 should again be used when leaving Flight Level 240.

4. SPECIAL MILITARY OPERATIONS

a. Pilots of NORAD interceptor aircraft on air defense missions not under ATC jurisdiction will adjust their transponders to reply on MODE A/3 Code 00.

NOTE.—Pilots of NORAD/ADC and SAC target/strike aircraft operating in accordance with an approved ALTRV need not comply with the code assignments in paragraphs 2, 3, or 4 above on that portion of the route specified in the approved ALTRV. ATC retains the prerogative, however, to instruct the pilots of these flights to operate the radar beacon transponder on the appropriate ATC code whenever safety dictates.

5. EMERGENCY OPERATION

a. When an emergency occurs, the pilot of an aircraft equipped with a coded radar beacon transponder, who desires to alert a ground radar facility to his emergency condition and who cannot establish communications without delay with an air traffic control facility may adjust his transponder to reply on Mode A/3, Code 77.

b. The pilot should understand that he may not be within a radar coverage area and that, even if he is, certain radar facilities are not yet equipped to automatically recognize Code 77 as an emergency signal. Therefore, he should establish radio communications with an air traffic control facility as soon as possible.

6. RADAR BEACON PHRASEOLOGY

a. Air traffic controllers, both civil and military, will use the following phraseology when referring to operation of the Air Traffic Control Radar Beacon System (ATCRBS)/Mark X IFF (SIF):

SQUAWK ALPHA/THREE CODE (number)—Operate radar beacon transponder on designated mode and code. (Transponder has not been operating on Mode A/3.)

SQUAWK CODE (number)—Operate transponder on a different code. (Transponder is already operating on a previously specified mode and code.)

SQUAWK IDENT—Engage the "IDENT" feature (military I/P) of the transponder.

SQUAWK ALPHA/THREE CODE (number) AND IDENT—Operate transponder on specified mode and code and engage the "IDENT" feature. (Transponder has not been operating on Mode A/3.)

SQUAWK CODE (number) and IDENT—Operate transponder on a different code and "IDENT." (Transponder is already operating on a previously specified mode and code.)

SQUAWK STANDBY—Switch transponder to standby position.

SQUAWK LOW/NORMAL—Operate transponder on low or normal sensitivity as specified. Transponder is operated in "NORMAL" position unless ATC specified "LOW" ("ON" is used instead of "NORMAL" as a master control label on some types of transponders.)

STOP SQUAWK (mode in use)—Switch off specified mode (used only when more than one mode may be in operation).

STOP SQUAWK—Switch off transponder.

SQUAWK MAYDAY—Operate transponder in the emergency position. (Mode A Code 77 for civil transponder. Mode 3 Code 77 and/or emergency feature for military transponder.

CHANGEOVER POINTS

1. These points are established on VOR airways in order that pilots will not continue to use the radio guidance display from one facility in the same airspace that other aircraft are using radial guidance from a different facility. These points are based on signal coverage provided by each respective VOR along direct airway segments. The changeover point symbol, as depicted on the En Route Charts, indicates the location in nautical miles between two VOR's along a direct Victor airway at which the aircraft receiver should be tuned to the station ahead.

2. Pilots operating via the Low Altitude Victor Airways System will obtain track guidance by reference to the closest VHF aid forming the airway route segment, except when reference to a specific aid is indicated by a radio changeover point on En Route Charts.

DIRECTIONAL REPORTING

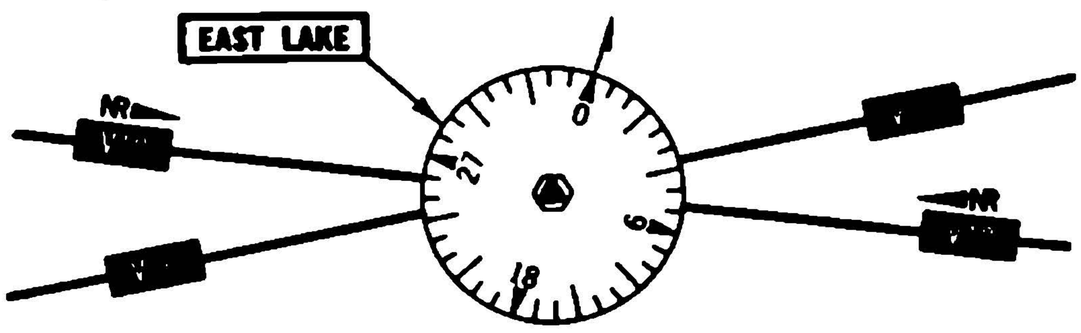
1. Some compulsory reporting points have been designated as applicable only to specific airways and/or directions of flight. These reporting points will be considered as noncompulsory for the other airways and/or directions of flight. As such, there will be times when a controller will, of necessity, request a position report on the noncompulsory portion. However, this will relieve the undue burden on both the pilot and controller as position reports will be required only as necessary for control purposes. The

DIRECTIONAL REPORTING (Con't)

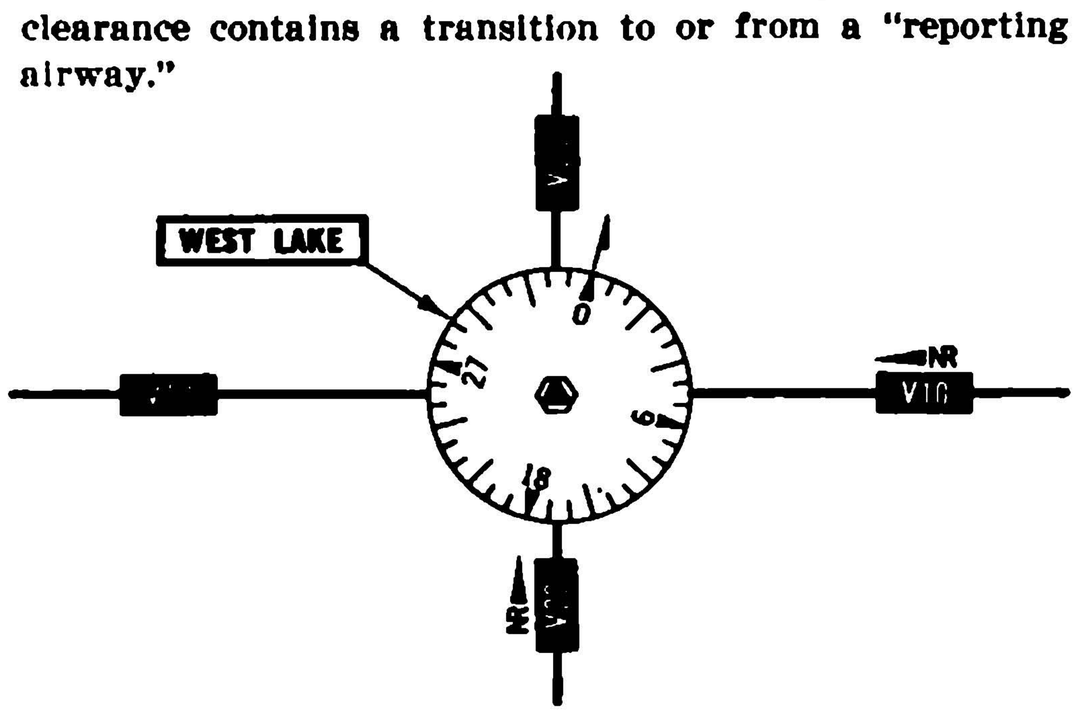
fact that a reporting point is designated as "directional" does not relieve the pilot of reporting his time and altitude/flight level upon reaching it when it is used as a clearance limit or holding fix.

2. The symbol NR► will be used on Coast and Geodetic Survey and other government aeronautical charts to indicate reporting "Not Required" at the next reporting point unless at that reporting point a transition is made to a "reporting airway." Upon crossing a directional reporting point, a pilot shall report his position if his clearance contains a transition from a non-reporting airway to a reporting airway or from a reporting airway to a non-reporting airway at that reporting point. There are instances where two or more airways utilize the same VOR radial and a position report is not required from aircraft on one or more of these airways but is required from aircraft cleared via the other airway/s; therefore, the symbol is shown in conjunction with the specific airways designator/s to which it applies.
3. The directional requirement applies only to aircraft en route via airways at the reporting point. Aircraft crossing the reporting point, on a direct flight not via airways, shall report the fix. In addition, an aircraft entering or leaving an airway on a direct flight at that reporting point shall report the fix.

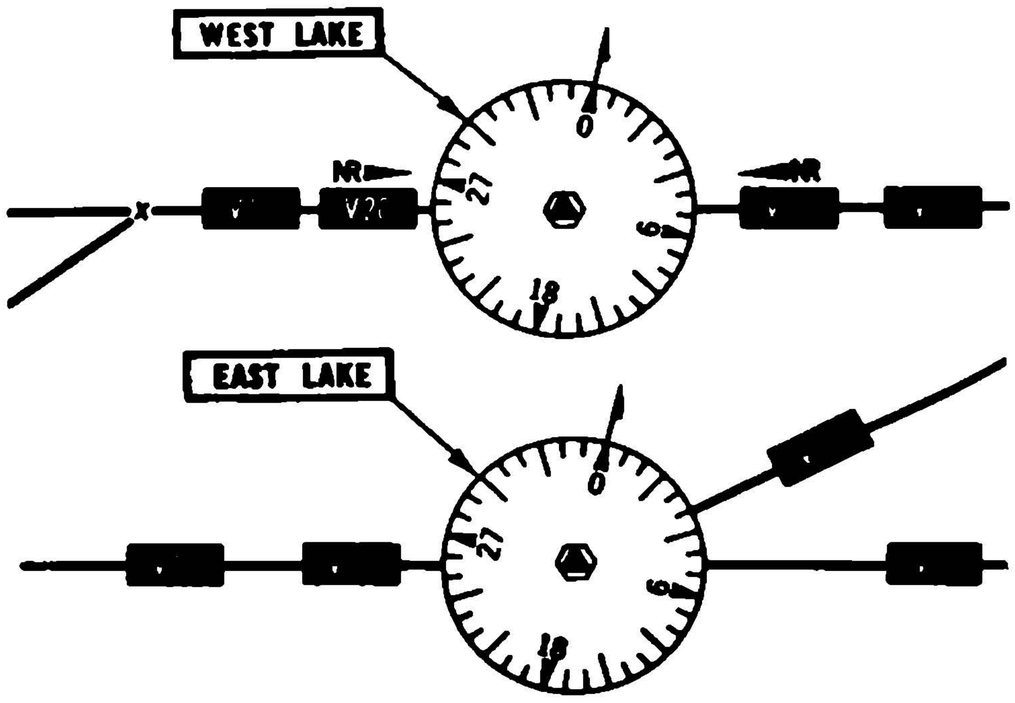
Examples:



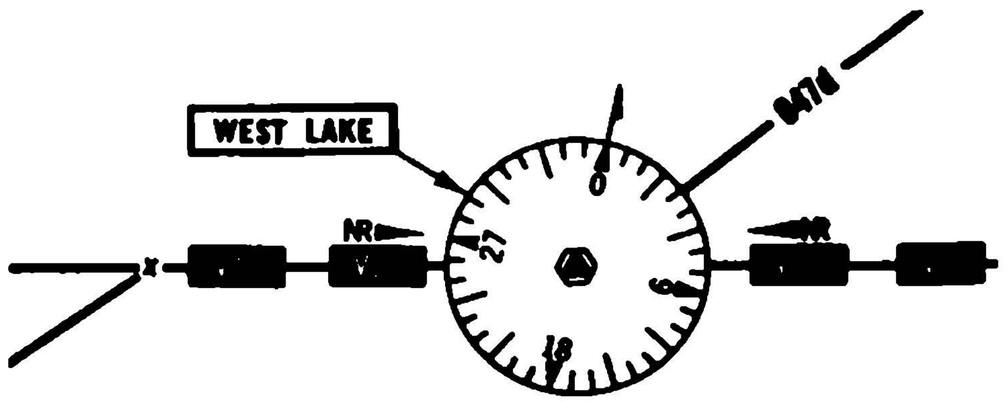
Aircraft proceeding Victor 10 do not report East Lake as the reporting symbol indicates it's not a "reporting airway." The absence of a reporting symbol for Victor 20 denotes it as a "reporting airway" which indicates that aircraft proceeding Victor 20 must report East Lake. Aircraft proceeding Victor 10, East Lake, Victor 20 *or* Victor 20 East Lake, Victor 10 shall report as their clearance contains a transition to or from a "reporting airway."



Eastbound aircraft on Victor 10 report as the "Not Required" in this instance is for westbound aircraft only. The same principle applies to southbound a northbound aircraft on Victor 20. However, an a craft proceeding northbound on Victor 20 thence ea bound on Victor 10 would report as a transition is be made to a "reporting airway"; aircraft proceeding we bound on Victor 10 thence northbound Victor 20 wo not report as the transition is being made from a "n reporting airway" to another "non-reporting airway.



This is an example of differing requirements for airways utilizing the same VOR radial. Aircraft clea via Victor 10 report West Lake but aircraft cleared Victor 20 would not. All aircraft report East Lake.



The aircraft on course 047d is a direct off-airw flight and would report West Lake. An aircraft ceeding eastbound or westbound to West Lake the via the 047d radial shall report West Lake as a tra tion is being made to a direct course, a situation ide cal to a "reporting airway."

AIRCRAFT CLIMBING/DESCENDING

1. During any phase of flight, pilots are requested adhere to the following procedures whenever cle by ATC to descend or climb to an altitude or fl level.
   a. Unless the ATC clearance requires otherwise, gin descent or climb promptly on acknowle ment of the clearance; and
   b. If an altitude change of 1,000 feet or less is quired, descend or climb at a rate of not m than 500 feet per minute; or
   c. If an altitude change of more than 1,000 fee required, descend or climb as rapidly as prac able to 1,000 feet above or below the assig altitude and then at a rate of not more than

AIRCRAFT CLIMBING/DESCENDING (Con't)

feet per minute until the assigned altitude is reached.

NOTE.—Pilots of military aircraft should use as a minimum the recommended climb and descent rates contained in the aircraft operating handbook.

. Information is issued to pilots of IFR aircraft whenever less than the applicable minimum time separation between such aircraft will exist, and one aircraft is cleared to climb/descend in accordance with VFR through the altitude of the other. Traffic information is also issued at other times when deemed necessary by the controller or requested by the pilot.

MILITARY CLIMB CORRIDOR RESTRICTED AIRSPACE

ATC facilities apply the following procedures when aircraft are operating on an IFR clearance (including those cleared by ATC to maintain VFR conditions on top) via a route which lies within joint-use or military climb corridor restricted airspace.

a. The ATC facility controlling an aircraft immediately before it would enter the restricted airspace will coordinate as necessary with the ATC facility designated as the controlling facility or with the using agency to obtain permission for the aircraft to operate in the restricted airspace.

b. If permission is obtained, the ATC facility will allow the aircraft to operate in the restricted airspace without issuing specific clearance for it to do so.

c. If permission cannot be obtained, the ATC facility will issue an amended clearance so the aircraft will avoid the restricted airspace.

Note that a, b, c above apply only to joint-use and military climb corridor restricted airspace and not to prohibited and nonjoint-use airspace. For the latter categories, the ATC facility will issue a clearance so the aircraft will avoid the restricted airspace unless it is on an approved altitude reservation mission or has obtained its own permission to operate in the airspace and so informs the controlling facility.

Restricted airspace is depicted on the Flight Information Publication, En Route Chart appropriate for use at the altitude or flight level being flown. For joint-use and military climb corridor restricted airspace, these charts show the name of the ATC facility designated as the controlling facility or the name of the using agency. For prohibited and nonjoint-use restricted airspace, the phrase "NO A/G" is shown.

RADAR ASSISTANCE TO VFR AIRCRAFT

. Radar equipped FAA Air Traffic Control facilities provide assistance and navigation service to VFR aircraft, provided such aircraft can communicate with the facility, are within radar coverage, and can be radar identified. Radar navigation assistance (vectors) may be provided VFR pilots when:

a. The pilot requests;

b. The controller suggests and the pilot agrees;

c. Special programs have been established which specify locations and special VFR service is advertised; or,

d. When air safety requires in the judgement of the controller.

2. Pilots operating in accordance with Visual Flight Rules and not equipped or trained for IFR flight should use caution in requesting radar assistance if such assistance may result in flight in IFR weather conditions, either intentionally or by accident. In many cases, the radar controller will be unable to determine if flight into instrument conditions will result from his instructions. Furthermore, although the radar controller may be able to provide separation from other traffic and navigational guidance to an airport or other suitable location, the *job of flying the aircraft safely remains with the pilot.* Experience has shown that many pilots cannot maintain control of their aircraft when clouds or other reduced visibility conditions are encountered.

3. To avoid hazards arising from VFR flights being radar vectored into IFR weather conditions, pilots in difficulty should observe the following:

a. If an alternate course of action is available which will permit flight in VFR weather conditions, pilots not instrument rated or operating aircraft not equipped for IFR flight should choose the alternative rather than request radar approach or letdown in IFR weather conditions; or

b. If the pilot is not instrument rated and no alternate course of action is available he should so advise the radar facility and "declare an emergency". The pilot must keep the controller advised of the weather conditions in which the aircraft is operating and along its course ahead. Assistance will be provided on the basis that the navigational guidance information issued is advisory in nature.

c. If the pilot is instrument rated and the aircraft is instrument equipped, the pilot should so indicate by filing an instrument flight plan. Assistance will be provided on the basis that the flight can operate safely in IFR weather conditions.

4. Pilots should clearly understand that authorization to proceed in accordance with such radar navigational assistance does not constitute authorization for the pilot to violate the Federal Aviation Regulations.

LAKE, ISLAND, AND MOUNTAIN REPORTING SERVICE

1. Selected Flight Service Stations provide flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.
2. Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface," "Overlake," etc., are indicated on charts published in the Airman's Guide. To obtain this service, contact the FSS by telephone or radio giving present position, type aircraft, altitude, indicated airspeed, proposed route of flight, and mainland estimate.
3. After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.

COMMUNICATIONS

1. POSITION REPORTING

a. The safety and effectiveness of traffic control depends to a large extent on accurate position reporting. In order to provide the proper separation and expedite aircraft movements, Air Traffic Control must be able to make accurate estimates of the progress of every aircraft operating on an IFR flight plan.

b. When a position report is to be made over a VOR radio facility, the time reported should be the time at which the first complete reversal of the "to-from" indicator is accomplished.

c. When a position report is made over a facility by means of an airborne ADF, the time reported should be the time at which the indicator makes a complete reversal.

d. When an aural or light-panel indication is used to determine the time of passing a reporting point, such as a fan marker, "Z" marker, cone of silence or intersection of range courses, the time should be noted when the signal is first received and again when it ceases. The mean of the two times should then be taken as the actual time over the fix. If position is given with respect to distance and direction from a reporting point, the distance and direction should be computed as accurately as possible.

e. Pilots are required to maintain a continuous listening watch on the appropriate frequency and furnish position reports as indicated by symbol on En Route Charts.

f. The compulsory reporting point symbol is the solid triangle ( ); the "on request" reporting point being an open triangle ( ). Reports over an "on request" reporting point are only necessary when requested by ATC.

(1) **Flights along airways/routes**—A position repo required by all flights regardless of alti over each compulsory reporting point a the route being flown, except where other indicated by a "Not Required" sy This includes flights operating in accord with an ATC clearance specifying "VFR ditions on top."

NOTE.—In Alaska some position reports are required when operating below 15,200′ MSL. These location shown on the en route charts by a circled letter leadered to the reporting point: This procedure not apply to flights operating on an altitude assign of "VFR-on-top."

(2) **Flights Along a Direct Route**—Regardless o altitude being flown, including flights op ing in accordance with an ATC clearance ifying "VFR conditions-on-top," pilots report over each reporting point used o flight plan to define the route of flight.

g. Position reports should include the follo items: (1) Identification, (2) Position, (3) (4) Altitude, (5) Type of flight plan (not requir IFR position reports made direct to ARTC Ce or approach control), (6) ETA over next repo point, (7) *The name only of the next succe reporting point along the route of flight*, an pertinent remarks.

Example:

An aircraft operating along Victor Airwa between Pittsburgh and Minneapolis w make the following report when over I field, Mich.: NOVEMBER NINER ONE XRAY OVER LITCHFIELD FIVE AT EIGHT THOUSAND INSTRUM FLIGHT PLAN ESTIMATING PULL ONE FOUR ONE EIGHT *MILWAU*. A corrected estimate should be forwarde Air Traffic Control any time it become parent that an estimate as previously mitted, is in error in excess of *three* mi

h. The following reports should be made to AT FSS facilities without request:

(1) The time and altitude/flight level reach holding fix or point to which cleared.

(2) When vacating any previously assigned tude/flight level for a newly assigned tude/flight level.

(3) When leaving any assigned holding fi point.

(4) When leaving final approach fix inboun final approach .

(5) When an approach has been missed. (Re clearance for specific action, i.e., to alte airport, another approach, etc.)

i. Navigation or position reports will not norm be required by ATC with reference to aids established for use in the structure in which ation is conducted, except as may be essentia terminal area transition purposes.

COMMUNICATIONS (Con't)

j. Pilots encountering weather conditions which have not been forecast, or hazardous conditions which have been forecast, shall forward a report of such weather to Air Traffic Control. The reporting of unanticipated weather or hazardous conditions may be of importance to the safety of other aircraft proposing flight within the area.

k. **Position reporting in a radar environment:**

(1) Pilots of radar identified aircraft which will remain under radar surveillance may be authorized to discontinue position reports over fixes designated as compulsory reporting points. The controller will grant this authorization using the phraseology "OMIT POSITION REPORTS."

(2) When authorized to omit position reports, the controller, at the time radar service is terminated or at his discretion will issue instructions to resume normal position reporting using the phraseology "RESUME NORMAL POSITION REPORTING."

(3) Monitor normal air traffic control communications frequencies. On initial contact when changing frequencies, pilots should comply with standard contact procedures described in Transfer of Control under 2. DIRECT COMMUNICATIONS — CONTROLLERS/PILOTS.

(4) Pilots of aircraft operating below Flight Level 240, who have been advised to omit position reports, will be furnished the appropriate altimeter setting when passing compulsory reporting points as observed by radar.

2. DIRECT COMMUNICATIONS— CONTROLLERS/PILOTS

a. Air Traffic Control facilities are equipped with radio transmitters and receivers for direct communications with IFR air traffic on certain VHF, UHF and L/MF frequencies. The frequencies normally used are published on appropriate en route charts. IFR operations are expedited through the use of direct communications; however, to reduce frequency congestion, pilots are requested to use these frequencies strictly for communications pertinent to the control of IFR aircraft. Flight plan filing, en route weather, forecasts and similar data should be requested through Flight Service Stations, company radio or appropriate military facilities capable of performing these services.

(1) Center Sector Discrete Frequency—an ARTCC is divided into sectors; each sector is handled by one Controller, or team of controllers, and has its own sector discrete frequency. As an IFR flight progresses from one sector to an other, the pilot is requested to change to the appropriate sector discrete frequency.

(2) Center Area Discrete Frequency—A frequency used as back-up for the center sector frequencies and is available to each sector in the ARTCC. It is always monitored by at least one controller who can quickly put an IFR flight in radio contact with the appropriate sector.

b. **Transfer of Control**

(1) Air traffic controllers may utilize direct or indirect communications media to require a pilot to contact an adjacent sector within a facility, or an adjacent facility, whenever necessary to effect transfer of control.

(2) The following phraseology will be used to effect transfer of control: "(aircraft identification) CONTACT (facility name) ON (frequency) (time or point), OVER."

Examples:

"BEECHCRAFT TWO ONE BRAVO, CONTACT INDIANAPOLIS CENTER ON ONE TWO FIVE POINT ONE OVER."

"AIR FORCE FIVE FOUR THREE TWO ONE CONTACT ATLANTA CENTER ON THREE ONE SEVEN POINT SIX OR ONE THREE FIVE POINT SIX AT ONE THREE FIVE ZERO, OVER."

"EASTERN FIVE ZERO TWO, CONTACT WASHINGTON CENTER ON ONE TWO THREE POINT SEVEN AT ROANOKE, OVER."

(3) The following phraseologies should be utilized by pilots for establishing contact with the designated facility:

(a) When contact is to be followed by a position report:

"(name) CENTER, (THIS IS) (aircraft identification), (position), OVER."

A typical example of the exchange of communications would be:

"WASHINGTON CENTER, (THIS IS) EASTERN FIVE ZERO TWO, ROANOKE, OVER."
"EASTERN FIVE ZERO TWO, (THIS IS) WASHINGTON CENTER, GO AHEAD."

"EASTERN FIVE ZERO TWO, (OVER) ROANOKE THREE SIX (AT) ONE NINER THOUSAND, (ESTIMATING) MONTEBELLO FIVE TWO, GORDONSVILLE, (OVER)."

"EASTERN FIVE ZERO TWO, ROGER."

COMMUNICATIONS (Con't)

(b) When contact is to be made at a specific time or point and no position report is required:

"(name) CENTER, (THIS IS) (aircraft identification), ESTIMATING (reporting point) (time) AT (altitude/flight level), OVER."
"(name) CENTER, (THIS IS) (aircraft identification), ESTIMATING (reporting point) (time) AT (altitude/flight level) CLIMBING/DESCENDING TO (altitude/flight level) OVER."

A typical example of exchange of communications would be:

"CHICAGO CENTER, (THIS IS) BEECHCRAFT ONE TWO THREE FOUR, ESTIMATING CHICAGO HEIGHTS FOUR TWO, AT NINER THOUSAND, DESCENDING TO FIVE THOUSAND, OVER."
"BEECHCRAFT ONE TWO THREE FOUR (THIS IS) CHICAGO CENTER, ROGER."

c. It should be noted that whenever contact with ATC is to be followed immediately by a position report, the name of the reporting point should be included in the contact. This will alert the controller that such information is forthcoming. When a position report is not required, an estimate for the next reporting point, the actual altitude and, if appropriate, the altitude to which climb or descent is being made, should be included in the initial contact. The controller will simply acknowledge that contact has been established, or, when required, issue appropriate control instructions.

NOTE.—Federal Aviation Regulations require the pilo maintain a continuous watch on the appropriate r frequencies; therefore, a pilot receiving a clearance as dicated above, should remain on the frequency he is *until* the time or point to change to the newly assi frequency.

NOTE.—If two-way communications cannot be establi as indicated in Paragraph b(1), a pilot should attempt t contact the transferring controller for the assignmen an alternate frequency or other instructions. If, how communications are not re-established, the pilot sh then contact the appropriate communications mediun indicated in the following Frequency Use Plan.

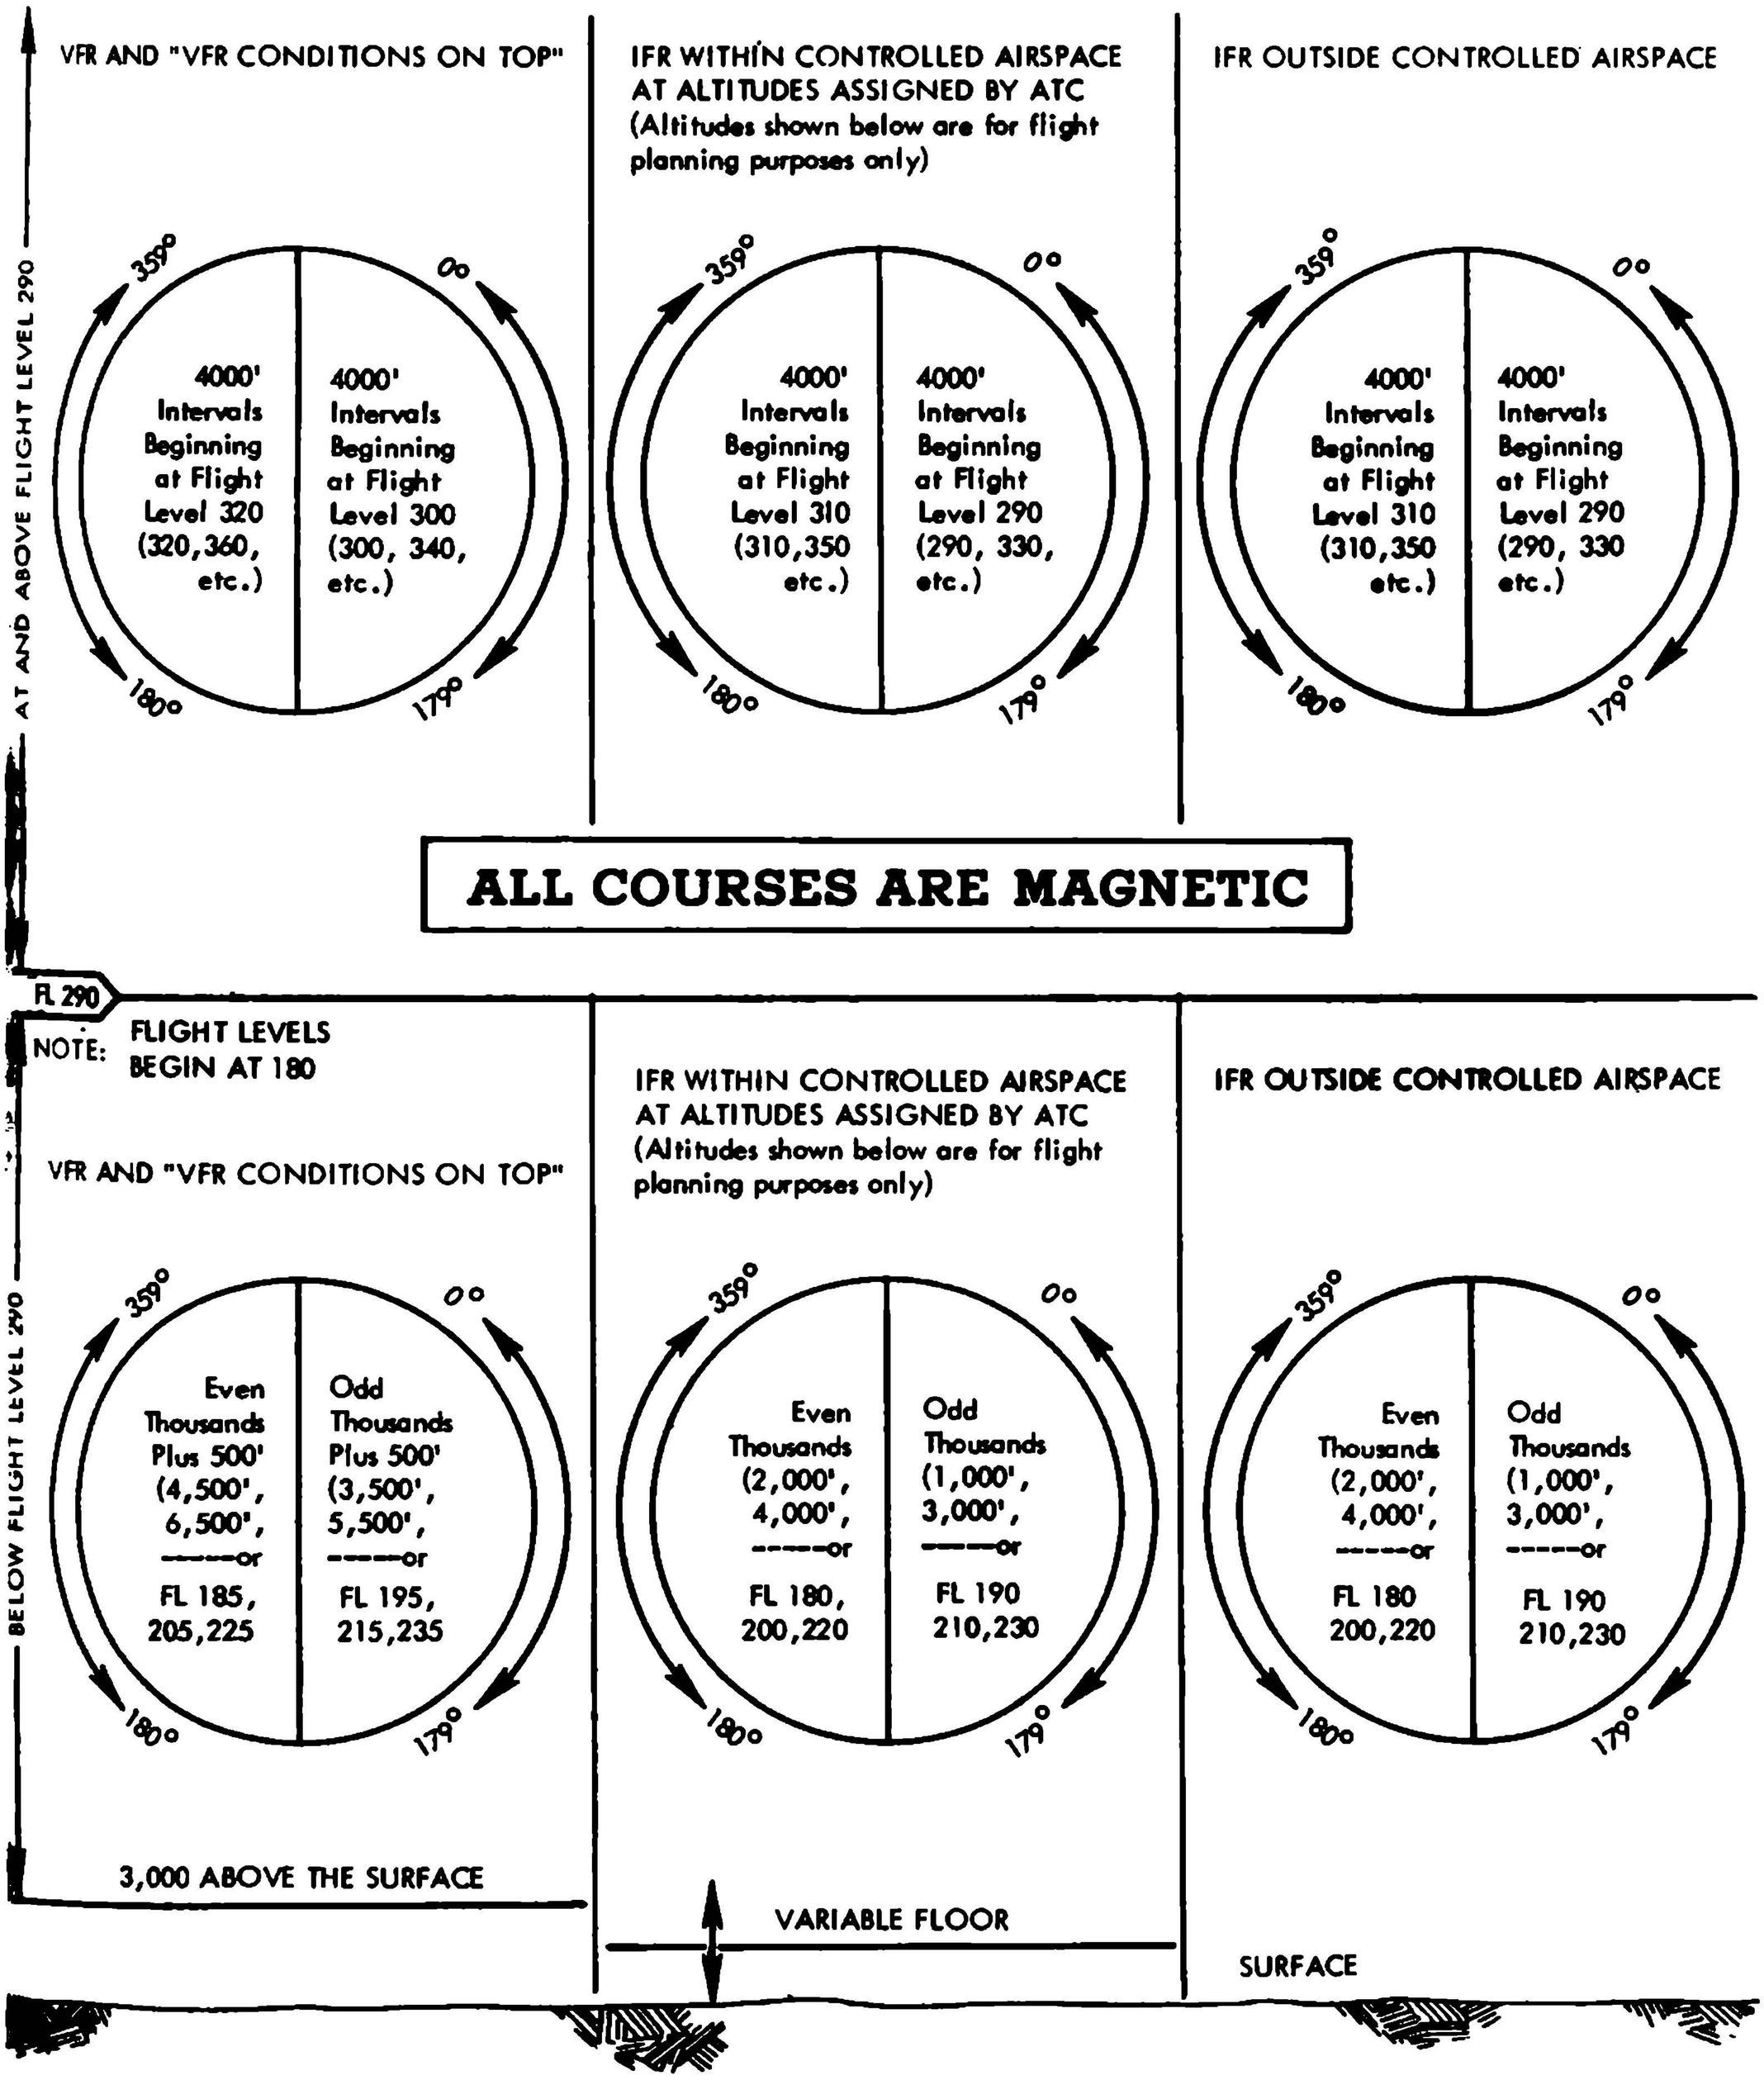
3. FREQUENCY USE PLAN

a. The following table provides a plan by w pilots may determine the frequency they wil expected to use, when the sector discrete frequ (Priority One) has been specified, in effec transfer of control, and two-way communicat cannot be established.

Priority	**First**
Civil/Military VHF	Sector Discrete Frequ as assigned.
Military UHF	Sector Discrete Frequ as assigned.
Priority	**Second**
Civil/Military VHF	Below FL 240–Center A Discrete Frequency (if propriate). FL 240 above—FSS–126.7.
Military UHF	FSS–272.7 (at all altitud
Priority	**Third**
Civil/Military VHF	Air carrier-company ra if unable, FSS–126.7 (eral Aviation and Mili FSS–126.7, 122.1/122.2 VOR
Military UHF	FSS–255.4

CRUISING ALTITUDES

FAR PARTS 91.109,91.121



ARRIVAL

VFR ADVISORY INFORMATION

1. VFR advisory information is provided by numerous radar and nonradar *Approach Control* facilities to those pilots intending to land at an airport served by an approach control tower. This information includes: wind, runway, traffic and NOTAM information.
2. Such information will be furnished upon initial contact with concerned approach control facility. The pilot will be requested to change to the *tower* frequency at a predetermined time or point, to receive further landing information.
3. Where available, use of this procedure will not hinder the operation of VFR flights by requiring excessive spacing between aircraft or devious routing. Radio contact points will be based on time or distance rather than on landmarks.
4. Compliance with this procedure is not mandatory but pilot participation is encouraged.

AIRPORT ADVISORY SERVICE (NONRADAR)

1. Flight Service Stations (FSS) located at airports where there are no control towers in operation provide advisory information to arriving and departing aircraft. This service is offered for safety purposes; traffic control is not exercised.
2. Arriving and departing radio-equipped VFR aircraft are required to maintain radio contact with the FSS while operating within a 5 mile radius of those stations that are properly depicted on Sectional or World Aeronautical Charts in accordance with F.A.R. 91.89. Aircraft operating IFR will maintain radio contact with the facility specified by ATC. Receiver-only-equipped aircraft are required to maintain a listening watch on the airport advisory frequency—122.2 mc.
3. Airport advisories provide: wind direction and velocity, favored runway, altimeter setting, pertinent known traffic, Notices to Airmen, airport taxi routes, airport traffic patterns, and instrument approach procedures. These elements are varied so as to best serve the current traffic situation. Pilots using other than the favored runways should advise the FSS immediately.
4. Recommended phraseologies and communications procedures are as follows:

AIRCRAFT DEPARTING: When ready to taxi, the pilot should notify the station of his intentions. Except for scheduled air carriers or other frequ users of the airport, this information sh include not only the aircraft identification, also the aircraft type, location, type of fl planned (VFR or IFR), and destination.

Example:

Aircraft: GRAND FORKS RADIO, THIS COMANCHE SIX ONE THREE EIGHT, TERMINAL BUILDING RAMP, READY TAXI, VFR TO DULUTH, OVER.

Station: COMANCHE SIX ONE THREE EIG THIS IS GRAND FORKS RADIO, WI THREE TWO ZERO DEGREES AT TWO FI FAVORING RUNWAY THREE ONE, AI METER THREE ZERO ZERO ONE, TI ONE TWO TWO FIVE, CESSNA 0 SEVENTY MAKING TOUCH AND GO LA INGS ON RUNWAY THREE ONE.

NOTE.—The take-off time should be reported to the as soon as practicable. If the aircraft has limited ec ment and it is necessary to use the navigational featu the radio range immediately after take-off, advise the of this before shifting frequency from 122.2 to the range. such cases, advisories will be transmitted over both 1 and the range frequency.

AIRCRAFT ARRIVING: When operating VFR, a I should transmit position and altitude informa to the FSS when 15 miles from the airport.

Example:

Aircraft: GRAND FORKS RADIO, THIS TRI-PACER ONE SIX EIGHT NINI OVER KEY WEST, TWO THOUSAND, LA ING GRAND FORKS, OVER.

Station: TRI-PACER ONE SIX EIGHT NIN THIS IS GRAND FORKS RADIO, OVER I WEST AT TWO THOUSAND, WIND ONE F ZERO DEGREES AT ONE TWO, FAVOR RUNWAY ONE THREE, ALTIMETER T NINER EIGHT NINER, DC–3 TAKING RUNWAY ONE THREE, CESSNA ONE FO ON DOWNWIND LEG RUNWAY ONE THI MAKING TOUCH AND GO LANDINGS, MANCHE DEPARTED RUNWAY ONE THI AT ONE SIX PROCEEDING EASTBOU OVER.

NOTE.—Pilots should guard 122.2 mcs. until clear of runway after landing and report leaving the runwa the FSS.

RADAR TRAFFIC INFORMATION SERVICE

1. A service provided by radar air traffic control facilities. Pilots receiving this service are advised of any aircraft observed on the radar scope which, in the judgment of the controller, appears to constitute a potential conflict to the operation of their aircraft.
   a. **Purpose of the Service**—Radar Traffic Information Service is not intended to relieve the pilot of his responsibility for continual vigilance to see and avoid other aircraft. It is provided to aid him in his visual surveillance by calling to his attention a specific direction in which radar indicates possible conflicting traffic to exist. Pilots are reminded that the surveillance radar utilized by the controller does not provide altitude information.
   b. **Provision of the Service**—The provision of this service is not mandatory. Many factors, such as limitations of the radar, volume of traffic, controller workload and communications frequency congestion, could prevent the controller from providing this service. The controller possesses complete discretion for determining whether he is able to provide or continue to provide this service in a specific case. His reason against providing or continuing to provide the service in a particular case is not subject to question nor need it be communicated to the pilot. In other words, the provision of this service is entirely dependent upon whether the controller believes he is in a position to provide it, subject to the foregoing limitations:
      (1) Traffic information is routinely provided to all aircraft operating on IFR flight plans except when the pilot advises he does not desire the service.
      (2) Traffic information may be provided for flights not operating on IFR flight plans when requested by pilots of such flights.

   NOTE.—Participation by VFR pilots in formal programs implemented at certain terminal locations constitutes pilot request. This also applies to participating pilots at those locations where arriving VFR flights are encouraged to make their first contact with the tower on the approach control frequency.

   c. **Issuance of Traffic Information**—Traffic information will include the following concerning the target constituting traffic:
      (1) Azimuth from the aircraft, in terms of the twelve hour clock;
      (2) Distance from the aircraft in nautical miles and;
      (3) Direction in which the target is proceeding.
      (4) Type aircraft and altitude (if known).

      Example:

      Traffic 10 o'clock, 3 miles, west-bound, (type aircraft and altitude, if known). The pilot may, upon receipt of traffic information, request a vector (heading) to avoid such traffic. The vector will be provided to the extent possible as determined by the controller.

EXPANDED RADAR SERVICE FOR ARRIVING AND DEPARTING FLIGHTS IN TERMINAL AREAS

1. This service has been implemented at certain terminal locations. Pilot participation is urged but is not mandatory.
2. The purpose of this service is to adjust the flow of arrival VFR and IFR aircraft into the traffic pattern in a safe and orderly manner. To participate, pilots of VFR aircraft should initiate radio contact with approach control when reaching the perimeter of the area in which the VFR services are provided. Approach control then provides the pilot with wind direction and velocity, runway in use, traffic information, routings, etc., as necessary, for proper sequencing with other traffic en route to the airport.
3. After radar contact is established, the pilot is directed to fly specific headings either to join an appropriate leg of the traffic pattern or to position the flight behind the preceding aircraft in the landing sequence. When a flight is positioned behind the preceding aircraft and the pilot reports having that aircraft in sight, he will be directed to follow it. Upon being told to contact the tower, radar service will end. A landing sequence number will thereafter be assigned by the tower.
4. Pilots of departing VFR aircraft desiring Traffic Information Service should request the service on initial contact with ground control and advise proposed direction of flight. Following take-off, the tower will advise when to contact departure control and the frequency to be used.

TERMINAL RADAR SERVICE
(An Evaluation of Terminal Area Positive Separation)

1. A service designed to provide segregation of controlled from uncontrolled aircraft around airport terminals. This is accomplished by establishing a special terminal radar service area for participating aircraft with airspace available below and above the area for use of nonparticipating aircraft.

AERONAUTICAL ADVISORY STATIONS (UNICOM)—122.8, 123.0 MC.

1. 122.8 mc. is assigned to airports *not* served by a control tower. Its use is limited to the necessities of safe and expeditious operation of private aircraft pertaining to runway and wind conditions, types of fuel available, weather, and dispatching. Secondarily, communications may be transmitted concerning ground transportation, food and lodging during transit.
2. 123.0 mc. is assigned to airport *served* by a control tower. Communications on this frequency are identical to those permitted on 122.8 mc., with the exception of information such as runway and wind conditions, weather, etc. which would be furnished by the tower. THIS SERVICE SHALL NOT BE USED FOR AIR TRAFFIC CONTROL PURPOSES.

AERONAUTICAL MULTICOM SERVICE 122.9 MC.

1. A mobile service used to provide communications essential to conduct of activities being performed by or directed from private aircraft.

Example:

Ground/air communications pertaining to agriculture, raching, conservation activities, forest fire fighting, aerial advertising and parachute jumping. THIS SERVICE SHALL NOT BE USED FOR AIR TRAFFIC CONTROL PURPOSES.

APPROACH CONTROL

1. Approach control is responsible for controlling all instrument flights terminating within its area of responsibility. Approach control may serve one or more airfields, and control is exercised primarily by direct pilot/controller communications. Prior to arriving at the destination radio facility, instructions will be received from ARTCC to contact on approach control.

a. Radar Approach Control

(1) Arriving aircraft are either cleared to an outer fix most appropriate to the route being flown with vertical separation and, if required, holding information or, when radar handoffs are effected between the ARTCC and approach control, or between two approach control facilities, aircraft are cleared to the airport or to a fix so located that the handoff will be completed prior to the time the aircraft reaches the fix. When radar handoffs are utilized, successive arriving flights may be handed off to approach control with radar separation in lieu of vertical separation. After release to approach control, aircraft are vectored to the appropriate final approach course (ILS, VOR, ADF, etc.). Radar vectors and altitude/flight levels will be issued as required for spacing and separating aircraft. *Therefore, pilots must not deviate from the headings issued by approach control.* The radar vector issued for interception of the final approach course will be such as to enable the pilot to establish his aircraft on the final approach course prior to reaching the approach fix. Aircraft will be cleared for approach at the time the final heading for interception of the final approach course is issued, or after the aircraft is established on the final approach course prior to passing the approach fix. When established on the final approach course, radar separation will be maintained and the pilot will be expected to complete the approach utilizing existing approach aids (ILS, radio beacons, etc.) as the primary means of navigation. Therefore, *pilots must not deviate from the normal final approach course unless a clearance to do so is recei from Air Traffic Control.* After passing approach fix (outer marker, radio range, e on final approach, aircraft are expected proceed direct to the airport and comp the approach or effect the missed appro procedure published for that airport.

(2) IFR aircraft may be descended to the m mum vectoring altitude and vectored to a p tion in the airport traffic pattern whene the ceiling is at least 500 feet above the m mum vectoring altitude and the visibility at least three miles. This procedure afford a more expeditious service to arriv aircraft and preclude unnecessary vecto to the final approach fix of a published ins ment approach procedure.

(3) With a "visual approach" clearance, the p operating on an IFR flight plan in VFR ditions may deviate from the prescribed strument approach procedure and proceed the airport with visual reference to the face. Radar service will be terminated w aircraft are told to contact the tower. tower will assign a landing sequence num

INSTRUMENT APPPROACH

1. GENERAL

a. Instrument approach procedures are depicted Coast and Geodetic Survey Approach and Land Charts. Air Traffic Control may suggest a spec instrument approach procedure to expedite tra This is usually accomplished by issuing a cl ance for the specific approach. If the pilot of aircraft does not desire such approach he may quest a different type of approach. However may be necessary for Air Traffic Control to w hold a clearance for the different approach u such time as traffic conditions permit. Under s circumstances the pilot of the approaching airc may accept the suggested approach or wait fo different approach. The omission of a specific t of approach in the clearance, "Cleared for proach," indicates to the pilot any approved t of approach may be used at his discretion he should begin descent to approach altitude soon as possible. Normally, traffic conditi require Air Traffic Control to issue a clearan specifying the type of approach. If the pilo involved in an emergency situation, he will given priority in the type of approach as may necessary under the circumstances.

b. If the pilot is not familiar with the specified proach procedure, Air Traffic Control should advised and the clearance will include detailed formation on the execution of the specified proach. When an approach involves a proced turn, the turn normally shall be executed wit a distance of ten miles from the facility. H ever, in order to provide adequate separation fr

INSTRUMENT APPROACH (Con't)

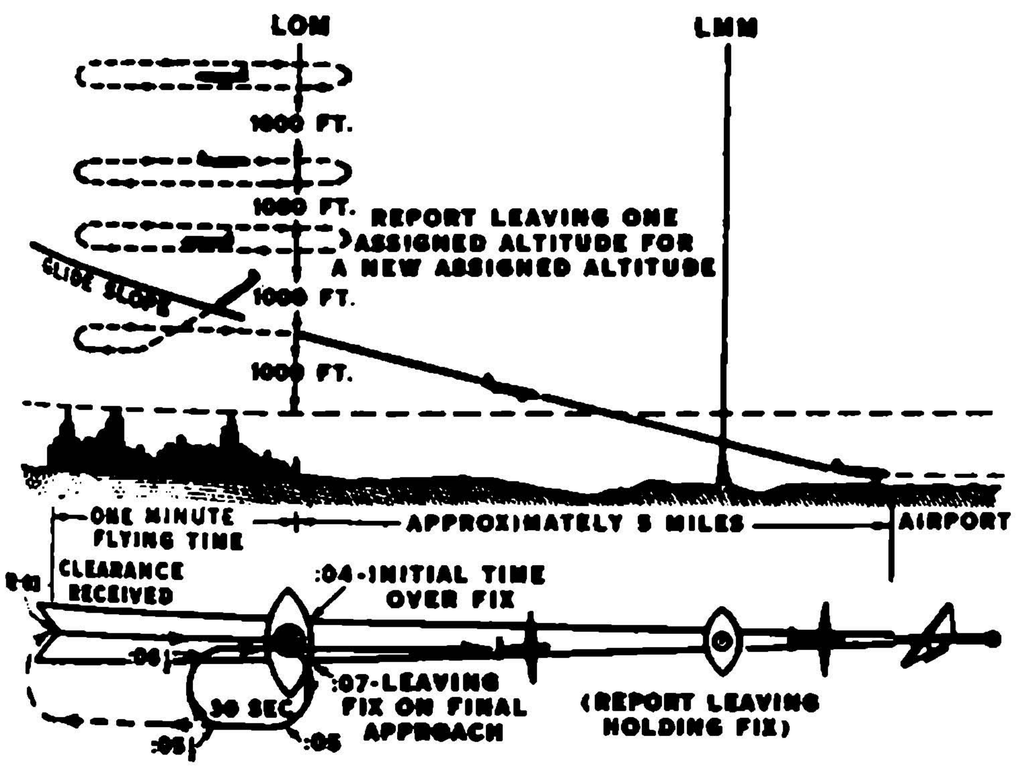
departing traffic, Air Traffic Control may specify the point at which the turn shall be executed (expressed in minutes or miles outbound from the facility) which will be consistent with the limitations of the specific approach procedure for the airport.

2. INSTRUMENT APPROACH FROM HOLDING PATTERN

a. Each pilot in an approach sequence will be given advance notice as to the time he should leave the holding point on approach to the airport. When a time to leave the holding point has been received, the pilot should adjust his flight path to leave the fix as closely as possible to the designated time.

Example:

The dotted line indicates a 1-minute holding pattern, the solid line indicates the aircraft flight path from the time clearance was received.



b. At 12:03 local time, in the example shown, a pilot holding, receives instructions to leave the fix inbound at 12:07. These instructions are received just as the pilot has completed turn at the outbound end of the holding pattern and is proceeding inbound towards the fix. Arriving back over the fix, the pilot notes that the time is 12:04 and that he has three minutes to lose in order to leave the fix at the assigned time. Since the time remaining is more than two minutes, the pilot plans to fly a race track pattern rather than a 360° turn, which would use up two minutes. The turns at the ends of the race track pattern will consume approximately two minutes. Three minutes to go, minus two minutes required for turns, leaves one minute for level flight. Since two portions of level flight will be required to get back to the fix inbound, the pilot halves the one minute remaining and plans to fly level for 30 seconds outbound before starting his turn back toward the fix on final approach. If the winds were negligible at flight altitude, this procedure would bring the pilot inbound across the fix precisely at the specified time of 12:07. However, if the pilot expected a headwind on final approach, he should shorten his 30 seconds outbound course somewhat, knowing that the wind will carry him away from the fix faster while outbound and decrease his ground speed while returning to the fix. On the other hand, if the pilot knew he would have a tailwind on final approach, he should lengthen his calculated 30-second outbound heading somewhat, knowing that the wind would tend to hold him closer to the fix while outbound and increase his ground speed while returning to the fix.

3. LANDING PRIORITY

a. A clearance for a specific type of approach (ILS, ADF, VOR or Straight-in Approach) to an aircraft operating on an IFR flight plan does not mean that landing priority will be given over other traffic. Traffic control towers handle all aircraft, regardless of the type of flight plan, on a "first-come, first-served" basis. Therefore, because of local traffic or runway in use, it may be necessary for the controller, in the interest of safety, to provide a different landing sequence. In any case, a landing sequence will be issued each aircraft as soon as possible to enable the pilot to properly adjust his flight path.

4. LANDING MINIMUMS

a. The minimum ceiling and visibility requirements for civil pilots making instrument approaches at civil airports are included on Standard Instrument Approach Procedures.

b. The following procedures are applicable to all arriving IFR civil aircraft conducting published instrument approaches.

c. When an official weather report is made available to the controller which indicates that weather conditions are below the minima published for the particular approach being executed or to be executed, ATC will:

(1) Issue the weather report to all arriving IFR aircraft.

(2) Advise pilots of other than military or scheduled air carrier aircraft that the reported weather is below the published minima and request such pilots to advise their intentions.

Example:

WEATHER (Weather Report). THIS IS BELOW PUBLISHED MINIMA FOR (Type of Approach) APPROACH. ADVISE INTENTIONS.

(3) Issue approach clearance, landing clearance or other clearances and/or instructions, as appropriate, in accordance with each pilot's stated intentions and the traffic situation.

INSTRUMENT APPROACH (Con't)

Each landing clearance shall be expressly qualified with the phrase "IF YOU HAVE LANDING MINIMA".

Example of Landing Clearance:

CLEARED TO LAND IF YOU HAVE LANDING MINIMA.

NOTE.—The foregoing procedures are predicated on the basis that: The Weather Bureau Report, RVR reading and/or runway visibility report, as appropriate, constitutes the official weather report, and the weather minima published for the particular approach on Instrument Approach Procedure Charts, as amended by NOTAMs, if any, are applicable. The pilot is governed by and will be observing the provisions, of Part 609.4/G/ Regulations of the Administrator.

5. MONITORING ILS

a. Communications should be established with the appropriate FAA control tower or with the FAA Flight Service Station, where there is no control tower, prior to starting an ILS approach. This is in order to receive advisory information as to the operation of the facility. It is also recommended that the aural signal of the ILS be monitored during an approach to assure continued reception and receipt of advisory information.

6. MISSED APPROACH

a. When a landing is not completed after an instrument approach, a pilot shall follow the prescribed missed approach procedure (unless an alternate missed approach procedure is specified by Air Traffic Control) and obtain further clearance from Air Traffic Control. The flight then may request clearance for another approach. Traffic permitting, an approach clearance may be issued immediately or the flight may be required to hold until clearance for approach can be issued. A pilot may, at any time, request clearance to an alternate airport.

RADAR MONITORING OF INSTRUMENT APPROACHES

1. When approaches are being monitored by radar, the radar advisories serve only as a secondary aid, since the pilot has selected the ILS or other navigational aid as the primary aid for the approach.
2. At FAA radar locations, all instrument approaches made on navigational aids whose final approach course from the final approach fix to the runway coincides with the Precision Approach Radar (PAR) course and whose final approach fix lies within the coverage of PAR will be monitored and radar advisories furnished to the pilot whenever the reported weather is below basic VFR minima (1000 and 3). This advisory information, derived from radar observations, includes the provision of advice on:
   a. The flight's position relative to the final appro fix and major obstructions.
   b. The distance above or below the prescribed gl path and/or the distance left or right of the p scribed final approach course when a flight ceeds the elevation and/or azimuth safety zo indicated on the PAR display.

      NOTE.—Altitude information is not tr mitted to aircraft executing other than an approach because the descent portions of s approaches do not coincide with the depi PAR glide path.

   c. The distance from "touchdown" each mile on f or, for flights executing other than an ILS proach, the distance from the end of the runv after passing the final approach fix, and
   d. A situation which, in the judgment of the cont ler, is likely to affect the safety of the flight.
3. Prior to starting final approach, the pilot will be vised of the frequency on which the advisories wil transmitted. This will normally be the ILS local voice channel. If, for any reason, radar adviso cannot be furnished, the pilot will be so advised.
4. Radar advisories will be terminated and the pilot advised when:
   a. The pilot reports the approach lights or the r way in sight, or
   b. The controller observes the aircraft to have reac a position approximately ½ mile from the appro end of the runway, whichever occurs first.

SPEED ADJUSTMENT OF ARRIVING AIRCRAFT

1. To avoid excessive vectoring in the establishment arrival sequences, pilots of radar-controlled arriv aircraft which are transitioning from en route to destination airport may be requested by ATC to just aircraft speeds in accordance with the followi
   a. All speed adjustment requests shall be expre in terms of knots and shall be predicated on i cated air speed (IAS).
   b. Speed adjustment procedures shall not be app to flights conducting published jet penetration
   c. Pilots complying with speed adjustment requ will be expected to maintain a speed within] or minus ten knots of the specified speed.
   d. Approach clearances supersede speed adjustn assignments and pilots are expected to effect th own speed adjustments, as necessary, to comp the approach. If it is determined by ATC t speed adjustment procedures are no longer quired prior to the issuance of an approach cl ance, the pilot of the aircraft concerned shall advised to resume normal speed.
   e. Unless prior concurrence in the use of a lo speed is obtained, speed adjustment requests

SPEED ADJUSTMENT (Con't)

an arriving flight to maintain a specified speed will be made in accordance with the following minima:

(1) To multi-engine turbojet and propeller-driven aircraft which are operating more than 30 nautical miles from destination airport:
A SPEED NOT LESS THAN 250 KNOTS IAS;

(2) To multi-engine turbo jet and propeller-driven aircraft which are operating 20 to 30 nautical miles from destination airport, and

(a) At or above 10,000' MSL:
A SPEED NOT LESS THAN 250 KNOTS IAS; or
(b) Below 10,000' MSL:
A SPEED NOT LESS THAN 200 KNOTS IAS;

(3) To multi-engine jet aircraft which are operating less than 20 nautical miles from destination airport:
A SPEED NOT LESS THAN 180 KNOTS IAS; or

(4) To multi-engine propeller-driven aircraft which are operating less than 20 nautical miles from destination airport:
A SPEED NOT LESS THAN 150 KNOTS IAS.

NOTE.--Controllers have been advised that utilization of the minimum speeds set forth above for propeller-driven aircraft will sometimes be impractical, since some aircraft in this category cruise at lower speeds and cannot attain the speeds specified.

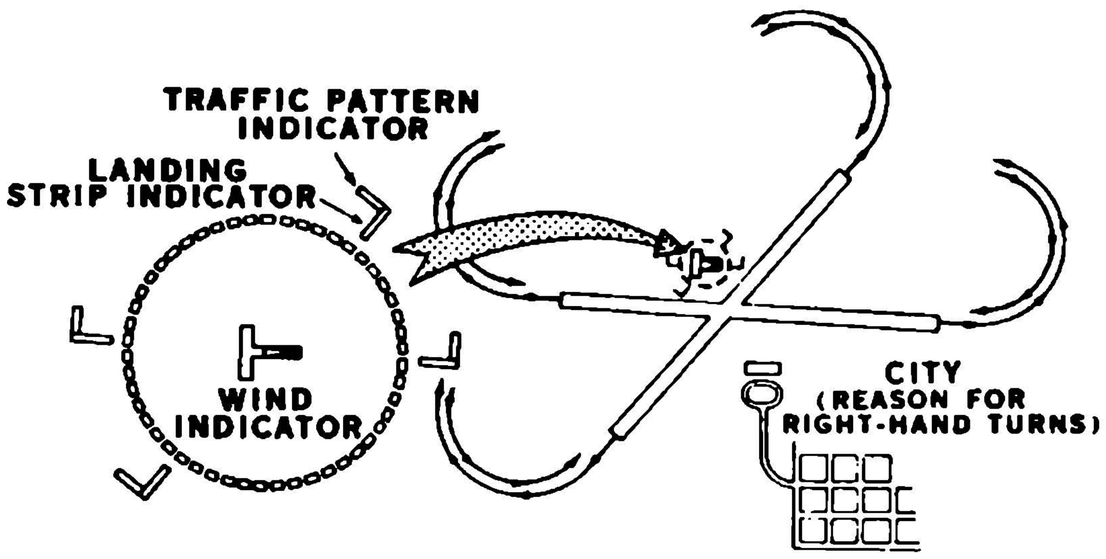
f. Speed adjustment of multi-engine propeller-driven aircraft which cannot attain the minimum speeds set forth above, or of single-engine aircraft, shall be accomplished by requesting such flights to, if practicable:
(1) Maintain a specified speed equivalent to that of the preceding/succeeding aircraft; or
(2) Increase or decrease speed utilizing increments of 10 knots or multiples thereof.

2. The pilots retain the perogative of rejecting the application of speed adjustment by ATC, if in his opinion, it will adversely affect the operating characteristics of the aircraft. In such cases, the pilot is expected to advise ATC of the speed that will be used.

LANDING

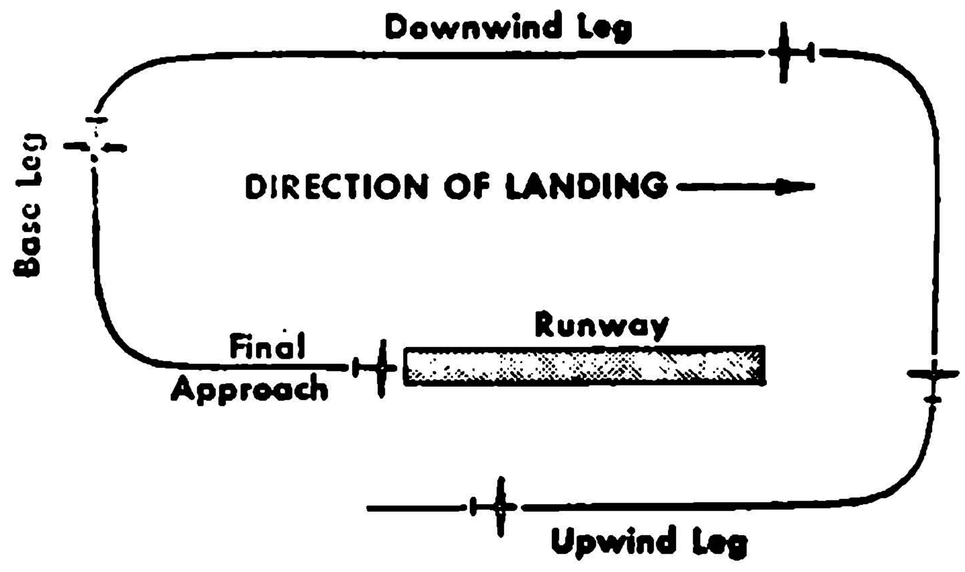
TRAFFIC PATTERN DIRECTION

1. The segmented circle system consists of the following components: A wind indicator (sock) will be found at the center of the circle. Associated with the wind indicator and also located at the center of the circle, is the landing direction indicator, which may be a tetrahedron or tee, either free swinging or set for a particular runway. Although appearing as a single unit, the L-shaped indicator located at various positions around the segmented circle or at the end of a runway actually consists of two parts. That portion of the L in alignment with or parallel to a runway is known as the landing strip indicator. The other section of the L running at a right angle to the runway is known as the traffic pattern indicator.



2. Preparatory to a landing, the pilot should concern himself with the indicator for the approach end of the runway to be used. If the pilot will mentally enlarge the indicator for the runway to be used, the base and final approach legs of the traffic pattern to be flown immediately become apparent. Similar treatment of the indicator at the departure end of the runway will clearly indicate the direction of turn to join the cross wind leg of the traffic pattern after takeoff.
3. A flashing amber light in the center of the segmented circle or on top the control tower or adjoining building indicates clockwise flow of traffic is in effect at that time and that right turns shall be made unl otherwise authorized by Air Traffic Control.
4. Right hand flow of traffic may also be shown by in cators located at either the segmented circle or e of the runway. A pilot may determine the direct of traffic flow by circling the airport at an altitu above the airport area.
5. At airports where traffic control is exercised by control tower, traffic and taxi patterns have b established to specify the desired flow of ground a air traffic operating on and in the vicinity of an a airport. If the traffic pattern is not known, foll other traffic unless otherwise advised. Control tow operators issue clearances or other information pilots as necessary for aircraft to generally foll the desired flight path (traffic patterns) when fly the airport traffic area/control zone and the prop taxi routes (taxi patterns) when operating on t ground.
6. The following terminology for the various com nents of a traffic pattern has been adopted as star ard for use by control towers and pilots:

STANDARD TRAFFIC PATTERN COMPONENTS



Upwind leg.	A flight path parallel to l landing runway in the rection of landing.
Crosswind leg.	A flight path at right ang to the landing runway its upwind leg.

Downwind leg. A flight path parallel to the landing runway in the direction opposite to landing.

Base leg. A flight path at right angles to the landing runway off its approach end and extending from the downwind leg to the intersection of the extended runway center line.

Final approach. A flight path in the direction of landing along the extended runway center line from the base leg to the runway.

GENERAL

U.S. ENTRY AND DEPARTURE REQUIREMENTS

1. GENERAL

a. Air Commerce Regulations of the United States Part 6, place certain responsibilities upon owners and operators of aircraft engaging in flight to/from foreign countries.

b. Customs, and the other agencies concerned, desire to facilitate air travel to the fullest extent possible while carrying out their responsibilities. Plane operators can assist greatly by familiarizing themselves with the regulations and by complying with them under all circumstances. Failure to do so may incur substantial penalties.

c. The following sets forth principal requirements of concern to private plane operators engaging in international flights.

2. ARRIVAL AND DEPARTURE MANIFESTS

a. All aircraft departing from the continental United States or Alaska for Canada or the French Islands of St. Pierre or Miquelon are exempt from filing an arrival or departure manifest. Aircraft arriving from any other place are required to file arrival and departure manifests. However, the Immigration and Naturalization Service does not require private aircraft not carrying passengers for hire to file an arrival or departure manifest when arriving from or departing to Mexico.

3. ADVANCE NOTICE REQUIRED

a. Advance notice of each arrival must be furnished U.S. Customs officials at or nearest the place of intended first landing who will notify the Immigration and Public Health officials, except that separate notice to the Public Health Service is required fo rentry to the Virgin Islands.

b. Advance notice should be sent so as to be received in sufficient time to enable the officers designated to inspect the aircraft to reach the place of landing before arrival of the aircraft. At those airports where full time customs service is not available, at least one hour advance notice is required for this purpose.

c. Notification may be made by telephone, which is preferable, by telegram or by radio. The notice should specify the following: (1) Type of aircraft; (2) Identification; (3) Name of pilot; (4) Place of last departure; (5) Airport of entry; (6) Number of alien and citizen passengers, and (7) estimated time of arrival. (Indicating whether C.S.T., E.S.T., etc.) Private aircraft arriving from Canada or Mexico may request that advance notice of arrival to customs officers be included in the *flight plan* filed in those countries if destined to an airport in the U.S. where flight notification service is available. At a landing rights airport such notices will then be treated as applications for permission to land.

d. Aircraft may use the following method of notifying customs when departing from a country or remote area where a pre-departure flight plan cannot be filed or an "advise customs" message cannot be included in a pre-departure flight plan. Call the nearest domestic or international FAA Flight Service Station as soon as it is estimated that radio communications can be established and file a VFR (DVFR) flight plan and include as the last item "advise customs." The station with which such a flight plan is filed will forward it to the appropriate FAA station who will notify the customs office responsible for the destination airport.

e. If the pilot fails to include "advise customs" in the radioed flight plan, it will be assumed that he has made other arrangements and FAA *will not* advise customs.

f. FAA assumes no responsibility for any delays in advising customs if the flight plan is given to FAA too late for delivery to customs before arrival of the aircraft. FAA cannot relay an "advise customs" flight plan if the pilot indicates a destination airport where flight service notice to customs if NOT available.

4. AIRPORTS FOR ENTRY AND REENTRY

a. If the operator of a private aircraft returning to or visiting the United States wishes to *land at any airport of entry, advance notice of arrival* is necessary. This advance notice should be sent also to the immigration and public health officers at or nearest the intended place of first landing.

b. If he intends to land at a place *not designated as an airport of entry, he must obtain permission to make such landing, and give advance notice of arrival* to the customs office nearest the intended place of first landing. It is not necessary that separate requests be sent to immigration and public health officers in these cases.

U.S. ENTRY AND DEPARTURE (Con't)

c. **What to report**—The advance notice should specify the type of aircraft, registration marks, name of commander, place of last departure, international airport, number of alien passengers, number of citizen passengers, and the estimated time of arrival. *This advance notice should be sent in time to enable officers designated to inspect the aircraft to reach the place of landing before the plane arrives.*

d. Upon arrival, the operator and passengers will be examined in the same manner as any international traveler. They must declare any articles acquired aboard. If passengers or cargo are carried for hire, an inward manifest must be filed. Customs officers will supply forms for both types of declarations.

5. EMERGENCY

a. If an emergency landing is made in the United States, the plane operator should report as promptly as possible to the nearest customs, immigration, and public health officers. He should not permit any merchandise or baggage to be removed, or any passengers to depart without official permission unless necessary for preservation of life or property.

6. CHARGES

a. No charges are made for services during business hours *when a landing takes place at any airport of entry*: *except* that, when an aircraft arrives on Sunday or holiday, or during other than regular hours, OVERTIME PAY WILL BE COLLECTIBLE. These charges are required by law. They may amount to as much as two days' pay for each officer for any service performed on a Sunday or holiday. However, the charges are prorated where more than one aircraft is processed.

b. *If the landing is made at a place other than an airport of entry*, any expenses incurred by Government officers in going to and from the place of landing are payable by the plane operator. In addition, if the aircraft arrives on a Sunday or holiday, or during other than regular hours, OVERTIME PAY WILL BE COLLECTIBLE.

7. TRANSBORDER FLIGHTS TO CANADA

a. Customs regulations allow the clearance by telephone of private aircraft departing for Canada and not carrying cargo.

b. If not carrying cargo, passengers for hire, nor departing to pick up passengers for hire at points in Canada, a private aircraft departing for Canada does not require a clearance of any type.

c. If carrying passengers for hire or departing to pick up passengers for hire at points in Canada and not carrying cargo, approval of clearance may be applied for by telephone when consideration of distance and expense or, in an emergency, time a present.

d. For Buffalo-Niagara Falls area apply to the supe visory inspector at the Peace Bridge at Buffalo to the supervisory inspector at the Rainbow Brid at Niagara Falls. The telephone number at t Peace Bridge is GRant 1180 and at the Rainb Bridge BUtler 2-4562. When approval of t clearance is obtained from the Peace Bridge, t general outward declaration should be mailed United States Customs, Peace Bridge, Buffa New York. Similarly, when approval of clearan is obtained from the Rainbow Bridge, the gener outward declaration should be mailed to Unit States Customs, Rainbow Bridge, Niagara Fal New York.

e. Special arrangements have been made with Ca ada and Mexico that substantially differ from t requirements outlined above. Complete deta are included in the International Flight Inform tion Manual which can be obtained from Su of Documents, Government Printing Office, Was D.C. 20402.

8. AIRPORTS OF ENTRY

a. Any aircraft may land at one of the following ai ports and permission to land from U.S. Customs not required. However, advance notice of arriv must be furnished to U.S. Customs. This may l included in your *flight plan* filed in Canada Mexico if destined to an airport where flight noti cation service is available.

ADIZ PROCEDURES (F.A.R. PART 99)

1. An "Airfiled" flight plan makes the aircraft subje to interception for positive identification. Pilots a strongly urged, therefore, to file DVFR Flight Pla required for Security Control either in person or t telephone. FAA Flight Service Stations will acce collect long distance telephone calls made for t purpose of filing required DVFR flight plans. T following procedures apply:
   a. Contact the long distance telephone operator a place a collect, station-to-station call from "S CURITY PILOT (your last name)" to the FA station.
   b. When the FAA accepts the call, file your DVF flight plan as expeditiously as possible.
2. Pilots should note that FAA stations will not acce collect calls from locations which are obviously mu closer to another FAA station, neither will they a cept calls which do not contain the key words "S CURITY PILOT (name)." In order to conserve go ernment funds, FAA stations will not accept lor distance collect calls from any pilot within the D fense Area. DVFR flight plans from such points wi be accepted, however, if filed at no expense to t government.

ADIZ PROCEDURES (Con't)

ADIZ Operational Requirements, Abbreviated Form

	Southern Border Domestic ADIZ	Alaskan Domestic ADIZ	Coastal ADIZ	DEWIZ
Flight Plan	Required for northbound aircraft.	Required	Required	Required before take-off ETDP required. Exception permitted in Part 99.13
Functioning Two-way Radio.	Required except as stated in Part 99.1(c)	Required except as stated in Part 99.1(c)	Required except as stated in Part 99.1(c)	Required.
Recommended ADIZ Tolerances	Within 5 minutes of estimate and 10 nautical miles of course centerline.	Within 5 minutes of estimate and 10 nautical miles of course centerline.	Within 5 minutes of estimate and 20 nautical miles of course centerline.	Within 5 minutes of estimate and 20 nautical miles of course centerline.
Position Reports	Normal IFR reports or—VFR give ETP at least 15 minutes before penetration.	Normal IFR reports or—VFR give ETP at least 15 minutes before penetration.	Same as Domestic ADIZ or—inbound foreign aircraft initial report at least one hour from U.S.	Normal IFR reports or—VFR report prior to penetration. Correlation of ground filed data may be requested.
Air Defense Emergencies Part 99.7	ADDITIONAL SPECIAL SECURITY INSTRUCTIONS MAY BE ISSUED DURING DEFENSE EMERGENCY OR AIR DEFENSE EMERGENCY CONDITIONS.			
Aircraft excepted from compliance to the provisions of Part 99 other than Part 99.7	Local exemptions granted by FAA ARTCC.	Local exemptions granted by FAA ARTCC.	Local exemptions granted by FAA ARTCC.	Local exemptions granted by FAA ARTCC.
	Aircraft remaining within 10 nautical miles of departure point within the Continental U.S.	Aircraft remaining within 10 nautical miles of departure point within the Continental U.S.	Aircraft remaining within 10 nautical miles of departure point within the Continental U.S.	Aircraft remaining within 10 nautical miles of departure point within the Continental U.S.
	Aircraft with TAS less than 180 knots.	Aircraft with TAS less than 180 knots.	Aircraft with TAS less than 180 knots, north of 28°N or west of 85°W.	Aircraft with TAS less than 180 knots—listening watch required.
	Aircraft from U.S. southbound through Southern Border ADIZ not entering Coastal ADIZ.		Flight over or within 3 nautical miles of any island in Hawaiian Coastal ADIZ.	

NOTE: Detailed procedures to be followed by the pilot are contained in Part 99, for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington D.C. 20402

SCATER PROCEDURES

(Security Control of Air Traffic and Electromagnetic Radiations)

All pilots should guard a FAA control frequency at all times. In event of emergency, SCATER directives will be broadcast over these frequencies. VFR flights may expect to be ordered to land at nearest facility. IFR flights will proceed as directed by ARTCC.

Following the declaration of an Air Defense Emergency, SECURITY CONTROL RULES will become effective. These rules are included in the published SCATER Plan. Pilots should contact the nearest Air Traffic Control facility upon being advised of an Air Defense Emergency or of a CONELRAD RADIO ALERT or that SCATER has been implemented. They will then be advised as to the requirements for Security Control, if any, for flight operations.

INTERCEPTION SIGNALS

There are occasions when interceptor pilots are required to transmit instructions to pilots of intercepted aircraft. When radio communications are not available, the accompanying visual signals are used. These signals are applicable within the airspace over the United States including Alaska and Hawaii, and the territories and possessions of the United States, including the territorial waters thereof.

Interceptor pilots required to transmit instructions by visual means shall approach the aircraft to be intercepted from astern, employing the Interception Pattern for Identification of Transport Aircraft. A distance of at least 500 feet shall be maintained between aircraft exchanging signals. These signals have also been adopted by Canada and are applicable within the airspace over Canada.

IRST SERIES

Signal by interceptor	Meaning	Response by intercepted Aircraft
ly :c-ng wings from a position in :ait of intercepted aircraft and ter acknowledgement a slow rel turn on to the desired :urse. ght s day with the addition of a ser- s of flashing lights at irregular :er.als by any means available. ote:—If the interceptor in- ds only to lead intercepted air- aft away from an area it signals front and to the left of the in- rcepted aircraft. If the inter- ptor intends to lead intercepted craft for a landing it signals in nt and to the right of the inter- pted aircraft. If the intercepted aircraft is able to maintain sufficient eed to follow the interceptor: 1 The interceptor shall fly in the direction the intercepted aircraft should fly, circle to the left, and fly again in the proper direction. 2 When the area for descent is reached the interceptor shall circle to the right. The intercepted aircraft should then let down in the descending turn at the minimum rate of descent.	'Follow me' 'Fly in this direction 'Descend in this area'	Day or Night Rocking wings and following. Rocking wings and maintaining indicated direction. Rocking wings and commencing descent.

ECOND SERIES

Signal by interceptor	Meaning	Response by intercepted aircraft
y or Night P abrupt break away upward 90 degrees or more.	'You may proceed	Day or Night Rocking wings.

THIRD SERIES (To be used on arriving in vicinity of aerodrome).

Signal by interceptor	Meaning	Response by intercepted aircraft
Day Circling aerodrome and lowering landing gear. Night As day and showing steady lights if carried.	'Land at this aerodrome.	Day or Night Same as interceptor, and proceed to land.

FOURTH SERIES (To be used if intercepted aircraft finds aerodrome inadequate.)

Signal by intercepted aircraft	Meaning	Response by interceptor
Day Rocking wings while passing over landing runway at a height exceeding 1,000 feet above the level of the aerodrome. Night Flashing landing lights while passing over the landing runway at a height not exceeding 1,000 feet above the level of the aerodrome. (If unable to flash landing lights, flash any lights available.)	'Aerodrome that you have designated is inadequate'.	Day or Night If it is desired that other aircraft follow him to an alternative aerodrome, the interceptor signals the FIRST series. Should the interceptor decide to release intercepted aircraft he signals the SECOND series (meaning 'You may proceed')

DISTRESS SERIES

Signal by intercepted aircraft	Meaning	Response by interceptor
Day Porpoising. Night Switching on landing lights and holding steady beam.	'In distress'.	Day or Night Use appropriate interception signal, as shown above.

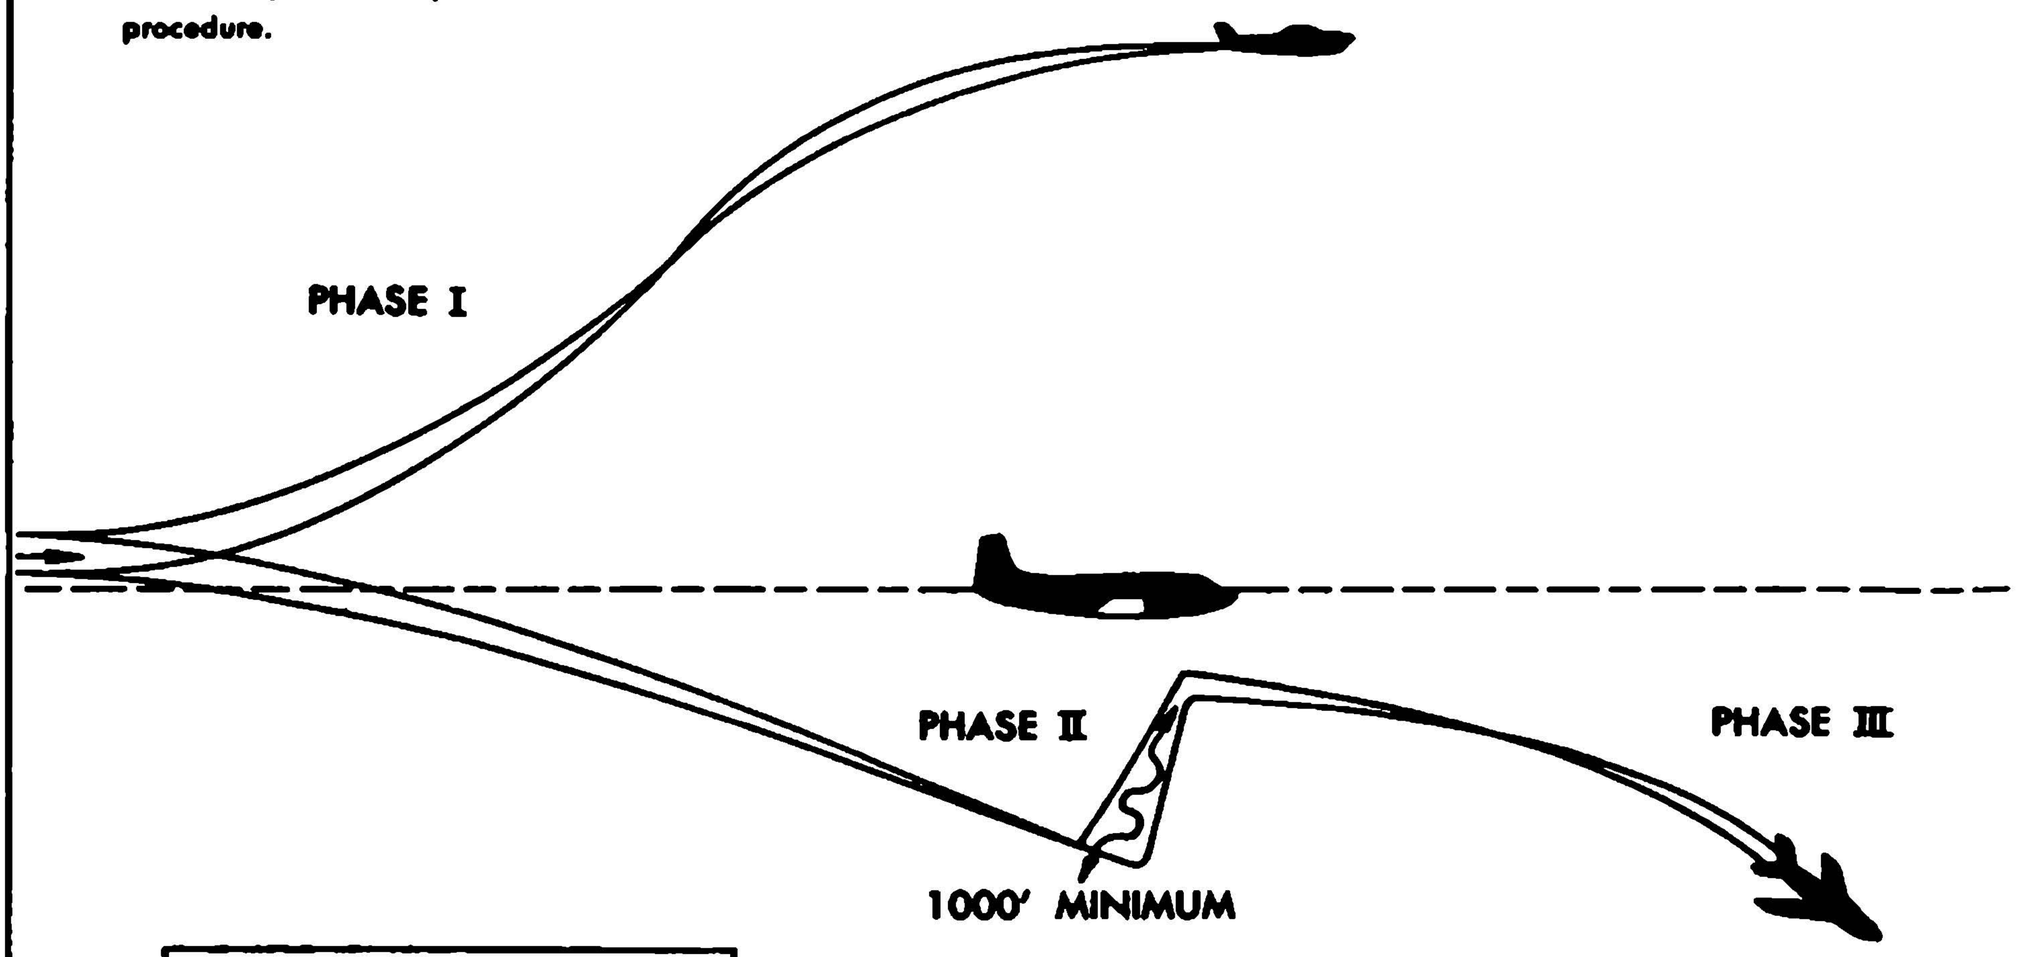
INTERCEPTION PATTERN FOR IDENTIFICATION OF TRANSPORT AIRCRAFT

PHASE I

Intercepting aircraft approach intercepted aircraft from astern. Element leader reduces throttle and extends dive brakes. Wingman continues to the opposite side of the intercepted aircraft from the leader and climbs to 4000 feet above target aircraft altitude for the purpose of maintaining surveillance, using economical power setting. Should weather ceiling not permit surveillance from this position, wingman will assume a position of either side of aircraft which will permit observation of both the aircraft and his element leader at a distance of 3000 feet from the intercepted aircraft, if visibility permits. During surveillance, wingman will maintain position by S-turns rather than reducing speed with dive brakes. The desired position of the element leader is 1000 feet abreast the aircraft at the aircraft's altitude. After speed and position are stabilized, element proceeds with Phase II of the procedure.

PHASE II

Wingman continues surveillance. Element leader begins gentle closure of aircraft at same level until no closer than absolutely necessary to obtain information needed. As he gives identification information to director, wingman copies information for mission report. Element leader uses every precaution to avoid startling intercepted aircrew or passengers, keeping constantly in mind that maneuvers considered normal to a fighter aircraft may be considered hazardous to passengers and crews of nonfighter aircraft. Upon completion of identification, fighter-interceptors withdraw from aircraft's vicinity as outlined in Phase III.



INTERCEPTION PATTERN FOR DAY-VISUAL IDENTIFICATION OF AIRCRAFT

PHASE III

Element leader breaks gently away from aircraft in shallow dive to pick up speed. Wingman stays well clear of intercepted aircraft and joins leader.

Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

GENERAL

A pilot in any emergency phase (uncertainty, alert, or distress) should do three things to obtain assistance:

a. *If equipped with IFF, switch to "Emergency" position.*

b. *Contact controlling agency and give nature of distress and pilot's intentions.* If unable to contact controlling agencies, attempt to contact any agency on assigned frequency or any of the following frequencies (transmit and receive):

Frequency	Emission	Effective Range in Nautical Miles	Guarded By
121.5 mc	Voice	Generally limited to radio line-of-sight	All military towers, most civil towers, VHF direction finding stns, radar facilities. Flight Service Stns. Ocean Station Vessels.
243.0 mc	Voice	Generally limited to radio-line-of-sight	All military towers, most civil towers, VHF direction finding stns, radar facilities. Flight Service Stns. Ocean Station Vessels.
2182 kc	Voice	Generally less than 300 miles for average aircraft installations	Some ships and boats, Coast Guard stations, most commercial coast stations.
500 kc	CW	Generally less than 100 miles for average aircraft installations	Most large ships most Coast Guard radio stations, most commercial coast stations.
8364 kc	CW	Up to several thousand miles, depending upon propagation conditions. Subject to "skip."	U.S.N. Direction Finding Stations, Ocean Station Vessels, most Coast Guard radio stations and some FAA International Flight Service Stations (IFSS)

Transmit as much of the following as possible:

(1) MAYDAY, MAYDAY, MAYDAY (if distress), or PAN, PAN, PAN (if uncertainty or alert). If CW transmission, use SOS (distress) or XXX (uncertainty or alert).

(2) Aircraft identification repeated three times.

(3) Type of aircraft.

(4) Position or estimated position (stating which).

(5) Heading (true or magnetic) (stating which).

(6) True airspeed or estimated true airspeed (stating which).

(7) Altitude.

(8) Fuel remaining in hours and minutes.

(9) Nature of distress.

(10) Pilot's intentions (bailout, ditch, crash landing, etc.).

(11) Assistance desired (fix, steer, bearing, escort, etc.).

(12) Two 10-second dashes with mike button (voice) or key (CW) followed by aircraft identification (once) and OVER (voice) or K (CW).

c. **Comply with instructions received.** Accept the "communications control" offered to you by the ground radio station, silence interfering radio stations, and do not shift frequency or shift to another ground station unless absolutely necessary.

2. Pilots of IFR flights experiencing two-way radio failure are expected to adhere to the procedures prescribed under "RADIO COMMUNICATIONS FAILURE" (F.A.R. PART 91.127). However, if a pilot should become lost, or if other factors prevent the pilot from being able to comply with prescribed procedures, such pilot, as well as pilot of VFR flights, may attempt to alert civil or military radar systems as follows:

a. **If receiver only is operating:** Fly triangular pattern to the RIGHT (see diagram). Hold each heading for two minutes (1 minute for jet use). Complete a minimum of two such patterns before resuming original course and then repeat pattern at 20-minute intervals. When flying triangular patterns to the right the emergency frequencies (121.5 or 243.0 mc) should be guarded. If pattern is observed by radar controllers, instructions will be given.

b. **If transmitter and receiver are both inoperative:** Fly a triangular pattern to the LEFT (see diagram), in the same manner as described above. If patterns are observed by radar controllers, an escort will be dispatched, if possible. If distressed aircraft is flying in IFR conditions or if at night, landing lights, navigational lights, etc., should be turned on to aid the interceptor. If intercepted, follow rescue aircraft.

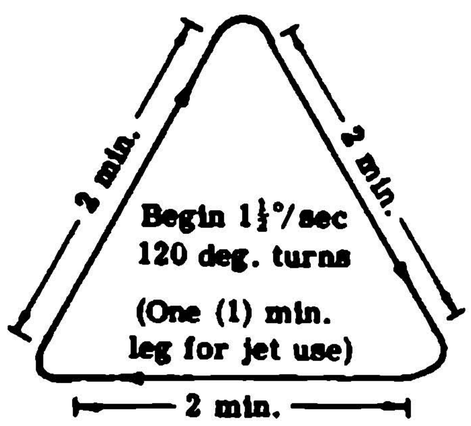


Figure 1 - With Receiver Operating Only

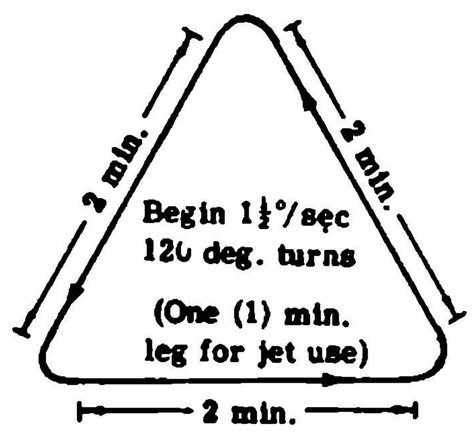

Figure 2 - With Transmitter and Receiver Inoperative

GENERAL (Con't)

c. The pilot should remember that he has *three* means of declaring an emergency:
(1) Emergency IFF;
(2) Sending emergency message; and
(3) Flying triangular pattern.

d. Ground stations have *three* electronic means of assisting:
(1) Receipt of emergency message;
(2) Radar detection of IFF signal and triangular pattern; and
(3) DF bearings.

e. **Pilots should remember the FOUR C's**

(1) **Confess** your predicament to any ground radio station. Do not wait too long. Give SAR a chance!

(2) **Communicate** with your ground link and pass as much of the distress message on first transmission as possible. We need information for best SAR action!

(3) **Climb** if possible for better radar and DF detection. If flying at low altitude, the chance for establishing radio contact is improved by climbing, also chances of alerting radar systems are sometimes improved by climbing or descending.

NOTE.—Climbing or descending under IFR conditions within controlled airspace is not permitted except in *emergency*. Any variation in altitude, track, etc., in connection with flying radar patterns will be unknown to Air Traffic Control. Air Traffic Control will operate on the assumption that the provision of FAR, Part 91.127 are being followed by the pilot.

(4) **Comply**—especially *Comply*—with advice and instructions received, if you really want help. Assist the ground "communications control" station to control communications on the distress frequency on which you are working (as that is the distress frequency for your case). Tell interfering stations to maintain silence until you call. Cooperate!

3. For bailout, set radio for continuous emission. For ditching or crash landing, radio should, if it is considered that there is no additional risk of fire and if circumstances permit, be set for continuous transmission.

4. When a pilot is in doubt of his position, or feels apprehensive for his safety, he should not hesitate to request assistance. Search and Rescue facilities, including Radar, Radio, and DF stations, are ready and willing to help. There is no penalty for using them. Delay has caused crashes and cost lives. Take Action!

SEARCH AND RESCUE

1. GENERAL

a. Search and Rescue is a life-saving service provided through the combined efforts of the FAA, Air Force, Coast Guard, State Boards, A nautic Commissions or other similar state agen who are assisted by other organizations suc the Civil Air Patrol, Sheriffs Air Patrol, S Police, etc. It provides search, survival aid, rescue of personnel of missing or crashed airc

b. Prior to departure on every flight, local or ot wise, someone at the departure point shoul advised of your destination and the route of fl if other than direct. Search efforts are o wasted and rescue is often delayed becaus pilots who thoughtlessly take off without te anyone where they are going.

c. All you need to remember to obtain this valu protection is:

(1) File a Flight Plan with an FAA Flight S ice Station in person or by telephone or r

(2) Close your flight plan.

(3) If you land at a location other than the tended destination, report the landing to nearest FAA Flight Service Station.

(4) If you land en route and are delayed r than 30 min. (15 min. for jets), report information to the nearest FSS.

(5) Remember that if you fail to report wi one-half hour after your ETA, a search be started to locate you.

d. If a crashed aircraft is observed:

(1) Determine if crash is marked with ye cross; if so, crash has already been repo and identified.

(2) Determine, if possible, type and number of craft and whether there is evidence of vivors.

(3) Fix, as accurately as possible, exact loca of crash.

(4) Transmit information to nearest FAA or c appropriate radio facility.

(5) Immediately after landing, make a comp report to nearest FAA, Air Force, or C Guard installation. Report may be mad long distance collect telephone.

e. To assure survival and rescue in the event crash landing the following advice is given:

(1) For flight over uninhabited land areas, wise to take suitable survival equipment pending on type of climate and terrain.

(2) If forced landing occurs at sea, chances survival are governed by degree of crew ficiency in emergency procedures and by e tivesness of water survival equipment.

(3) If it becomes necessary to ditch, distre aircraft should make every effort to ditch i a surface vessel. If time permits, the posi of the nearest vessel can be obtained fro

EARCH AND RESCUE (Con't)

Coast Guard Rescue Coordination Center through the FAA facility.

(4) The rapidity of rescue on land or water will depend on how accurately your position may be determined. If flight plan has been followed and your position is on course, rescue should be prompt.

(5) Unless you have good reason to believe that you will not be located by search aircraft, it is better to remain near your aircraft and prepare means for signalling whenever aircraft approach your position.

f. Search and Rescue facilities include:
(1) Rescue Coordination Centers;
(2) Search and Rescue aircraft;
(3) Rescue vessels;
(4) Pararescue and ground rescue teams;
(5) Emergency radio fixing.

CLOSE YOUR FLIGHT PLAN

a. The control tower does not automatically close flight plans since many of the landing aircraft are not operating on flight plans. It remains the responsibility of a pilot to close his own flight plan. This will prevent a needless search.

NATIONAL SEARCH AND RESCUE PLAN

a. Under the National Search and Rescue Plan, the U.S. Coast Guard is responsible for coordination of search and rescue for the Maritime Region, and the U.S. Air Force is responsible for coordination of search and rescue for the Inland Region. In order to carry out this responsibility, the Air Force and the Coast Guard have established Rescue Coordination Centers to direct search and rescue activities within their regions. This service is available to all persons and property in distress, both civilian and military. Normally, for aircraft incidents, information will be passed to the Rescue Coordination Centers through the appropriate Air Route Traffic Control Center.

Coast Guard Rescue Coordination Centers

Coast Guard Rescue Coordination Centers are served by major radio stations which guard 500 kc (CW) and 2182 kc (voice). In addition, San Francisco and Honolulu guard 8364 kc and 247 Coast Guard units along the sea coasts of the United States and shores of the Great Lakes guard 2182 kc (voice). All of these facilities are available for reporting distress or potential distress. THE CALL "NCU" (CW) or "COAST GUARD" (VOICE) ALERTS ALL COAST GUARD RADIO STATIONS WITHIN RANGE.

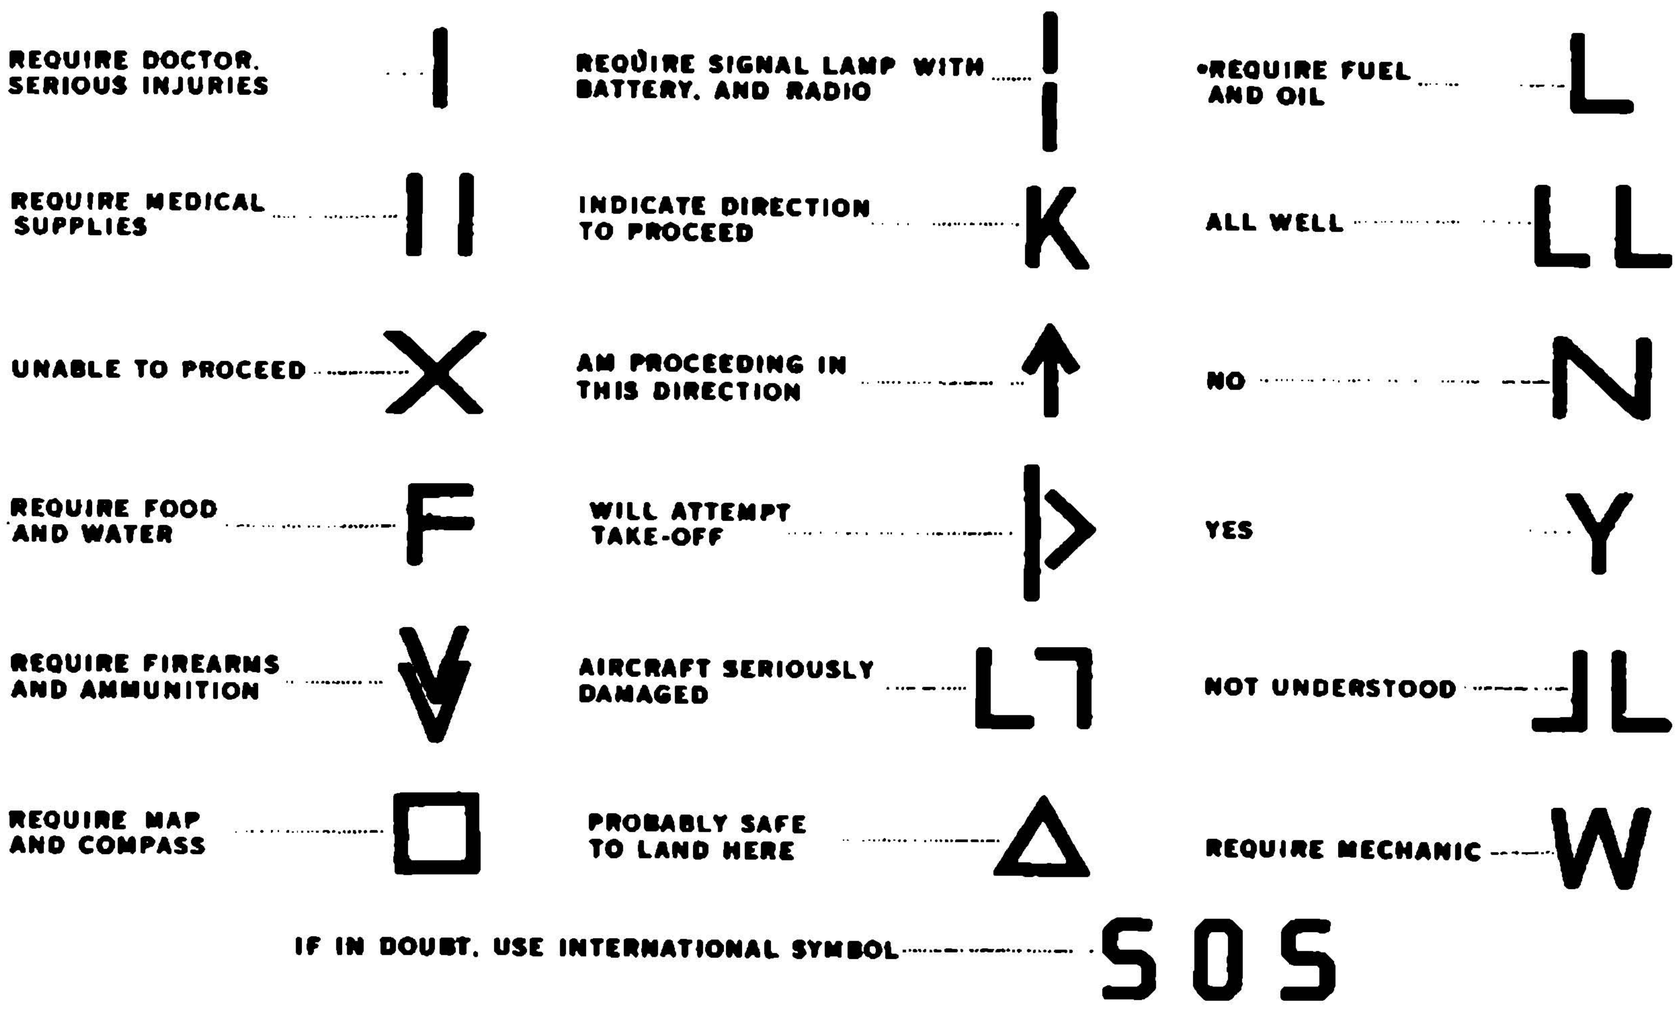
GROUND-AIR VISUAL CODE



INSTRUCTIONS

1. Lay out symbols by using strips of fabric or parachutes, pieces of wood, stones, or any available material.
2. Provide as much color contrast as possible between material used for symbols and background against which symbols are exposed.
3. Symbols should be at least 10 feet high or larger. Care should be taken to lay out symbols exactly as shown.
4. In addition to using symbols, every effort is to be made to attract attention by means of radio, flares, smoke, or other available means.
5. On snow covered ground, signals can be made by dragging, shoveling or tramping. Depressed areas forming symbols will appear black from the air.
6. Pilot should acknowledge message by rocking wings from side to side.

GROUND-AIR VISUAL CODE FOR USE BY GROUND SEARCH PARTIES

Fishtail plane

HOW TO USE THEM

If you are forced down and are able to attract the attention of the pilot of a rescue airplane, the body signals illustrated on this page can be used to transmit messages to him as he circles over your location. Stand in the open when you make the signals. Be sure that the background, as seen from the air, is not confusing. Go through the motions slowly and repeat each signal until you are positive that the pilot understands you.

RADIO COMMUNICATIONS FAILURE (F.A.R. PART 91.127)

1. It is virtually impossible to provide regulations and procedures applicable to all possible situations associated with radio communications failure in aircraft. During two-way radio communications failure when confronted with a situation not covered in the regulation, pilots are expected to exercise good judgment in whatever action they elect to take. Should the situation so dictate, they should not be reluctant to use the emergency action contained in FAR Part 91.127. Pilots who experience radio communications failure are urged to listen on any operational radio receiver for information broadcast by Air Traffic Control. Controllers have the capability of transmitting on most navigational facilities and do so where an aircraft communications failure is recognized.

2. In the event of two-way radio communications failure, pilots on an IFR flight plan shall comply with the provisions of FAR Part 91.127, Two-way Radio Communications Failure. The following procedures are provided as a detailed guide for pilots. It is expected that pilots will operate their aircraft in accordance with these procedures in the event of radio failure and ATC service will be provided on the basis that the pilot is operating in accordance with these procedures.

3. **In VFR Conditions**—If able to maintain flight in VFR conditions, continue flight under VFR and land as soon as practicable and notify ATC. It is not intended that the requirement to "land as soon as practicable" to be construed to mean "as soon as possible." The pilot retains his perogative of exercising his best judgment and is not required to land at an unauthorized airport, at an airport unsuitable fo rthe type of aircraft flown, or to land only minutes short of his intended destination. The primary objective of this provision is to preclude extended IFR operations in the air traffic control system .in VFR weather conditions. When operating "on top" and unable to descend VFR prior to the destination, the procedures contained in paragraph 4. are applicable.

4. **In IFR Conditions**—When in IFR conditions, or when unable to descend and land in VFR conditions, the following procedures are applicable.

   a. **Route**

      (1) If cleared to the destination airport or a radio facility serving the destination airport, proceed via the route specified in the last air traffic control clearance received to the radio facility to be used for the approach at the destination airport.

      (2) If cleared to a radio fix short of the radio facility serving the destination airport without holding instructions, *do not hold* but proceed via the route specified in the last air traffic control clearance received, or if no route beyond the clearance limit has been receiv proceed via flight planned route, to the ra facility to be used for the approach at t destination airport.

      (3) If cleared to a radio fix short of the ra facility serving the destination airport w holding instructions and a time to "exp *further* clearance," *hold until the time sp fied* then proceed via routing in accorda with (2) above to the radio facility to be u for the approach at the destination airp

      (4) If cleared to a radio fix short of the ra facility serving the destination airport w holding instructions and a time to "exp *approach* clearance," *hold and depart the so as to arrive over the radio facility to used for the approach at the destination port as nearly as posible to the expected proach clearance time received*, proceedin accordance with (2) above.

      (5) If cleared to a radio fix short of the ra facility serving the destination airport wh is on a route other than the route request ATC will specify a proposed routing bey such clearance limit by stating, "*EXPE FURTHER CLEARANCE VIA (propo routing).*" This proposed routing will spec either a new route to the destination airp or to a point intercepting the flight plan route. In such cases, the proposed rout should be followed in lieu of the flight plan rou'e.

      (6) If a departing flight is cleared via vector, lieu of a specified routing, to fix, radial airway, the flight should proceed by the m direct course possible to the fix, radial airway and then in accordance with two-w radio communications failure procedures.

      (7) If a flight is departing or en route an vector has taken it off the route specified the ATC clearance, the flight should be turned to the route specified in the ATC cl ance by the most direct course possible then proceed in accordance with two-w radio communications failure procedures.

   b. **Altitude**

      (1) If assigned an altitude/flight level in *highest route structure* filed in the flight p or subsequently requested, climb in accorda with the ATC clearance received and t maintain the assigned altitude/flight level the MEA, which ever is higher, to the ra facility to be used for the approach at destination airport.

      (2) If assigned an altitude *below the high route structure* requested, ATC will spec a time or fix at which further clearance be expected to an altitude/flight level wit the highest route structure requested by st ing, "*EXPECT FURTHER CLEARANCE*

RADIO COMMUNICATIONS FAILURE (Con't)

(altitude/flight level) AT (time/fix)." If radio communications *failure occurs prior to receiving a clearance* into the requested route structure,. the expected altitude/flight level should be considered an assigned altitude/flight level and a *climb* en route to the expected altitude should be made *at the time or location specified.*

(3) If assigned an altitude *below the highest route structure* filed or subsequently requested and ATC has not issued an "EXPECT FURTHER CLEARANCE AT (Altitude)," maintain the *assigned altitude/flight level or the MEA, whichever is higher, until 10 minutes after passing the first compulsory reporting point over which the failure prevented communications with Air Traffic Control, unless earlier climb is required by the minimum safe altitude.* Then climb to and maintain the lowest cardinal altitude/flight level at or above the MEA of the highest route structure requested. Cardinal altitudes are thousand-foot levels (15,000', 16,000' etc.). The MEA of the high altitude route structure is Flight Level 180.

(4) If a lower route structure has been specified as the final segment(s) of the route, the pilot should fly a route over the underlying airway maintaining the last assigned altitude/flight level.

(5) *If clearance to descend to an altitude below the highest requested route structure has been* received, *the last assigned altitude or the MEA, whichever is higher, should be maintained* in lieu of climbing back into the highest requested route structure.

(6) If *deviation from the altitude* assigned by Air Traffic Control is necessary in order to comply with a *higher MEA*, any subsequent descent required by a lower MEA shall not be made below the altitude last assigned by Air Traffic Control.

Example:

A flight is cruising at 8,000' (last assigned altitude) on an IFR flight plan when radio communications failure occurs. After passing the next fix, the minimum enroute altitude is 10,000' and climb is made to that altitude. On the last leg of the flight, the minimum enroute altitude is 3,500'. The flight descends back to 8,000' after passing the fix defining the termination of the 10,000' minimum enroute altitude segment since the last assigned altitude (8,000') is higher than the MEA (3,500').

c. Approach

(1) Maintain the enroute altitude/flight level to the radio facility to be used for the approach to the airport. Because of many variable involved, no attempt is made to specify the type approach to be used.

(a) If a *clearance for an approach* at the destination airport *has been received*, comply with the clearance or other instructions and make a descent for landing.

(b) If a *clearance for an approach* at the destination airport *has not been received*, start the descent from the en route altitude or flight level at the expected approach clearance time last received or, if no expected approach clearance time was received start the descent at the estimated time of arrival as indicated by the flight plan and subsequently amended by the pilot with Air Traffic Control, or upon arrival over the radio facility, which ever is later. An approved instrument approach procedure shall be executed unless VFR conditions are encountered and it is possible to continue descent and approach in accordance with VFR.

(c) If an aircraft is operating in accordance with an approach control clearance and has departed the outer fix on a radar vector, the flight should proceed by the most direct course to the radio facility to be used for the approach and thereafter execute an approved instrument approach procedure.

d. Holding

(1) If holding is necessary at the radio facility to be used for the approach at the destination airport:

(a) Holding and descent to the initial altitude for the execution of the instrument approach should be accomplished in a holding pattern on the side of the final approach course on which the procedure turn is prescribed.

(b) Where approved *military jet penetration* procedures have been published for the airport, *holding and descent* to initial penetration altitude/flight level should be accomplished in the *holding pattern in accordance with the procedure depicted on the jet approach and landing chart for that airport.*

5. SPECIAL MILITARY PROCEDURES

a. Aircraft, on a flight in which a delay enroute is planned, shall commence descent at the destination, at the estimated time of arrival (ETA) derived from the estimated time en route (ETE) plus any delay for which an ATC clearance has been obtained.

Example #1:

Point-to-point flight plan from A to B to C to D (airport of destination). Estimated elapsed time enroute specified in flight plan is three

RADIO COMMUNICATIONS FAILURE (Con't)

hours (A to D). Remarks indicate proposed two-hour local flight at B and one-hour local flight at C. On departure, flight is cleared to D (or a short range clearance limit). If radio communications failure is experienced prior to reaching B, flight should proceed to destination in accordance with established radio communications failure procedures. If the flight has obtained an amended clearance authorizing a two-hour delay at B and experiences radio communications failure prior to reaching B or after local flight is begun, local flight at B will be completed. Local flight at C will not be executed.

Example #2:

Round Robin flight plan from Point A to B to C and back to A. Estimated elapsed time enroute specified in flight plan is three hours (A to A). Remarks indicate one hour local flight at B and one hour local flight at A prior to landing. Action governing delay at B would be as indicated in example #1. If the flight is cleared for local flight at A and subsequently experiences radio communications failure, local flight will be completed before beginning letdown.

b. **Aerial Refueling**—Aircraft which have received authorization from ATC to conduct refueling operations involving more than one altitude/flight level and have not received clearance beyond the refueling track should exit the track at the lowest altitude/flight level specified in the clearance for the refueling portion of the flight and proceed in accordance with radio communications failure procedures.

c. **Oil Burner**—Aircraft which have been cleared for descent to the low altitude(s) of the route shall maintain the altitud(s) specified for the route. Aircraft which have not been cleared to descend to the Oil Burner route low altitude(s) s maintain the last assigned altitude/flight level proceed in accordance with radio communicat failure procedures.

d. **Turbojet En Route Penetration**—Aircraft which h been cleared for an en route penetration will ceed to the radio facility to be used for the proach at the destination airport at the last signed altitude or the Minimum Safe Alti whichever is higher and from that altitude exe the published penetration in lieu of climbin the initial penetration altitude.

FUEL JETTISONING

1. Should it become necessary to jettison fuel, the p should immediately advise Air Traffic Control. U receipt of advice that an aircraft will jettison f Air Traffic Control will broadcast or cause to broadcast immediately and every 3 minutes therea on appropriate Air Traffic Control, Flight Service tion and airline company radio frequencies the lowing:

   ADVISORY TO AIRCRAFT NOT ON A CLEARANCE—FUEL DUMPING IN PROGRES (aircraft type) (present position) (course/s) (a tude)—AVOID FLIGHT WITHIN 5 NAUTIC MILES OF FUEL DUMP AIRCRAFT.

2. Upon receipt of such a broadcast, pilots of airc affected, which are not on IFR flight plans or spe VFR clearances, should clear the area specified in advisory. Aircraft on IFR flight plans or spe VFR clearances will be provided specific separa by Air Traffic Control. At the termination of the jettisoning operation, pilots should advise Air Tr Control. Upon receipt of such information, Air T fic Control will issue, on appropriate frequencies, following:

   ADVISORY TO ALL CONCERNED—(airc type) FUEL DUMP TERMINATED.

AIRMAN'S INFORMATION MANUAL

ATC OPERATIONS AND PROCEDURES

SECTION II

MARCH 1965

FEDERAL AVIATION AGENCY

INTRODUCTION

Section II—ATC OPERATIONS AND PROCEDURES

Section II, ATC Operations and Procedures, is designed to serve as an official means of disseminating pertinent air traffic control information of interest to pilots of varied experience levels. The material is presented in layman's language to lessen the ambiguity which sometimes results from individual interpretation of rules, regulations and procedures.

The information published, governing flight operations, air traffic services and procedures within the conterminous United States is arranged and sequenced in accordance with that of a typical flight operation; i.e., preflight, departure, enroute, arrival and landing.

Supplemental to the sequenced flight operations, are supporting general and emergency information and procedures such as U.S. Entry and Departure Requirements, Air Defense Identification Zone (ADIZ) and SCATER procedures.

The Section concludes with Emergency Procedures. These procedures have been consolidated and placed last in the Section for quick and ready reference.

PREFLIGHT

GENERAL

1. Every pilot is urged to receive a preflight briefing nd to file a flight plan. This briefing would consist of eather, airport, and enroute navaid information. Briefng service may be obtained from a Flight Service Station ither by telephone/interphone, by radio when airborne, r by a personal visit to the Station.

WEATHER BRIEFING

1. Consult your local FAA Flight Service Station FSS) or Weather Bureau Airport Station (WBAS) for reflight weather briefing.

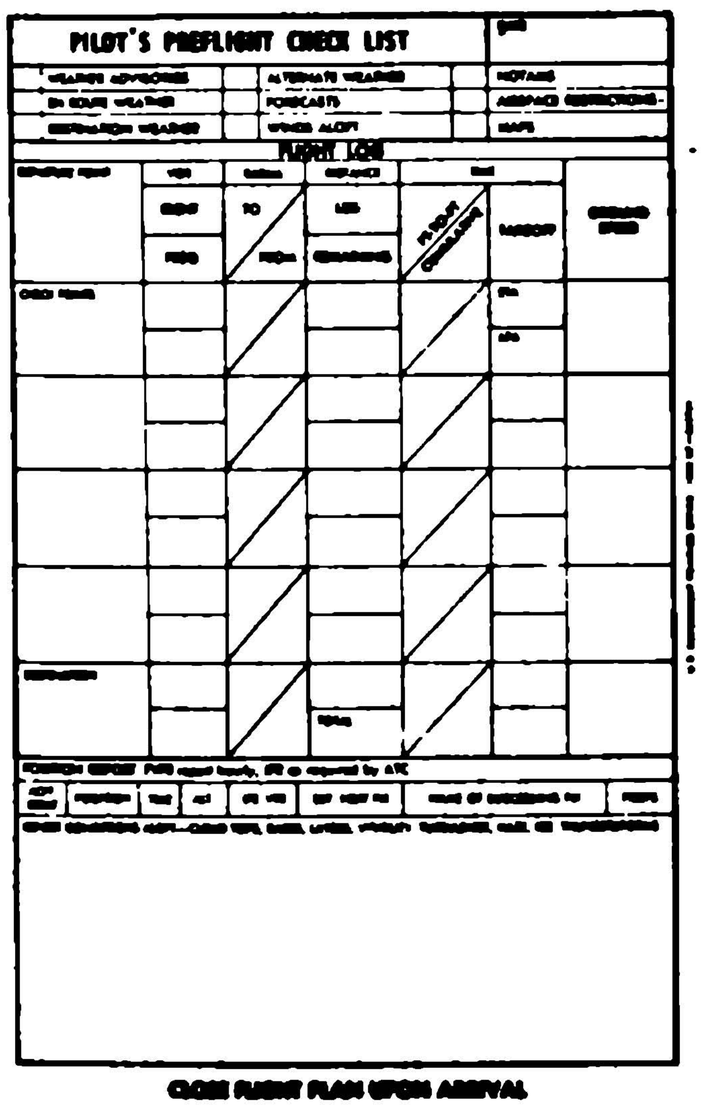
2. When telephoning for information, use the following rocedure:

a. Identify yourself as a pilot. (Many persons callng WB stations want information for purposes other an flying.)

b. State your intended route, destination, proposed eparture time and estimated time en route.

c. Advise if you intend to fly only VFR.

d. When talking to an FSS, you will be asked your ircraft identification for activity record purposes.



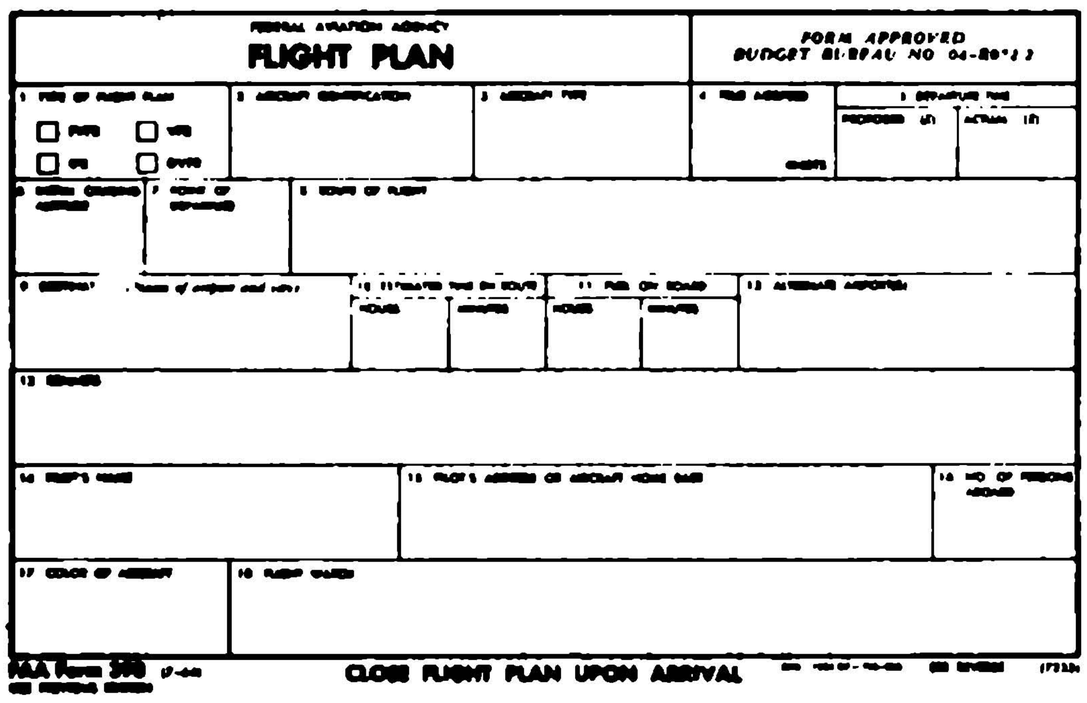
3. You are urged to use the Pilot's Preflight Check List hich is on the reverse of the flight plan form. The heck List is a reminder of items you should be aware of efore beginning flight. Also provided beneath the Check ist is a Flight Log for your use if desired.

FLIGHT PLAN—VFR

1. GENERAL

a. A flight plan is not required for VFR flight, however, it is strongly recommended that one be filed. This not only assures prompt search and rescue action in event you become overdue or missing, but it also permits en route stations and the destination station to render better service by having prior knowledge of your flight. All VFR flights, whether on a flight plan or not, should make regular position reports to FAA Flight Service Stations to receive altimeter settings and weather safety advisories.

b. Flight plan forms are available at all Flight Service Stations. A flight plan may be filed with the nearest Flight Service Station or airport traffic control tower, either in person or by telephone. Aircraft radio may be used to file if no other means are available. Some states operate aeronautical communications stations and most of thes ewill accept flight plans which are then sent to FAA for further handling.



NOTE.—Although FAR 91.83 does not require the information in item 16 for domestic flight, nor that in item 17 for any flight, pilots are urged to furnish this information to assist search and rescue if SAR action is required.

2. DVFR (DEFENSE VFR FLIGHT PLAN)

Detailed ADIZ procedures are found under GENERAL, page II-80

3. COMPOSITE FLIGHT PLAN (VFR & IFR)

a. Flight plans which specify VFR operation for one portion of a flight, and IFR for another portion, will be accepted at the point of departure. If VFR flight is proposed for the first portion of the flight, the pilot should request IFR clearance from (1) the FSS nearest the location at which change from VFR to IFR is proposed; or if unable to contact the FSS, (2) any air traffic control facility. In either case, if a *VFR flight plan* was filed for first portion of flight the pilot is responsible for notifying the FSS or air traffic control facility contacted to "CLOSE

FLIGHT PLAN—VFR (Con't)

VFR FLIGHT PLAN." The pilot must remain in VFR weather conditions until operating in accordance with the IFR clearance.

b. When a flight indicates IFR for the first portion of flight and VFR for the latter portion, the pilot will normally be cleared to the point at which the change is proposed. Once the pilot has reported over the clearance limit and does not desire further IFR clearance, he should advise Air Traffic Control to cancel the IFR portion of his flight plan. Further clearance will not be necessary for VFR flight beyond that point. If the pilot desires to continue his IFR flight plan beyond the clearance limit, he should contact Air Traffic Control at least five minutes prior to the clearance limit and request further IFR clearance. If the requested clearance is not received prior to reaching the clearance limit fix, the pilot will be expected to establish himself in a standard holding pattern on the radial/course to the fix.

4. CLOSING (F.A.R., PART 91.83(a))

VFR and DVFR flight plans must be closed (canceled), or an arrival report filed, within 30 minutes (15 minutes for jets) after the estimated time of arrival. To do this, merely notify the nearest Flight Service Station or air traffic control facility by radio or telephone. If a report is not received within this time, a communications search will be conducted by the FAA facilities along your route. If this search fails to locate your aircraft, a Rescue Coordination Center will be advised and an extensive, costly physical search for your aircraft will be initiated.

FLIGHT PLAN—IFR

1. GENERAL

a. Prior to departure from within, or prior to entering a control area or control zone, a pilot must submit a complete flight plan and receive an air traffic clearance. Instrument flight plans may be submitted to the nearest Flight Service Stations or airport traffic control tower either in person or by telephone (or by radio if no other means are available). Pilots should file IFR flight plans at least 30 minutes prior to estimated time of departure to preclude possible delay in receiving a departure clearance from ATC.

b. When filing a domestic IFR flight plan for flight in an aircraft equipped with a radar beacon transponder, DME equipment, or a combination of both, the pilot shall identify equipment capability by adding a suffix to the identification preceded by a slant, as follws:

AI2346/X	(Transponder, no code)
V23457/T	(Transponder, with code)
NI256/D	(DME)
R39857/L	(DME and transponder, no code)
AA409/B	(DME and transponder with code)

NOTE.—The suffix is not to be transmitted by radio as part of the aircraft identification.

●**c.** If TACAN only equipped, include "TACAN only" in the remarks section of the flight plan.

2. AIRWAYS/JET ROUTES

a. It is vitally important that the route of flight be accurately determined and described in the flight plan to permit accurate plotting and planning by air traffic control. The issuance of air traffic control clearances governing IFR flight within controlled airspace will be predicated on pilot conformance with adherence to ro procedures. To simplify definition of route and to fac tate air traffic control, pilots are requested to file fli plans via VOR Airways or Jet Routes established for at the altitude/flight level planned.

(1) If flight is to be conducted via the designated ways or jet routes, the route may be described by in cating the type and number of the airway(s) or route(s) requested. Federal airways or jet routes, whi ever is appropriate, which cross or merge for short tances with the airway or jet route requested should be indicated.

Example 1:

7000 MSP PRESCOTT V97 LAKEWOOD ORD

Spelled Out: Requesting 7000 feet from Minneapolis Paul International, via Prescott Intersection, Vic 97 to Lakewood Intersection, direct Chicago O'H International.

Example 2:

FL 250 MSP J30 J16 ORD

Spelled Out: Requesting Flight Level 250 Minneap St. Paul International, Jet Route 30, Jet Route to Chicago O'Hare International.

(2) The route of flight may also be described naming the reporting points over which the flight pass, provided the points named are established for at the altitude/flight level planned (see DIRE FLIGHTS below).

Example:

3000 DCA RVD BAL

Spelled Out: Requesting 3000 feet from Washington tional, via direct Riverdale direct Baltimore Frie ship International.

(3) When the route of flight is defined by named porting points, whether alone or in combination with ways or jet routes, and the navigational aids (VO VORTAC, TACAN, LF, RBN) to be used for the flight a combination of different types of aids, enough inform tion should be included to clearly indicate the route quested.

Example:

FL 310 LAX J5 LKV J3 GEG QE FL 330 HL500 HL515 WG

Spelled Out: Requesting Flight Level 310 from Los geles International via Jet Route 5 Lakeway, Route 3 Spokane, direct Kimberly, British Columb Low Frequency Range, Flight Level 330 High Le Airway 500 to Langruth, Manitoba VOR, High Le Airway 515 to Winnepeg, Manitoba.

(4) When filing IFR, it is to the pilots' advanta to file a "preferred route."

3. DIRECT FLIGHTS

a. All or any portions of the route which will not flown on the radials/courses of established airways routes, e.g., direct route flights, must be defined by in cating the radio fixes over which the flight will pa Fixes selected to define the route shall be those over whi the position of the aircraft can be accurately determine Such fixes automatically become compulsory reporti points for the flight, unless advised otherwise by AT Only those navigational aids established for use in particular structure, i.e., in the Low or High structur

FLIGHT PLAN—IFR (Con't)

may be used to define the en route phase of a direct flight within that structure.

●b. The azimuth feature of VOR aids and the azimuth and distance (DME) features of VORTAC/TACAN aids are assigned certain frequency protected areas of airspace which are intended for application to established airway and route use, and to provide guidance for planning flights outside of established airways or routes. These areas of airspace are expressed in terms of cylindrical service volumes of specified dimensions called "class limits" or "categories." An operational service volume has been established for each class in which adequate signal coverage and frequency protection can be assured. To facilitate use of VOR, VORTAC or TACAN aids, consistent with their operational service volume limits, pilot use of such aids for defining a direct route of flight in controlled airspace should not exceed the following:

(1) Operations above Flight Level 450-use aids not more than 200 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey Flight Information Publication En Route High Altitude Chart-U.S.

(2) Operation off established routes from 18,000 feet M.S.L. to Flight Level 450-use aids not more than 260 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey, Flight Information Publication, En Route High Altitude Chart—U.S.

(3) Operation of established airways below 18,000 feet M.S.L.—use aids not more than 80 nautical miles apart. These aids are depicted on the Coast and Geodetic Survey, Flight Information Publication, En Route, Low Altitude Chart—U.S.

c. Airway or jet route numbers, appropriate to the stratum in which operation will be conducted, may also be included to describe portions of the route to be flown.

Example:

140 MDW V6 V10 BRL STJ SLN GCK

Spelled Out: Requesting 14,000 feet Chicago Midway Airport Victor 6, Victor 10, Burlington, Iowa, direct St. Joseph, Missouri, direct Salina, Kansas, direct Garden City, Kansas.

NOTE.—When route of flight is described by radio fixes, the pilot will be expected to fly a direct course between the points named.

4. VFR OPERATIONS ON AN IFR FLIGHT PLAN (Ref. FAA EXAM–O–GRAM No. 6)

a. In preparation for IFR flight above an overcast or in an area of generally unlimited ceilings and visibility, pilots may request "VFR CONDITIONS ON TOP" to permit them to select an altitude, or altitudes of their choice, rather than specific ATC assigned altitudes.

b. Departing instrument-rated pilots who wish an IFR clearance only to climb through a layer of overcast or reduced visibility, and then continue flight VFR may request ATC clearance "TO VFR CONDITIONS ON TOP". This request may be made through a Flight Service Station, by telephone to ATS, or by request to the Tower before taxiing out. The clearance, which authorizes IFR flight through the cloud layer, will contain a near-by clearance limit, routing, and a request to report reaching "VFR CONDITIONS ON TOP". When the pilot reaches "VFR CONDITIONS ON TOP" and desires to cancel the IFR portion of his flight, he should so state. This type of operation can be combined with a VFR Flight Plan to destination.

c. No separation is provided. However, the pilot may expect to receive traffic information on known IFR traffic. Any time a pilot is flying "in the clear," whether at a specific assigned altitude or at an altitude assignment of "VFR CONDITIONS ON TOP", collision avoidance is the pilot's responsibility.

d. Remember that when flying on an IFR clearance with a VFR restriction, a pilot must comply with Instrument Flight Rules plus applicable Visual Flight Rules.

5. CANCELLING

a. IFR flight plans may be canceled any time by so notifying Air Traffic Control, provided the flight is operating in VFR weather conditions when such action is taken. Where conditions indicate that the remainder of the flight can be conducted in accordance with VFR, a pilot may avail himself of this procedure to remove any Air Traffic Control restrictions which may have been issued affecting his flight.

b. An IFR flight plan may be cancelled by delivering the following message to the controller or the air/ground station with which the flight is in communication: "CANCEL MY IFR FLIGHT PLAN." Since Air Traffic Control cannot approve or disapprove cancellation of the IFR flight plan, an acknowledgement that the message has been received is all that is required. If a flight plan has been cancelled and subsequent IFR operation becomes necessary, a new IFR flight plan must be filed and a traffic clearance received before encountering IFR weather conditions.

NOTE.—Where a DVFR flight plan requirement exists it will be the responsibility of the pilot to file this flight plan to replace the cancelled IFR flight plan.

DEPARTURE

COMMUNICATIONS

1. Pilots of departing aircraft should communicate with the control tower on the appropriate ground control frequency for taxi and clearance information and, unless otherwise advised, should remain on that frequency until they are ready to request take-off clearance. At that time, the pilot should communicate with the tower on the appropriate local control frequency.

2. The airport ground control frequencies 121.7 and 121.9 mc are normally provided to eliminate frequency congestion on the tower (local control) frequency. Provision of these frequencies for ground control and their use by aircraft and airport utility vehicles operated on the surface of the airport thus provides a clear VHF channel for arriving and departing aircraft. They are used for issuance of taxi information, clearances, and other necessary contacts between the tower and aircraft or other vehicles operated on the airport. Normally, only one of these ground control frequencies is assigned for use at an airport; however, at locations where the amount of traffic so warrants, both frequencies may be assigned with one or the other designated as a clearance delivery frequency.

3. Where the "ground control" frequency is not available (tower or aircraft), the tower normally will transmit to aircraft over an appropriate ground to air frequency.

4. Pilots of aircraft not equipped to transmit on a ground control frequency should transmit on the tower frequency and tune their receivers to the appropriate ground control frequency in accordance with the above.

NOTE.—See Airport Advisory Service (Non-Radar), under ARRIVAL, for communications procedures at airports not served by control towers.

LIGHT SIGNALS

1. The following procedures are used by airport traffic control towers in the control of aircraft not equipped with radio. These same procedures will be used to control aircraft equipped with radio if radio contact cannot be established. Airport traffic control personnel use a directive traffic control signal which emits an intense narrow beam of a selected color (either red, white, or green) when controlling traffic by light signals. Although the traffic signal light offers the advantage that some control may be exercised over non-radio equipped aircraft, pilots should be cognizant of the disadvantages which are:

a. The pilot may not be looking at the control tower at the time a signal is directed toward him.

b. The directions transmitted by a light signal are very limited since only approval or disapproval of a pilot's anticipated actions may be transmitted except by the use of the "General Warning Signal" which advises the pilot to be on the alert.

2. Portable traffic control light signals:

Color and Type of Signal	On the Ground	In Flight
STEADY GREEN	Cleared for take-off	Cleared to lar
FLASHING GREEN	Cleared to taxi	Return for landi (to be followe by steady gre at proper time
STEADY RED	Stop	Give way to oth aircraft and co tinue circling
FLASHING RED	Taxi clear of landing area (runway) in use	Airport unsafe—d not land
FLASHING WHITE	Return to starting point on airport	
ALTERNATING RED & GREEN	General Warning Signal—Exercise Extreme Caution	

3. Between sunset and sunrise, a pilot wishing to tract the attention of the air traffic control tower opera should turn on a landing light and taxi the aircraft position so that light is visible to the tower operator. T landing light should remain on until appropriate sign are received from the tower.

4. Pilots should acknowledge light signals by movi the ailerons or rudder during the hours of daylight or blinking the landing or navigation lights during the hou of darkness.

5. During the hours of daylight the lighting of the tating beacon will mean that ground visibility is less th three miles and/or that the ceiling is less than 1000 fe During the hours of darkness, flashing lights outlini the traffic direction indicator (tetrahedron, wind tee other device) will mean that ground visibility is less th three miles and/or the ceiling is below 1000 feet. T lighting of either of these signals indicates that a cle ance from Air Traffic Control is necessary for landi take-off, or flight in the traffic pattern if the airport within a control zone.

CLEARANCE

NOTE.—Refer to Airport Advisory Service (Nonradar), under ARRIVAL, for additional "clearance" information.

1. TAXI

a. A clearance must be obtained prior to taxiing on a runway, taking off or landing during the hours an airport traffic control tower is in operation. Authorization to taxi "to" a runway is authorization to cross runways that intersect the taxi route unless instructions to the contrary are received. Authorization to taxi "to" a runway does not constitute a clearance to taxi "on" that runway.

b. At those airports where the United States Government operates the control tower and ATC has authorized non-compliance with the requirement for two-way radio communications while operating within the airport traffic area, or at those airports where the United States Government does not operate the control tower and radio communications cannot be established, pilots shall obtain a clearance by visual light signal prior to taxiing on a runway and prior to take-off and landing. The following phraseologies and procedures are used in radio-telephone communications with aeronautical ground stations.

c. Aircraft identification, location, type of operation planned (VFR or IFR) and the point of first intended landing.

Example:

Aircraft: "WASHINGTON GROUND CONTROL, THIS IS BEECHCRAFT ONE THREE ONE FIVE NINER AT HANGAR EIGHT, READY TO TAXI, INSTRUMENT FLIGHT TO CHICAGO, OVER"

Tower: "BEECHCRAFT ONE THREE ONE FIVE NINER, RUNWAY THREE SIX, WIND ZERO THREE ZERO DEGREES AT TWO FIVE, ALTIMETER THREE ZERO ZERO FOUR, TIME ONE FOUR TWO SIX GREENWICH, ZERO NINER TWO SIX EASTERN. TAXI SOUTH HOLD SHORT OF RUNWAY THREE." (Runways are numberer to correspond to their magnetic bearing. Runway 27, for example, has a bearing of 270°. Wind directions issued by control towers are also magnetic.) Air route traffic control clearances are relayed to pilots by airport traffic controllers in the following manner:

Example:

Tower: "ATC CLEARS BEECHCRAFT ONE THREE ONE FIVE NINER TO THE CHICAGO MIDWAY AIRPORT, VIA VICTOR EIGHT, MAINTAIN EIGHT THOUSAND, OVER."

Aircraft: "BEECHCRAFT ONE THREE ONE FIVE NINER IS CLEARED TO THE CHICAGO MIDWAY AIRPORT, VIA VICTOR EIGHT, MAINTAIN EIGHT THOUSAND, OVER."

NOTE.—Normally, an ATC IFR clearance is relayed to a pilot by the ground controller. At busy locations, however, pilots may be instructed by the ground controller to "CONTACT CLEARANCE DELIVERY" on a frequency designated for this purpose. No surveillance or control over the movement of traffic is exercised by this position of operation.

2. TAKEOFF

a. Withholding Take-Off Clearance

(1) Take-off clearance will be denied to the pilot of any air carrier or commercial aircraft carrying passengers or property for compensation or hire whenever:

● (a) The runway visual range (RVR) for the departure runway is less than 1600 feet at those locations which have runway visual range digital displays.

(b) If RVR is not available, runway visibility for the departure runway is less than one quarter of a mile; or

(c) If neither RVR nor reported runway visibility is available, the prevailing visibility for the airport of departure is less than one quarter of a mile.

(2) If, upon being refused a take-off clearance, a pilot of an aircraft in the above category advises he is not carrying passengers or property for compensation or hire, for examp'e, business aircraft carrying company employees or an air carrier aircraft on a ferrying or training flight, take-off clearance may be authorized based on traffic conditions.

b. Air Traffic Clearance/Instruction

(1) When air traffic control issues a clearance, pilots are expected to execute its provision after acceptance. Any clearance in which the time of pilot execution is optional will so state—"At pilot discretion."

(2) When air traffic control issues an instruction, pilots are expected to comply with its provision upon receipt. ATC, in certain situations, will include the word "IMMEDIATELY" in an instruction to impress urgency of an imminent situation and expeditious compliance by the pilot is expected and necessary for safety.

(3) Traffic clearances will only provide standard separation between IFR flights. *During the time an IFR flight is operating in VFR weather conditions, it is the direct responsibility of the pilot to avoid other aircraft, since VFR flights may be operating in the same area without the knowledge of ATC.*

(4) Air Traffic Control will not issue clearances specifying that climb or descent or any portion of the flight be conducted in "VFR conditions," to any IFR flight, regardless of altitude, except under emergency situations, or unless specifically requested by the pilot. When a VFR restriction is issued at the pilot's request, general traffic information will be issued to the pilot of an aircraft operating with a clearance specifying a "VFR conditions" restriction for climb or descent.

(5) A traffic clearance originated by an ARTC Center and relayed to the pilot through a control or air/ground communication station will be prefixed by "ATC CLEARS." Other ATC messages which are originated by a center will be prefixed with "ATC REQUESTS" or "ATC ADVISES."

(6) The traffic clearance issued prior to departure will normally authorize flight to the airport of intended landing. Under certain conditions, at some locations a short range clearance procedure is utilized whereby a clearance is issued to a fix within or just outside of the terminal area and the pilot is advised of the frequency on which he will receive the long range clearance direct from the center controller.

(7) ATC facilities will use the phrase "VIA FLIGHT PLANNED ROUTE" in air traffic clearances to replace the lengthier detailed description of any portion of the route of flight that is identical to the route filed by the pilot. When used, the phrase will be preceeded by sufficient detailed route of flight information to establish the flight on the filed route. The *"VIA FLIGHT PLANNED ROUTE" phraseology does not include ap-*

CLEARANCE (Con't)

proval of altitudes filed in the flight plan. Specific altitude assignments will be issued in each clearance. Approval of any change of altitude, whether such altitude is contained in the flight plan or is subsequently desired en route, should be requested prior to reaching the point at which it is desired to make the change. IFR flight plans filed by the pilots should contain the complete route of flight and should be relayed to Air Traffic Control unchanged. Pilots may request route verification when considered necessary and are requested to do so whenever a filed route has been changed prior to departure. If route verification is desired prior to departure, the request should be included with initial call for taxi clearance to avoid delay in receiving the information.

(8) Amendments to the initial clearance will be issued at any time an air traffic controller deems such action necessary to avoid possible confliction between aircraft. Clearances will require that a flight "hold" or change altitude prior to reaching the point where standard separation from other IFR traffic would no longer exist. Some pilots have questioned this action and requested "traffic information" and were at a loss when the reply indicated "no traffic reported." In such cases the controller has taken action to prevent a traffic confliction whoch would have occurred at a distant point .

(9) A pilot may wish an explanation of the handling of his flight at the time of occurrence; however, controllers are not able to take time from their immediate control duties nor can they afford to overload the ATC communications channels to furnish explanations. Pilots may obtain an explanation by directing a letter or telephone call to the chief controller of the facility involved.

(10) Clearances are normally issued for the altitude/flight level and route filed by the pilot. However, due to traffic conditions, it is frequently necessary for ATC to specify an altitude/flight level or route different from that requested by the pilot. In addition, flow patterns have been established in certain congested areas, or between congested areas, whereby traffic capacity is increased by routing all traffic on preferred routes. Information on these flow patterns is available in offices where pre-flight briefing is furnished or where flight plans are accepted.

(11) The pilot has the privileges of requesting a different clearance from that which has been issued by ATC if he feels that he has information which would make another course of action more practicable or if aircraft forbid compliance with the clearance issued.

(12) Whenever an aircraft has been cleared to a point other than the destination airport, it is the responsibility of the ATC controller to furnish the pilot (or the air/ground communications facility concerned) with an additional clearance prior to the time the flight arrives at the clearance limit. This clearance may authorize flight beyond the clearance limit or contain holding instructions for the flight. However, when such clearance is not received by the time a flight is three minutes from the clearance limit the pilot is expected to effect speed reduction so as to cross the clearance limit initially at or below maxinum holding speed (unless subsequent clearance prior to reaching the clearance limit permits flight beyond it) ; and when reaching the clearance limit, begin holding in a STANDARD HOLDING PATTERN ON THE COURSE ON WHICH HE APPROACHES THE FIX (disregarding any other pattern shown for the fi maintaining the last assigned altitude/flight level a immediately request further clearance through the a ground station. The altitude/flight level of the aircr at this clearance limit will be protected so that sepa tion will exist in the event the aircraft holds await further clearance.

NOTE.—The foregoing should not be construed as be related in any way to the procedures which apply whe two-way radio failure occurs.

(13) Pilots should pay particular attention to clearance and not assume that the route and altitu flight level are the same as requested in the flight pl It is suggested that pilots make a written record of cle ances at the time they are received, and verify, by repeat back, any portions that are complex or about wh a doubt exists.

c. Special VFR Flight Clearance Procedures (F.A.R. Part 91.1

(1) An Air Traffic Control clearance is necessary avoid collision when operating under special VFR weat minimums in a control zone. When a control tower located within the control zone, a clearance must be tained from the tower before entering the control zo If no control tower is located within the control zo a clearance must be obtained from the nearest tow center, or Flight Service Station, prior to entering t control zone. In this instance, clearance arrangemer can be made by telephone.

(2) It is not necessary to file a complete flight pl with the request for clearance but the pilot should st his intentions in sufficient detail to permit air traffic c trol to fit his flight into the traffic flow. The clearar will not contain a specific altitude as the pilot must main clear of clouds. The controller may require t pilot to fly at or below a certain altitude due to otl traffic, but the altitude specified will permit flight at above the minimum safe altitude. In addition, at rad locations, flights may be vectored if necessary for cont purposes or on pilot request .

3. STANDARD INSTRUMENT DEPARTURES (SIDS)

a. A Standard Instrument Departure (SID) is an traffic control coded departure routing which has be established at certain airports to simplify clearance d livery procedures.

b. Pilots of air carrier or military aircraft operati under Instrument Flight Rules (IFR) at airports f which SIDs have been published may be issued clearanc whenever ATC determines it is appropriate.

c. Pilots of other than air carrier or military aircr operating under Instrument Flight Rules (IFR) at a ports for which SIDs have been published will not issued a SID clearance by ATC unless requested by t pilot.

●d. It will be the responsibility of each pilot to acce or refuse the clearance issued.

e. SIDs are published by the Coast & Geodetic Surv as a part of the Flight Information Publication packag

4. ADHERENCE TO AIR TRAFFIC CLEARANCE

a. When air traffic clearance has been obtained und either the Visual or Instrument Flight Rules, the pilot i command of the aircraft shall not deviate from the pr visions thereof unless an amended clearance is obtaine

CLEARANCE (Con't)

The addition of a VFR or other restriction, i.e., climb/descent point or time, crossing altitude etc., does not authorize a pilot to deviate from the route of flight or any other provision of the air traffic control clearance.

b. The most important and guiding principal to remember is that the last ATC clearance has precedence over related portions of the previous ATC clearance. A clearance which amends an altitude of a previous clearance does not affect route of flight nor does a clearance which amends the route of flight affect the altitude portion of a previous clearance.

Example: A departure flight receives a clearance to destination airport to maintain Flight Level 290. The clearance incorporates a SID which has certain altitude crossing instructions. Shortly after take-off, the pilot receives a new clearance changing the maintaining Flight Level from 290 to 250. In this instance, altitude restrictions are automatically canceled and the pilot should commence an unrestrictive climb to Flight Level 250. If the controller had wished to retain the altitude restrictions, he would have either restated them or made it clear in the language of the clearance that only the final maintaining level was being changed.

c. In case emergency authority is used to deviate from provisions of an ATC clearance the pilot in command shall notify ATC as soon as possible and obtain an amended clearance. In an emergency situation which results in no deviation from the Rules prescribed in Part 91 but which requires air traffic control to give priority to an aircraft, the pilot of such aircraft shall make a report within 48 hours of such emergency situation to the nearest FAA Regional Office.

d. In addition to altitude/flight level destination and/or route changes, increasing or decreasing the speed of an aircraft constitutes a change in a flight plan. Therefore, if any time the average true airspeed at cruising altitude between reporting points varies or is expected to vary from that given in the flight plan by *plus or minus ten knots*, air traffic control should be advised.

e. Air traffic clearances include data to assist pilots in identifying radio reporting points for where there is more than one type with the same name, for example: "Denver VOR." It is the responsibility of a pilot to notify air traffic control immediately if his radio equipment cannot receive the type of signals he must utilize to comply with his clearance.

f. The altitude/flight level instructions in an ATC clearance normally require that a pilot "MAINTAIN" the he altitude/flight level at which the flight will operate when in controlled airspace. Altitude/flight level changes while en route should be requested prior to the time the change is desired.

g. The term "CRUISE" may be used instead of "MAINTAIN" to signify to the pilot that descent from cruising altitude may be commenced at his discretion without further clearance from ATC. "CRUISE" is normally used only for relatively short flights in uncongested areas and is authorization for the flight to proceed to, and make an approach at, destination.

5. SEPARATION STANDARDS

a. Air traffic control effects separation of aircraft vertically by assigning different altitudes; longitudinally by providing a minimum time separation between aircraft on the same courses; and laterally by assigning different flight paths.

b. Standard separation will be provided between all aircraft operating on IFR flight plans except: (1) when "VFR" Conditions-On-Top" has been requested by a pilot and authorized by ATC in lieu of a specific cruising or holding altitude, and (2) when clearances specifying that climb or descent or any portion of the flight shall be conducted in "VFR Conditions" are issued.

DEPARTURE CONTROL

1. Departure Control is a tower-function responsible for ensuring separation between departures. So as to expedite the handling of departures, Departure Control may suggest a take-off direction other than that which may normally have been used under VFR handling. Many times it is preferred to offer the pilot a runway that will require the fewest turns after take-off to place the pilot on his filed course or selected departure route as quickly as possible. At many locations particular attention is paid to the use of preferential runways for local noise abatement programs, and route departures away from congested areas.

2. Departure Control utilizing radar will normally clear aircraft out of the terminal area using standard instrument departures via radio navigation aids. When a departure is to be vectored immediately following take-off, the pilot will be advised prior to take-off of the initial heading to be flown. When given a vector taking his aircraft off a previously assigned nonradar route, the pilot will be advised briefly what the vector is to achieve. Thereafter, radar service will be provided until the aircraft has been re-established "on-course" using an appropriate navigation aid and the pilot has been advised of his position; or, a handoff is made to another radar controller with further surveillance capabilities.

3. Controllers will inform pilots of the departure control frequencies and, if appropriate, the transponder code before take-off. Pilots should not operate their transponder until ready to start the take-off roll or change to the departure control frequency until required.

ENROUTE

AIRWAYS/ROUTE SYSTEMS

1. Two route systems have been established for air navigational purposes in the continguous 48 states; the VOR and L/MF System and the Jet Route System.

a. The VOR and L/MF Airway System consists of airways designated from 700 feet above the surface (or in some instances higher) to but not including 18,000 feet MSL and is designed to serve aircraft which operate at these altitudes. These airways are depicted on Coast and Geodetic Survey, Flight Information Publications, En Route Low Altitude Charts—U.S. Series L–1 through L–28.

(1) The VOR airways are predicated solely on VOR/VORTAC navigation aids and are depicted on aeronautical charts by a "V" ("Victor") followed by the airway number, e.g., V 12. These airways are numbered similarly to U.S. highways. As in the highway numbering system, a segment of an airway which is common to two or more routes carries the numbers of all the airways which coincide for that segment. When such is the case a pilot in filing a flight plan needs to indicate only that airway number of the route which he is using. *Alternate Airways* are identified by their location with respect to the associated main airway. "Victor 9 West" indicates an alternate airway associated with, and lying to the west of Victor 9. As in the interstate highway system, major metropolitan areas, in many instances, are connected by *preferred routes* of flight which may include many numbered airway segments. To facilitate flight planning and to reduce phraseology, these preferred routes are assigned an 800 series airway number. Accordingly, a pilot in filing a flight plan need only to indicate the 800 series airway number assigned to the route he is using.

(2) One of the major reasons for establishing a VOR airway system separate from the colored airway system (L/MF) is to facilitate route identification in flight plans and air traffic clearances. A pilot who intends to make an airway flight, using VOR facilities, will simply specify the appropriate "Victor" airway(s) in his flight plan. For example, if a flight is to be made from Chicago to New Orleans at 8000 feet, using omniranges only, the route may be indicated as "Departing from Chicago-Midway, cruising 8000 feet via Victor 9 to Moisant International." If flight is to be conducted in part by means of L/MF navigation aids and in part on omniranges, specifications of the appropriate colored airways and Victor airways in the flight plan will indicate which types of facilities will be used along the described routes, and, for IFR flight, permit ATC to issue a traffic clearance accordingly. As an example, route information for a flight from Chicago to New Orleans using L/MF facilities to St. Louis and VOR's to New Orleans would be given as "Departing Chicago-Midway cruising 8000 feet via Red 14, Amber 5 to St. Louis Victor 9 to Moisant International." A route may also be described by specifying the station over which the flight will pass, but in this case since many VOR's and L/MF aids have the sa name, the pilot must be careful to indicate which aid w be used as a particular location. This will be indicat in the route of flight portion of the flight plan by speci ing the type of facility to be used after the location na in the following manner: Newark L/MF, Allentown VC

(3) With respect to position reporting, compuls reporting points are designated for VOR Airway Syste Flights using Victor Airways will report over these poi only, unless requested otherwise by ATC to furnish ad tional position reports.

(4) The L/MF airways are predicated solely L/MF navigation aids and are depicted on aeronauti charts by color and number; e.g., Amber One. Green a Red airways are plotted east and west. Amber and Bl airways are plotted north and south. This obsolete s tem, which is incompatible with the VOR system, almost entirely replaced by the VOR airway system.

b. The Jet Route System consists of jet routes est lished from 18,000 feet MSL to FL 450 inclusive design to serve aircraft which customarily operate at the altitudes.

(1) Jet routes are based on VOR, VOR-DME a VORTAC facilities shown on high altitude charts. Th are identified by the letter "J" followed by a numb This structure is depicted on Coast and Geodetic Surv Flight Information En Route High Altitude Charts U.S. Series H–1 through H–4.

(2) Operation above FL 450 may be conducted a point-to-point basis. Navigational guidance is provid on an area basis utilizing those facilities depicted on t Coast and Geodetic Survey, Flight Information Publi tion En Route High Altitude Charts—U.S. Series H through H–4.

2. To the extent possible, these route systems have be aligned in an overlying manner to facilitate transiti between each. To simplify definition of route and facilitate air traffic control ,pilots are requested to f via the airways/jet routes published for the altitud flight level planned.

3. **Pilots are cautioned when flying in Canadian airspace, review Canadian Air Regulations.** Special attention shou be given to the parts which differ from U.S. Federal A ation Regulations. For example, the Canadian airwa "Block Airspace" restriction, which requires an A clearance when flying on airways between 9500′ a 23,000′ MSL east of longitude 114°W and between 12,5 and 23,000′ MSL west of longitude 114°W. In additi no person holding a commercial or private pilot licen without an instrument rating shall operate an aircra in VFR flight within block airspace unless he has succe fully completed a written examination demonstrating k knowledge of radio navigation and of air traffic contr procedures applicable to IFR flight including clearan and position reports and his license is endorsed to th effect by the Canadian Department of Transport.

CONTINENTAL CONTROL AREA

1. The Continental Control Area consists of the airspace of the 48 contiguous states and the District of Columbia at and above 14,500 feet MSL, but does not include:

a. The airspace less than 1500 feet above the surface of the earth; or

b. Prohibited and restricted areas, other than restricted area military climb corridors and the restricted areas listed in Subpart D of Part 71 of the F.A.R.

2. To alleviate the risk of collision between the high performance aircraft using this airspace, VFR minimums have been increased to: visibility, 5 miles; distance from clouds, 1000 feet under, 1000 over, and one mile horizontally.

POSITIVE CONTROL AREA

1. Airspace so designated wherein all aircraft are controlled. For operations within positive control areas, aircraft must be:

a. Operated under IFR at specified altitude assigned by ATC.

b. Equipped with instruments and equipment required for IFR operations and is flown by a pilot rated for instrument flight:

c. Equipped with a coded radar beacon transponder, having a Mode A (military Mode 3) 64 code capability, reply to Mode 3/A interrogation with the code specified by ATC; and

d. Radio equipped to provide direct pilot/controller communication on the frequency specified by ATC for the area concerned.

2. ATC may authorize deviations from the above requirements for operation in a positive control area. In the case of in-flight failure of a radar beacon transponder, ATC may immediately approve operation within a positive contro larea. In all other cases, requests for an authorization to deviate must be submitted at least four days before the proposed operation, in writing, to the ARTC Center having jurisdiction over the positive control area concerned. ATC may authorize deviations on a continuing basis or for an individual flight, as appropriate.

JET ADVISORY SERVICE

1. GENERAL

a. Jet Advisory Service has been established as a means of providing an increased degree of safety for civil air carrier turbojet and certain other civil flights. In radar jet advisory areas, this service is performed by selected radar equipped facilities and provides the pilots of civil air carrier turbojet and certain other civil flights with information intended to aid them to see and/or avoid other pertinent traffic. In nonradar jet advisory areas, civil air carrier turbojet and certain other civil flights receiving this service are afforded standard IFR separation from all other flights known by ATC to be operating within these areas. Although standard ATC separation is provided between aircraft receiving jet advisory service and all other aircraft within the nonradar jet advisory area, standard separation is not provided and may not exist between such aircraft and aircraft operating VFR or VFR conditions-on-top outside the area.

b. This service is provided to all civil air carrier turbojet flights. It is proffered by the appropriate ATC facility to other IFR civil flights, excluding those cleared to maintain "VFR conditions" or "VFR conditions-on-top," which are radar beacon equipped and cleared via jet routes along which jet advisory areas are prescribed; except that, jet advisory service is not provided to flights, other than civil air carrier turbojets, whose pilots have declined the service. Whenever workload will not permit provision of this service to all flights specified herein, it may be discontinued to flights other than civil air carrier turbojets. In such event, pilots of those flights affected will be so advised.

c. Except where positive control areas have been established, radar jet advisory areas consist of airspace prescribed not more than 16 statute miles on either side of specified jet routes, and in certain control areas and control area extensions, between Flight Levels 240 and 410 inclusive. Due to limited vertical radar coverage, however, the lower limits may be established above the Flight Level 240 and therefore, may overlie nonradar jet advisory areas. When radar jet advisory areas are established above nonradar jet advisory areas, the nonradar jet advisory areas are limited to levels below the radar jet advisory areas.

2. DEFINITIONS

Jet advisory service—The service provided certain civil flights while operating within radar and nonradar jet advisory areas. Within radar jet advisory areas, civil flights receiving this service are provided radar flight following, radar traffic information and vectors around observed traffic. In nonradar jet advisory areas, civil flights receiving this service are afforded standard IFR separation from all other flights known to ATC to be operating within these areas.

Radar flight following—The radar tracking of identified aircraft targets and the observation of the progress of such flights sufficiently to perform a particular radar function.

Radar traffic information—Any aircraft observed on the radar scope which in the judgment of the controller appears to constitute a hazard to the operation of flight being provided jet advisory service.

NOTE.—Radar jet advisory areas and nonradar jet advisory areas and the flight levels comprising these areas are depicted on En Route-High Altitude Charts, U.S.

3. JET ADVISORY AREA PROCEDURES

a. F.A.R. Part 91.99 requires an aircraft equipped with a functioning Mode 3/A radar beacon transponder, to operate the transponder on the code specified by ATC. This regulation imposes no additional operational restriction, control or communications requirements on non-air carrier civil or military VFR flights or IFR flights cleared to climb or descend in VFR conditions or cleared to maintain VFR conditions-on-top when operating within radar jet advisory areas.

(1) To comply with the transponder requirements, transponders shall be adjusted as outlined in "Air Traffic Control Radar Beacon System (ATCRBS)."

NOTE.—Although charts may show radar jet advisory areas overlapping restricted airspace, pilots of aircraft conducting authorized operations within such airspace are not required to operate transponders during the time such airspace is being utilized for the purpose for which designated; however, operation of transponders as described above is

JET ADVISORY SERVICE (Con't)

encouraged. Flights authorized by the air traffic control facility (controlling agency) to operate through or within such airspace, or flights leaving such airspace to enter a radar jet advisory area are required to operate transponders as described above.

b. Pilots of aircraft not equipped with functioning coded beacon transponders desiring to operate within radar jet advisory areas when operating VFR, or IFR when cleared to climb or descend in VFR conditions or to maintain VFR conditions-on-top, must obtain specific authorization from the appropriate ARTC Center prior to the time of entering such areas. ATC clearances specifying climb or descent in VFR conditions or a cruising level of VFR conditions-on-top, but not including specific authorization to operate within or across radar jet advisory areas, do not constitute such approval.

c. In the event of two-way communications failure which precludes obtaining authorization to operate within a radar jet advisory area, the flight may:

(1) When IFR—operate within a radar jet advisory area provided a specific altitude has been assigned by ATC.

(2) When VFR—operate within a radar jet advisory area provided an appropriate VFR cruising flight level is maintained.

4. SERVICE PROVIDED CIVIL AIR CARRIER TURBOJET AND CERTAIN OTHER CIVIL FLIGHTS WITHIN AREAS OF RADAR COVERAGE

a. Civil air carrier turbojet and certain other civil flights, as described in Paragraph 1.b above, are provided service as follows:

(1) Within radar jet advisory areas, flights are radar flight followed and furnished traffic information and vectors, subject to limitations set forth below, to avoid traffic observed with radar.

(2) Within positive control airspace, jet advisory service is not provided and procedures prescribed for control of traffic within such airspace apply.

(3) Outside radar jet advisory areas and positive control airspace, IFR flights are radar flight followed and furnished radar traffic information at all altitudes and flight levels to the maximum extent practicable consistent with controller workload and limitations of the radar equipment.

b. Primary radar is utilized at all times, unless precipitation or electronic countermeasure interference or other conditions render it unusable. Radar beacon is utilized for identification, radar handoff and primary radar target reinforcement to the maximum extent practicable. In the event either the primary radar or the radar beacon system is unusable, service is continued with that system which is still usable, and pilots are advised accordingly.

NOTE.—Due to the fact that coverage patterns obtained from primary radar and radar beacon may not be the same in all areas, even though their antennas are co-located, it is possible that this service will be provided in areas from which only primary radar or radar beacon returns are being received. If both systems are operating normally the pilot will not be advised of these circumstances.

c. Radar handoff of flights receiving this service is effected at all times above Flight Level 240 within overlapping radar coverage, unless the controller is prevented from doing so by circumstances beyond his control. Radar handoff of these flights below Flight Level 240 effected to the extent permitted by equipment, train personnel and traffic conditions.

d. Traffic information furnished flights receiving tl service includes, to the extent practicable, informati as to whether observed radar traffic is seen with rad beacon, and if the type aircraft is unknown, by the r of the words "fast" or "slow," advice on the relati speed of the observed radar traffic.

e. Whenever, in the opinion of the jet advisory c troller, an observed primary radar or beacon aircr target is on a course which is likely to cause it to mer with or touch the target of the flight receiving this se ice, that flight is vectored to avoid the observed traf insofar as possible, whether or not the pilot reque vectoring, except that:

(1) Whenever feasible, flights not receiving this se ice, but radar identified and in communication with t jet advisory controller, may be vectored to avoid the flig being provided the service.

(2) If the pilot of the flight being provided this ser ice advises that he does not desire vectoring, the c troller does not provide radar vectors but will contin to provide traffic information.

(3) If the pilot of the flight being provided this ser ice advises that he has the potentially conflicting traf in sight, radar vectors are not given.

(4) Flights receiving this service are not vector to avoid nonbeacon targets which are judged by the co troller to be slow moving, unless specifically request by the pilot; however, traffic information regarding suc flights is furnished.

(5) Flights receiving this service are not vector to avoid other IFR flights that are in communication wi the jet advisory controller; are radar identified; ar are being afforded nonradar IFR separation from the flights. When such flights are operating at assigne flight levels which differ by 2,000 feet or less from tl assigned flight level of the flight being provided this ser ice and the radar flight paths of these aircraft are suc that, in the opinion of the controller, a vector would l necessary if altitude separation did not exist, the contro ler will issue traffic information, including assigned flig levels, to both aircraft concerned.

(6) When a concentration of targets is observed l the jet advisory controller which precludes vectoring t avoid individual targets, pilots of flights receiving th service are advised of the traffic, and that vectors canno be given from individual targets. They are also told th extent of vectoring that would be necessary to avoid th area in which said traffic exists. Should a pilot reque to be vectored around that area, the request will be com plied with, provided it is within usable radar coverag Should he not request vectoring around the area, he wi be advised when his aircraft is clear of the area and ve toring from individual targets is being resumed.

f. When a civil flight, as specified in Paragraph 1.b is operating VFR in a terminal area, the terminal ai traffic control facility provides radar traffic informatio or, in lieu therof, visual surveillance and advise regar ing traffic to the maximum extent practicable consisten with workload, traffic conditions, weather, etc. Insofa as is possible, radar surveillance is maintained until visua surveillance is established.

JET ADVISORY SERVICE (Con't)

5. RADIO OR RADAR FAILURE PROCEDURES APPLICABLE TO FLIGHTS BEING PROVIDED RADAR JET ADVISORY SERVICE

a. In the event of a ground radar failure the pilot is expected to continue in accordance with his last received ATC clearance remaining on the radar facility's radio frequency until further advised. If the radar failure will be prolonged, the pilot may be advised to change to an appropriate ARTC Center frequency until radar service can be resumed.

b. In the event of loss of communication with the jet advisory controller on the last assigned control frequency, the pilot should attempt to re-establish communication with the controller as specified in "COMMUNICATIONS". If it has been determined that only the aircraft transmitting capabilities have failed, the pilot should be alert for advice on the last assigned control frequency of 121.5 mc to acknowledge instructions by actuating the radar beacon IDENT features or by executing specific code changes.

6. VFR FLIGHT REQUIREMENTS FOR NONRADAR JET ADVISORY AREAS

a. These areas consist of airspace prescribed from Flight Level 270 thru 310 inclusive, and from Flight Level 370 thru 410 inclusive, along segments of specified jet routes where radar traffic information cannot be provided due to lack of radar coverage. Their width is not more than 16 statute miles on either side of such jet routes as specified in Federal Aviation Regulations, Part 75.

b. Air Route Traffic Control Centers provide IFR separation between civil flights receiving this service and all other aircraft known to ATC operating within nonradar jet advisory areas, including VFR and IFR flights cleared to maintain VFR conditions-on-top or to climb or descend in VFR conditions, which are authorized to transit nonradar jet advisory areas. The following operational procedures apply to pilots of all aircraft operating VFR, as well as those cleared by ATC to climb or descend in VFR conditions or cleared to maintain VFR conditions-on-top which desire to fly across or within those areas designated as nonradar jet advisory areas.

(1) Specific authorization must be obtained from the appropriate ARTC Center prior to entering these designated areas. When an ATC clearance specifies climb or descent in VFR conditions or a cruising level of VFR conditions-on-top and does not include specific authorization to transit these areas, the pilot must obtain such authorization prior to entering a nonradar jet advisory area.

c. Request for specific authorization to proceed VFR or VFR conditions-on-top, across or within these areas must include a position report, type of aircraft and estimated time of entry and exit from these segments. Unrestricted authorization will be granted, except that when conflict with a civil flight receiving this service is indicated, aircraft operating VFR or IFR maintaining VFR conditions-on-top will be advised of the civil flight and said approval will restrict operation to specific flight level(s), time or locality, as appropriate, to preclude conflict with the civil flight.

d. No ATC separation is provided between VFR traffic or between VFR and IFR traffic other than civil flights receiving this service; however, traffic information is issued as appropriate.

7. The above procedures are applicable to those areas designated in Part 75 of Federal Aviation Regulations.

HOLDING

1. When holding at a VOR station pilots should begin the turn to the outbound leg at the time of the first complete reversal of the "to-from" indicator.

2. The direction to hold with relation to the holding fix will be specified as one of eight general points of the compass; i.e., North, Northeast, East, etc.

3. Pilots are always expected to hold in a standard right turn pattern unless specifically advised otherwise by ATC. When it is necessary that a non-standard pattern be flown, the ATC clearance will specify "left turns."

4. ATC clearance requiring that an aircraft be held at a holding point will include the following information:

a. To hold in a Standard or Nonstandard Pattern.

(1) The direction to hold from holding point;

(2) Holding fix;

(3) On (specified) radial, course, magnetic bearing, airway number or jet route;

(4) Outbound leg length in nautical miles if DME is to be used;

(5) Left turns, if nonstandard pattern is to be used;

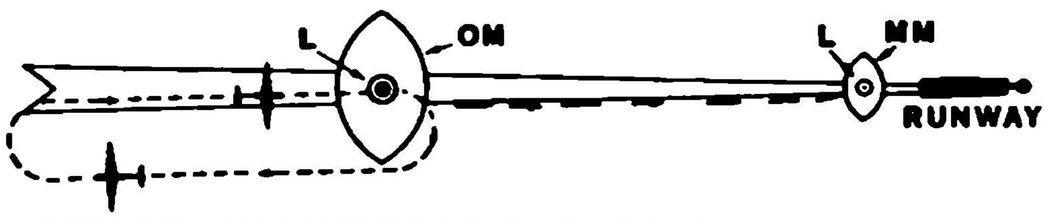
(6) Time to expect further clearance, or time to expect approach clearance.

b. Detailed holding instructions: Same as **a** (1), (2), and (3) above with following additions to (4) and (5):

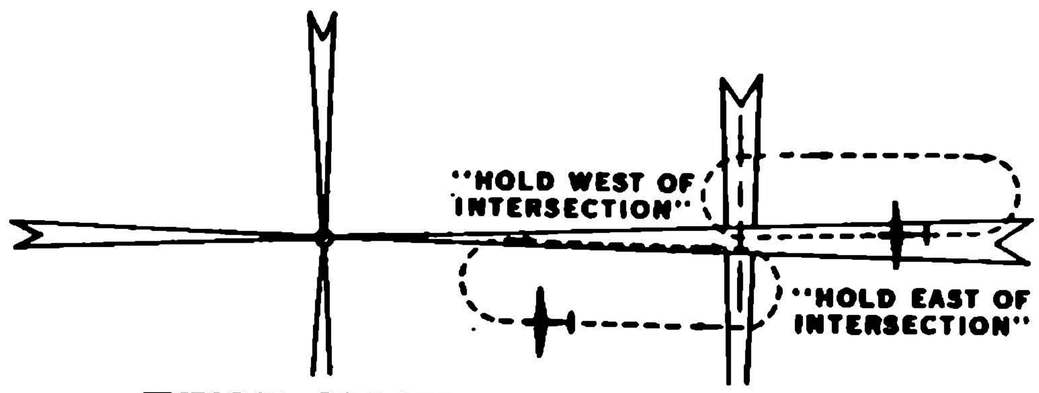
(4), or minute/s if DME is not to be used.

(5), or right turns if standard pattern is to be used.

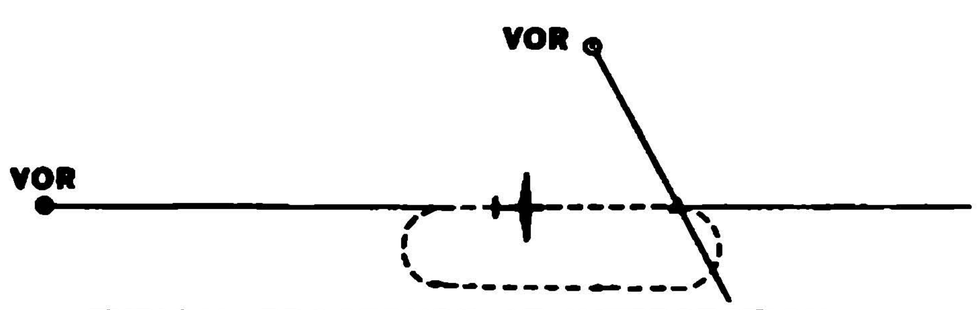
EXAMPLES OF HOLDING



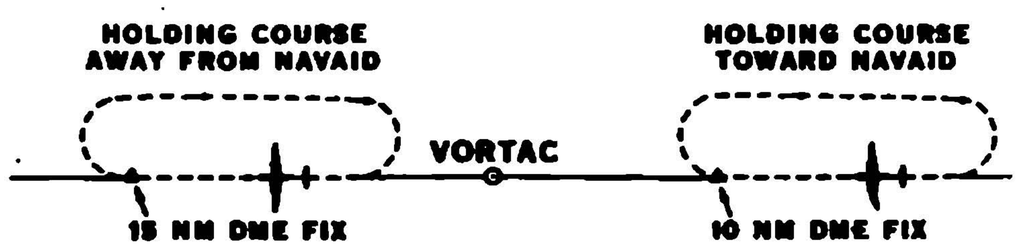
TYPICAL PROCEDURE ON AN ILS OUTER MARKER



TYPICAL PROCEDURE AT INTERSECTION OF RADIO RANGE COURSES



TYPICAL PROCEDURE AT INTERSECTION OF VOR RADIALS



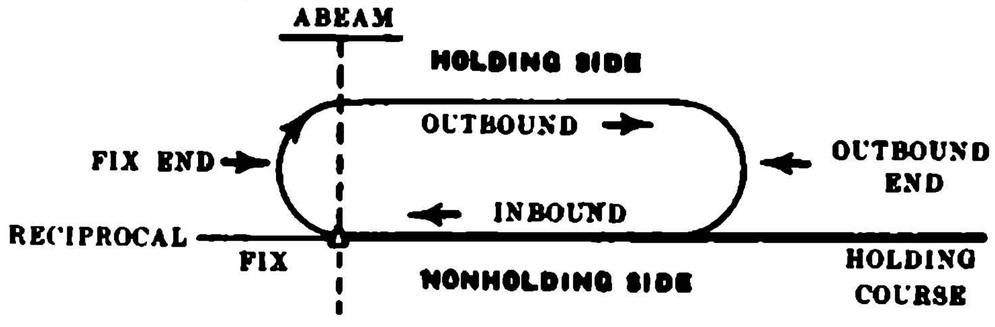
TYPICAL PROCEDURE AT DME FIX

HOLDING (Con't)

5. Holding pattern airspace protection is based on the following procedures. They are the only procedures for entry and holding recommended by FAA.

a. Entry Procedures

(1) Descriptive Terms



Standard Pattern : Right turns (illustrated)
Nonstandard Pattern: Left turns

(2) Airspeeds (maximum)

(a) Propeller-driven ..... 175K IAS

(b) Civil turbojet

1. MHA through 6,000 feet ..... 200K IAS
2. Above 6,000 feet through 14,000 feet ..... 210K IAS

Above 14,000 feet ..... 230K IAS

(c) Military turbojet

1. All-except aircraft listed below in (2) and (3) ..... 230 IAS
2. F-84F, F-100[1], F-102, F-104, F-106, T-38, F-4, F-8, F-11, A-5 ..... 265K IAS
3. F-100[1], F/RF-101, F-105, B-58 .. 310K IAS

[1] F-100 holding speed depends upon weight and drag configuration.

(d) Turboprop aircraft may operate at normal climb IAS while climbing in a holding pattern and turbojet aircraft may operate at 310K IAS or less while climbing in a holding pattern.

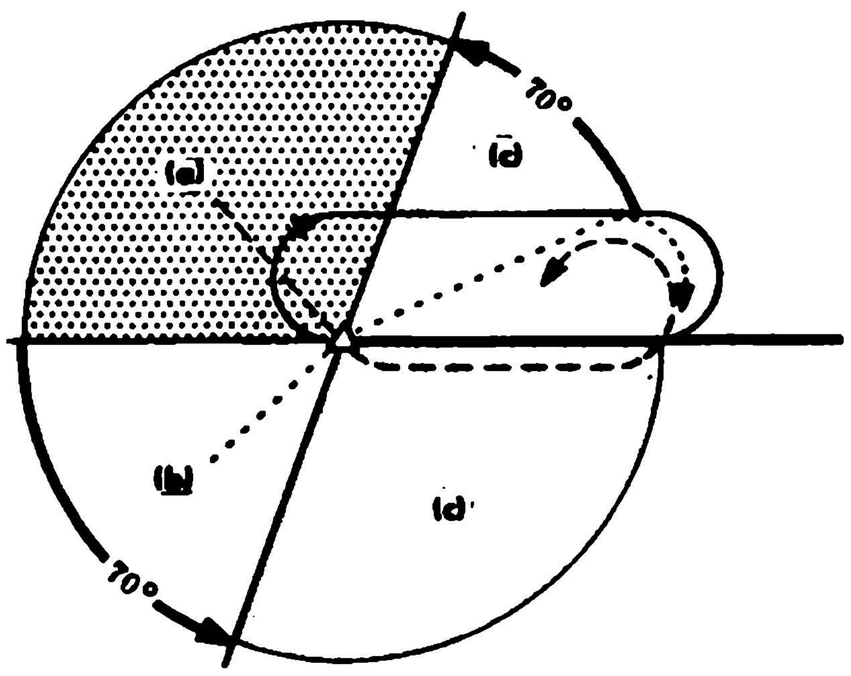
(3) Entry

(a) Parallel Procedure—Parallel holding course, turn left, and return to holding fix or intercept holding course.

(b) Teardrop Procedure—Proceed on southbound track of 30° (or less) to holding course, turn right to intercept holding course.

(c) Direct Entry Procedure—Turn right and fly the pattern.

STANDARD PATTERN



(4) Timing

(a)	At or below 14,000 ft. MSL	Above 14,000 ft. MSL
INBOUND leg*	1 min.	1½ min.

*NOTE.—The *initial* outbound leg should be flown for min. or 1½ min. (appropriate to altitude). Timing subsequent outbound legs should be adjusted as necessa to achieve proper inbound leg time.

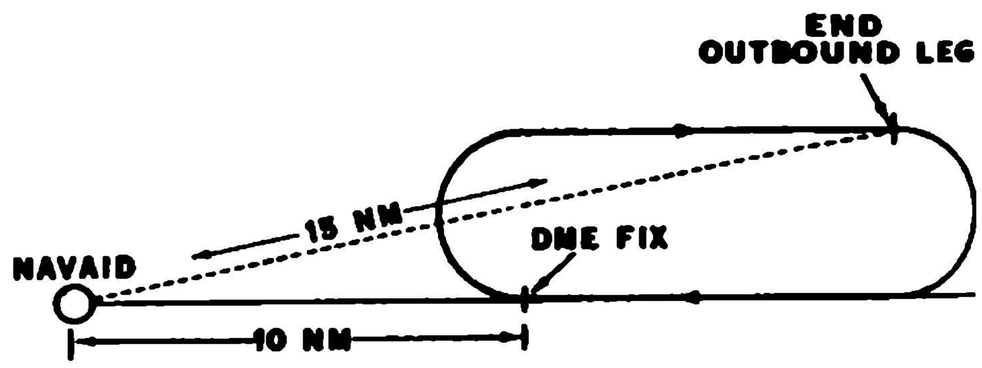
(b) Outbound timing begins *over* or *abeam* t fix, whichever occurs later. If the *abeam* position ca not be determined, start timing when turn to outbou is completed.

(5) Distance Measuring Equipment (DME)

(a) DME holding is subject to the same entry a holding proceduresc except that distances (nautical mile are used in lieu of time values. The *outbound course* a DME holding pattern is called the outbound leg of t pattern. The length of the outbound leg will be specifi by the controller. The end of the outbound leg is det mined by the odometer reading.

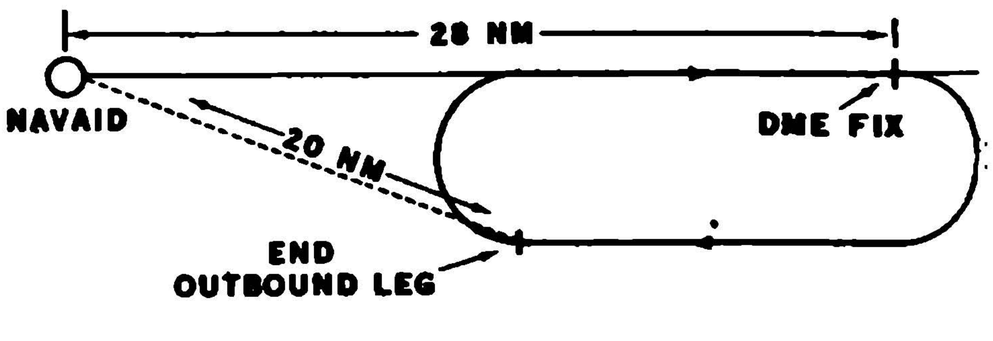
Example:

When the inbound course is *toward* the navaid a the fix distance is 10 NM, and the leg length is 5N then the end of the outbound leg will be reached wh the odometer reads 15 NM.



Example:

When the inbound course is *away* from the nava and the fix distance is 28 NM and the leg length 8 NM, then the end of the outbound leg will be reach when the odometer reads 20 NM.



(6) Pilot Action

(a) Cross holding fix initially at or below ma mum holding airspeed. Effect speed reduction within minutes prior to estimated initial time over the holdi fix.

(b) Make all turns during entry and while hol ing at: (1) 3° per second, or (2) 30° bank angle, or (25° bank angle provided a flight director system is use whichever requires the least bank angle.

(c) Compensate for known effect of wind, exce when turning.

(d) Determine entry turn from aircraft headi upon arrival at the holding fix. Plus or minus 5° heading is considered to be within allowable good ope ating limits for determining entry.

HOLDING (Con't)

(e) Advise ATC immediately if any increased airspeed is necessary due to turbulence or if unable to accomplish any part of the holding procedures.

(7) **Nonstandard Holding Pattern**—Fix end and outbound end turns are made to the left. Entry procedures for a nonstandard pattern are oriented in relation to the 070° line on the holding side just as in the standard pattern.

b. When holding at a fix and instructions are received specifying the time of departure from the fix, the pilot should adjust his flight path within the limits of the established holding pattern in order to leave the fix at the exact time specified. After departing the holding fix, normal speed is to be resumed with respect to other governing speed requirements such as terminal area speed limits, specific ATC requests, etc. Where the fix is associated with an instrument approach, and timed approaches are in effect, a procedure turn shall not be executed unless the pilot advises ATC, since aircraft holding are expected to proceed inbound on final approach directly from the holding pattern when approach clearance is received.

7. RADAR SURVEILLANCE OF OUTER FIX HOLDING PATTERN AIRSPACE AREAS.

a. Whenever aircraft are holding at an outer fix, ATC will usually provide radar surveillance of the outer fix holding pattern airspace area, or any portion of it, if it is shown on the controller's radar scope.

b. The controller will attempt to detect any holding aircraft that stray outside the holding pattern airspace area and will assist any detected aircraft to return to the assigned airspace area.

c. Many factors could prevent ATC from providing this additional service, such as workload, number of targets, precipitation, ground clutter, and radar system capability. These circumstances may make it unfeasible to maintain radar identification of aircraft or to detect aircraft straying from the holding pattern. The provision of this service depends entirely upon whether the controller believes he is in a position to provide it and does not relieve a pilot of his responsibility to adhere to an accepted ATC clearance.

AIR TRAFFIC CONTROL RADAR BEACON SYSTEM (ATCRBS)

1. GENERAL

a. Air Traffic Control Radar Beacon System (ATCRBS) is similar to and compatible with military coded radar beacon equipment (Mark X (SIF)). Civil Mode A is identical to military Mode 3.

b. Civil and military transponders except Basic Mark X, should be adjusted to the "on" or normal operating position as late as practicable prior to takeoff and to "off" or "standby" as soon as practicable after completing landing roll unless the change to "standby" has been accomplished previously at the request of ATC.

c. Basic Mark X (IFF) equipment should not be operated except in emergency or at ATC request. ATC will not normally request Basic Mark X (IFF) transponder operation.

d. When filing a domestic IFR flight plan for flight in an aircraft equipped with a radar beacon transponder, DME equipment, or a combination of both, the pilot shall identify equipment capability by adding a suffix to the identification, preceded by a slant, i.e.:

A12346/X	(Transponder, no code)
V23457/T	(Transponder, with code)
N1256/D	(DME)
R39851/L	(DME and transponder, no code)
AA409/B	(DME and transponder, with code)

NOTE.—The suffix is not to be transmitted by radio as part of the aircraft identification.

e. If entering a U.S. domestic control area from outside the U.S., the pilot should advise on first radio contact with a U.S. air traffic control center that such equipment is available by adding "transponder" or "no code transponder" as appropriate, to the aircraft identification.

f. The pilot of a military flight operating on a Mode other than Mode A/3 should adjust his transponder to reply simultaneously on the appropriate Mode A/3 code as set forth herein.

g. Under no circumstances should be pilot of a civil aircraft operate his transponder on Code 00.

2. INSTRUMENT FLIGHT RULES (IFR) FLIGHT PLAN

a. Adjust transponder to reply on the Mode A/3 code specified by ATC. The transponder shall be operated only as specifically directed by ATC. Except as may be required in an emergency, (see para. 5) when a flight has been assigned a code, it should remain on that code until further advised by ATC or until landing roll is completed at destination, at which time the transponder should be placed in "standby" position.

b. If the pilot cancels his IFR flight plan prior to reaching the terminal area of his destination, he should adjust his transponder to Code 06 or 07 according to the instructions below for VFR flight.

3. VISUAL FLIGHT RULES (VFR)

a. Adjust transponder to reply on the approriate Mode A/3 code as indicated below, unless otherwise advised by ATC.

(1) Code 06—for operation below Flight Level 240.

(2) Code 07—for operation at or above Flight Level 240.

NOTE.—Code 06 should be used when climbing to Flight Level 240 or above until leaving 23,000 feet MSL. Code 07 should then be dialed in. When descending from Flight Level 240 or above, Code 06 should again be used when leaving Flight Level 240.

4. SPECIAL MILITARY OPERATIONS

a. Pilots of NORAD interceptor aircraft on air defense missions not under ATC jurisdiction will adjust their transponders to reply on MODE A/3 Code 00.

●b. When prior coordination has been effected with each facility concerned, or when specified in an ALTRV, air defense exercise target aircraft use codes 50 and 64 from the point where the strike phase of the mission begins to the target location. When an authorization to deviate from FAR 91.97 has been executed, these aircraft use the "Standby" position of the transponder or one of the other codes allocated to NORAD (up to 14 codes as specified in the authorization in addition to codes 50 and 64), between points specified in the route. ATC retains the prerogative to instruct aircraft operating under such an authorization to reply on the appropriate ATC mode and code whenever safety dictates. ATC will be informed when any unscheduled change to the transponder operation is effected.

ATC RADAR BEACON SYSTEM (ATCRBS) (Con't)

5. EMERGENCY OPERATION

a. When an emergency occurs, the pilot of an aircraf equipped with a coded radar beacon transponder, who desires to alert a ground radar facility to his emergency condition and who cannot establish communications without delay with an air traffic control facility may adjust his transponder to reply on Mode A/ 3, Code 77.

b. The pilot should understand that he may not be within a radar coverage area and that, even if he is, certain radar facilities are not yet equipped to automatically recognize Code 77 as an emergency signal. Therefore, he should establish radio communications with an air traffic control facility as soon as possible.

6. RADAR BEACON PHRASEOLOGY

Air traffic controllers, both civil and military, will use the following phraseology when referring to operation of the Air Traffic Control Radar Beacon System (ATCRBS) Mark X IFF (SIF):

SQUAWK ALPHA/THREE CODE (number)—Operate radar beacon transponder on designated mode and code. (Transponder has not been operating on Mode A/3.)

SQUAWK CODE (number)—Operate transponder on a different code. (Transponder is already operating on a previously specified mode and code.)

SQUAWK IDENT—Engage the "IDENT" feature (military I/P) of the transponder.

SQUAWK ALPHA/THREE CODE (number) AND IDENT—Operate transponder on specified mode and code and engage the "IDENT" feature. (Transponder has not been operating on Code A/3.)

SQUAWK CODE (number) and IDENT—Operate transponder on a different code and "IDENT." (Transponder is already operating on a previously specified mode and code.)

SQUAWK STANDBY—Switch transponder to standby position.

SQUAWK LOW/NORMAL—Operate transponder on low or normal sensitivity as specified. Transponder is operated in "NORMAL" position unless ATC specified "LOW" ("ON" is used instead of "NORMAL" as a master control label on some types of transponders.)

STOP SQUAWK (mode in use)—Switch off specified mode (used only when more than one mode may be in operation).

STOP SQUAWK—Switch off transponder.

SQUAWK MAYDAY—Operate transponder in the emergency position. (Mode A Code 77 for civil transponder. Mode 3 Code 77 and/or emergency feature for military transponder.

CHANGEOVER POINTS

1. These points are established on VOR airways in order that pilots will not continue to use the radio guidance display from one facility in the same airspace that other aircraft are using radial guidance from a different facility. These points are based on signal coverage provided by each respective VOR along direct airway segments. The changeover point symbol, as depicted on the En Route Charts, indicates the location in nautical miles between two VOR's along a direct Victor airway at which the aircraft receiver should be tuned to the station ahead.

2. Pilots operating via the Low Altitude Victor Airways System will obtain track guidance by reference to the closest VHF aid forming the airway route segment, except when reference to a specific aid is indicated by a radio changeover point on En Route Charts.

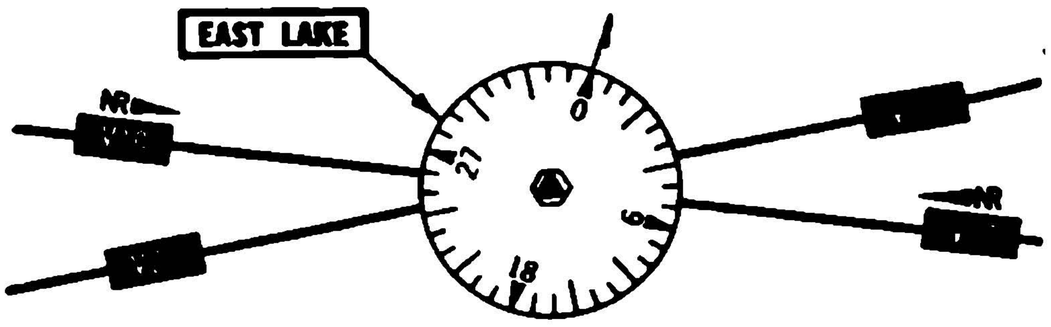
DIRECTIONAL REPORTING

1. Some compulsory reporting points have been desi nated as applicable only to specific airways and/or dire tions of flight. These reporting points will be consider as noncompulsory for the other airways and/or directio of flight. As such ,there will be times when a controll will, of necessity, request a position report on the nc compulsory portion. However, this will relieve the und burden on both the pilot and controller as position r ports will be required only as necessary for control pu poses. The fact that a reporting point is designated "directional" does not relieve the pilot of reporting i time and altitude/flight level upon reaching it when it. used as a clearance limit or holding fix.

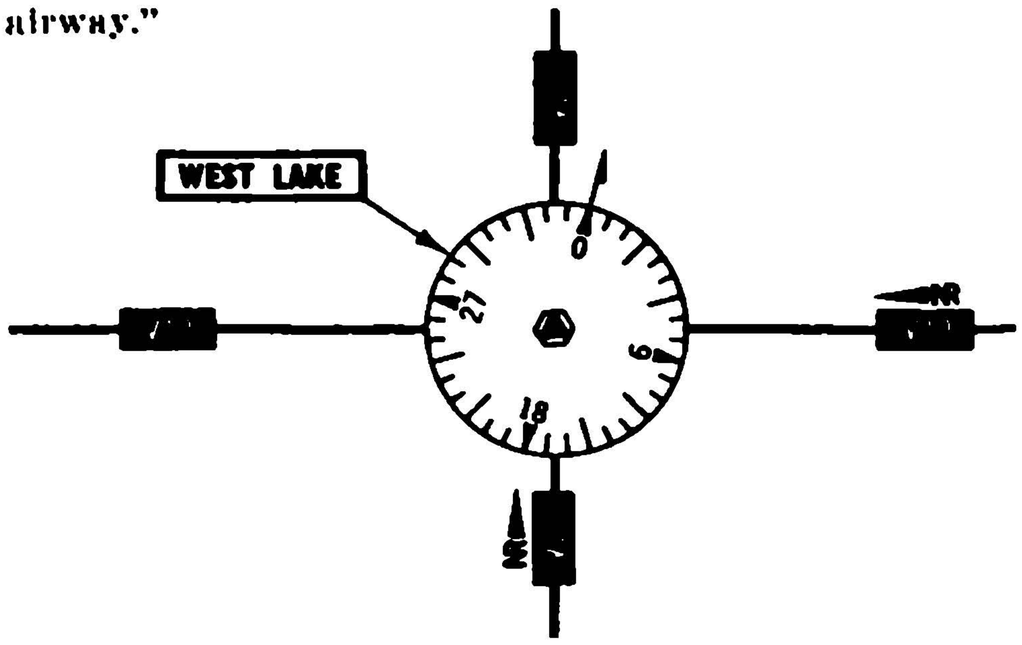
2. The symbol ▬▬ will be used on Coast and Ge detic Survey and other government aeronautical cha to indicate reporting "Not Required" at the next repo ing point unless at that reporting point a transition made to a "reporting airway." Upon crossing a dir tional reporting point, a pilot shall report his position his clearance contains a transition from a non-reporti to a reporting airway at that reporting point. The are instances where two or more airways utilize t same VOR radial and a position report is not requir from aircraft on one or more of these airways but required from aircraft cleared via the other airway/ therefore, the symbol is shown in conjunction with t specific airways designator/s to which it applies.

3. The directional requirement applies only to aircra en route via airways at the reporting point. Aircra crossing the reporting point, on a direct flight not v airways, shall report the fix. In addition, an aircra entering or leaving an airway on a direct flight at th reporting point shall report the fix.

Examples:

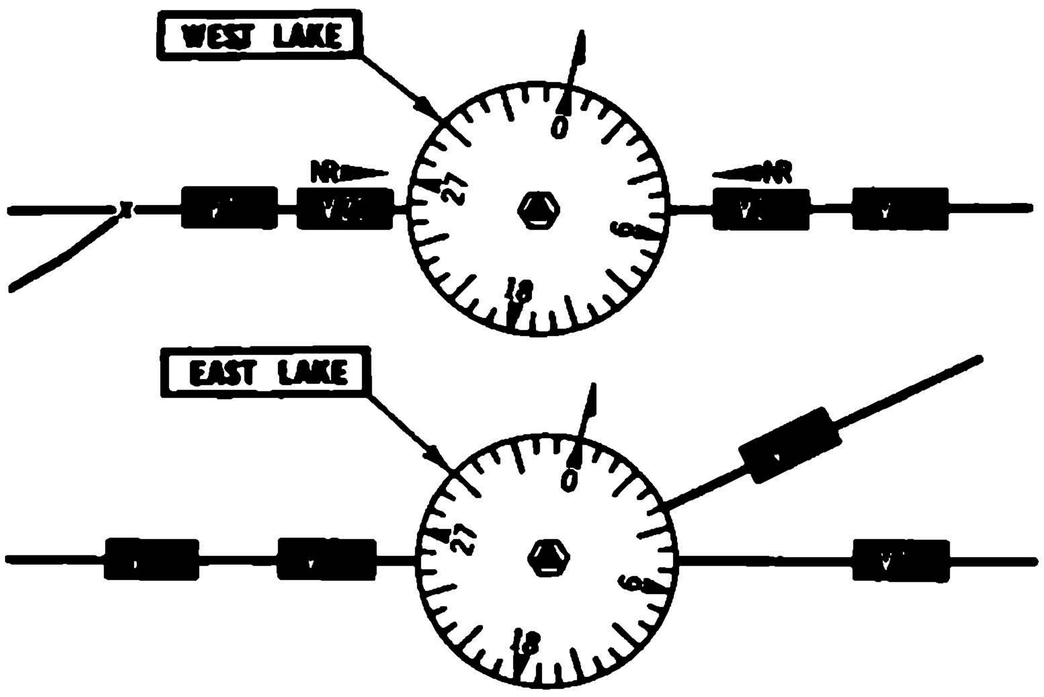


Aircraft proceeding Victor 10 do not report East La as the reporting symbol indicates it's not a "reporti airway." The absence of a reporting symbol for Vict 20 denotes it as a "reportin gairway" which indicat that aircraft proceeding Victor 20 must report East Lak Aircraft proceeding Victor 10, East Lake, Victor 20 Victor 20 East Lake, Victor 10 shall report as the clearance contains a transition to or from a "reporti airway."

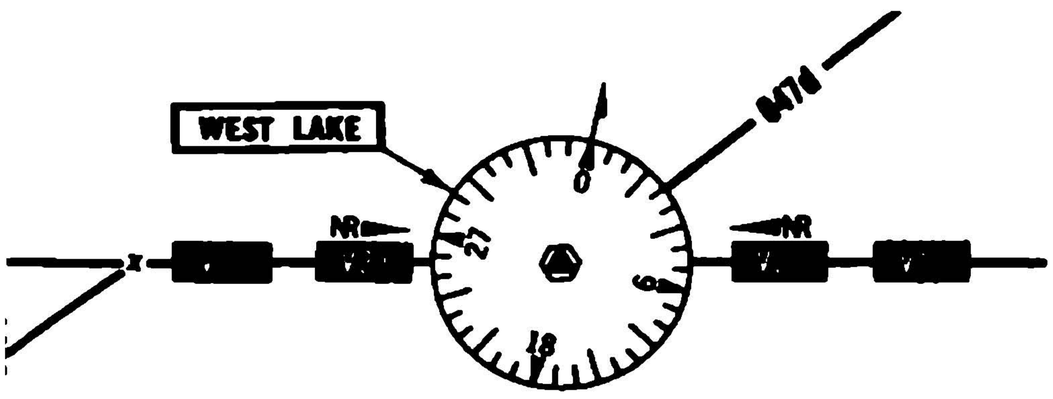


DIRECTIONAL REPORTING (Con't)

Eastbound aircraft on Victor 10 report as the "Not Required" in this instance is for westbound aircraft only. The same principle applies to southbound and northbound aircraft on Victor 20. However, an aircraft proceeding northbound on Victor 20 thence eastbound on Victor 10 would report as a transition is being made to a "reporting airway"; aircraft proceeding westbound on Victor 10 thence northbound Victor 20 would not report as the transition is being made from a "non-reporting airway" to another "non-reporting airway."



This is an example of differing requirements for two airways utilizing the same VOR radial. Aircraft cleared via Victor 10 report West Lake but aircraft cleared via Victor 20 would not. All aircraft report East Lake.



The aircraft on course 047d is a direct off-airways flight and would report West Lake. An aircraft proceeding eastbound or westbound to West Lake thence via the 047d radial shall report West Lake as a transition is being made to a direct course, a situation identical to a "reporting airway."

AIRCRAFT CLIMBING/DESCENDING

1. During any phase of flight, pilots are requested to adhere to the following procedures whenever cleared by ATC to descend or climb to an altitude or flight level.

a. Unless the ATC clearance requires otherwise, begin descent or climb promptly on acknowledgement of the clearance; and

b. If an altitude change of 1,000 feet or less is required, descend or climb at a rate of not more than 500 feet per minute; or

c. If an altitude change of more than 1,000 feet is required, descend or climb as rapidly as practicable to 1,000 feet above or below the assigned altitude and then at a rate of not more than 500 feet per minute until the assigned altitude is reached.

●d. If it is necessary during a climb or descent to level off at an intermediary altitude, advise ATC.

NOTE.—Pilots of military aircraft should use as a minimum the recommended climb and descent rates contained in the aircraft operating handbook.

2. Information is issued to pilots of IFR aircraft whenever less than the applicable minimum time separation between such aircraft will exist, and one aircraft is cleared to climb/descend in accordance with VFR through the altitude of the other. Traffic information is also issued at other times when deemed necessary by the controller or requested by the pilot.

RESTRICTED AIRSPACE

1. ATC facilities apply the following procedures when aircraft are operating on an IFR clearance (including those cleared by ATC to maintain VFR conditions on top) via a route which lies within joint-use or military climb corridor restricted airspace.

a. The ATC facility controlling an aircraft immediately before it would enter the restricted airspace will coordinate as necessary with the ATC facility designated as the controlling facility or with the using agency to obtain permission for the aircraft to operate in the restricted airspace.

b. If permission is obtained, the ATC facility will allow the aircraft to operate in the restricted airspace without issuing specific clearance for it to do so.

c. If permission cannot be obtained, the ATC facility will issue an amended clearance so the aircraft will avoid the restricted airspace.

2. Note that a, b, c above apply only to joint-use and military climb corridor restricted airspace and not to prohibited and nonjoint-use airspace. For the latter categories, the ATC facility will issue a clearance so the aircraft will avoid the restricted airspace unless it is on an approved altitude reservation mission or has obtained its own permission to operate in the airspace and so informs the controlling facility.

3. Restricted airspace is depicted on the Flight Information Publication, En Route Chart appropriate for use at the altitude or flight level being flown. For joint-use and military climb corridor restricted airspace, these charts show the name of the ATC facility designated as the controlling facility or the name of the using agency. For prohibited and nonjoint-use restricted airspace, the phrase "NO A/G" is shown.

RADAR ASSISTANCE TO VFR AIRCRAFT

1. Radar equipped FAA Air Traffic Control facilities provide assistance and navigation service to VFR aircraft, provided such aircraft can communicate with the facility, are within radar coverage, and can be radar identified. Radar navigation assistance (vectors) may be provided VFR pilots when:

a. The pilot requests;

b. The controller suggests and the pilot agrees;

c. Special programs have been established which specify locations and special VFR service is advertised; or,

d. When air safety requires in the judgement of the controller.

RADAR ASSISTANCE TO VFR AIRCRAFT (Con'd)

2. Pilots operating in accordance with Visual Flight Rules and not equipped or trained for IFR flight should use caution in requesting radar assitance as such assistance may result in flight in IFR weather conditions, either intentionally or by accident. In many cases, the radar controller will be unable to determine if flight into instrument conditions will result from his instructions. Furthermore, although the radar controller may be able to provide separation from other traffic and navigational guidance to an airport or other suitable location, the *job of flying the aircraft safely remains with the pilot.* Experience has shown that many pilots cannot maintain control of their aircraft when clouds or other reduced visibility conditions are encountered.

3. To avoid hazards arising from VFR flights being radar vectored into IFR weather conditions, pilots in difficulty should observe the following:

a. If an alternate course of action is available which will permit flight in VFR weather conditions, pilots not instrument rated or operating aircraft not equipped for IFR flight should choose the alternative rather than request radar approach or letdown in IFR weather conditions; or

b. If the pilot is not instrument rated and no alternate course of action is available he should so advise the radar facility and "declare an emergency". The pilot must keep the controller advised of the weather conditions in which the aircraft is operating and along its course ahead. Assistance will be provided on the basis that the navigational guidance information issued is advisory in nature.

c. If the pilot is instrument rated and the aircraft is instrument equipped, the pilot should so indicate by filing an instrument flight plan. Assistance will be provided on the basis that the flight can operate safely in IFR weather conditions.

4. Pilots should clearly understand that authorization to proceed in accordance with such radar navigational assistance does not constitute authorization for the pilot to violate the Federal Aviation Regulations.

LAKE, ISLAND, AND MOUNTAIN REPORTING SERVICE

1. Selected Flight Service Stations provide flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.

2. Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface," "Overlake," etc., are indicated on charts published in Section III. To obtain this service, contact the FSS by telephone or radio giving present position, type of aircraft altitude, indicated airspeed, proposed route of flight, and mainland estimate.

3. After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.

COMMUNICATIONS

1. POSITION REPORTING

a. The safety and effectiveness of traffic control d pends to a large extent on accurate position reporti In order to provide the proper separation and exped aircraft movements, Air Traffic Control must be able make accurate estimates of the progress of every aircr operating on an IFR flight plan.

b. When a position report is to be made over a V(radio facility, the time reported should be the time which the first complete reversal of the "to-from" in cator is accomplished.

c. When a position report is made over a facility means of an airborne ADF, the time reported should the time at which the indicator makes a complete versal.

d. When an aural or light-panel indication is used determine the time of passing a reporting point, such a fan marker, "Z" marker, cone of silence or intersecti of range courses, the time should be noted when the sig is first received and again when it ceases. The mean the two times should then be taken as the actual ti over the fix. If position is given with respect to distar and direction from a reporting point, the distance a direction should be computed as accurately as possit

e. Pilots are required to maintain a continuous liste ing watch on the appropriate frequency and furni position reports as indicated by symbol on En Rou Charts.

f. The compulsory reporting point symbol is the so triangle (▲); the "on request" reporting point bei an open triangle (△). Reports over an "on reque reporting point are only necessary when requested ATC.

(1) **Flights along airways/routes**—A position report required by all flights regardless of altitude over ea compulsory reporting point along the route being flow except where otherwise indicated by a "Not Require symbol. This includes flights operating in a cordance with an ATC clearance specifying "VFR con tions on top."

NOTE.—In Alaska some position reports are required o when operating below 15,200′ MSL. These locations shown on the en route charts by a circled letter " leadered to the reporting point: . This procedure d not apply to flights operating on an altitude assignm of "VFR-on-top."

(2) **Flights Along a Direct Route**—Regardless of the al tude being flown, including flights operating in accor ance with an ATC clearance specifying "VFR conditio on-top," pilots shall report over each reporting poi used on the flight plan to define the route of flight.

g. Position reports should include the following item (1) Identification, (2) Position, (3) Time, (4) Altitu (5) Type of flight plan (not required in IFR positi reports made direct to ARTC Centers or approach c trol), (6) ETA over next reporting point, (7) *The na only of the next succeeding reporting point along t route of flight*, and (8) pertinent remarks.

Example:

An aircraft operating along Victor Airway 30 b tween Pittsburgh and Minneapolis would make t following report when over Litchfield, Mich.: N VEMBER NINER TWO ONE XRAY OVER LITC FIELD FIVE SIX AT EIGHT THOUSAND I

COMMUNICATIONS (Con't)

STRUMENT FLIGHT PLAN ESTIMATING PULLMAN ONE FOUR ONE EIGHT *MILWAUKEE*. A corrected estimate should be forwarded to Air Traffic Control any time it becomes apparent that an estimate as previously submitted, is in error in excess of *three* minutes.

●NOTE—Pilots in Alaska, Hawaii, U.S. Territories and possessions, operating at or above flight level 240 and who have requested and received a clearance specifying "VFR Conditions On Top" are requested to report their "actual" altitude as part of their IFR position reporting procedure and advise ATC prior to making an altitude change.

h. The following reports should be made to ATC or FSS facilities without request:

(1) The time and altitude/flight level reaching a holding fix or point to which cleared.

(2) When vacating any previously assigned altitude/flight level for a newly assigned altitude/flight level.

(3) When leaving any assigned holding fix or point.

(4) When leaving final approach fix inbound on final approach.

(5) When an approach has been missed. (Request clearance for specific action, i.e., to alternate airport, another approach, etc.)

i. Navigation or position reports will not normally be required by ATC with reference to aids not established for use in the structure in which operation is conducted, except as may be essential for terminal area transition purposes.

j. Pilots encountering weather conditions which have not been forecast, or hazardous conditions which have been forecast, shall forward a report of such weather to Air Traffic Control. The reporting of unanticipated weather or hazardous conditions may be of importance to the safety of other aircraft proposing flight within the area.

k. Position reporting in a radar environment:

(1) Pilots of radar identified aircraft which will remain under radar surveillance may be authorized to discontinue position reports over fixes designated as compulsory reporting points. The controller will grant this authorization using the phraseology "OMIT POSITION REPORTS."

(2) When authorized to omit position reports, the controller, at the time radar service is terminated or at his discretion will issue instructions to resume normal position reporting using the phraseology "RESUME NORMAL POSITION REPORTING."

(3) Monitor normal air traffic control communications frequencies. On initial contact when changing frequencies, pilots should comply with standard contact procedures described in Transfer of Control under 2. DIRECT COMMUNICATIONS — CONTROLLERS/PILOTS.

(4) Pilots of aircraft operating below Flight Level 240, who have been advised to omit position reports, will be furnished the appropriate altimeter setting when passing compulsory reporting points as observed by radar.

2. DIRECT COMMUNICATIONS—CONTROLLERS/PILOTS

a. Air Traffic Control facilities are equipped with radio transmitters and receivers for direct communications with IFR air traffic on certain VHF, UHF and L/MF frequencies. The frequencies normally used are published on appropriate en route charts. IFR operations are expedited through the use of direct communications; however, to reduce frequency congestion, pilots are requested to use these frequencies strictly for communications pertinent to the control of IFR aircraft. Flight plan filing, en route weather, forecasts and similar data should be requested through Flight Service Stations, company radio or appropriate military facilities capable of performing these services.

(1) Center Sector Discrete Frequency—an ARTCC is divided into sectors; each sector is handled by one Controller, or team of controllers, and has its own sector discrete frequency. As an IFR flight progresses from one sector to an other, the pilot is requested to change to the appropriate sector discrete frequency.

(2) Center Area Discrete Frequency—A frequency used as back-up for the center sector frequencies and is available to each non-radar sector in the ARTCC. It is always monitored by at least one controller who can quickly put an IFR flight in radio contact with the appropriate sector.

b. Transfer of Control

(1) Air traffic controllers may utilize direct or indirect communications media to require a pilot to contact an adjacent sector within a facility, or an adjacent facility, whenever necessary to effect transfer of control.

(2) The following phraseology will be used to effect transfer of control: "(aircraft identification) CONTACT (facility name) ON (frequency) (time or point), OVER."

Examples:

"BEECHCRAFT TWO ONE BRAVO, CONTACT INDIANAPOLIS CENTER ON ONE TWO FIVE POINT ONE OVER."

"AIR FORCE FIVE FOUR THREE TWO ONE CONTACT ATLANTA CENTER ON THREE ONE SEVEN POINT SIX OR ONE THREE FIVE POINT SIX AT ONE THREE FIVE ZERO, OVER."

"EASTERN FIVE ZERO TWO, CONTACT WASHINGTON CENTER ON ONE TWO THREE POINT SEVEN AT ROANOKE, OVER."

(3) The following phraseologies should be utilized by pilots for establishing contact with the designated facility:

(a) When contact is to be followed by a position report:

"(name) CENTER, (THIS IS) (aircraft identification), (position), OVER."

A typical example of the exchange of communications would be:

"WASHINGTON CENTER, (THIS IS) EASTERN FIVE ZERO TWO, ROANOKE, OVER."

"EASTERN FIVE ZERO TWO, (THIS IS) WASHINGTON CENTER, GO AHEAD."

"EASTERN FIVE ZERO TWO, (OVER) ROANOKE THREE SIX (AT) ONE NINER THOUSAND, (ESTIMATING) MONTEBELLO FIVE TWO, GORDONSVILLE, (OVER)."

"EASTERN FIVE ZERO TWO, ROGER."

(b) When contact is to be made at a specific time or point and no position report is required:

"(name) CENTER, (THIS IS) (aircraft identification), ESTIMATING (reporting point)

COMMUNICATIONS (Con't)

(time) AT (altitude/flight level), OVER."
"(name) CENTER, (THIS IS) (aircraft identification), ESTIMATING (reporting point) (time) AT (altitude/flight level) CLIMBING/DESCENDING TO (altitude/flight level) OVER."

A typical example of exchange of communications would be:
"CHICAGO CENTER, (THIS IS) BEECHCRAFT ONE TWO THREE FOUR, ESTIMATING CHICAGO HEIGHTS FOUR TWO, AT NINER THOUSAND, DESCENDING TO FIVE THOUSAND, OVER."
"BEECHCRAFT ONE TWO THREE FOUR (THIS IS) CHICAGO CENTER, ROGER."

c. It should be noted that whenever contact with ATC is to be followed immediately by a position report, the name of the reporting point should be included in the contact. This will alert the controller that such information is forthcoming. When a position report is not required, an estimate for the next reporting point, the actual altitude and, if appropriate, the altitude to which climb or descent is being made, should be included in the initial contact. The controller will simply acknowledge that contact has been established, or, when required, issue appropriate control instructions.

NOTE.—Federal Aviation Regulations require the pilot to maintain a continuous watch on the appropriate radio frequencies; therefore, a pilot receiving a clearance as indicated above, should remain on the frequency he is on *until* the time or point to change to the newly assigned frequency.

NOTE.—If two-way communications cannot be established as indicated in Paragraph b(1), a pilot should attempt to re-contact the transferring controller for the assignment of an alternate frequency or other instructions. If, however, communications are not re-established, the pilot should then contact the appropriate communications medium as indicated in the following Frequency Use Plan.

3. FREQUENCY USE PLAN

a. The following table provides a plan by which pilots may determine the frequency they will be expected to use, when the sector discrete frequency (Priority One) has been specified, in effecting transfer of control, and two-way communications cannot be established.

Priority	**First**
Civil/Military VHF	Sector Discrete Frequency as assigned.
Military UHF	Sector Discrete Frequency as assigned.
Priority	**Second**
Civil/Military VHF	Below FL 240–Center Area Discrete Frequency (if appropriate). FL 240 and above—FSS–126.7.
Military UHF	FSS–272.7 (at all altitudes).
Priority	**Third**
Civil/Military VHF	Air carrier-company radio, if unable, FSS–126.7 General Aviation and Military FSS–126.7, 122.1/122.2 or VOR
Military UHF	FSS–255.4

• SPECIAL USE AIRSPACE

1. It is mandatory that pilots avoid unauthorized eration in prohibited areas and restricted areas and tremely important that warning areas not be penetra unless prior approval has been obtained. The follow explanation is to impress on all concerned the purp of such areas and indicate that hazards are presented activities within restricted and warning areas. Caut and intensive student jet training areas contain activ of interest to the nonparticipating pilot. The ope tions conducted within these areas are not conside hazardous and consist primarily of high volume milit training. These five types of airspace are depicted aeronautical charts published by the Coast and G detic Survey.

a. Prohibted Area. Airspace identified by an area the surface of the earth within which the flight of craft is prohibited. Such areas are established security or other reasons associated with the natio welfare. These areas are published in the Fede Register.

b. Restricted Area. Airspace identified by an area the surface of the earth within which the flight of craft, while not wholly prohibited, is subject to rest tions. Activities within these areas must be confined cause of their nature or limitations imposed upon craft operations that are not a part of those activit or both. Restricted areas denote the existence of usual, often invisible, hazards to aircraft. Penetrat of restricted areas during periods of activity may extremely hazardous to the aircraft and its occupar Restricted areas are published in the Federal Regis and constitute Part 73 of the Federal Aviation Re lations.

c. Warning Area. Warning areas are established yond the three-mile limit. They are areas of defir dimensions established to contain both visible and visible hazards to nonparticipating aircraft. Thou the activities within the warning areas are as hazard as those contained within restricted areas, warning ar cannot be legally designated because they are over ternational waters. Penetration of warning areas d ing periods of activity may be hazardous to the aircr and its occupants. Official descriptions of warning ar may be obtained upon request to the FAA, Washingt D.C.

d. Caution Area. Areas of defined dimensions with which the military training activities conducted, thou not hazardous, are of interest to nonparticipating pilo There are no restrictions applicable to flight with these areas. Information concerning these areas m be obtained upon request to the FAA, Washington, D.

e. Intensive Student Jet Training Area (ISJTA). These are are depicted on aeronautical charts to identify traini of student jet pilots. There is no restriction to VF flight in these areas. Information on these traini areas may be obtained from any FSS within 100 mil of the area.

ARRIVAL

VFR ADVISORY INFORMATION

1. VFR advisory information is provided by numerous radar and nonradar *Approach Control* facilities to those pilots intending to land at an airport served by an approach control tower. This information includes: wind, runway, traffic and NOTAM information.

2. Such information will be furnished upon initial contact with concerned approach control facility. The pilot will be requested to change to the *tower* frequency at a predetermined time or point, to receive further landing information.

3. Where available, use of this procedure will not hinder the operation of VFR flights by requiring excessive spacing between aircraft or devious routing. Radio contact points will be based on time or distance rather than on landmarks.

4. Compliance with this procedure is not mandatory but pilot participation is encouraged.

AIRPORT ADVISORY SERVICE (NONRADAR)

1. Flight Service Stations (FSS) located at airports where there are no control towers in operation provide advisory information to arriving and departing aircraft. This service is offered for safety purposes; traffic control is not exercised.

2. Arriving and departing radio-equipped VFR aircraft are requiring to maintain radio contact with the FSS while operating within a 5 mile radius of those stations that are properly depicted on Sectional or World Aeronautical Charts in accordance with F.A.R. 91.89. Aircraft operating IFR will maintain radio contact with the facility specified by ATC. Receiver-only-equipped aircraft are required to maintain a listening watch on the airport advisory frequency—122.2 mc.

3. Airport advisories provide: wind direction and velocity, favored runway, altimeter setting, pertinent known traffic, Notices to Airmen, airport taxi routes, airport traffic patterns, and instrument approach procedures. These elements are varied so as to best serve the current traffic situation. Pilots using other than the favored runways should advise the FSS immediately.

4. Recommended phraseologies and communications procedures are as follows:

AIRCRAFT DEPARTING: When ready to taxi, the pilot should notify the station of his intentions. Except for scheduled air carriers or other frequent users of the airport, this information should include not only the aircraft identification, but also the aircraft type, location, type of flight planned (VFR or IFR), and destination.

Example:

Aircraft: GRAND FORKS RADIO, THIS IS COM: CHE SIX ONE THREE EIGHT, ON TERMIN BUILDING RAMP, READY TO TAXI, VFR DULUTH, OVER.

Station: COMANCHE SIX ONE THREE EIGI THIS IS GRAND FORKS RADIO, WIND THR TWO ZERO DEGREES AT TWO FIVE FAV(ING RUNWAY THREE ONE, ALTIMET THREE ZERO ZERO ONE, TIME ONE T\ TWO FIVE, CESSNA ONE-SEVENTY MAKI TOUCH AND GO LANDINGS ON RUNW. THREE ONE.

NOTE.—The take-off time should be reported to the F as soon as practicable. If the aircraft has limited eq ment and it is necessary to use the navigational feature the radio range immediately after take-off, advise the F of this before shifting frequency from 122.2 to the range. such cases, advisories will be transmitted over both 12 and the range frequency.

AIRCRAFT ARRIVING: When operating VFR, a pilot shou transmit position and altitude information to t FSS when 15 miles from the airport.

Example:

Aircraft: GRAND FORKS RADIO, THIS IS TI PACER ONE SIX EIGHT NINER, OVER KI WEST, TWO THOUSAND, LANDING GRA FORKS, OVER.

Station: TRI-PACER ONE SIX EIGHT NINE THIS IS GRAND FORKS RADIO, OVER KI WEST AT TWO THOUSAND, WIND ONE FI ZERO DEGREES AT ONE TWO, FAVORI RUNWAY ONE THREE, ALTIMETER TW NINER EIGHT NINER, DC-3 TAKING-OI RUNWAY ONE THREE, CESSNA ONE FOR ON DOWNWIND LEG RUNWAY ONE THRI MAKING TOUCH AND GO LANDINGS, C MANCHE DEPARTED RUNWAY ONE THRI AT ONE SIX PROCEEDING EASTBOUN OVER.

NOTE.—Pilots should guard 122.2 mcs. until clear of t runway after landing and report leaving the runway the FSS.

RADAR TRAFFIC INFORMATION SERVICE

1. A service provided by radar air traffic control faci ties. Pilots receiving this service are advised of ai aircraft observed on the radar scope which, in the jud ment of the controller, apears to constitute a potenti conflict to the operation of their aircraft.

a. **Purpose of the Service**—Radar Traffic Informatic Service is not intended to relieve the pilot of his respo sibility for continual vigilance to see and avoid oth aircraft. It is provided to aid him in his visual surve

ADAR TRAFFIC INFORMATION SERVICE (Con't)

ance by calling to his attention a specific direction in hich radar indicates possible conflicting traffic to exist. ilots are reminded that the surveillance radar utilized y the controller does not provide altitude information.

b. Provision of the Service—The provision of this service s not mandatory. Many factors, such as limitations of he radar, volume of traffic, controller workload and ommunications frequency congestion, could prevent the ontroller from providing this service. The controller ssesses complete discretion for determining whether e is able to provide or continue to provide this service n a specific case. His reason against providing or conuing to provide the service in a particular case is not bject to question nor need it be communicated to the ilot. In other words, the provision of this service is ntirely dependent upon whether the controller believes e is in a position to provide it, subject to the foregoing mitations:

(1) Traffic information is routinely provided to all ircraft operating on IFR flight plans except when the ilot advises he does not desire the service.

(2) Traffic information may be provided for flights ot operating on IFR flight plans when requested by ilots of such flights.

NOTE.—Participation by VFR pilots in formal programs implemented at certain terminal locations constitutes pilot request. This also applies to participating pilots at those locations where arriving VFR flights are encouraged to make their first contact with the tower on the approach control frequency.

c. Issuance of Traffic Information—Traffic information ill include the following concerning a target which ay constitute traffic for an aircraft that is:

(1) Radar identified:

(a) Azimuth from the aircraft in terms of the welve hour clock;

(b) Distance from the aircraft in nautical miles;

(c) Direction in which the target is proceeding; nd

(d) Type of aircraft and altitude or, if unnown, the relative speed of the observed traffic; i.e., ow or fast moving.

Example:

Traffic 10 o'clock, 3 miles, west-bound (type aircraft and altitude, if known or relative speed of the observed traffic). The pilot may, upon receipt of traffic information, request a vector (heading) to avoid such traffic. The vector will be provided to the extent possible as determined by the controller.

(2) Not radar identified:

(a) Distance and direction with respect to a fix;

(b) Direction in which the target is proceeding; nd

(c) Type of aircraft and altitude or, if unnown, the relative speed of the observed traffic, i.e., ow or fast moving.

Example:

Traffic 8 miles out of the airport northeastbound, (type aircraft and altitude or relative speed of the observed traffic).

EXPANDED RADAR SERVICE FOR ARRIVING AND DEPARTING FLIGHTS IN TERMINAL AREAS

1. This service has been implemented at certain terminal locations. Pilot participation is urged but is not mandatory.

2. The purpose of this service is to adjust the flow of arrival VFR and IFR aircraft into the traffic pattern in a safe and orderly manner. To participate, pilots of VFR aircraft should initiate radio contact with approach control when reaching the perimeter of the area in which the VFR services are provided. Approach control then provides the pilot with wind direction and velocity, runway in use, traffic information, routings, etc., as necessary, for proper sequencing with other traffic en route to the airport.

3. After radar contact is established, the pilot is directed to fly specific headings either to join an appropriate leg of the traffic pattern or to position the flight behind the preceding aircraft in the landing sequence. When a flight is positioned behind the preceding aircraft and the pilot reports having that aircraft in sight, he will be directed to follow it. Upon being told to contact the tower, radar service will end. A landing sequence number will thereafter be assigned by the tower.

4. Pilots of departing VFR aircraft desiring Traffic Information Service should request the service on initial contact with ground control and advise proposed direction of flight. Following take-off, the tower will advise when to contact departure control and the frequency to be used.

•TERMINAL RADAR SERVICE

(Provided in designated Terminal Radar Service Areas, TRSA).

1. This service has been implemented at certain terminal locations and is provided on a voluntary pilot participating basis.

2. The purpose of this service is to provide, to the extent possible separation between all participating VFR aircraft and all IFR aircraft operating within the airspace defined as the TRSA.

3. The TRSA is primarily a radar environment and control is predicated thereon, however, this does not preclude application of nonradar separation when required or deemed appropriate. During weather conditions equal to or better than basic VFR:

(a) 500 feet vertical separation may be used between VFR aircraft and/or between VFR and IFR aircraft.

(b) Visual separation may be used between VFR aircraft and/or between VFR and IFR aircraft when the pilot sees the other aircraft and reports he will maintain visual separation from it.

4. Within the TRSA traffic information on observed but unidentified targets will, to the extent possible, be provided all IFR and participating VFR aircraft and such aircraft, at the request of the pilot, will be vectored to provide standard radar separation from the observed traffic, insofar as possible.

AERONAUTICAL ADVISORY STATIONS (UNICOM)—122.8, 123.0 MC.

1. 122.8 mc is assigned to airports *not* served by a control tower. Its use is limited to the necessities of safe and expeditious operation of private aircraft pertaining to runway and wind conditions, types of fuel available, weather, and dispatching. Secondarily, communications may be transmitted concerning ground transportation, food and lodging during transit.

2. 123.0 mc is assigned to airports *served* by a control tower. Communications on this frequency are identical to those permitted on 122.8 mc, with the exception of information such as runway and wind conditions, weather, etc. which would be furnished by the tower. THIS SERVICE SHALL NOT BE USED FOR AIR TRAFFIC CONTROL PURPOSES.

AERONAUTICAL MULTICOM SERVICE 122.9 MC.

1. A mobile service used to provide communications essential to conduct of activities being performed by or directed from private aircraft.

Example:

Ground/air communications pertaining to agriculture, ranching, conservation activities, forest fire fighting, aerial advertising and parachute jumping. THIS SERVICE SHALL NOT BE USED FOR AIR TRAFFIC CONTROL PURPOSES.

APPROACH CONTROL

1. Approach control is responsible for controlling all instrument flight terminating within its area of responsibility. Approach control may serve one or more airfields, and control is exercised primarily by direct pilot/controller communications. Prior to arriving at the destination radio facility, instructions will be received from ARTCC to contact an approach control.

a. Radar Approach Control

(1) Arriving aircraft are either cleared to an outer fix most appropriate to the route being flown with vertical separation and, if required, holding information or, when radar handoffs are effected between the ARTCC and approach control, or between two approach control facilities, aircraft are cleared to the airport or to a fix so located that the handoff will be completed prior to the time the aircraft reaches the fix. When radar handoffs are utilized, successive arriving flights may be handed off to approach control with radar separation in lieu of vertical separation. After release to approach control, aircraft are vectored to the appropriate final approach course (ILS, VOR, ADF, etc.). Radar vectors and altitude/flight levels will be issued as required for spacing and separating aircraft. *Therefore, pilots must not deviate from the headings issued by approach control.* The radar vector issued for interception of the final approach course will be such as to enable the pilot to establish his aircraft on the final approach course prior to reaching the approach fix. Aircraft will be cleared for approach at the time the final heading for interception of the final approach course is issued, or after the aircraft is established on the final approach course prior to passing the approach fix. When established on the final approach course, radar separation will be maintained and the pilot will be expected to complete the approach utiliz existing approach aids (ILS, radio beacons, etc.) as primary means of navigation. Therefore, *pilots m not deviate from the normal final approach course unl a clearance to do so is received from Air Traffic Cont* After passing the approach fix (outer marker, ra range ,etc.) on final approach, aircraft are expected proceed direct to the airport and complete the appro or effect the missed approach procedure published that airport.

● (2) IFR aircraft may be descended to the m mum vectoring altitude, vectored to a position in airport traffic pattern and cleared for a "visual proach" whenever the reported ceiling is at least feet above the minimum vectoring altitude and the v bility is three miles or more. With a "visual approa clearance, the pilot operating on an IFR flight plan n deviate from the prescribed instrument approach p cedure and proceed to the airport with visual refere to the surface, maintaining VFR conditions at all tin This procedure will afford a more expeditious service arriving aircraft and preclude unnecessary vectoring the final approach course of a published instrument proach procedure.

● (3) Clearance for a visual approach is issu when:

(a) The pilot of an aircraft not following a p ceding aircraft reports sighting the airport and tower controller has the aircraft in sight, or

(b) An aircraft is positioned behind a preced aircraft and the pilot of the succeeding aircraft ports sighting that aircraft.

● (4) Radar separation is provided from any p ceding IFR aircraft until the clearance for a visu approach is issued. Pilots cleared for a visual approa are reminded to advise ATC whenever they are una to continue following the preceding aircraft and/or th encounter less than basic VFR weather conditio Radar service will be terminated when the pilot is t to contact the tower. The tower will assign a landing quence number.

INSTRUMENT APPROACH

1. GENERAL

a. Instrument approach procedures are depicted Coast and Geodetic Survey Approach and Landing Char Air Traffic Control may suggest a specific instrum approach procedure to expedite traffic. This is usua accomplished by issuing a clearance for the specific proach. If the pilot of the aircraft does not desire su approach he may request a different type of approa However, it may be necessary for Air Traffic Control withhold a clearance for the different approach until su time as traffic conditions permit. Under such circu stances the pilot of the approaching aircraft may acc the suggested approach or wait for a different approa The omission of a specific type of approach in the cle ance, "Cleared for Approach," indicates to the pilot a approved type of approach may be used at his discreti and he should begin descent to approach altitude as so as possible. Normally, traffic conditions require A Traffic Control to issue a clearance specifying the type approach. If the pilot is involved in an emergency sit ation, he will be given priority in the type of approa as may be necessary under the circumstances.

INSTRUMENT APPROACH (Con't)

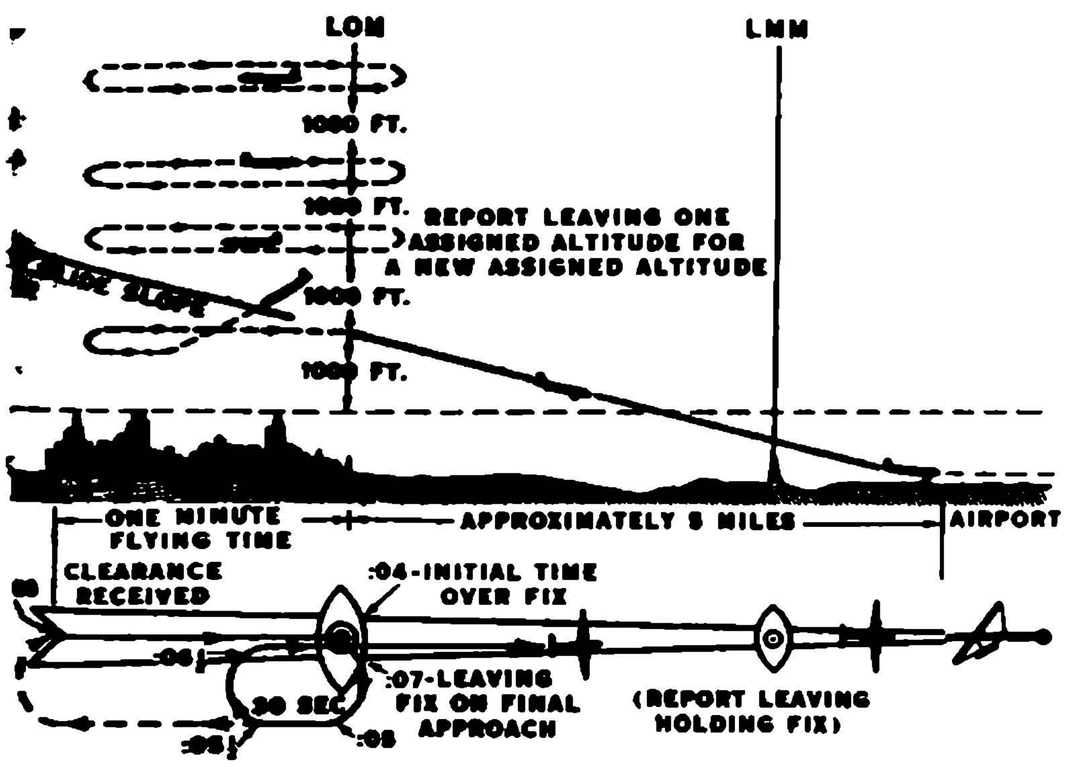
b. If the pilot is not familiar with the specified approach procedure, Air Traffic Control should be advised and the clearance will include detailed information on the execution of the specified approach. When an approach involves a procedure turn, the turn normally shall be executed within a distance of ten miles from the facility. However, in order to provide adequate separation from departing traffic, Air Traffic Control may specify the point at which the turn shall be executed (expressed in minutes or miles outbound from the facility) which will be consistent with the limitations of the pecific approach procedure for the airport.

2. INSTRUMENT APPROACH FROM HOLDING PATTERN

a. Each pilot in an approach sequence will be given advance notice as to the time he should leave the holding point on approach to the airport. When a time to leave the holding point has been received, the pilot should adjust his flight path to leave the fix as closely as possible to the designated time.

Example:

The dotted line indicates a 1-minute holding pattern, the solid line indicates the aircraft flight path from the time clearance was received.



b. At 12:03 local time, in the example shown, a pilot holding, receives instructions to leave the fix inbound at 12:07. These instructions are received just as the pilot has completed turn at the outbound end of the holding pattern and is proceeding inbound towards the fix. Arriving back over the fix, the pilot notes that the time is 12:04 and that he has three minutes to lose in order to leave the fix at the assigned time. Since the time remaining is more than two minutes, the pilot plans to fly a race pattern rather than a 360° turn, which would use up two minutes. The turns at the ends of the race track pattern will consume approximately two minutes. Three minutes to go, minus two minutes required for turns, leaves one minute for level flight. Since two portions of level flight will be required to get back to the fix inbound, the pilot halves the one minute remaining and plans to fly level for 30 seconds outbound before starting his turn back toward the fix on final approach. If the winds were negligible at flight altitude, this procedure would bring the pilot inbound across the fix precisely at the specified time of 12:07. However, if the pilot expected a headwind on final approach, he should shorten his 30 seconds outbound course somewhat, knowing that the wind will carry him away from the fix faster while outbound and decrease his ground speed while returning to the fix. On the other hand, if the pilot knew he would have a tailwind on final approach ,he should lengthen his calculated 30-second outbound heading somewhat, knowing that the wind would tend to hold him closer to the fix while outbound and increase his ground speed while returning to the fix.

3. LANDING PRIORITY

a. A clearance for a specific type of approach (ILS, ADF, VOR or Straight-in Approach) to an aircraft operating on an IFR flight plan does not mean that landing priority will be given over other traffic. Traffic control towers handle all aircraft, regardless of the type of flight plan, on a "first-come, first-served" basis. Therefore, because of local traffic or runway in use, it may be necessary for the controller, in the interest of safety to provide a different landing sequence. In any case, a landing sequence will be issued each aircraft as soon as possible to enable the pilot to properly adjust his flight path.

4. LANDING MINIMUMS

a. The minimum ceiling and visibility requirements for civil pilots making instrument approaches at civil airports are included on Standard Instrument Approach Procedures.

b. The following procedures are applicable to all arriving IFR civil aircraft conducting published instrument approaches.

c. When an official weather report is made available to the controller which indicates that weather conditions are below the minima published for the particular approach being executed or to be executed, ATC will:

(1) Issue the weather report to all arriving IFR aircraft.

(2) Advise pilots of other than military or scheduled air carrier aircraft that the reported weather is below the published minima and request such pilots to advise their intentions.

Example:

WEATHER (Weather Report). THIS IS BELOW PUBLISHED MINIMA FOR (Type of Approach) APPROACH. ADVISE INTENTIONS.

(3) Issue approach clearance, landing clearance or other clearances and/or instructions, as appropriate, in accordance with each pilot's stated intentions and the traffic situation. Each landing clearance shall be expressly qualified with the phrase "IF YOU HAVE LANDING MINIMA".

Example of Landing Clearance:

CLEARED TO LAND IF YOU HAVE LANDING MINIMA.

NOTE.—The foregoing procedures are predicated on the basis that: The Weather Bureau Report, RVR reading and/or runway visibility report, as appropriate, constitutes the official weather report, and the weather minima published for the particular approach on Instrument Approach Procedure Charts, as amended by NOTAMs, if any, are applicable. The pilot is governed by and will be observing the provisions, of Part 600.4/G/ Regulations of the Administrator.

INSTRUMENT APPROACH (Con't)

5. MONITORING ILS

a. Communications should be established with the appropriate FAA control tower or with the FAA Flight Service Station ,where there is no control tower, prior to starting an ILS approach. This is in order to receive advisory information as to the operation of the facility. It is also recommended that the aural signal of the ILS be monitored during an approach to assure continued reception and receipt of advisory information.

6. MISSED APPROACH

a. When a landing is not completed after an instrument aproach, a pilot shall follow the prescribed missed approach procedure (unless an alternate missed approach procedure is specified by Air Traffic Control) and obtain further clearance from Air Traffic Control. The flight then may request clearance for another approach. Traffic permitting, an approach clearance may be issued immediately or the flight may be required to hold until clearance for approach can be issued. A pilot may, at any time, request clearance to an alternate airport.

RADAR MONITORING OF INSTRUMENT APPROACHES

1. When approaches are being monitored by radar, the radar advisories serve only as a secondary aid, since the pilot has selected the ILS or other navigational aid as the primary aid for the approach.

●2. At FAA radar locations, all instrument approaches made on navigational aids whose final approach course from the final approach fix to the runway coincides with the Precision Approach Radar (PAR) course and whose final approach fix lies within the coverage of PAR will be monitored and radar advisories furnished to the pilot whenever the reported weather is below basic VFR minima (1000 and 3).

3. Prior to starting final approach, the pilot will be advised of the frequency on which the advisories will be transmitted. This will normally be the ILS localizer voice channel. If, for any reason, radar advisories cannot be furnished, the pilot will be so advised.

●4. Advisory information, derived from radar observations, includes information on:

a. Passing the final approach fix. (At this point, the pilot may be requested to report sighting the approach lights or the runway.)

b. Distance above or below the prescribed glide path (*this information given only to those aircraft executing an ILS approach*) and/or the distance left or right of the prescribed final approach course when an aircraft exceeds the elevation and/or azimuth safety zones indicated on the PAR display.

NOTE.—Altitude information is not transmitted to aircraft executing other than ILS approaches because the descent portions of these approaches generally do not coincide with the depicted PAR glide path.

c. A situation which, in the judgment of the controller, is likely to affect the safety of the flight.

●5. Radar advisories and radar service will be terminated and the pilot so informed when:

a. The pilot reports the approach lights or the runway in sight, or

b. The aircraft reaches the ILS middle marker o point corresponding in distance to the point where glide slope intercepts 200 feet elevation, whichever closer to the end of the runway.

SPEED ADJUSTMENT OF ARRIVING AIRCRAF

1. To avoid excessive vectoring in the establishment arrival sequences, pilots of radar-controlled arriving craft which are transitioning from en route to the de nation airport may be requested by ATC to adjust craft speeds in accordance with the following:

a. All speed adjustment requests shall be expres in terms of knots and shall be predicated on indica air speed (IAS).

b. Speed adjustment procedures shall not be appl to flights conducting published jet penetrations.

c. Pilots complying with speed adjustment reque will be expected to maintain a speed within plus or mi ten knots of the specified speed.

d. Approach clearances supersede speed adjustm assignments and pilots are expected to effect their o speed adjustments, as necessary, to complete the proach. If it is determined by ATC that speed adjt ment procedures are no longer required prior to issuance of an approach clearance, the pilot of the craft concerned shall be advised to resume normal spe

e. Unless prior concurrence in the use of a lo speed is obtained, speed adjustment requests for an ar ing flight to maintain a specified speed will be made accordance with the following minima:

(1) To multi-engine turbojet and propeller-driv aircraft which are operating more than 30 nautical mi from destination airport:

A SPEED NOT LESS THAN 250 KNOTS IA

(2) To multi-engine turbo jet and propeller-driv aircraft which are operating 20 to 30 nautical miles fr destination airport, and

(a) At or above 10,000' MSL:

A SPEED NOT LESS THAN 250 KNO IAS; or

(b) Below 10,000' MSL:

A SPEED NOT LESS THAN 200 KNOTS IA

(3) To multi-engine jet aircraft which are op ating less than 20 nautical miles from destination airpo

A SPEED NOT LESS THAN 180 KNOTS IA or

(4) To multi-engine propeller-driven aircraft whi are operating less than 20 nautical miles from destinati airport:

A SPEED NOT LESS THAN 150 KNOTS IA

NOTE.—Controllers have been advised that utilization the minimum speeds set forth above for propeller-driven craft will sometimes be impractical, since some aircraft this category cruise at lower speeds and cannot attain speeds specified.

f. Speed adjustment of multi-engine propeller-driv aircraft which cannot attain the minimum speeds forth above, or of single-engine aircraft, shall be acco plished by requesting such flights to, if practicable:

(1) Maintain a specified speed equivalent to th of the preceding/succeeding aircraft; or

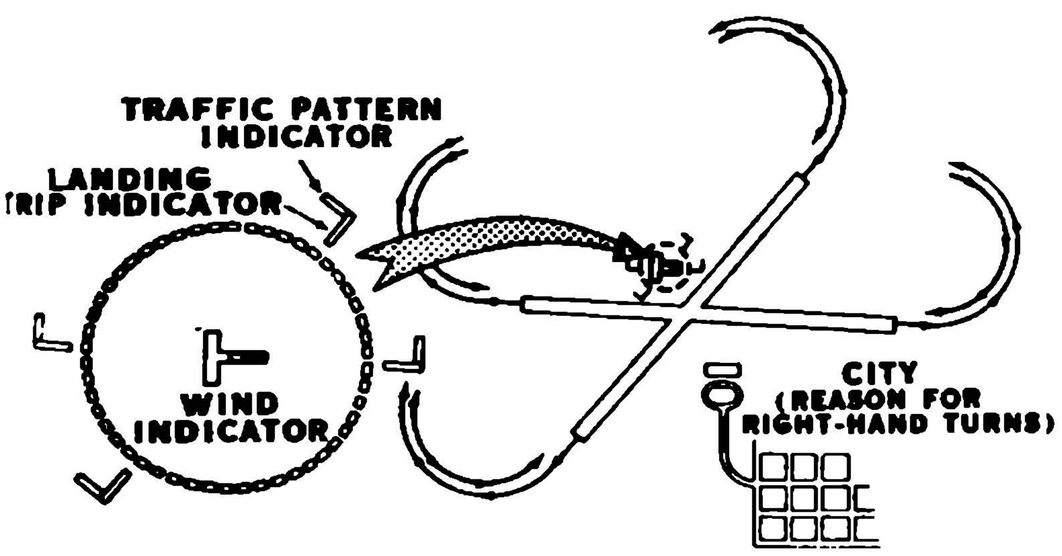
(2) Increase or decrease speed utilizing incremen of 10 knots or multiples thereof.

2. The pilots retain the perogative of rejecting t application of speed adjustment by ATC, if in his opinio it will adversely affect the operating characteristics the aircraft. In such cases, the pilot is expected advise ATC of the speed that will be used.

LANDING

TRAFFIC PATTERN DIRECTION

1. The segmented circle system consists of the following components: A wind indicator (sock) will be found at the center of the circle. Associated with the wind indicator and also located at the center of the circle, is the landing direction indicator, which may be a tetrahedron or tee, either free swinging or set for a particular runway. Although appearing as a single unit, the L-shaped indicator located at various positions around the segmented circle or at the end of a runway actually consists of two parts. That portion of the L in alignment with or parallel to a runway is known as the landing strip indicator. The other section of the L running at a right angle to the runway is known as the traffic pattern indicator.



2. Preparatory to a landing, the pilot should concern himself with the indicator for the approach end of the runway to be used. If the pilot will mentally enlarge the indicator for the runway to be used, the base and final approach legs of the traffic pattern to be flown immediately become apparent. Similar treatment of the indicator at the departure end of the runway will clearly indicate the direction of turn to join the cross wind leg of the traffic pattern after takeoff.

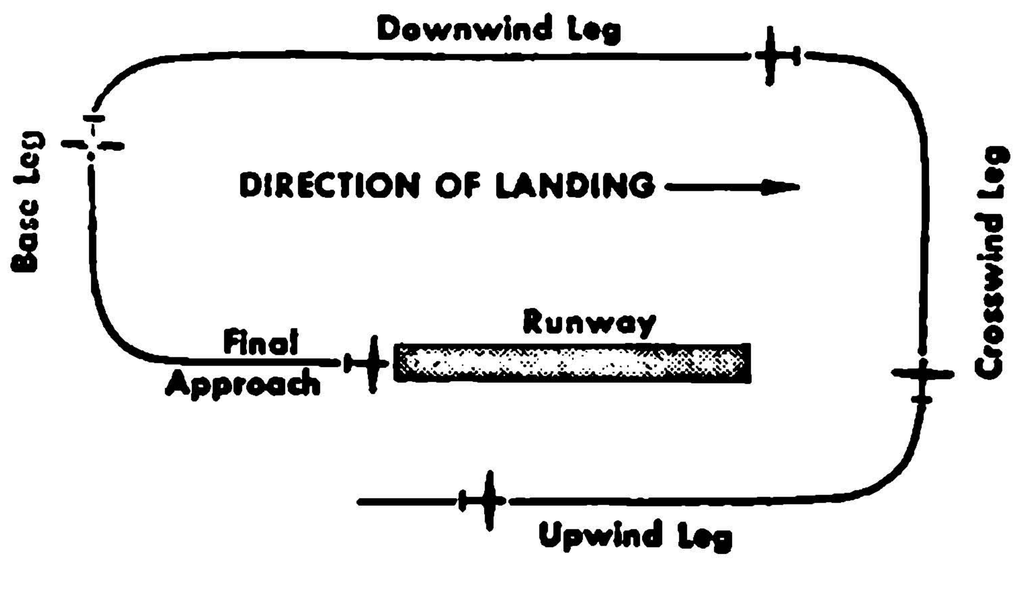
3. A flashing amber light in the center of the segmented circle or on top the control tower or adjoining building indicates clockwise flow of traffic is in effect at that time and that right turns shall be made unless otherwise authorized by Air Traffic Control.

4. Right hand flow of traffic may also be shown by indicators located at either the segmented circle or ends of the runway. A pilot may determine the direction of traffic flow by circling the airport at an altitude above the airport traffic area.

5. At airports where traffic control is exercised by a control tower, traffic and taxi patterns have been established to specify the desired flow of ground and air traffic operating on and in the vicinity of an airport. If the traffic pattern is not known, follow other traffic unless otherwise advised. Control tower operators issue clearances or other information to pilots as necessary for aircraft to generally follow the desired flight path (traffic patterns) when flying the airport traffic area/control zone and the proper taxi routes (taxi patterns) when operating on the ground.

6. The following terminology for the various components of a traffic pattern has been adopted as standard for use by control towers and pilots:

STANDARD TRAFFIC PATTERN COMPONENTS



Upwind leg—A flight path parallel to the landing runway in the direction of landing.

Crosswind leg—A flight path at right angles to the landing runway off its upwind leg.

Downwind leg—A flight path parallel to the landing runway in the direction opposite to landing.

Base leg—A flight path at right angles to the landing runway off its approach end and extending from the downwind leg to the intersection of the extended runway center line.

Final approach—A flight path in the direction of landing along the extended runway center line from the base leg to the runway.

GENERAL

U.S. ENTRY AND DEPARTURE REQUIREMENTS

GENERAL

a. Air Commerce Regulations of the United States art 6, place certain responsibilities upon owners and erators of aircraft engaging in flight to/from foreign untries.

b. Customs, and the other agencies concerned, desire facilitate air travel to the fullest extent possible while rrying out their responsibilities. Plane operators can sist greatly by familiarizing themselves with the regutions and by complying with them under all circumances. Failure to do so may incur substantial penalances. Failure to do so may incur substantial penalties.

c. The following sets forth principal requirements of ncern to private plane operators engaging in interational flights.

ARRIVAL AND DEPARTURE MANIFESTS

All aircraft departing from the continental United tates or Alaska for Canada or the French Islands of t. Pierre or Miquelon are exempt from filing an arrival r departure manifest. Aircraft arriving from any other lace are required to file arrival and departure manifests. owever, the Immigration and Naturalization Service es not inquire private aircraft not carrying passengers r hire to file an arrival or departure manifest when rriving from or departing for Mexico.

. ADVANCE NOTICE REQUIRED

a. Advance notice of each arrival must be furnished .S. Customs officials at or nearest the place of intended rst landing who will notify the Immigration and Public ealth Service is required for entry to the Virgin Islands.

b. Advance notice should be sent so as to be received sufficient time to enable the officers designated to spect the aircraft to reach the place of landing before rrival of the aircraft. At those airports where full time stoms service is not available, *at least one hour adance notice is required for this purpose.*

c. Notification may be made by telephone, which is referable, by telegram or by radio. The notice should pecify the following: (1) Type of aircraft; (2) Identication; (3) Name of pilot; (4) Place of last departure; 5) Airport of entry; (6) Number of alien and citizen assengers, and (7) estimated time of arrival. (Indicatg whether C.S.T., E.S.T., etc.) Private aircraft arrivg from Canada or Mexico may request that advance otice of arrival to customs officers be included in the *ight plan* filed in those countries if destined to an airort in the U.S. where flight notification service is availble. At a landing rights airport such notices will then e treated as applications for permision to land.

d. Aircraft may use the following method of notifying ustoms when departing from a country or remote area here a pre-departure flight plan cannot be filed or an "advise customs" message cannot be included in a predeparture flight plan. Call the nearest domestic or international FAA Flight Service Station as soon as it is estimated that radio communications can be established and file a VFR (DVFR) flight plan and include as the last item "advise customs." The station with which such a flight plan is filed will forward it to the appropriate FAA station who will notify the customs office responsible for the destination airport.

e. If the pilot fails to include "advise customs" in the radioed flight plan, it will be assumed that he has made other arrangements and FAA *will not* advise customs.

f. FAA assumes no responsibility for any delays in advising customs if the flight plan is given to FAA too late for delivery to customs before arrival of the aircraft. FAA cannot relay an "advise customs" flight plan if the pilot indicates a destination airport where flight service notice to customs is NOT available.

4. AIRPORTS FOR ENTRY AND REENTRY

a. If the operator of a private aircraft returning to or visiting the United States wishes to *land at any airport of entry, advance notice of arrival* is necessary. This advance notice should be sent also to the immigration and public health officers at or nearest the intended place of first landing.

b. If he intends to land at a place *not designated as an airport of entry, he must obtain permission to make such landing, and give advance notice of arrival* to the customs office nearest the intended place of first landing. It is not necessary that separate requests be sent to immigration and public health officers in these cases.

c. **What to report**—The advance notice should specify the type of aircraft, registration marks, name of commander, place of last departure, international airport, number of alien passengers, number of citizen passengers, and the estimated time of arrival. *This advance notice should be sent in time to enable officers designated to inspect the aircraft to reach the place of landing before the plane arrives.*

d. Upon arrival, the operator and passengers will be examined in the same manner as any international traveler. They must declare any articules acquired aboard. If passengers or cargo are carried for hire, an inward manifest must be filed. Customs officers will supply forms for both types of declarations.

5. EMERGENCY

If an emergency landing is made in the United States, the plane operator should report as promptly as possible to the nearest customs, immigration, and public health officers. He should not permit any merchandise or baggage to be removed, or any passengers to depart without official permission unless necessary for preservation of life or property.

U.S. ENTRY AND DEPARTURE (Con't)

6. CHARGES

a. No charges are made for services during business hours *when a landing takes place at any airport of entry: except* that, when an aircraft arrives on Sunday or holiday, or during other than regular hours, OVERTIME PAY WILL BE COLLECTIBLE. These charges are required by law. They may amount to as much as two days' pay for each officer for any services performed on a Sunday or holiday. However, the charges are prorated where more than one aircraft is processed.

b. *If the landing is made at a place other than an airport of entry*, any expenses incurred by Government officers in going to and from the place of landing are payable by the plane operator. In addition, if the aircraft arrives on a Sunday or holiday, or during other than regular hours, OVERTIME PAY WILL BE COLLECTIBLE.

7. TRANSBORDER FLIGHTS TO CANADA

a. Customs regulations allow the clearance by telephone of private aircraft departing for Canada and not carrying cargo.

b. If not carrying cargo, passengers for hire, nor departing to pick up pasengers for hire at points in Canada, a private aircraft departing for Canada does not require a clearance of any type.

c. If carrying passengers for hire or departing to pick up passengers for hire at points in Canada and not carrying cargo, approval of clearance may be applied for by telephone when consideration of distance and expense or, in an emergency, time are present.

d. For Buffalo-Niagara area apply to the supervisory inspector at the Peace Bridge at Buffalo or to the supervisory inspector at the Rainbow Bridge at Niagara Falls. The telephone number at the Peace Bridge is GRant 1180 and at the Rainbow Bridge BUtler 2–4562. When approval of the clearance is obtained from the Peaece Bridge, the general outward declaration should be mailed to United States Customs, Peace Bridge, Buffalo, New York. Similarly, when approval of clearance is obtained from the Rainbow Bridge, the general outward declaration should be mailed to United States Customs, Rainbow Bridge, Niagara Falls, New York.

e. Special arrangements have been made with Canada and Mexico that substantially differ from the requirements outlined above. Complete details are included in the International Flight Information Manual which can be obtained from Supt. of Documents, Govenrment Printing Office, Wash., D.C. 20402.

8. AIRPORTS OF ENTRY

a. Any aircraft may land at one of the following airports and permission to land from U.S. Customs is not required. However, advance notice of arrival must be furnished to U.S. Customs. This may be included in your *flight plan* filed in Canada or Mexico if destined to an airport where flight notification service is available.

ADIZ PROCEDURES (F.A.R. PART 99)

1. An "Airfield" flight plan makes the aircraft sub to interception for positive identification. Pilots strongly urged, therefore, to file DVFR Flight Plans quired for Security Control either in person or by phone. FAA Flight Service Stations will accept col long distance telephone calls made for the purpose filing required DVFR flight plans. The following cedures apply:

a. Contact the long distance telephone operator place a collect, station-to-station call from "SECUR PILOT (your last name)" to the FAA station.

b. When the FAA accepts the call, file your DV flight plan as expeditiously as possible.

2. Pilots should note that FAA stations will not ac collect calls from locations which are obviously m closer to another FAA station, neither will they ac calls which do not contain the key words "SECUR PILOT (name)." In order to conserve governu funds, FAA stations will not accept long distance col calls from any pilot within the Defense Areea. DV flight plans from such points will be accepted, howe if filed at no expense to the government.

SCATER PROCEDURES
(Security Control of Air Traffic and Electromagnetic Radiations)

1. All pilots should guard a FAA control frequency at ll times. In event of emergency, SCATER directives ill be broadcast over these frequencies. VFR flights ay expect to be ordered to land at nearest facility. FR flights will proceed as directed by ARTCC.

2. Following the declaration of an Air Defense Emerency, SECURITY CONTROL RULES will become effece. These rules are included in the published SCATER lan. Pilots should contact the nearest Air Traffic Conol facility upon being advised of an Air Defense Emerncy or that SCATER has been implemented. They will en be advised as to the requirements for Security Conol, if any, for flight operations.

INTERCEPTION SIGNALS

There are occasions when interceptor pilots are required to transmit instructions to pilots of intercepted aircraft. When radio communications are not available, the accompanying visual signals are used. These signals are applicable within the airspace over the United States including Alaska and Hawaii, and the territories and possessions of the United States, including the territorial waters thereof.

Interceptor pilots required to transmit instructions by visual means shall approach the aircraft to be intercepted from astern, employing the Interception Pattern for Identification of Transport Aircraft. A distance of at least 500 feet shall be maintained between aircraft exchanging signals. These signals have also been adopted by Canada and are applicable within the airspace over Canada.

IRST SERIES

Signal by interceptor	Meaning	Response by intercepted Aircraft
ay cking wings from a position in ast of intercepted aircraft and ter acknowledgement a slow ul turn on to the desired urse.	'Follow me'	Day or Night Rocking wings and following.
ight day with the addition of a ser- s of flashing lights at irregular tervals by any means available. ote:—If the interceptor in- ds only to lead intercepted air- aft away from an area it signals front and to the left of the in- rcepted aircraft. If the inter- ptor intends to lead intercepted rcraft for a landing it signals in ont and to the right of the inter- pted aircraft.		
If the intercepted aircraft is able to maintain sufficient eed to follow the interceptor:		
) The interceptor shall fly in the direction the intercepted aircraft should fly, circle to the left, and fly again in the proper direction.	'Fly in this direction	Rocking wings and maintaining indicated direction.
) When the area for descent is reached the interceptor shall circle to the right. The intercepted aircraft should then let down in the descending turn at the minimum rate of descent.	'Descend in this area'	Rocking wings and commencing descent.

ECOND SERIES

Signal by interceptor	Meaning	Response by intercepted aircraft
ay or Night n abrupt break away upward f 90 degrees or more.	'You may proceed	Day or Night Rocking wings.

THIRD SERIES (To be used on arriving in vicinity of aerodrome).

Signal by interceptor	Meaning	Response by intercepted aircraft
Day Circling aerodrome and lowering landing gear. Night As day and showing steady lights if carried.	'Land at this aerodrome.	Day or Night Same as interceptor, and proceed to land.

FOURTH SERIES (To be used if intercepted aircraft finds aerodrome inadequate.)

Signal by intercepted aircraft	Meaning	Response by interceptor
Day Rocking wings while passing over landing runway at a height exceeding 1,000 feet above the level of the aerodrome. Night Flashing landing lights while passing over the landing runway at a height not exceeding 1,000 feet above the level of the aerodrome. (If unable to flash landing lights, flash any lights available.)	'Aerodrome that you have designated is inadequate'.	Day or Night If it is desired that other aircraft follow him to an alternative aerodrome, the interceptor signals the FIRST series. Should the interceptor decide to release intercepted aircraft he signals the SECOND series (meaning 'You may proceed')

DISTRESS SERIES

Signal by intercepted aircraft	Meaning	Response by interceptor
Day Porpoising. Night Switching on landing lights and holding steady beam.	'In distress'.	Day or Night Use appropriate interception signal, as shown above.

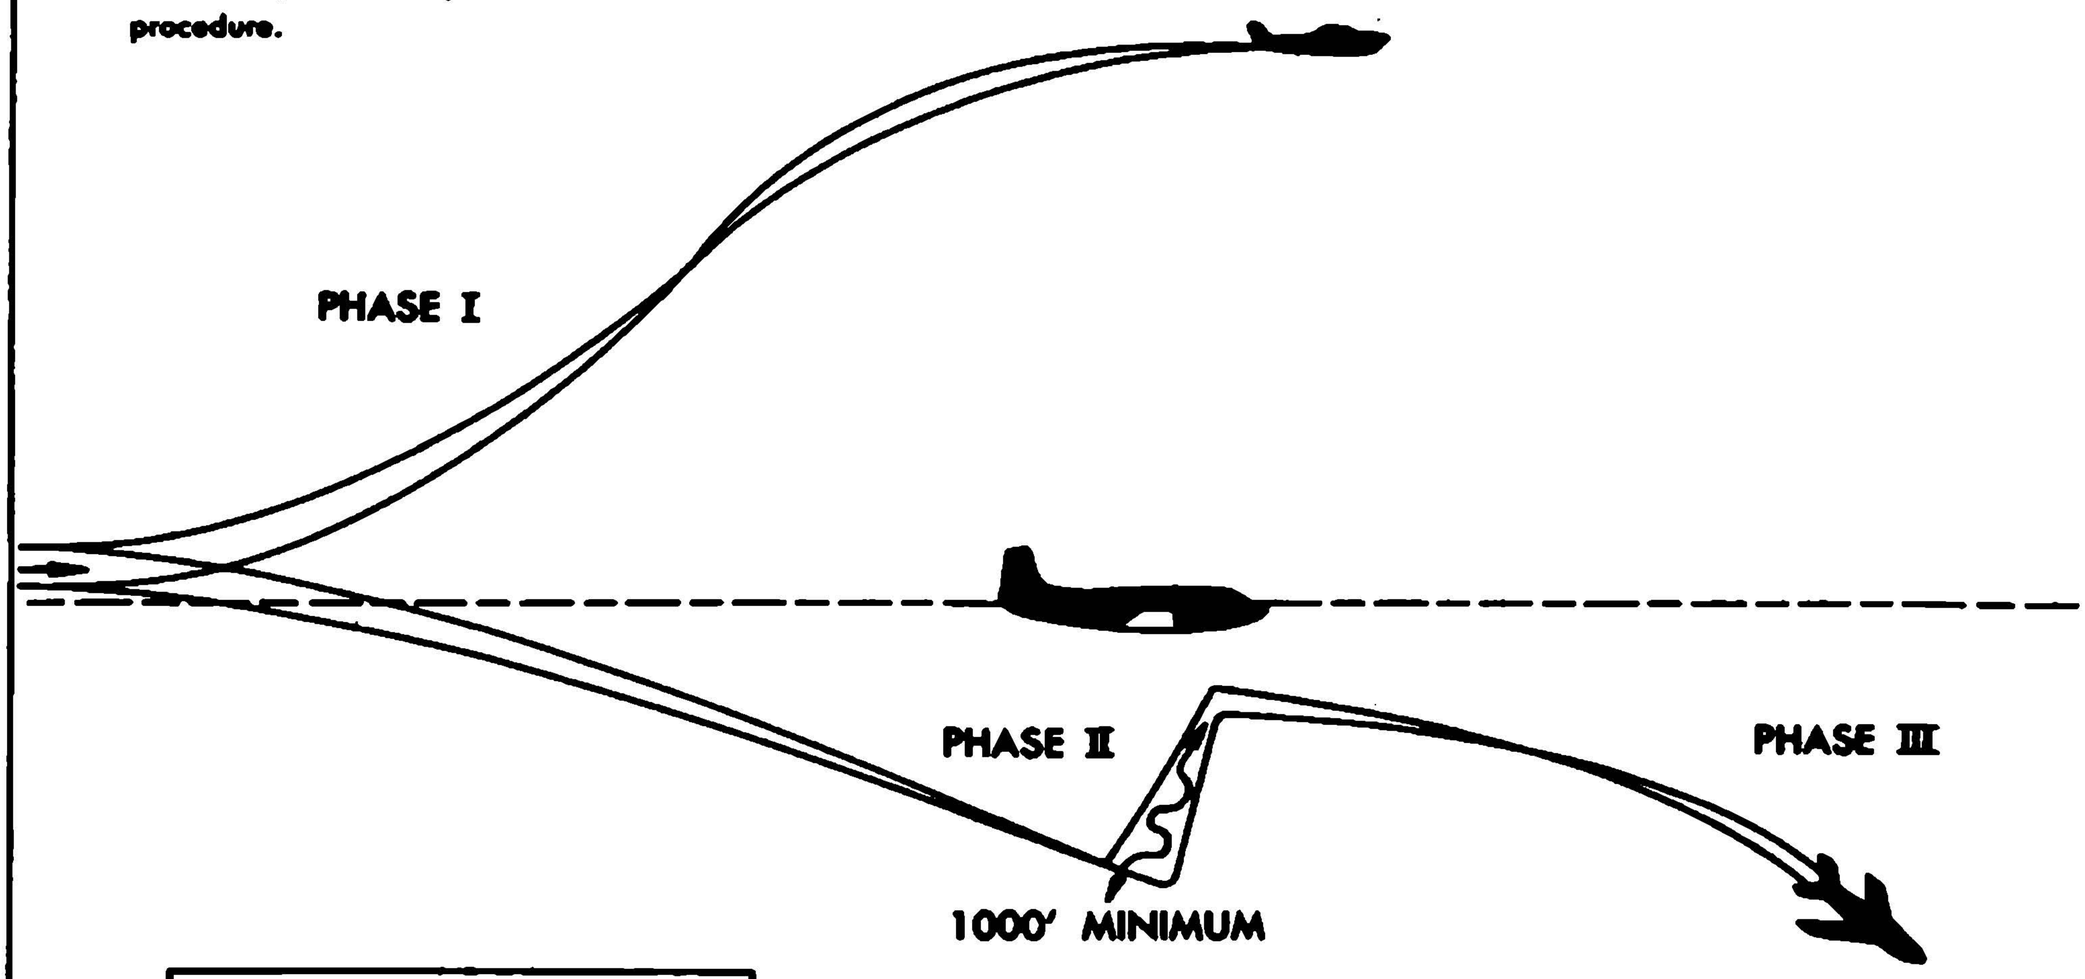
INTERCEPTION PATTERN FOR IDENTIFICATION OF TRANSPORT AIRCRAFT

PHASE I

Intercepting aircraft approach intercepted aircraft from astern. Element leader reduces throttle and extends dive brakes. Wingman continues to the opposite side of the intercepted aircraft from the leader and climbs to 4000 feet above target aircraft altitude for the purpose of maintaining surveillance, using economical power setting. Should weather ceiling not permit surveillance from this position, wingman will assume a position of either side of aircraft which will permit observation of both the aircraft and his element leader at a distance of 3000 feet from the intercepted aircraft, if visibility permits. During surveillance, wingman will maintain position by S-turns rather than reducing speed with dive brakes. The desired position of the element leader is 1000 feet abreast the aircraft at the aircraft's altitude. After speed and position are stabilized, element proceeds with Phase II of the procedure.

PHASE II

Wingman continues surveillance. Element leader begins gentle closure of aircraft at same level until no closer than absolutely necessary to obtain information needed. As he gives identification information to director, wingman copies information for mission report. Element leader uses every precaution to avoid startling intercepted aircrew or passengers, keeping constantly in mind that maneuvers considered normal to a fighter aircraft may be considered hazardous to passengers and crews of nonfighter aircraft. Upon completion of identification, fighter-interceptors withdraw from aircraft's vicinity as outlined in Phase III.



INTERCEPTION PATTERN FOR DAY-VISUAL IDENTIFICATION OF AIRCRAFT

PHASE III

Element leader breaks gently away from aircraft in shallow dive to pick up speed. Wingman stays well clear of intercepted aircraft and joins leader.

Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

EMERGENCY PROCEDURES

GENERAL

1. A pilot in any emergency phase (uncertainty, alert, or distress) should do three things to obtain assistance:

a. *If equipped with IFF, switch to "Emergency" position.*

b. *Contact controlling agency and give nature of distress and pilot's intentions.* If unable to contact controlling agencies, attempt to contact any agency on assigned frequency or any of the following frequencies (transmit and receive):

Frequency	Emission	Effective Range in Nautical Miles	Guarded By
121.5 mc	Voice	Generally limited to radio line-of-sight	All military towers, most civil towers, VHF direction finding stns, radar facilities. Flight Service Stns. Ocean Station Vessels.
243.0 mc	Voice	Generally limited to radio-line-of-sight	All military towers, most civil towers, VHF direction finding stns, radar facilities. Flight Service Stns. Ocean Station Vessels.
2182 kc	Voice	Generally less than 300 miles for average aircraft installations	Some ships and boats, Coast Guard stations, most commercial coast stations.
500 kc	CW	Generally less than 100 miles for average aircraft installations	Most large ships most Coast Guard radio stations, most commercial coast stations.
8364 kc	CW	Up to several thousand miles, depending upon propagation conditions. Subject to "skip."	U.S.N. Direction Finding Stations, Ocean Station Vessels, most Coast Guard radio stations and some FAA International Flight Service Stations (IFSS)

Transmit as much of the following as possible:

(1) MAYDAY, MAYDAY, MAYDAY (if distress), or PAN, PAN, PAN (if uncertainty or alert). If CW transmision, use SOS (distress) or XXX (uncertainty or alert).

(2) Aircraft identification repeated three times.

(3) Type of aircraft.

(4) Position or estimated position (stating which).

(5) Heading (true or magnetic) (stating which).

(6) True airspeed or estimated true airspeed (stating which).

(7) Altitude.

(8) Fuel remaining in hours and minutes.

(9) Nature of distress.

(10) Pilot's intentions (bailout, ditch, crash landing, etc.).

(11) Assistance desired (fix, steer, bearing, escort, etc.).

(12) Two 10-second dashes with mike button (voice) or key (CW) followed by aircraft identification (once) and OVER (voice) or K (CW).

c. **Comply with instructions received.** Accept the "communications control" offered to you by the ground radio station, silence interfering radio stations, and do not shift frequency or shift to another ground station unless absolutely necessary.

2. Pilots of IFR flights experiencing two-way radio failure are expected to adhere to the procedures prescribed under "RADIO COMMUNICATIONS FAILURE" (F.A.R. PART 91.127). However, if a pilot should become lost, or if other factors prevent the pilot from being able to comply with prescribed procedures, such pilot, as well as pilot of VFR flights, may attempt to alert civil or military radar systems as follows:

a. **If receiver only is operating:** Fly triangular pattern to the RIGHT (see diagram). Hold each heading for two minutes (1 minute for jet use). Complete a minimum of two such patterns before resuming original course and then repeat pattern at 20-minute intervals. When flying triangular patterns to the right the emergency frequencies (121.5 or 243.0 mc) should be guarded. If pattern is observed by radar controllers, instructions will be given.

b. **If transmitter and receiver are both inoperative:** Fly a triangular pattern to the LEFT (see diagram), in the same manner as described above. If patterns are observed by radar controllers, an escort will be dispatched, if possible. If distressed aircraft is flying in IFR conditions or if at night, landing lights, navigational lights, etc., should be turned on to aid the interceptor. If intercepted, follow rescue aircraft.

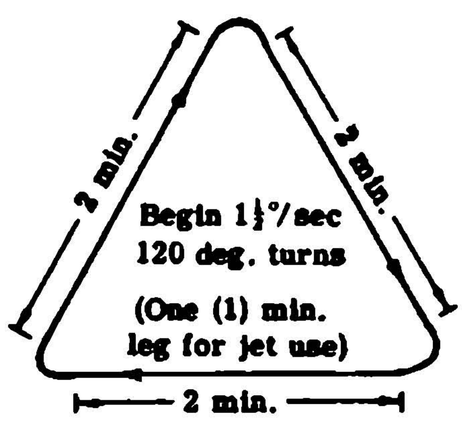


Figure 1 - With Receiver Operating Only

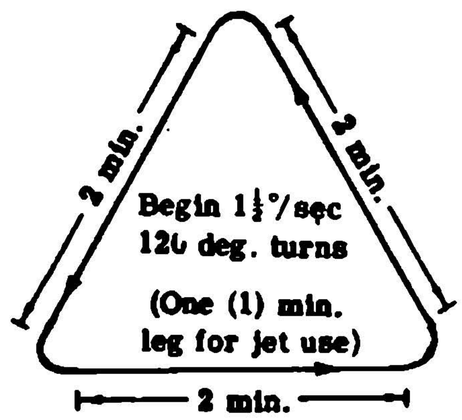

Figure 2 - With Transmitter and Receiver Inoperative

GENERAL (Con't)

c. The pilot should remember that he has *three* means of declaring an emergency:

(1) Emergency IFF;

(2) Sending emergency message; and

(3) Flying triangular pattern.

d. Ground stations have *three* electronic means of assisting:

(1) Receipt of emergency message;

(2) Radar detection of IFF signal and triangular pattern; and

(3) DF bearings.

e. **Pilots should remember the FOUR C's**

(1) **Confess** your predicament to any ground radio station. Do not wait too long. Give SAR a chance!

(2) **Communicate** with your ground link and pass as much of the distress message on first transmission as possible. We need information for best SAR action!

(3) **Climb** if possible for better radar and DF detection. If flying at low altitude, the chance for establishing radio contact is improved by climbing, also chances of alerting radar systems are sometimes improved by climbing or descending.

NOTE.—Climbing or descending under IFR conditions within controlled airspace is not permitted except in *emergency*. Any variation in altitude, track, etc., in connection with flying radar patterns will be unknown to Air Traffic Control. Air Traffic Control will operate on the assumption that the provision of FAR, Part 91.127 are being followed by the pilot.

(4) **Comply**—especially *Comply*—with advice and instructions received, if you really want help. Assist the ground "communications control" station to control communications on the distress frequency on which you are working (as that is the distress frequency for your case). Tell interfering stations to maintain silence until you call. Cooperate!

3. For bailout, set radio for continuous emission. For ditching or crash landing, radio should, if it is considered that there is no additional risk of fire and if circumstances permit, be set for continuous transmission.

4. When a pilot is in doubt of his position, or feels apprehensive for his safety, he should not hesitate to request assistance. Search and Rescue facilities, including Radar, Radio, and DF stations, are ready and willing to help. There is no penalty for using them. Delay has caused and cost lives. Take Action!

SEARCH AND RESCUE

1. GENERAL

a. Search and Rescue is a life-saving service provided through the combined efforts of the FAA, Air Force, Coast Guard, State Boards, Aeronautic Commissions or other similar state agencies who are assisted by other organizations such as the Civil Air Patrol, Sheriffs Air Patrol, State Police, etc. It provides search, survival aid, and rescue of personnel of missing or crashed aircraft.

b. Prior to departure on every flight, local or otherwise, someone at the departure point should be advised of your destination and the route of flight if other than direct. Search efforts are often wasted and rescue is often delayed because of pilots who thoughtlessly take off without telling anyone where they are going.

c. All you need to remember to obtain this valuab protection is:

(1) File a Flight Plan with an FAA Flight Servi Station in person or by telephone or radio.

(2) Close your flight plan.

(3) If you land at a location other than the i tended destination, report the landing to the near FAA Flight Service Station.

(4) If you land en route and are delayed more th 30 min. (15 min. for jets), report this information the nearest FSS.

(5) Remember that if you fail to report within o half hour after your ETA, a search will be started locate you.

d. If a crashed aircraft is observed:

(1) Determine if crash is marked with yellow cro if so, crash has already been reported and identified.

(2) Determine, if possible, type and number of a craft and whether there is evidence of survivors.

(3) Fix, as accurately as possible, exact location crash.

(4) Transmit information to nearest FAA or oth appropriate radio facility.

(5) Immediately after landing, make a complete r port to nearest FAA, Air Force, or Coast Guard install tion. Report may be made by long distance collect te phone.

e. To assure survival and rescue in the event of crash landing the following advice is given:

(1) For flight over uninhabited land areas, it wise to take suitable survival equipment depending type of climate and terrain.

(2) If forced landing occurs at sea, chances f survival are governed by degree of crew proficiency emergency procedures and by effectivenss of water su vival equipment.

(3) If it becomes necessary to ditch, distressed ai craft should make every effort to ditch near a surfa vessel. If time permits, the position of the neare vessel can be obtained from a Coast Guard Rescue C ordination Center through the FAA facility.

(4) The rapidity of rescue on land or water w depend on how accurately your position may be d termined. If flight plan has been followed and yo position is on course, rescue should be prompt.

(5) Unless you have good reason to believe that y will not be located by search aircraft, it is better remain near your aircraft and prepare means for s nalling whenever aircraft approach your position.

f. Search and Rescue facilities include:

(1) Rescue Coordination Centers;

(2) Search and Rescue aircraft;

(3) Rescue vessels;

(4) Pararescue and ground rescue teams;

(5) Emergency radio fixing.

2. CLOSE YOUR FLIGHT PLAN

a. The control tower does not automatically cl flight plans since many of the landing aircraft are operating on flight plans. It remains the responsibil of a pilot to close his own flight plan. This will prev a needless search.

3. NATIONAL SEARCH AND RESCUE PLAN

a. Under the National Search and Rescue Plan, t U.S. Coast Guard is responsible for coordination search and rescue for the Maritime Region, and

SEARCH AND RESCUE (Con't)

U.S. Air Force is responsible for coordination of search and rescue for the Inland Region. In order to carry out this responsibility the Air Force and the Coast Guard have established Rescue Coordination Centers to direct search and rescue activities within their regions. This service is available to all persons and property in distress, both civilian and military. Normally, for aircraft incidents, information will be passed to the Rescue Coordination Centers through the appropriate Air Route Traffic Control Center.

•REPORTING AIRCRAFT ACCIDENTS, INFLIGHT HAZARDS AND OVERDUE AIRCRAFT

(Civil Aeronautics Board, Safety Investigation Regulations, Part 320 (in part)).

1. NOTIFICATION

a. The operator of an aircraft shall immediately, and by the most expeditious means available, notify the Civil Aeronautics Board, Bureau of Safety Field Office nearest the accident or occurrence when:

(1) As a result of the operation of an aircraft, any person (occupant or nonoccupant) receives fatal or serious injury or any aircraft receives substantial damage;

(2) Aircraft collide in flight;

(3) The following inflight hazards are experienced:

(a) Fire;

(b) Rapid decompression requiring emergency action;

(c) Unwanted or asymmetrical thrust reversal;

(d) Flight control system malfunction or failure;

(e) Inability of any required flight crew member to perform his normal flight duties as a result of injury or illness.

(f) An aircraft is overdue and is believed to have been involved in an accident.

b. The following information is required if available:

(1) Location;

(2) Date;

(3) Time;

(4) Aircraft make, model, and registration number and nationality;

(5) Names of operator and crew;

(6) Number of persons involved;

(7) Injuries of each person;

(8) Weather conditions;

2. REPORTS

a. The operator shall file a report on CAB Form 453 or 454, available from the Civil Aeronautics Board Field Offices, the Civil Aeronautics Board, Washington, D.C., and the Federal Aviation Agency Flight Standards District Office:

(1) Within ten (10) days after an occurrence for which notification is required in 1 (a) and (b) above;

(2) When, after seven (7) days, an overdue aircraft is still missing;

(3) Upon request of an authorized representative of the Civil Aeronautics Board;

b. Each crew member, if physically able at the time the report is submitted, shall attach thereto a statement setting forth the facts, conditions and circumstances relating to the accident or occurrence as they appear to him to the best of his knowledge and belief. If the crew member is incapacitated, he shall submit the statement as soon as he is physically able.

3. WHERE TO FILE REPORTS

a. The operator of an aircraft shall file with the Field Office of the Civil Aeronautics Board nearest the acci-

SEARCH AND RESCUE (Con't)

dent or occurrence any report required by this section involving:

(1) Aircraft having a maximum take-off weight of more than 12,500 pounds or rotorcraft regardless of weight.

(2) Aircraft having a maximum take-off weight of 12,500 pounds or less operated by an air carrier certificated to engage in air transportation in the State of Alaska; and

(3) Aircraft, regardless of maximum take-off weight, where fatal injuries have occurred to any occupant of such aircraft.

b. The operator of an aircraft shall file with the FAA Flight Standards District Office nearest the accident or occurrence any report required by this section involving fixed-wing aircraft with a maximum take-off weight of 12,500 pounds or less except reports which are required to be filed with the Board pursuant to paragraph A above. FAA Flight Standards District Offices are listed on last page of Section II in Airman's Information Manual.

c. Civil Aeronautics Board field Safety Office addresses and telephone numbers are **Anchorage:** P.O. Box 2219, Anchorage, Alaska; BRoadway 2–7001. **Chicago:** Suite 206, 6525 North Avenue, Oak Park, Ill.; VIllage 8–9565. **Denver:** 1549 Emporia Street, Auroa, Colo.; EMpire 6–8249. **Fort Worth:** 100 North University Drive, University Plaza Building, Fort Worth 7, Tex.; EDison 6–2463. **Kansas City:** 912 East 63d Street, Kansas City, Mo. 64110; EMerson 3–2220 and 3–2221. **Los Angeles:** Los Angeles International Airport, 5820 Avion Drive, Room 228, Los Angeles 45, Calif.; SPring 6–0117. **Miami:** P.O. Box 48–0931, Miami International Airport, Miami 48, Fla.; TUxedo 5–2445. **New York:** Federal Building, Room 101, New York International Airport, Jamaica, Long Island, New York; 995–3333. **Oakland:** P.O. Box 2386, Oakland Airport Station, Oakland 14, Calif.; LOckhaven 8–1290. **Seattle:** Room 202, Administration Building, King County Airport, Seattle 8, Wash.; PArkway 3–9474.

RADIO COMMUNICATIONS FAILURE (F.A.R. PART 91.127)

1. It is virtually imposible to provide regulations and procedures applicable to all possible situations associated with radio communications failure in aircraft. During two-way radio communications failure when confronted with a situation not covered in the regulation, pilots are expected to exercise good judgment in whatever action they elect to take. Should the situation so dictate, they should not be reluctant to use the emergency action contained in FAR Part 91.127. Pilots who experience radio communications failure are urged to listen on any operational radio receiver for information broadcast by Air Traffic Control. Controllers have the capability of transmitting on most navigational facilities and do so where an aircraft communications failure is recognized.

2. In the event of two-way radio communications failure, pilots on an IFR flight plan shall comply with the provisions of FAR Part 91.127, Two-way Radio Communications Failure. The following procedures are provided as a detailed guide for pilots. It is expected that pilots will operate their aircraft in accordance with these procedures in the event of radio failure and ATC service will be provided on the basis that the pilot is operati in accordance with these procedures.

3. **In VFR Conditions**—If able to maintain flight in VF conditions, continue flight under VFR and land as so as practicable and notify ATC. It is not intended th the requirement to "land as soon as practicable" to construed to mean "as soon as possible." The pilot tains his perogative of exercising his best judgment a is not required to land at an unauthorized airport, at airport unsuitable for the type of aircraft flown, or land only minutes short of this intended destination. T primary objective of this provision is to preclude tended IFR operations in the air traffic control system VFR weather conditions. When operating "on top" a unable to descend VFR prior to the destination, the p cedures contained in paragraph 4. are applicable.

4. **In IFR Conditions**—When in IFR conditions, or wh unable to descend and land in VFR conditions, the f lowing procedures are applicable.

a. Route

(1) If cleared to the destination airport or a rad facility serving the destination airport, proceed via t route specified in the last air traffic control clearan received to the radio facility to be used for the approa at the destination airport.

(2) If cleared to a radio fix short of the rad facility serving the destination airport without holdi instructions, *do not hold* but proceed via the route spe fied in the last air traffic control clearance received, or no route beyond the clearance limit has been receive proceed via flight planned route, to the radio facility be used for the approach at the destination airport.

(3) If cleared to a radio fix short of the rad facility serving the destination airport with holding i structions and a time to "expect *further* clearance," *ho until the time specified* then proceed via routing in a cordance with (2) above to the radio facility to be us for the approach at the destination airport.

(4) If cleared to a radio fix short of the rad facility serving the destination airport with holding i structions and time to "expect *approach* clearance," *ho and depart the fix so as to arrive over the radio facili to be used for the approach at the destination airpo as nearly as possible to the expected approach clearan time received*, proceeding in accordance with (2) abo

(5) If cleared to a radio fix short of the rad facility serving the destination airport which is on route other than the route requested, ATC will specify proposed routing beyond such clearance limit by statin "*EXPECT FURTHER CLEARANCE VIA (propos routing).*" This proposed routing will specify either new route to the destination airport or to a point int cepting the flight planned route. In such cases, the pr posed routing should be followed in lieu of the flig planned route.

(6) If a departing flight is cleared via vector, lieu of a specified routing, to fix, radial or airway, t flight should proceed by the most direct course possib to the fix, radial or airway and then in accordan with two-way radio communications failure procedure

(7) If a flight is departing or en route and a ve tor has taken if off the route specified in the ATC cle ance, the flight should be returned to the route specifi

RADIO COMMUNICATION FAILURE (Con't)

n the ATC clearance by the most direct course possi-le and then proceed in accordance with two-way radio ommunications failure procedures.

b. Altitude

(1) If assigned an altitude/flight level in the *ighest route structure* **filed in the flight plan or sub-equently requested, climb in accordance with the ATC earance received and then maintain the assigned al-itude/flight level or the MEA, whichever is higher, o the radio facility to be used for the approach at the estination airport.**

(2) If assigned an altitude ***below the highest*** *oute structure* **requested, ATC will specify a time or ix at which further clearance can be expected to an ltitude/flight level within the highest route structure equested by stating, "*EXPECT FURTHER CLEAR-NCE AT (altitude/flight level) AT (time/fix).*" If adio communications *failure occurs prior to receiving clearance* into the requested route structure, the ex-ected altitude/flight level should be considered an as-igned altitude/flight level and a *climb* en route to the xpected altitude should be made *at the time or location pecified.***

(3) If assigned an altitude ***below the highest route*** *tructure* **filed or subsequently requested and ATC has ot issued an "EXPECT FURTHER CLEARANCE AT Altitude)," maintain the** ***assigned altitude/flight level r the MEA, whichever is higher, until 10 minutes after assing the first compulsory reporting point over which he failure prevented communications with Air Traffic Control, unless earlier climb is required by the minimum afe altitude.*** **Then climb to and maintain the lowest ardinal altitude/flight level at or above the MEA of he highest route structure requested. (Cardinal alti-udes are thousand-foot levels 15,000', 16,000' etc.) The MEA of the high altitude route structure is Flight evel 180.**

(4) If a lower route structure has been specified s the final segment(s) of the route, the pilot should ly a route over the underlying airway maintaining the ast assigned altitude/flight level.

(5) ***If clearance to descend to an altitude below he highest requested route structure has been*** **received,** ***he last assigned altitude or the MEA, whichever is igher, should be maintained*** **in lieu of climbing back nto the highest requested route structure.**

(6) If ***deviation from the altitude*** **assigned by Air Traffic Control is necessary in order to comply with a** *igher MEA,* **any subsequent descent required by a ower MEA shall not be made below the altitude last ssigned by Air Traffic Control.**

Example:

A flight is cruising at 8,000' (last assigned altitude) on an IFR flight plan when radio communications failure occurs. After passing the next fix, the minimum enroute altitude is 10,000' and climb is made to that altitude. On the last leg of the flight, the minimum enroute altitude is 3,500'. The flight descends back to 8,000' after passing the fix defining the termination of the 10,000' minimum enroute altitude segment since the last assigned altitude (8,000') is higher than the MEA (3,500').

c. Approach

(1) Maintian the enroute altitude/flight level to the radio facility to be used for the approach to the airport. Because of many variable involved, no attempt is made to specify the type approach to be used.

(a) If a *clearance for an approach* **at the destination airport** *has been received,* **comply with the clearance or other instructions and make a descent for landing.**

(b) If a *clearance for an approach* **at the destination airport** *has not been received,* **start the descent from the en route altitude or flight level at the expected approach clearance time last received or, if no expected approach clearance time was received start the descent at the estimated time of arrival as indicated by the flight plan and subsequently amended by the pilot with Air Traffic Control, or upon arrival over the radio facility, whichever is later. An approved instrument approach procedure shall be executed unless VFR conditions are encountered and it is posible to continue descent and approach in accordance with VFR.**

(c) If an aircraft is operating in accordance with an approach control clearance and has departed the outer fix on a radar vector, the flight should proceed by the most direct course to the radio facility to be used for the approach and thereafter execute an approved instrument approach procedure.

d. Holding

(1) If holding is necessary at the radio facility to be used for the approach at the destination airport:

(a) Holding and descent to the initial altitude for the execution of the instrument approach should be accomplished in a holding pattern on the side of the final approach course on which the procedure turn is prescribed.

(b) Where approved *military jet penetration* **procedures have been published for the airport,** ***holding and descent*** **to initial penetration altitude/flight level should be accomplished in the** ***holding pattern in accordance with the procedure depicted on the jet approach and landing chart for that airport.***

5. SPECIAL MILITARY PROCEDURES

a. Aircraft, on a flight in which a delay enroute is planned, shall commence descent at the destination, at the estimated time of arrival (ETA) derived from the estimated time en route (ETE) plus any delay for which an ATC clearance has been obtained.

Example #1:

Point-to-point flight plan from A to B to C to D (airport of destination). Estimated elapsed time enroute specified in flight plan is three hours (A to D). Remarks indicate proposed two-hour local flight at B and one-hour local flight at C. On departure, flight is cleared to D (or a short range clearance limit). If radio communications failure is experienced prior to reaching B, flight should proceed to destination in accordance with established radio communications failure procedures. If the flight has obtained an amended clearance authorizing a

RADIO COMMUNICATION FAILURE (Con't)

two hour delay at B and experiences radio communications failure prior to reaching B or after local flight is begun, local flight at B will be completed. Local flight at C will not be executed.

Example #2:

Round Robin flight plan from Point A to B to C and back to A. Estimated elapsed time enroute specified in flight plan is three hours (A to A). Remarks indicate one hour local flight at B and one hour local flight at A prior to landing. Action governing delay at B would be as indicated in example #1. If the flight is cleared for local flight at A and subsequently experiences radio communications failure, local flight will be completed before beginning letdown.

b. Aerial Refueling—Aircraft which have received authorization from ATC to conduct refueling operations involving more than one altitude/flight level and have not received clearance beyond the refueling track should exit the track at the lowest altitude/flight level specified in the clearance for the refueling portion of the flight and proceed in accordance with radio communications failure procedures.

c. Oil Burner—Aircraft which have been cleared for descent to the low altitude(s) of the route shall maintain the altitude(s) specified for the route. Aircraft which have not been cleared to descend to the Oil Burner route low altitude(s) shall maintain the last assigned altitude/flight level and proceed in accordance with radio communications failure procedures.

d. Turbojet En Route Penetration—Aircraft which have been cleared for an en route penetration will proceed to the radio facility to be used for the approach at the destination airport at the last assigned altitude or the Minimum Safe Altitude whichever is higher and from that altitude execute the published penetration in lieu of climbing to the initial penetration altitude.

FUEL JETTISONING

1. Should it become necessary to jettison fuel, the pilot should immediately advise Air Traffic Control. Upon receipt of advice that an aircraft will jettison fuel, Air Traffic Control will broadcast or cause to be broadcast immediately Air Traffic Control, Flight Service Station and airline company radio frequencies the following:

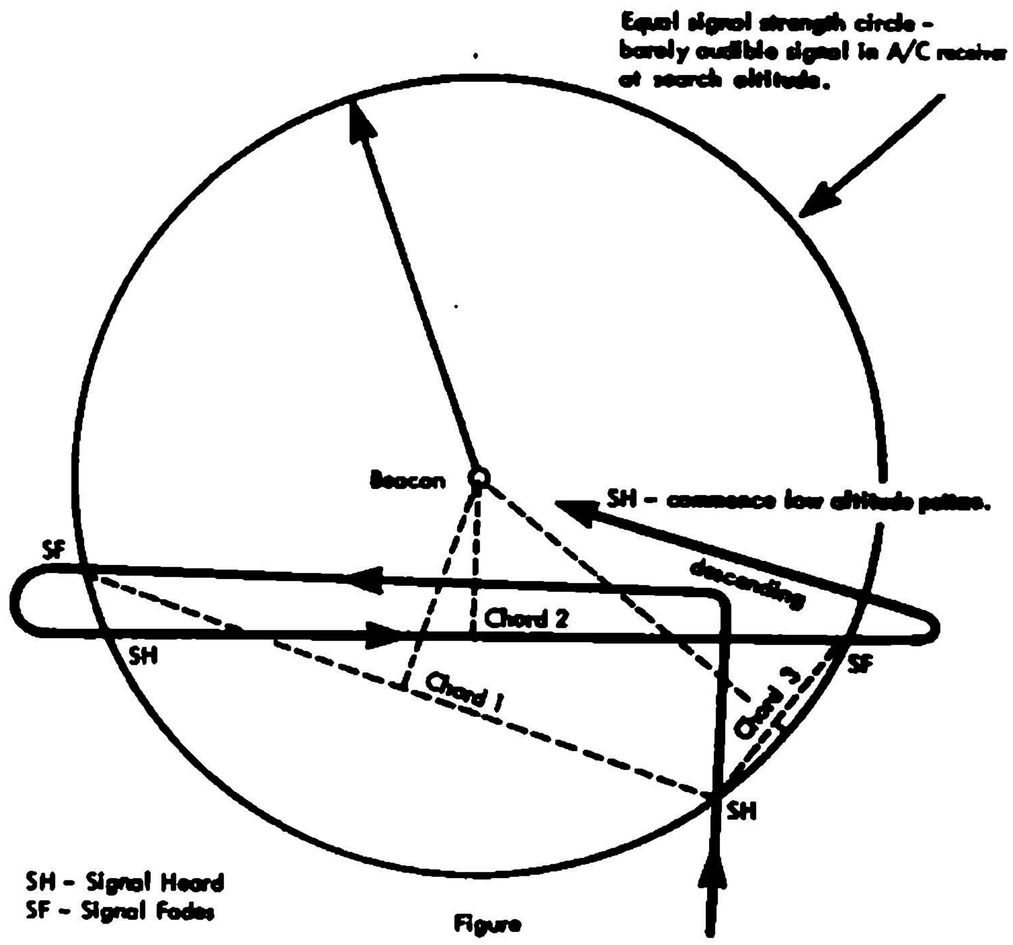
ADVISORY TO AIRCRAFT NOT ON ATC CLEARANCE—FUEL DUMPING IN PROGRESS—(aircraft type) (present position) course/s) (altitude)—AVOID FLIGHT WITHIN 5 NAUTICAL MILES OF FUEL DUMP AIRCRAFT.

2. Upon receipt of such a broadcast, pilots of aircraft affected, which are not on IFR flight plans or special VFR clearances, should clear the area specified in the advisory. Aircraft on IFR flight plans or special VFR clearances will be provided specific separation by Air Traffic Control. At the termination of the fuel jettisoning operation, pilots should advise Air Traffic Control. Upon receipt of such information, Air Traffic Control will issue, on appropriate frequencies, the following:

ADVISORY TO ALL CONCERNED—(aircraft type) FUEL DUMP TERMINATED.

LOCATING RESCUE BEACON

The initial search for survivors equipped with a VH or UHF beacon will be at high altitude to take advanta of the increased range afforded by altitude. The receiv should be tuned to the frequency of the beacon wi squelch off. The frequency should be guarded aurall and visually if the search aircraft has suitable homi equipment. While some progress is being made towa standardization on the type of signal emitted by the survival beacons, search and rescue personnel shou

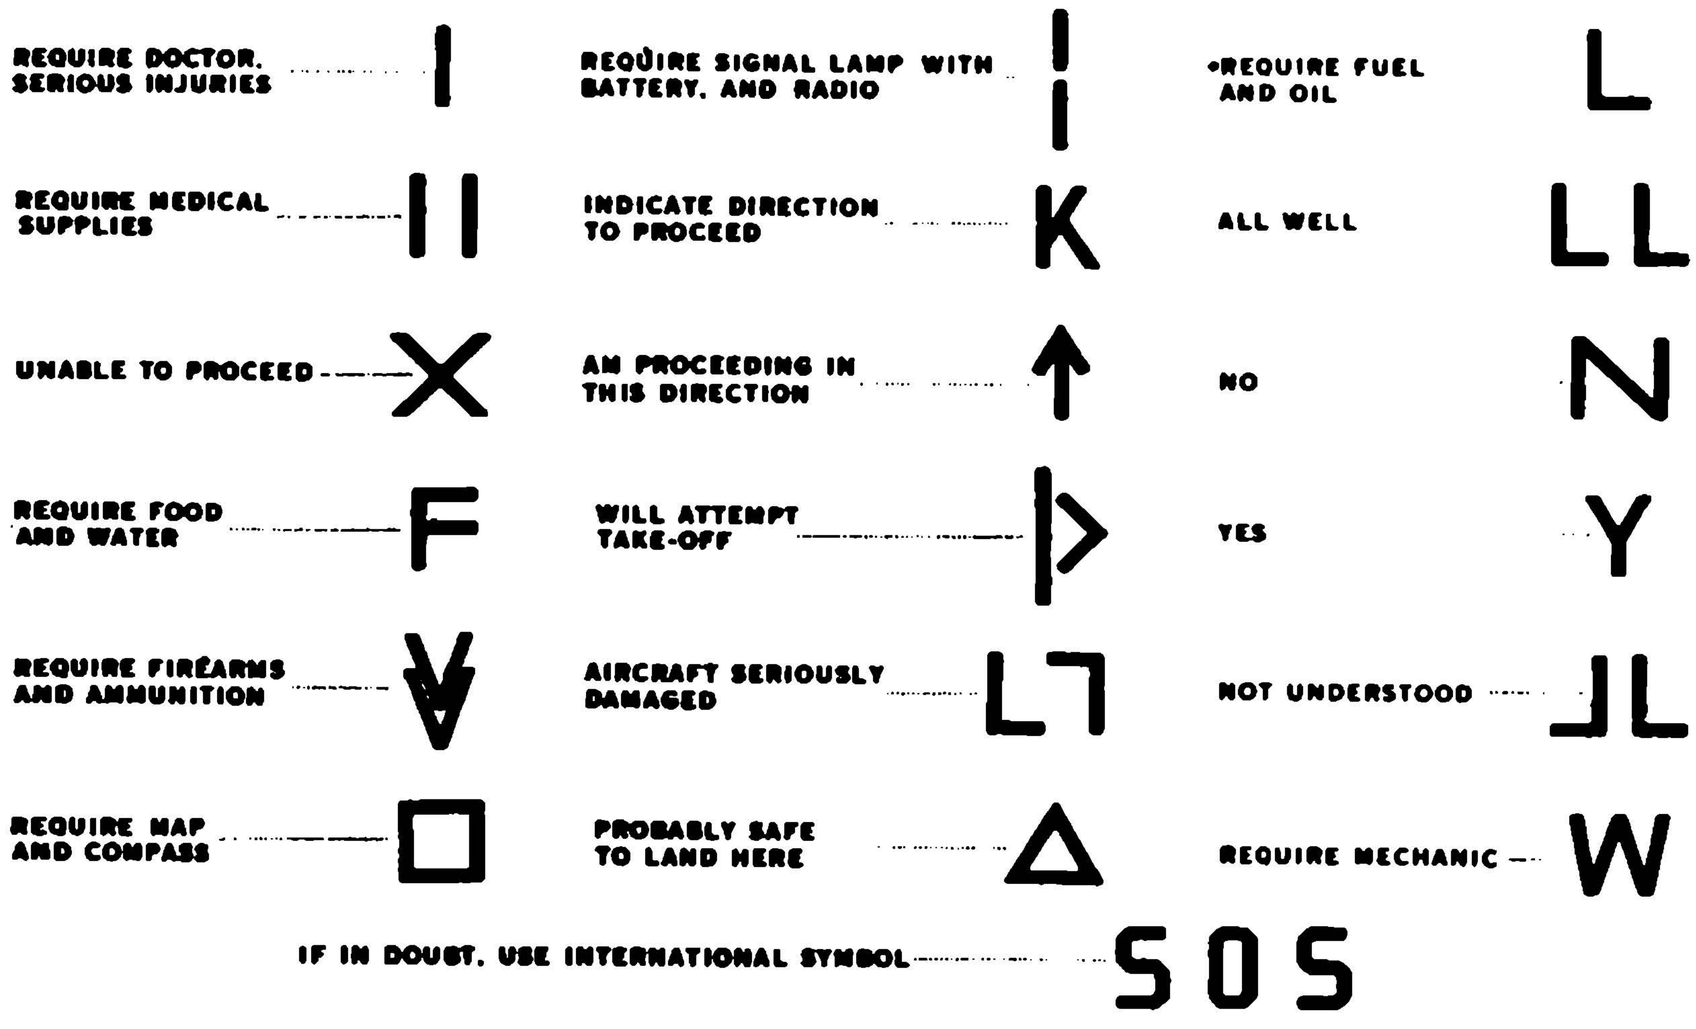


Figure

realize that complete standardization may not be achieve in the near future. If the type of signal emitted by th particular beacon is not known, searchers should be ale for any signal on the frequency, including a steady ton Types of signals used by these beacons are: steady ton (this may become a warbling tone if the beacon is floatin in the ocean); a definite warbling tone built into th beacon; an interrupted tone (a peculiar "beep-beep-beep" built into the beacon.

Once the beacon signal is detected, it will be a simpl matter for the search aircraft with homing equipmen However, if the search aircraft has only receiver cap bility, it can still locate the survivors by flying a boxin in pattern. Figure illustrates one such pattern. Bo ing-in patterns assume that the lines of equal signa strength will be circular, as shown in figure. Thu an aircraft flying at constant altitude can determine th limits of successive chords to the equal signal strengt circle corresponding to a barely audible signal on its ow receiver by plotting its position as the signal appears an and again when it fades. The perpendicular bisector o each chord is an approximate line of position containin the beacon. The intersection of any 2 lines of position wil indicate the approximate location of the beacon and th aircraft will be able to proceed to the approximate posi tion and descending to appropriate altitude, the aircraf can then make another low-level boxing-in pattern and/o carry out a close visual search for the survivors by an convenient high probability visual search pattern.

GROUND-AIR VISUAL CODE



INSTRUCTIONS

1. Lay out symbols by using strips of fabric or parachutes, pieces of wood, stones, or any available material.
2. Provide as much color contrast as possible between material used for symbols and background against which symbols are exposed.
3. Symbols should be at least 10 feet high or larger. Care should be taken to lay out symbols exactly as shown.
4. In addition to using symbols, every effort is to be made to attract attention by means of radio, flares, smoke, or other available means.
5. On snow covered ground, signals can be made by dragging, shoveling or tramping. Depressed areas forming symbols will appear black from the air.
6. Pilot should acknowledge message by rocking wings from side to side.

HOW TO USE THEM

If you are forced down and are able to attract the attention of the pilot of a rescue airplane, the body signals illustrated on this page can be used to transmit messages to him as he circles over your location. Stand in the open when you make the signals. Be sure that the background, as seen from the air, is not confusing. Go through the motions slowly and repeat each signal until you are positive that the pilot understands you.

Federal Aviation Agency

Airman's INFORMATION MANUAL

SECTION III

FLIGHT DATA AND SPECIAL OPERATIONS

EFFECTIVE 0501Z 10 DECEMBER 1964

To 0501Z 7 JANUARY 1965

AIRMAN'S INFORMATION MANUAL

INTRODUCTION

This Airman's Information Manual (AIM) has been developed by the Federal Aviation Agency as a pilot's operational manual replacing the Airman's Guide, Directory of Airports and Seaplane Bases, and the Flight Information Manual within the conterminous United States. The existing Alaska Airman's Guide and Chart Supplement and the Pacific Airman's Guide and Chart Supplement will continue to be published every 28 days.

The new AIM presents, in a single document, all information necessary for the planning and conduct of a flight in the National Airspace System. The content and format reflect user identified requirements and provide a "one package" approach.

The manual is divided into six sections, each composed of a specific category or family of information, fashioned into a format consistent with the operational needs of aviation. In contradistinction to previous flight information publications issued by FAA, the design concept of the AIM has provided for consolidation of similar information, segregation of air traffic control procedural information and its sequencing according to operational use, and the elimination of administrative and non-essential data.

The AIM is designed to be carried in the cockpit and may be used collectively or independently by sections. The manual is published as loose-leaf pages, and is three-hole punched to fit a standard three-ring binder.

New or amended textual or tabulated information except in the Airport/Facility Directory, is indicated by a solid dot prefixing the heading, paragraph, or line.

Each section of the AIM will be published at varying intervals during the year, depending on the stability or frequency or change of the information.

The various sections and the revision cycle of each are:

Section I	Basic Flight Manual	Semi-annually
Section II	ATC Operations and Procedures	Quarterly
Section III	Flight Data and Special Operations	Every 28 days
Section III–A	Notices to Airmen	Every 14 days
Section IV	Airport Directory	Semi-annually
Section IV–A	Airport/Facility Directory	Every 28 days

The above schedule provides a completely new manual every 6 months.

The revision cycle of Sections III and IV–A is every 28 days, the same as the IFR Enroute charts. Since the charts contains basically enroute information, the AIM serves as a supplementary publication, providing information for planning and terminal operations. Therefore, radio navigation aids are on the charts and unlike the Airman's Guide, are not tabulated in the AIM. Every effort has been made to minimize and eliminate duplication of information within publicatons and between publications and charts.

A Master Alphabetical Index of the AIM has been included in Section III because this section is issued every 28 days and thereby permits keeping the index current.

A brief description of the contents of each section in the AIM follows.

Section I—Basic Flight Manual

This section contains information of an instructional, educational, and training nature, assembled and presented in a systematic format, categorized by subject matter. The novice pilot, as well as the more experienced pilot will find here the basic fundamentals of knowledge for operating in the National Airspace System, information on adverse factors affecting safety of flight and health, and a list af available publications of general operational interest.

Section II—ATC Operations and Procedures

Section II is designed to serve as an official means of disseminating pertinent ATC information of interest to all pilots. The information governing flight operations, air traffic services, and procedures is presented in layman's language and avoids ambiguities which often result from individual interpretations of rules. Data is seqeunced in accordance with typical flight operations: Preflight, departure, enroute, arrival and landing procedures. In addition, supporting general procedures and information such as ADIZ, and SCATER procedures is included. Emergency procedures are combined and published at the end of the section.

Section III—Flight Data and Special Operations

Operational data most subject to change and which is not appropriate for inclusion within other sections of the AIM is carried in Section III. Because it contains critical flight data most subject to change, this section should be kept close at hand in the event of a divergence in enroute flight. Some of the most significant material contained in Section III is described below.

A Master Alphabetical Index giving a complete and comprehensive cross-referenced list of all aeronautical information in the AIM.

A glossary or explanation of aeronautical term or phrases used in the AIM, and a list of commonly used abbreviations.

Special Notices of pertinent current information of operational value for both preflight planning and enroute operations. These Special Notices are divided into three categories: General Notices—those of a general nature with universal application; Area Notices—those pertinent to a specific geographical aren; and Regulatory Notices—these are condensations of changes to or new rules, parts, Advisory Circulars, Special Procedures and other regulatory matters of operational interest.

A Visual Navigation Chart Bulletin, as a means of updating the Sectional Charts, providing a cumulative tabu'ation of the major changes in aeronautical information occurring since the last chart publication date.

Detailed description tabulations and charts of Special Operations such as Oil Burner Routes and military refueling tracks.

Section III—A—Notices to Airmen

This section serves as a supplement, issued every fourteen days, to the AIM and provides operationally required data pertinent to the continuous NOTAMs carried in the daily teletypewriter NOTAM Summary (NOSUM), revisions to Oil Burner routes, and those airman advisories deemed essential to the safe conduct of flight.

Sections IV and IV–A—Airport Directory

Within Sections IV and IV–A there are provided an Airport Directory, a tabulation of ARTCC communications, frequencies, and a tabulation of Flight Service Stations.

Section IV contains the Airport Directory which is a listing of all known airports, heliports, and seaplane bases available for transient civil use within the conterminous United States, and indicates those airport services and facilities available at each. The seaplane tabulation and the heliport tabulation follow the airport tabulation. Military airports and privately owned and operated airports closed to civil aviation are not listed.

Section IV–A contains an Airport/Facility Directory providing an integrated tabulation of major airports, heliports and seaplane bases which have terminal navaids and communications facilities available at the airport. This tabulation combines all facilities and services available at each airport (heliport or seaplane base) or terminal area into a single listing.

In both Sections IV and IV–A, airports are listed alphabetically by geographical location (city or town) within each state. Airports tabulated in IV–A are cross-referenced in Section IV.

In Section IV–A, the Airport/Facility Directory is followed by the tabulation of all ARTC Center VHF communications frequencies. This, in turn, is followed by the tabulation of FSS's, which shows their telephone numbers, the number of the associated Weather Bureau Office, and other pertinent data.

Errors, Omissions, or Suggested Changes

Errors, omissions, or suggested changes should be forwarded to the Federal Aviation Agency, Air Traffic Service, Attention AT-600, Washington, D.C. 20553. Airport managers, operators and owners are urged to review data for their airport and report any errors or omissions to FAA at the address given above.

Procurement

The Airman's Information Manual is available on annual subscription for $15.00, plus $4.00 additional for foreign mailing. Requests should be directed to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Orders should be accompanied by check or money order made payable to the Superintendent of Documents.

INTRODUCTION

Section III—FLIGHT DATA AND SPECIAL OPERATIONS

Section III contains operational flight data most subject to continuous change that is not appropriate for inclusion within other sections of the Manual. Because it contains such critical flight data, this section should be kept close at hand in the event of a divergence in en route flight.

The information in Section III is presented in various tabulations or grouping arrangements appropriate to the specific items. Typical examples are: Preferred Routes, VOR Receiver Check Points, Parachute Jumping Areas, and Substitute Route Structures.

The Master Alphabetical Index of the entire Manual is provided in this Section. This complete and comprehensive index lists all items of information, cross referenced under all headings to which reference might reasonably be made, giving section and page number. Within the index, any reference involving emergency actions or procedures is printed in bold-face type.

As a means of updating the Sectional Charts produced by the Coast and Geodetic Survey, Department of Commerce, a Visual Navigation Chart Bulletin is included in Section III. This bulletin provides a cumulative tabulation of the major changes in aeronautical information that have occurred since the last publication date (normally every 6 months) of each sectional chart. Only those changes to controlled airspace and special use airspace, airports, and radio navigation facilities that present a hazardous condition or impose a restriction on the pilot are listed, thereby continually providing the VFR pilot with the essential data for keeping his sectional charts current until they are reissued.

At the end of Section III are grouped detailed tabulations and charts of special operations and areas such as Oil Burner Routes, and military low altitude refueling tracks. This arrangement provides a consolidated presentation of areas and special operations that are not designated through rule-making procedures.

GLOSSARY OF AERONAUTICAL TERMS

AIR DEFENSE IDENTIFICATION ZONE (ADIZ)—The area of airspace over land or water within which the ready identification, the location, and the control of aircraft are required in the interest of national security. For operating details see ADIZ procedures.

AIRPORT ADVISORY AREA—The area within five statute miles of an uncontrolled airport on which is located a Flight Service Station so depicted on the appropriate Sectional Aeronautical Chart.

AIRPORT ADVISORY SERVICE—A service provided by a Flight Service Station to enhance the safety of terminal operations of airports where a station is operating but where there is no control tower.

AIRPORT SURFACE DETECTION EQUIPMENT (ASDE)—Radar equipment specifically designed to detect all principal features on the surface of an airport, including vehicular traffic, and to present the entire picture on a radar indicator console in the control tower. ASDE has a maximum range of four miles, though its 16 inch diameter scope usually displays an area of only one mile radius about the control tower.

AIRPORT SURVEILLANCE RADAR (ASR)—Radar providing position of aircraft by azimuth and range data without elevation data. It is designed for a range of 50 miles.

AIRPORT TRAFFIC AREA—The airspace within a circular limit defined by a five statute mile horizontal radius from the geographical center of an airport at which an operative airport traffic control tower is located and extending upwards from the surface to, but not including, 2,000 feet above the surface.

AIR ROUTE SURVEILLANCE RADAR (ARSR)—Long range radar which increases the capability of ATC for handling heavy en route traffic. An ARSR site is usually located at some distance from the ARTCC it serves.

AIR ROUTE TRAFFIC CONTROL CENTER (ARTCC)—A facility established to provide traffic control service to Instrument Flight Rules (IFR) flights operating within controlled airspace and principally during the en route phase of flight.

ALTITUDE RESERVATION (ALTRV)—Airspace utilization under prescribed conditions, normally employed for the mass movement of aircraft or other special user requirements which cannot otherwise be accomplished. ALTRV's are approved by the appropriate FAA facility.

APPROACH CONTROL SERVICE—Air traffic control service, provided by a terminal area traffic control facility, for arriving and or departing IFR flights and, on occasion, VFR flights.

APPROACH GATE—That point on the final approach course which is one mile from the approach fix on the side away from the airport or five miles from the approach end of the runway, whichever is farthest from the runway.

CARDINAL ALTITUDES OR FLIGHT LEVELS—"Odd" or "even" thousand-foot altitudes or flight levels. Examples: 5000, 6000, 7000, FL 250, FL 260, FL 270.

CAUTION AREA—An area in which there is a visible hazard to flight or navigation, such as aircraft maneuvers, parachute drops, etc. There is no restriction on flight. A caution area was established to warn the pilot that activities may be in progress which will require him to be constantly on the alert. Activities are of such nature that there should be ample time to take diversionary or evasive action if necessary.

CEILING—The height above the ground or water of the lowest layer of clouds or obscuration phenomena that is reported as "broken," "overcast," or "obscuration" and not classified as "thin" or "partial."

CENTRAL ALTITUDE RESERVATION FACILITY (CARF)—An Air Traffic Service facility established to conduct the volume of coordination, planning and approval of special user requirements under the altitude reservation concept.

CONSOLAN—A low frequency, long-distance navaid used principally for transoceanic navigation.

CONTERMINOUS U.S.—Forty-eight states and the District of Columbia.

CONTINENTAL CONTROL AREA—The area, which includes that airspace within the contermious United States at and above 14,500 feet MSL, excluding airspace less than 1,500 feet above terrain, and prohibited and restricted areas (except certain specified restricted areas).

CONTINENTAL U.S.—Forty-nine states. The original 48 states and Alaska.

CONTROL AREA—Controlled airspace extending upwards from a specified height above the surface of the earth. Unless otherwise provided in appropriate cases, control areas extend upward from 700 feet above the surface until designated from 1,200 feet above the surface or from at least 500 feet below the MEA, whichever is higher, to the base of the continental control area.

CONTROL ZONE—Controlled airspace extending upwards from the surface of the earth. Control zones may include one or more airports and are normally circular areas 5 statute miles in radius with extension where necessary to include instrument approach and departure paths.

CRUISE—The term "cruise" used instead of "maintain" in an ATC clearance indicates that descent from cruising altitude may be commenced at pilot's discretion without further clearance from ATC. "Cruise" is normally used only on relatively short flights in uncongested areas, and is authorization for the flight to proceed to, and make an approach at, destination.

DISCRETE FREQUENCY—A frequency assigned a particular function.

EXPECTED APPROACH CLEARANCE TIME (EAC)—The time at which it is expected that an arriving aircraft will be cleared to commence approach for a landing.

FINAL APPROACH—IFR—The flight path of an aircraft which is inbound to the airport on an approved final instrument approach course, commencing at the point of interception of said course and extending to the airport or the point where circling for landing or missed approach is executed.

FINAL APPROACH—VFR—A flight path of a landing aircraft in the direction of landing along the extended runway center line from the base leg to the runway.

FIX—A geographical position determined visually, by reference to one or more radio navigational aids, by celestial plotting, or by another navigational device.

FLIGHT ADVISORY SERVICE—Advice and information provided by a facility to assist pilots in the safe conduct of flight.

FLIP—Flight Information Publication.

FLIGHT LEVEL (FL)—A level of constant atmospheric pressure related to a reference datum 29.92" HG. For example: Flight Level 250 is equivalent to an altimeter indication of 25,000 feet, and Flight Level 265 to 26,500 feet.

FLIGHT SERVICE STATION (FSS)—A facility operated by the FAA to provide flight assistance service.

IFR CONDITIONS—Weather conditions below the minimum prescribed for flights under VFR.

INITIAL APPROACH—Initial approaches to a facility are normally made over specified routes to the primary navigation facility. When the approach fix is not the primary navigation facility, the transition routes are specified and shown on the particular AL chart. The minimum en route altitude for the route along which the pilot has been flying is normally used as the initial approach altitude. The high level initial approach altitude is usually termed "Initial Penetration Altitude" and is considered as the altitude at which the aircraft begins a penetration. This altitude is established for each particular procedure and is indicated on the associated AL chart.

INTERROGATOR—The ground-based surveillance radar beacon transmitter-receiver which scans in synchronism with a primary radar, transmitting discrete radio signa which repetitiously request all transponders, on the mo being used, to reply. The replies received are then mixe with the primary radar video to be displayed on th same plan position indicators.

JET ROUTES—A high altitude route system, at and abo 24,000 feet MSL, predicated on a network of designate high altitude VHF/UHF facilities. (For operating pr cedures applicable to this system see ENROUTE).

JOINT USE RESTRICTED AREA—An area wherein an aircra may operate if prior permission has been granted b either the restricted area "using agency" or the "co trolling agency." (1) The using agency organization, military command whose activity within a restricte area necessitated the area being so designated: exce that, in the case of those Restricted Area/Military Clim Corridors which do not have a designated controllin agency, the using agency is a military air traffic contr facility which may be contacted for transit through th climb corridor. The using agency notifies the controllin agency whenever permission may be granted by th controlling agency for transit of, or flight within a re stricted area. (2) The controlling agency is a designate FAA facility which may authorize transit of a restricte area.

MAINTAIN—The altitude/flight level instructions in a ATC clearance normally require that a pilot "maintain the altitude/flight level at which the flight will opera when in controlled airspace. Altitude/flight lev changes while en route should be requested prior to th time the change is desired.

MAXIMUM AUTHORIZED ALTITUDE (MAA)—An MAA is th highest altitude, within the Intermediate Airway Syste at which adequate reception of navigational aid signa is assured.

MINIMUM CROSSING ALTITUDES (MCA)—The lowest altitud at certain radio fixes at which an aircraft must cro when proceeding in the direction of a higher minimu en route IFR altitude.

MINIMUM EN ROUTE IFR ALTITUDE (MEA)—The altitude effect between radio fixes which assures acceptable nav gational signal coverage and meets obstruction clearanc requirements between those fixes.

MINIMUM OBSTRUCTION CLEARANCE ALTITUDE (MOCA)—Th specified altitude in effect between radio fixes on VO airways, off-airway routes on route segments, whic meets obstruction clearance requirements for the entir route segment and which assures acceptable navigation signal coverage only within 22 nautical miles of a VOI

MINIMUM RECEPTION ALTITUDE (MRA)—The lowest altitud required to receive adequate signals to determine specif VOR/VORTAC/TACAN fixes.

MODE—The number or letter referring to the specifi pulse spacing of the signal transmitted by an interrog tor.

RADAR BEACON (SSCONDARY RADAR)—A radar system in which the object to be detected is fitted with cooperative equipment in the form of a radio receiver/transmitter (transponder). Radio pulses transmitted from the searching transmitter/receiver (interrogator) site are received in the cooperative equipment and used to trigger a distinctive transmission from the transponder. This latter transmission, rather than a reflected signal, is then received back at the transmitter/receiver site.

RADAR ADVISORY SERVICE—The provision of advice or information based on radar observation.

RADIAL—A radial is a magnetic bearing extending from a VOR, VORTAC, or TACAN.

RESTRICTED AREA—Airspace identified by an area on the surface of the earth within which the flight of aircraft, while not wholly prohibited, is subject to restrictions.

PRIMARY RADAR—A radar system in which a minute portion of a radio pulse transmitted from a site is reflected off an object and then received back at that site.

PROHIBITED AREA—Designated airspace within which the flight of aircraft is prohibited.

RESTRICTED AREA—Airspace designated within which the flight of aircraft, while not wholly prohibited, is subject to restriction.

TARGET—The indication displayed on a radar scope resulting from a primary radar return or a radar beacon reply.

TRANSITION AREA—An area extending upward from 1,200 feet or higher above the surface when designated to complement control zones; from 700 feet above the surface when designated in conjunction with an airport with no control zone but for which an instrument approach procedure has been prescribed; or from 1,200 feet or higher above the surface when designated in conjunction with airway route structures or segments. Unless otherwise limited, transition areas terminate at the base of the overlying control area or Continental Control Area.

TRANSPONDER—The airborne radar beacon receiver-transmitter which automatically receives radio signals from all interrogators on the ground, and selectively replies with a specific reply pulse or pulse group only to those "interrogations" being received on the mode to which it is set to respond.

VECTOR—A heading issued to the pilot for the purpose of providing navigational guidance by means of radar.

VISIBILITY, PREVAILING—The horizontal distance at which targets of known distance are visible over at least half of the horizon. It is normally determined by an observer on or close to the ground viewing buildings or other similar objects during the day and ordinary city lights at night. Under low visibility conditions the observations are usually made at the control tower. Visibility is REPORTED IN MILES AND FRACTIONS OF MILES in the Aviation Weather Report. If a single value does not adequately describe the visibility, additional information is reported in the "Remarks" section of the report.

VISIBILITY, RUNWAY—The horizontal distance at which a stationary observer near the end of the runway can see an ordinary light (about 25 candlepower) at night or a dark object against the horizon sky in the daytime. In practice the human observer is used very little for this observation. Instead runway visibility is normally determined by a transmissometer (a photoelectric device calibrated in terms of a human observer). It is REPORTED IN MILES AND FRACTIONS OF MILES in the "Remarks" section of the Aviation Weather Report. A meter in the control tower gives the FAA traffic controller a continuous indication of the runway visibility at transmissometer locations. Runway visibility, where available, is used in place of prevailing visibility for the determination of minimums on a transmissometer runway. This program is gradually being replaced by Runway Visual Range at transmissometer locations.

VISIBILITY, RUNWAY VISUAL RANGE (RVR)—An instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end; it is based on the sighting of either high intensity runway lights or on the visual contrast of other targets—whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal, AND NOT SLANT, visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is REPORTED IN HUNDREDS OF FEET. At the present time, RVR observations are automatically furnished to FAA tower controllers at approximately 25 locations from readout equipment connected to the remote transmissometer installation. RVR provides an additional operating minimum at fields equipped with specified navigational aids. For example, at the present time the RVR minimum at Newark is 2000 ft. (in combination with a minimum descent altitude of 218' MSL) for both takeoffs and landings regardless of the reported ceiling and visibility.

WARNING AREA—An airspace warning area or, as more commonly known, a warning area, is the same as a restricted area (hazard to flight or navigation) but is located outside the continental United States. Boundaries are agreed upon jointly by Government and industry. Penetration of a warning area, as of a restricted area, during periods of activity may be extremely hazardous. Warning areas are established to permit military maneuvers and firing in certain offshore areas as a necessary feature of combat training. To do this the military services must obtain the necessary cooperation of other users of airspace.

ABBREVIATIONS

Note: "s" may be added for plural, or as appropriate.

acft..... aircraft
adjt..... adjacent
admin.... administration
AGL..... above ground level
Airgi..... Airguide
alt..... altitude
amdt..... amendment
ANRA.... air navigation radio aids
ant..... antenna
apch..... approach
apchg..... approaching
aprxly.... approximately
arpt..... airport
arr..... arrival/arrive
ARTCC... Air Route Traffic Control Center
ASDE..... airport surface detection equipment
ATC..... air traffic control
auto..... automatic
aux..... auxiliary
avbl..... available
awy..... airway

BC..... back course
bcn..... beacon
bcst..... broadcast
bldg..... building
bndry..... boundary
brg..... bearing
btn..... between

clsd..... closed
clrnc..... clearance
cntr..... center
Co..... county
comm.... communication
comsnd... commissioned
comsng... commissioning
config..... configuration
constr.... construction
constrd... constructed
cont..... continuous/continuously
crs..... course
CS/T..... combined station/tower
ctc..... contact
ctl..... control
ctld..... controlled

dalgt..... daylight
demsnd... decommissioned
demol.... demolition
DF..... direction finder
discntd... discontinued
DME..... UHF standard (TACAN compatible) distance measuring equipment
dptg..... departing
dptr..... departure

efctv..... effective
elev..... elevation
emgcy.... emergency
eng..... engine
eqpmt.... equipment
excp..... except
extsn..... extension
extsv..... extensive

facil..... facility
flashg.... flashing
fld..... field
flt..... flight
flwg..... following
FM..... fan marker
fone..... telephone
freq..... frequency
FSS..... Flight Service Station

GCA..... groundcontrolled approach
gnd..... ground
GWT..... gross weight

hi-..... high-
hr..... hour
hvy..... heavy
hwy..... highway

ident..... identification
IFR..... Instrument Flihgt Rules
IFSS..... International Flight Service Station
ILS..... instrument landing system
imdtly.... immediately
inbnd..... inbound
indef..... indefinitely
info..... information
inop..... inoperative
inst..... instrument
int..... intersection
intl..... international
intsv..... intensive

J-bar..... jet runway barrier

kc..... kilocycles

lat..... latitude
lcl..... local
lclzr..... localizer
lctd..... located
lctn..... location
LFR..... Low/Medium frequency radio range
lgt..... light
lgtd..... lighted
lgtg..... lighting
LMM..... compass locator at middle marker ILS
lnd..... land
lndg..... landing
LOM..... compass locator at outer marker ILS
long..... longitude

M..... magnetic (after a bearing)
MAA..... maximum authorized altitude
mag..... magnetic
maj..... major
max..... maximum
mc..... megacycles
MCA..... minimum crossing altitude
MEA..... minimum enroute IFR altitude
meml..... memorial
mi..... mile
min..... minimum or minute
MM..... middle marker ILS
MOCA.... minimum obstruction clearance altitude
mod..... modernization/modification
MRA..... minimum reception altitude
mrkd..... marked
mrkg..... marking
MSL..... mean sea level
mun..... municipal

natl..... national
navaid.... navigational aid
ngt.....night

nmi..... nautical mile/s
No..... number

obstn..... obstruction
oct..... octane
OM..... outer marker ILS
operg..... operating
opern..... operation
outbnd.... outbound

patn..... pattern
permly.... permanently
p-line..... pole line
pwr..... power

quad..... quadrant

rad..... radial
RAE..... Royal Aircraft Establishment visual glide slope indicator
RAPCON..radar approach control
RATCC... radar air traffic control center
rbn..... radio beacon
rcv..... receive
rcvg..... receiving
rcvr..... receiver
rdo..... radio
reconstr... reconstruction
REIL..... runway end identification lights
relctd..... relocated
rgt..... right
rng..... range
rnwy..... runway
ruf..... rough
RVR..... runway visual range
RVV..... runway visibility values

sked..... schedule
smi..... statute mile/s
SR..... sunrise
SS..... sunset
stn..... station
sys..... system

T..... true (after a bearing)
TACAN... UHF navigational facility—omnidirectional course and distance information

tet..... tetrahedron
tfc..... traffic
tkof..... take-off
tmprly.... temporarily
tmpry.... temporary
trans..... transcribed
trml..... terminal
trng..... training
tsmt..... transmit
tsmtg..... transmitting
tsmtr..... transmitter
TV..... television
twr..... tower
txwy..... taxiway

UFN..... until further notice
unavbl.... unavailable
uncltd.... uncontrolled
unlgtd.... unlighted
unmrkd... unmarked

VASI..... visual approach slope indicat
vcnty..... vicinity
VFR..... visual flight rul
VOR..... VHF navigation facility—omr directional, course only
VOR-DME. collocated VOR navigational facility and UHF standar navigational facility and UHF standar distance mea uring equipment
VORTAC.. collocated VOR and TACAN navigational facilities
VOT..... a VOR Receiver Testing Facility
vsby..... visibility

wea..... weather
WIP..... work in progres
wt..... weight

THE NOTAM CODE

INTRODUCTION

The NOTAM Code provides for coding NOTAM information to reduce telecommunications transmission time and reduce translation difficulties in the International Service.

A NOTAM Code group contains 5 letters. The first letter is always the letter Q to indicate a code abbreviation for use in the composition of NOTAMs. The letter Q has been chosen to avoid conflict with any assigned radio call sign.

NOTAM code significations shall be amplified or completed where necessary by adding appropriate words, contractions, frequencies, location identifiers, place names, or figures. Approved abbreviations shall be used in preference to plain language whenever possible. The information necessary to complete a NOTAM code group, as indicated by a blank space, shall be given except when (1) the blank spaces are enclosed within parentheses or brackets to indicate their completion is optional; e.g., LHX QIEIK 15 MIN. Meaning: the LaJunta Colorado airport beacon is available on request at 15 minutes' notice; or (2) an alternative meaning shown in parentheses is selected and the blank space in this alternative meaning is complete; e.g., QAPOK 116.9. Meaning: the radio range on 116.9 Mc. resumed normal operation.

Expressions or words in parentheses which do not include blank spaces have the following significances:

(1) When following a blank space, signifies the explanation of information to be used in filling the preceding blank.

(2) When following a word or expression, signifies an alternative to the word or expression.

CODE GROUP FORMATION

5-letter NOTAM code groups are formed in the following manner:

(1) First Letter.—The letter Q.

(2) Second and Third Letters.—The appropriate combination of 2 letters, selected from the "2nd and 3rd letters" section of the code, identify the facility, service or danger to aircraft in flight being reported. The *second* letter has been restricted to A, E, I, O, or U. These letters also serve to classify the aid, facility, or service described: i.e., the letters A and E signify radio aids. The letter I signifies lighting facilities. The letters O and U signify airports, search and rescue, and dangers to aircraft in flight.

(3) Fourth and Fifth Letters.—The appropriate cominbation of 2 letters, selected from the "4th and 5th Letters" section, denote the operating status of the facility, service, or danger to aircraft being reported. The *fourth* letter has been restricted to A, E, I, O, or U.

DECODE

SECOND AND THIRD LETTERS

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	RADIO AIDS		
AA	. . . [*specify TWR, APP, ACC or FIC*] air traffic services receiver . . . kc/s. (*or* . . . Mc/s.).	AY	200 Mc/s. Distance Measuring Equipment.
AB	Inner marker, Instrument Landing System.	AZ	Station location marker VHF.
AC	. . . [*specify TWR, APP, ACC or FIC*] air traffic services transmitter . . . kc/s. (*or* . . . Mc/s.).	EA	En-route Surveillance Radar.
AD	Middle marker, Instrument Landing System.	EB	Broadcasting station (public).
AE	Outer marker, Instrument Landing System.	EC	CONSOL or CONSOLAN station.
AF	Fan-type marker.	ED	DECCA or DECTRA.
AG	Glide path, Instrument Landing System.	EE	Ground Controlled Approach System (GCA).
AH	Non-directional Beacon (NDB).	EF	Terminal Area Surveillance Radar.
AI	Instrument Landing System (ILS).	EG	Gee.
AJ	Radio range (other than VOR) and associated voice communications.	EH	Elevation element of the Precision Approach Radar (PAR).
AK	Radio receiving facilities.	EI	Monitoring device associated with . . . (*specify*) radio aid.
AL	Localizer, Instrument Landing System.	EJ	All air-ground facilities (except . . .).
AM	Locator, inner, Instrument Landing System.	EK	Precision Approach Radar (PAR).
AN	TACAN.	EL	LORAN.
AO	Locator, outers, Instrument Landing System.	EM	Azimuth element of the Precision Approach Radar (PAR).
AP	VOR (VHF Omnidirectional Radio Range) and associated voice communications.	EN	DME (1000 Mc/s. Distance Measuring Equipment).
AQ	VOR (VHF Omnidirectional Radio Range).	EO	Beam Approach Beacon System (BABS).
AR	Radio range (other than VOR).	EP	Radar responder beacon.
AS	Radio range leg.	EQ	Surveillance Radar Element (SRE) of GCA.
AT	Attentional signal.	ER	Radio transmitting facilities.
AU	Meteorological communications . . . kc/s. (*or* . . . Mc/s.).	ES	All radio-navigation facilities (except . . .).
AV	Voice communications . . . kc/s. (*or* . . . Mc/s.).	ET	Teletypewriter transmitting facility (ies).
AW	Unassigned.	EU	Radio direction-finding station . . . (*frequency or type*).
AX	Non-directional Beacon (NDB) and voice facility.	EV	VORTAC (the combination of VOR and TACAN).
		EW	Ground interrogator, SSR system.
		EX	Unassigned.
		EY	Ground movement radar.
		EZ	Unassigned.
	LIGHTING FACILITIES		
IA	Boundary lights.	ID	Channel lights.
IB	Aerodrome beacon.	IE	Light beacon.
IC	Unassigned.	IF	Floodlights.

DECODE

SECOND AND THIRD LETTERS (Contd.)

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	LIGHTING FACILITIES (Contd.)		
IG	Angle-of-approach lights.	IP	Approach light system [type . . . {*specify LSA (low intensity) or LSB (high intensity*}] (for runway number . . .).
IH	Taxiway lights.		
II	Hazard beacon.		
IJ	Threshold lights (for runway number . . .).	IQ	Runway alignment beacon.
		IR	Runway lights [type . . . {*specify LSA (low intensity) or LSB (high intensity)*}] (for runway number . . .).
IK	Flares.		
IL	All landing area lighting facilities.		
IM	Identification beacon.	IS	Strip lights [for strip . . . (*number or magnetic direction*)].
IN	Unassigned.	IT–IY	Unassigned.
IO	Obstruction lights.	IZ	Airway course lights.

AERODROMES — SEARCH AND RESCUE — DANGERS TO AIRCRAFT IN FLIGHT

OA	Land aerodrome.	UB	Mooring buoys.
OB	Beaching facilities.	UC	Unassigned.
OC	Water aerodrome.	UD	Prohibited, restricted or danger area designated as . . . (*name or reference identification*).
OD	Meteorological forecast service.		
OE	Meteorological observation service.		
OF	Meteorological watch service.	UE	Aircraft.
OG	Runway arresting gear.	UF	Fixed balloons.
OH	Helicopter landing area.	UG	Bombing or aerial depth charge dropping.
OI–OL	Unassigned.		
OM	All runways [except number(s) . . .].	UH	Air exercises (*or* flying displays).
ON	Stopway for runway number.	UI	Gun or missile firing.
OO	Taxiway(s).	UJ	Glider flying.
OP	Rescue vessel.	UK	Demolition of explosives.
OQ	Ocean Station Vessel.	UL	Landing direction indicator.
OR	Refueling [. . . type fuel(s) *or* . . . octane].	UM	Mooring and docking facilities.
		UN	Parachute jumping exercises.
OS	Search and rescue aircraft [*specify VLR, LRG, MRG, SRG or HEL*].	UO–UP	Unassigned.
		UQ	Apron.
OT	Crash and fire fighting facilities.	UR	Runway(s) and number(s).
OU	Unassigned	US	Strip . . . (*number or magnetic direction*).
OV	. . . [*specify TWR, APP, ACC or FIC*] air traffic service.	UT	Grass landing area.
		UU	Unassigned.
OW–OY	Unassigned.	UV	Fog dispersal equipment.
		UW–UY	Unassigned.
OZ	Warship.		
UA	Alighting area.	UZ	Runway threshold (number . . .).

753-036 O - 64 - III-2

DECODE

FOURTH AND FIFTH LETTERS

4th & 5th Letters	SIGNIFICATION	4th & 5th Letters	SIGNIFICATION
	HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES		
AA	Unassigned.	EC	Characteristics *or* identification *or* radio call sign changed to . . .
AB	Usable for length of . . . and width of . . .	ED	Operating frequency(ies) will be changed to . . . kc/s. (*or* . . . Mc/s.) effective . . . (*date/time*).
AC	Covered by snow to a depth of . . . NOTE.—*This snow is not compacted.*	EE–EG	Unassigned.
AD	Cleared of soft snow, full length and width.	EH	Not heard.
AE	Totally free of snow and ice.	EI–EL	Unassigned.
AF	Covered by [. . . (*type*)] ice to a depth of . . .	EM	Military operations only.
AG–AH	Unassigned.	EN	Not available due to . . . (*specify reason*) from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
AI	Operating without tone modulation.	EO	Unassigned.
AJ	Operating without coding.	EP	Available on prior permission (of . . .) only.
AK	Covered by compacted snow to a depth of . . .	EQ–ER	Unassigned.
AL	Operating on reduced power.	ES	Out of service from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] due to the following condition(s) . . .
AM	Snow clearance in progress [estimated time of completion is . . . (*date/time*)].	ET	Test operation only. NOT for operational use.

Elyria, Nimrod Arpt: 2000Z thru 0300Z Mon thru Fri., 1500Z thru 2400Z Sat and Sun. Up to 12,500' AGL.

Fostoria, Snyder Arpt: Weekends and holidays. Intermittently during the wk. Up to 12,000' AGL.

Geneva, Germack Arpt: 3 mi SE Suns 1600Z–0200Z. Up to 9,000'.

Jefferson Arpt: Suns 1200 to 2100 EDT. Up to 12,500'.

Piqua Arpt: Up to 12,000'. Daily.

Shady Grove Arpt: 8 mi SW Akron-Canton arpt. Weekends. Up to 10,000'.

South Dayton Arpt: Up to 18,000'. Daily.

Springfield Arpt: Wed, Sat and Suns. Up to 12,500'.

Waynesville Arpt: Suns. Up to 10,000'.

Williamsburg, Fisher Arpt: Weekends. Up to 20,000'.

Xenia Arpt: Daily. Up to 20,000'.

Youngstown: 2 mi W and 1½ mi S of Parkman, Ohio. Tues, Thurs and weekends. Up to 13,000'.

OKLAHOMA

Oklahoma City, Richards Arpt: Weekends, holidays, occasionally weekdays. Up to 12,500' AGL.

Stroud Mun Arpt: Within 5 mi radius of arpt. Up to 12,500' AGL.

OREGON

Astoria, Clatsop Co. Arpt: Various alts. Holidays and weekends.

Cave Junction, Illinois Valley Airstrip: 2 mi N and 5 mi NE. Periodically June thru Sept. From 2000' AGL.

Medford Arpt: 4 mi W. Light weekdays, moderate to hvy weekends and holidays. Various altitudes.

Portland: From various alts, moderate wkdays, hvy wkends and holidays. Jump sites 5 mi S of Hillsboro arpt: 3 mi S of Beaverton arpt; 3 mi E of Scholl Arpt, Orchards, Wash; and 7 mi NNE Scholl Arpt.

Redmond, Roberts Fld: 10 mi E arpt & 4 mi SW Prineville Arpt. Daily. From 2,000'.

PENNSYLVANIA

Campbelltown, Reigles Arpt: Daily. Up to 15,000'.

Hazleton Mun Arpt: 3 mi N. Weekdays 1700 to Sunset; weekends 1200 to sunset. Up to 7500' MSL.

Johnsville NAF: Within 2 mi radius. Up to 13,000'.

Meadville, Port Meadville: Within 1.5 mi radius of fld. Weekends. Up to 12,500'.

New Hanover Arpt: Most activities weekends. Up to 12,500'.

Pottstown Arpt: Weekends. Up to 8000′.
Reading, Gen. Spaatz Arpt: Weekends. Up to 10,000′.

RHODE ISLAND

Greene Riconn Arpt: Daily. Up to 11,000′.

SOUTH CAROLINA

Fairfax Arpt: Weekends. Up to 12,500′.
Lane Arpt: Low level navigation and parachute drops every day and night, 300′ to 1000′.
Moncks Corner Mun Arpt: Weekends. Up to 10,000′.
Orangeburg Mun Arpt: Weekends and holidays. Up to 12,500′.
Sumter Arpt: Daily 1800Z to sunset. From 7,200′. Sat, Sun, holidays. Up to 10,000′.
Timmonsville, Huggins Arpt: Sat, Sun and holidays. From 10,000′.
Walterboro Mun Arpt: Weekends. From 10,000′.

TENNESSEE

Chattanooga, Lovell Fld: 16 mi ESE. Continuously. Up to 10,000′.
Cleveland, Hardwick Fld: 6 mi S. 0600 to 1900 EST 7 days per wk. Up to 12,500′.
Nashville, Cornelia Fort Airpark: Weds, weekends and holidays. Up to 7500′.
Nashville, Cumberland Fld: 6 mi NW. Irregular schedule. Ctc BNA FSS for details.
Tri-City Arpt: 20 mi SSW at Decker Farm Arpt Irregular schedule. Up to 7,000′.

TEXAS

Abilene Dyess AFB: One mile E of S end rnwy. From 3300′.
Amarillo, Palo Duro Arpt: 2 mi radius. Wk ends and holidays SR to SS. Up to 16,000′ MSL.
Cleburne Arpt: Weekends. Up to 7,500′ MSL.
El Paso: 6 nmi NW Biggs AFB. Up to 17,500′ MSL.
Ganado, Calaway Arpt: Weekends. Up to 10,000′.
Houston, Crosby Arpt: 2 mi W and 8 mi W. Weekend and occasional wk days. Up to 20,000′.
Houston, Waller Arpt: Parachuting, gliding and ballooning within 5 mi radius. Daily, day and ngt. Up to 24,000′.
Lampassas Arpt: Weekends. Up to 14,000′ MSL.
Mercedes, Rebel Fld: 2 mi rad. Weekends. Up to 12,500′.
Midland: 3 mi N of Ector Co. Arpt, Odessa, Tex. Weekends and holidays, occasionally weekdays. Up to 15,000′ MSL.
San Antonio, Lakefield Arpt: 1.5 mi W. Weekends and holidays. Up to 14,000′.
San Antonio, Stinson Fld: 4 NM S SW.
San Marcos, Camp Gary AAF: Weekends and holidays. Up to 14,500′.
Taylor Mun Arpt: Weekends.

UTAH

Bountiful, Sky Haven Arpt: Daily. Up to 13,500′ MSL.
Ogden: 8 mi N. Up to 12,000′ MSL. Daily.
Sandy, Alta Air Park: Daily. Up to 14,000′ MSL.

VERMONT

Bristol Arpt: 7/8 mi NW. Weekends. SR to SS. Up 7500′.
Swanton, Austin Arpt: Weekends. Up to 6000′.

VIRGINIA

Blackstone AAF: Daily. Up to 25,000′. Occasional sl diving.
Clover Arpt: 3 mi radius. Suns. Up to 8,000′.
Forest, New London Arpt: Daily. Up to 11,000′.
Hopewell Arpt: Weekends. Up to 9000′.
Leesburg: 2 nmi N or 10 nmi Herndon VOR on 34 radial. Weekends. Up to 12,500′. Occasional n jump.
Midland: 8 nmi from CSN VOR on 120° rad. Weeken Up to 12,000′.
New Castle Intl Arpt: Weekends and holiday. Up 14,000′.
Pulaski, New River Valley Arpt: Weekends, holidays, a evening. Up to 13,000′.
South Boston, Tuck Arpt: Within 3 mi radius. Suns 12 to 1800 EST. Up to 10,000′.
South Norfolk Arpt: Within 5 mi radius. Weekends a evenings. Up to 13,000′.
Suffolk Mun Arpt: Weekends and holidays. Up to 12,00
Waynesboro Arpt: Wk ends 1800Z–SS. Up to 10,000′.
West Point Arpt: Weekends and holidays. Up to 12,0

WASHINGTON

Enumclaw Arpt: Weekends and holidays. Up to 15,00
Issaquah-Sky Ranch Arpt: Wed, Fri and weekends. Up 7000′.
Moses Lake Mun Arpt: 1.5 mi NE. Daily up to 10,000′.
Oak Harbor, Whidbey Island NAS: Weekends. Up to 12,50 MSL.
Puyallup, Thun Fld: Tues, Thurs and weekends. Up 12,000′.
Richland Arpt: 3 mi W SR to 1 hr after SS. Up to 12,50 AGL.

WEST VIRGINIA

Morgantown Arpt: 8 NM SSW. Days.

WISCONSIN

Juneau (Dodge Co Arpt): Weekdays after 1700 Sat a Sun afternoons. Up to 13,500′.
Lake Geneva/Natl Sports Parachuting Center: Daily. Up 15,000′.
Superior Arpt: 5 mi SE weekends SR–SS. Up to 12,500′.
Menomonee Falls, Aero Park Arpt: 2200–SS Mon thru Fr Up to 12,500′ MSL.
Osseo: 3 mi W. Sundays. Up to 10,000′.

PREFERRED ROUTES

A system of preferred routes has been established to guide pilots in planning their route of flight, to minimize route changes during the operational phase of flight, and to aid in the efficient orderly management of the air traffic using federal airways. The preferred routings which follow are designed to serve the needs of airspace users and to provide for a systematic flow of air traffic in the major terminal and en route flight environments. Cooperation by all pilots in filing preferred routes will result in fewer traffic delays and will better provide for efficient departure, en route and arrival air traffic control service.

The following list will hereafter appear in EACH issue of the AIRGI.
This list contains preferred routes for the low altitude stratum (below 18,000 feet MSL).

Low Altitude Stratum—A distinctive numbering system (800 Series) has been introduced to indicate some of the preferred routes in this stratum and thereby eliminate the present lengthy route descriptions. Many of the preferred routes, however, retain the common basic airway numbers to use the two systems of numbering in combination. Additional designations of "800 Series Airways" will be made where simplicity and convenience to both pilots and controllers dictate such assignments.

Preferred Route Starting and Terminating Fixes--Preferred routes generally commence and terminate at fixes on or near the perimeter of the terminal area.

Depicted on the Area Charts, produced by Coast and Geodetic Survey, are the normal routes between the airport and the preferred route starting/terminating fixes. Whenever a fix is shown in **bold-face** type, pilots should refer to the appropriate Area Chart for the routing he may expect prior to or after that fix as appropriate.

Preferred routes beginning/ending with an airway number indicate that the airway essentially overlies the airport and flights are normally cleared directly on the airway. All preferred routes are listed alphabetically under the name of the departure airport. Major airports in close proximity are listed under the principal airport and categorized as a metropolitan area; e.g., Chicago Metro Area. Official location identifiers are used in the route description for VOR, VORTAC navaids. L/MF navaids are identified by the identifier and type: e.g., MIV,LFR, DOV,Rbn. Intersection names are spelled out. Where two navaids or an intersection and a navaid follow in succession, the route is direct.

(L20, 23)=Enroute chart numbers.

STANDARD INSTRUMENT DEPARTURES (SIDs)

A Standard Instrument Departure (SID) is a means for simplifying air traffic control clearances and relay and delivery procedures, and presents such air traffic control clearances to the pilot in pictorial and narrative form or narrative form only.

SIDs are established at civil airport for the most frequently used departure routes, if their establishment would be advantageous to both the users and air traffic control, and if the SID will materially reduce the verbiage of an air traffic control clearance.

SIDs are established at military airports, for the most frequently used departure routes, regardless of the simplicity or complexity of the air traffic control clearance.

Application of the SID program is limited to those flights where the pilots file in a proposed instrument flight plan a request for a specific SID or any SID available for the airport of departure.

The filing of a specific SID or any SID for the airport of departure in a proposed instrument flight plan or any request by the pilot, prior to takeoff, for a specific or any SID will be considered as a statement by the pilot that he is familiar with and has available in pictorial and narrative form or narrative form only all the SIDs pertinent to his operation from the airport of departure.

Participation in this program is voluntary on the part of the pilot. However, an accepted SID must be complied with as provided in Civil Air Regulations Sec. 60.21.

CALIFORNIA

Meadows Field, Bakersfield

Effective Dec. 10, 1964

BAKERSFIELD FOUR DEPARTURE

Via Bakersfield 205 radial to intercept and proceed via Lake Hughes 300 radial to Gorman 328 radial. Then via (transition) or (assigned route). Intercept Lake Hughes 300 radial/15 mile DME fix on Bakersfield 205 radial at (minimum 4,000 feet). Gorman Transition: via Gorman 328 radial to Gorman. Lake Hughes Transition: via Lake Hughes 300 radial to Lake Hughes. Palmdale Transition: via Lake Hughes 300 radial to intercept and proceed via Gorman 088 and Palmdale 269 radials to Palmdale. Note: This SID requires a minimum climb rate of 230 feet per mile to 9,500 feet.

GRAPEVINE THREE DEPARTURE

Via Bakersfield 148 and Gorman 328 radials to Gorman. Note: This SID requires a minimum climb rate of 290 feet per mile to 9,500 feet.

SANDBERG FOUR DEPARTURE

Via Bakersfield 121 and Lake Hughes 328 radials to Gorman 088 radial. Cross Arvin Intersection at (minimum 7,300 feet). Note: This SID requires a minimum climb rate of 400 feet per mile to 7,700 feet.

Fresno Air Terminal

In narrative form only

PINEDALE ONE DEPARTURE

Via direct Fresno VORTAC, then via (transition (assigned route). Castle Transition—Via Fresno 273 Castle 150 radials to Castle VOR.

BOWLES ONE DEPARTURE

Via direct Fresno radio Beacon: then a 135 magn bearing from the Fresno radio beacon to intercept the Banos 084 radial at or above 3,000 feet; then via Banos 084 radial to the Fresno 141 radial. Pixley Tra tion—Turn right via Fresno 141 and Bakersfield radials to Bakersfield. Exeter Transition—Continue Los Banos 084 radial to intercept and proceed via Fr 123 and Portersville 323 radials to Porterville.

CONNECTICUT

Bradley Field, Windsor Locks

In narrative form only

AVON ONE DEPARTURE

Via Poughkeepsie VOR 089 radial to Poughkee VOR. Cross Madison VOR 348 radial at or below 5 Cross Bridgeport VOR 357 radial at (as assigned ATC) then via (transition) or (assigned route). Hu not Transition: via Poughkeepsie VOR direct Hugue VORTAC.

HARTFORD ONE DEPARTURE

Via direct Hartford VOR. Hartford VOR 258 radial Yale intersection. Cross Madison VOR 360 radial at below 4000 feet. Cross Yale Intersection (as assigned ATC) then via (assigned route).

Bradley Field, Windsor Locks

Effective Dec. 10, 1964

STAFFORD ONE DEPARTURE

Departure headings from all runways will be assigned for to take-off. Via direct to V146, thence via V146 to tnam VORTAC; thence via Putnam VORTAC 100 dial to V16, V16 to Millis Intersection. Maintain at or low 3,000 feet for 3 minutes after departure; cross Put-m VORTAC at (as assigned by ATC) then via (as-gned route).

MADISON ONE DEPARTURE

Departure headings from all runways will be assigned for to take-off. Via 360° radial Hartford VOR to Hart-rd VOR; then direct Madison VOR; then V475 to Deer rk VOR. Maintain at or below 3,000 feet for 3 minutes ter departure; cross Madison VOR at (as assigned by TC) then via (assigned route).

Miami Intl Airport

Effective Jan. 7, 1965

MELBOURNE TWO DEPARTURE

Via the Biscayne Bay VOR 345 radial and the Vero ach VORTAC 178 radial to the Vero Beach VORTAC. hen via (transtion) or (assigned) route. Snapper ansition—Via the Vero Beach VORTAC 043 radial the Barracuda Intersection.

Concurrently cancel the Melbourne One Departure.

MASSACHUSETTS

Logan Field, Boston

Effective Dec. 10, 1964

GRENIER FIVE DEPARTURE

Via Boston VORTAC 347 radial to Manchester VOR-AC/Boston VORTAC 35 mile DME fix; cross Gardner ORTAC 101 radial/Boston VORTAC 15 mile DME fix as assigned by ATC). Then via (transition) or (as-gned route). Albany Transition—Via Manchester VOR-AC 290 radial to intercept the Albany VORTAC 097 dial to Albany VORTAC. Cambridge Transition—Via 90 to Cambridge VOR. Burlington Transition—Via 11 to Burlington VOR. Plattsburg Transition—Via anchester VORTAC 352 radial to Concord VOR direct Plattsburg VORTAC. Hopkins Transition—Via Man-ester VORTAC 290 radial Cambridge VOR 108 radial Cambridge VOR; thence via Cambridge via 289 rad-l, Syracuse VORTAC 105 radial to Syracuse VORTAC.

Concurrently cancel Grenier Four Departure.

NEVADA

Reno Mun Airport

VISTA FOUR DEPARTURE

Effective Dec. 10, 1964

Climb within three miles Reno Airport to cross the Airport at or above 6,400'. Then via Reno 230 radial to Reno. Then via (transition) or (assigned route). Hazen Tranition—via Reno 039 and Hazen 266 radials to Hazen. Youngstown Transition—via Reno 117 radial to intercept V105. Steamboat Transition—hold NE of Reno on the 039 radial, right turns, until reaching 10,500'. Then via Reno 190 radial to intercept V494. Cross Steamboat Intersection at (minimum 12,000'). Note: This SID requires a ceiling of at least 2,000', visibility two miles and a minimum climb rate of 200' per mile to 9,000'.

WASHOE FOUR DEPARTURE

Climb within three miles of Reno Airport to cross the Airport at or above 6,900'. Then via a 162 magnetic bearing from Reno Radio Beacon to Washoe Intersection. Cross Washoe at or above 10,000'. Then via (transition) or (assigned route). Wabuska Transition—via heading 085 to intercept V105. Lake Tahoe Transition— hold south of Washoe Intersection on the Reno 180 radial, right turns, until reaching (minimum 12,000'). Then inbound via Lake Tahoe 060 radial to intercept (V28/V113/V494/V6). Note: This SID requires a ceiling of at least 2,500', visibility two miles and a minimum climb rate of 250' per mile to 10,000'.

NEW YORK

Hancock Airport, Syracuse

In narrative form only

KIRKVILLE ONE DEPARTURE

Via front course Syracuse ILS and Georgetown VOR 352 radial to Georgetown VOR; cross Syracuse ILS LOM at 2,000 feet; cross Utica VOR 277 radial at 5,000 feet. Then via (assigned route). Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

MONROE ONE DEPARTURE

Via front course Syracuse ILS, Georgetown VOR 352 radial to West Monroe Intersection, cross Syracuse ILS LOM at 2,000 feet. Then via (transition) or (assigned route). Florence Transition—Via Syracuse VORTAC 050 radial and V145 to Utica VOR. Syracuse Transition—Via Syracuse VORTAC 050 radial to Syracuse VORTAC. Pulaski Transition—Via Georgetown VOR 352 radial and V29 to Pulaski Intersection. Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

John F. Kennedy Intl Airport, New York

Effective Jan. 7, 1965

KINGSTON ONE DEPARTURE

Via vector to Kingston VOR 160 radial. Kingston VOR 160 radial to Kingston VOR. Cross LaGuardia VOR 135 radial at or below 4000 feet. Cross LaGuardia VOR 092 radial at or above 5000 feet. Cross Kennedy VORTAC 054 radial at or above 8000 feet. Then via

(transition) or (assigned route). Dutchess Transition—Via Kingston VOR direct Poughkeepsie VOR.

Concurrently cancel Clermont Two Departure.

LaGuardia Field, New York

Effective Dec. 10, 1964

BAYVILLE FOUR DEPARTURE

Take-off Runway 4, 22, 31. Maintain runway heading for vector. Take-off Runway 13. Turn right after departure, heading 160, climb to 1500′ or for 45 seconds after passing airport boundary, whichever occurs first; then turn left heading 040 for vector. NOTE: After departure turn right to heading 160 as soon as practicable. Vector to LaGuardia VOR 071 radial; then via LaGuardia VOR 071 radial to Sound Intersection. Cross Carmel VOR 187 radial at or above 3000 feet; then via (transition) or (assigned route). TAMIE TRANSITION—Via Sound Intersection direct Bridgeport VOR; Bridgeport VOR 020 radial to Tamie Intersection.

ECHO LAKE THREE DEPARTURE

Take-off Runway 4, 22, 31. Maintain runway heading for vector. Take-off Runway 13. Turn right after departure, heading 160, climb to 1500′ or for 45 seconds after passing airport boundary, whichever occurs first; then turn left heading 040 for vector. NOTE: After departure turn right to heading 160 as soon as practicable. Vector to Sparta VORTAC 119 radial; then via Sparta VORTAC 119 radial to Sparta VORTAC. Cross Carmel VOR 237 radial at 4000 feet; cross Carmel VOR 250 radial at or above 6000 feet; then via (transition) or (assigned route). THORNHURST TRANSITION—Via Sparta VORTAC 295 radial and Thornhurst VORTAC 113 radial to Thornhurst VORTAC. DALTON TRANSITION—Direct Wilkes-Barre VORTAC; Wilkes-Barre VORTAC 309 radial to Huguenot VORTAC 291 radial; J70 to Erie VORTAC. Mid-State Transition—Via Sparta VORTAC 292 radial and Philipsburg VORTAC 082 radial to Philipsburg VORTAC.

WHITE HOUSE FIVE DEPARTURE

Take-off Runway 4, 22, 31. Maintain runway heading for vector. Take-off Runway 13. Turn right after departure heading 160, climb to 1500′ or for 45 seconds after passing airport boundary, whichever occurs first; then turn left heading 040 for vector. NOTE: After departure, turn right to heading 160 as soon as practicable. Vector to Sparta VORTAC 119 radial; then via the Sparta VORTAC 119 radial and V3 to Solberg VORTAC. Cross Carmel VOR 237 radial at 4000 feet; cross Sparta VORTAC 130 radial at or above 6000 feet; then via (transition) or (assigned route). Salisbury Transition—Via Solberg VORTAC 237 radial and Woodstown VOR 360 radial and Woodstown VOR 180 radial to J79.

PARK RIDGE ONE DEPARTURE

NOTE.—1. Will be approved only if both New York ARTCC and LaGuardia Tower radar is operating. 2. May be filed only by westbound turboprop/turbojet type aircraft.

Take-off Runway 4, 22, 31. Maintain runway heading for vector. Take-off Runway 13. Turn right after departure, heading 160, climb to 1500′ or for 45 seconds af passing airport boundary, whichever occurs first; tl turn left heading 040 for vector. Vector to Wilkes-Ba VORTAC 122 radial; then via Wilkes-Barre VORT 122 radial to Wilkes-Barre VORTAC. Cross Carmel V 237 radial at 4000 feet; cross Carmel VOR 250 radial a above 6000 feet; then via (transition) or (assigned rout Erie Transition—Via Wilkes-Barre VORTAC 309 ra to Huguenot VORTAC 291 radial; J70 to Erie VORT. Buffalo Transition—Via Wilkes-Barre VORTAC radial and Allentown VORTAC 352 radial to J95; J9 Buffalo VORTAC.

Concurrently, cancel the Bayville Three, Echo L Two, and White House Four Departures.

OHIO

Youngstown Mun Arpt.

In narrative form only

SALEM THREE DEPARTURE

Via Youngstown VOR 197 radial to Ellwood C VORTAC 302 radial. Cross Akron VORTAC 084 ra at 3000 or above. Then via Ellwood City VORTAC radial to the Ellwood City VORTAC. Cross Ellw City VORTAC (as assigned by ATC), then via assig route.

Departing aircraft shall be established on the Youn town VOR 197 radial within 10 miles of the Youngsto VOR.

Burke Lakefront Airport, Cleveland

Effective Dec. 10, 1964

CRIB TWO DEPARTURE

Via Akron Vortac 323 radial and Chardon Vortac radial to Crib Intersection. Then via transition or signed route. Intercept Chardon Vortac 285 radial 2000 feet Cross Crib Intersection at minimum of 3 feet. Cleveland Transition—Via the Cleveland Vor 027 radial to Cleveland Vortac.

Concurrently cancel the Crib One Departure.

RHODE ISLAND

T. F. Green Arpt., Providence

In narrative form only

WARWICK ONE DEPARTURE

Takeoff Rnwy 5L/R–34—turn right to 160 heading soon as practicable after leaving 500′. Climb on 160 he ing to intercept Quonset Pt. VOR 038 radial. Take Rnwy 16—Maintain rnwy heading to intercept Quon Pt. VOR 038 radial. Takeoff Rnrwy 23L/R—Turn l to 090 heading as soon as practicable after leaving 5 Climb on 090 heading to intercept Quonset Pt. VOR radial. Radar vector to Providence VOR 132 radial Quonset Pt. VOR 038 radial to Quonset Pt. VOR the via Quonset Pt. VOR 218 radial to V–46. Cross Quon Pt. VOR at 5000′ or below. Cross Norwich VORTAC 1 radial at 7000′. Cross Hampton VORTAC 082 radial assigned by ATC) then via (assigned route).

STERLING TWO DEPARTURE

Takeoff Runway 34–5L/R—turn left to 250 heading soon as practicable after leaving 500 feet. Climb on 2

eading to intercept Providence VOR 284 radial. Takeoff unway 23L/R–16—turn right to 340 heading as soon as racticable after leaving 500 feet. Climb on 340 heading o intercept Providence VOR 284 radial. Radar vector o Providence VOR 284 radial thence via Providence VOR 84 radial to Sterling VHF intersection. Cross Sterling HF intersection at / as assigned by ATC/then via/transition/or/assigned/route. Riverhead Transition via V16/879.

UTAH

Salt Lake City Mun No. 1 Arpt

Effective Dec. 10, 1964

PROVO ONE DEPARTURE

Via the Salt Lake 160 and Provo 341 radials to Provo. hen via (transition) or (assigned route). Delta Transition: via the Provo 188 and Delta 008 radials to Delta. ilford transition: via the Provo 188 and Milford 007 dials to Milford. Bryce Canyon transition: via the rovo 170 and Bryce Canyon 351 radials to Bryce Canon. Note: This SID requires a minimum climb rate of 5' per mile.

Change Stansbury Two Departure to read Stansbury hree Departure and revise Delta transition as follows: elta transition: turn left via Malad 162 and Delta 348 dials to Delta. Cross Stansbury Intersection at (minimum 10,500').

WYOMING

Casper Air Terminal

Effective Nov 12, 1964

Cancel Buckman Two Departure.

COLORADO

Stapleton Airfield, Denver

Effective Nov. 12, 1964

LONGMONT TWO DEPARTURE

Via Denver 320 and Kremmling 067 radials to Kremmng. Cross Longmont Intersection/Denver 21 mile DME westbound at or above 15,600'. NOTE: This SID requires a minimum climb rate of 430' per mile.

GOLDEN TWO DEPARTURE

Via Denver 243 and Grand Junction 050 radials to rand Junction. Cross Denver 22 mile DME fix at or ove 9,500'. Cross Denver 35 mile DME fix at or above ,000'. NOTE: This SID requires a minimum climb te of 430' per mile.

SUPERIOR TWO DEPARTURE

Via Denver 263 and Kremmling 082 radials to Kremmg. Cross Superior Intersection/Denver 23 mile DME x at or above 13,400'. NOTE: This SID requires a inimum climb rate of 430' per mile.

GUNNISON TWO DEPARTURE

Via Denver 193 radial to intercept Kiowa 232 and unnison 050 radials to Gunnison. Cross Silo Intersecon at or above 11,000'. Cross Lake George Intersecon/Denver 50 mile DME fix at or above 13,200'.

Concurrently cancel Longmont One/Golden One/Superior One Departures.

ADDITIONAL SIDs

In addition to the above, the following areas have SID's published separately in graphic form in the C & GS low altitude chart package.

Casper Air Terminal, Casper
Cheyenne Mun. Airport, Cheyenne

SUBSTITUTE ROUTE STRUCTURE
SHUT DOWN OF ENROUTE NAVIGATION AIDS

An extensive Airways Modernization Program is currently being effected, which requires the scheduled temporary shutdown of selected enroute navigation aids. This action will affect associated airways/routes, MEA's, etc., and will obsolete related information shown on the Enroute Low-Altitude, and High-Altitude U.S. charts. These facilities may be shutdown and/or returned to operation during the period between publication dates of the Enroute U.S. Charts. During this shutdown period the following Substitute Route Structure is operational. NOTAMS are published to cover any change in status of these facilities and pilots are advised to check NOTAMS thoroughly prior to each operation. Pilots are further advised to contact FAA Flight Service Stations regarding any doubtful status of enroute navigation aids or airways.

ILLINOIS

CHICAGO, O'HARE "ORD" VORTAC SHUTDOWN

About Dec 7, TACAN portion of VORTAC will be shutdown for channel change to 86. About Dec 10, VOR will be shutdown for freq change to 113.9mc. Complete facility will resume opern about Dec 15. For substitute route structure during shutdown use the following:

VISUAL NAVIGATION CHART BULLETIN

The purpose of this Bulletin is to provide a tabulation of the major changes in aeronautical information that have occurred since the last publication date of each Sectional Aeronautical Chart. The general policy is to include only those changes to controlled airspace and special use airspace that present a hazardous condition or impose a restriction on the pilot; major changes to airports and radio navigational facilities, thereby providing the VFR pilot with the essential data necessary to update and maintain his chart current. When the Sectional Aeronautical Chart is republished, the corrective tabulation will be removed from this Bulletin.

ABERDEEN

38th Edition, August 20, 1964

Delete Madison arpt 44°01'N, 97°03'W. Delete Nicholas arpt 45°37'N, 101°30'W. Add obstn 2029' MSL 43°56'59''N, 96°54'36''. Add obstn 2040' MSL 44°23'-42''N, 97°00'37''W. In northern border change Bismarck VOR freq 115.7 to 116.5.

ALBANY

53rd Edition, July 23, 1964

Delete Dades arpt 43°28'N, 75°12'W. Delete East Greenbush arpt 42°34'N, 73°43'W. Add V196 airway Utica to Plattsburgh via Utica 016°T & Plattsburgh 336°T. Add obstn 1344' MSL 43°33'41''N, 72°17'14''W. Add obstn 2161' MSL 43°12'29''N, 72°09'40''W. Correct Schenectady Co ctl twr freq 321 to 321.1. Change Chester VOR freq from 108.6 to 117.3. Change Utica VOR freq from 112.0 to 113.9. Change Watertown VOR freq from 110.6 to 109.8. Change Binghamton VORTAC freq from 114.1 ch 88 to 114.3 ch 90. Change Griffis (AF) VOR freq 111.4 to 112.5. In southern border change Clermont VOR freq 114.3 to 117.6.

ALBUQUERQUE

53rd Edition, August 20, 1964

Add obstn 4100' MSL 34°31'00''N, 102°17'00''W. Add obstn 5012' MSL 35°08'03''N, 103°41'52''W. Delete Bacaville VOR 34°35'N, 106°50'W. Delete Dalhart RBn 36°01'N, 102°03'W. In eastern border correct Borger VOR ident BDG to BGD.

AROOSTOOK

41st Edition, April 30, 1964

Delete Green arpt 46°02'N, 68°16'W. Realign Red 9 airway direct from Montmorency RBn to Bagotville RBn. Add obstn 740' MSL 46°09'00''N, 70°12'17''W. Add obstn 525' MSL 46°10'45''N, 71°20'00''W. Add obstn 625' MSL 46°52'50''N, 71°19'35''W. Add obstn 349' MSL 47°00'00''N, 70°31'00''W. Add obstn 433' MSL 47°16'40''N, 70°12'00''W. Add obstn 593' MSL 46°-36'05''N, 65°55'50''W. Add Burtts RBn freq 350, ident LI, class MHW 46°03'52''N, 66°52'13''W. Add Charlo (Pvt) RBn freq 203, ident CL, class HW 47°59'N, 66°20'W. Extend Loring AFB Military Climb Corridor R-3002 1 mi S & 6 mi N. Realign Fredericton LFR W leg from 103°M to 096° M.

AUSTIN

58th Edition, November 12, 1964

No hazardous changes.

BEAUMONT

52nd Edition, September 17, 1964

Delete Saltzman arpt 29°57'N, 92°27'W. Add obstn 385' MSL 30°08'19''N, 94°38'26''W. Add obstn 351' MSL 30°26'18''N, 93°47'16''W. Add obstn 329' MSL 30°35'47''N, 91°31'47'W. Add obstn 598' MSL 30°39'-57''N, 92°08'14''W. Add obstn 347' MSL 31°03'33''N, 92°08'38''W. Add obstn 525' MSL 31°33'17''N, 92°-34'04''W. Add obstn 440' MSL 30°01'55''N, 94°59'37''W. SACRAMENTO
52nd Edition, June 25, 1964

Extend V244 airway from Duckwall int direct to Coaldale. Add V283 airway direct Reno to Fresno (165°M of Reno). Add Lake Tahoe, Calif. ctl zone 5 mi radius of arpt. Change San Francisco VOR freq 111.8 to 111.2. Relocate Willits arpt 39°27′N, 123°22′W & change elev 1356′ to 2054. Delete Sacramento LFR 38°29′N, 121°28′W. Delete Clarksburg FM 38°21′N, 121°38′W. Change Sparks RBn freq 215 to 329.

SALINA
51st Edition, September 17, 1964

Add obstn 2485′ MSL 38°09′26″N, 99°22′13″W. Change obstn 2875′ MSL to 2880′ MSL 38°25′54″N, 98°46′18″W. Add Manhattan (Pvt) RBn freq 391, ident MHK, class HW 39°06′55″N, 96°37′30″W.

SALT LAKE CITY
50th Edition, December 10, 1964

No hazardous changes.

SAN ANTONIO
54th Edition, June 25, 1964

Delete Houston FM 29°43′N, 95°19″W. Add obstn 1130′ MSL 29°38′06″N, 98°37′47″W. In western border change Rocksprings VOR freq 109.0 to 111.2.

SAN DIEGO
56th Edition, August 20, 1964

Delete Borrego Palms arpt 33°16′N, 116°23′W. Delete Torrey Pines arpt 32°54′N, 117°14′W. Delete Los Angeles Intl ctl twr freq 278. Delete Orange Co. ctl twr freq 326. Change NAAS Ream ctl twr freq 340.2 to 271.4. Delete Banning FM 33°55′N, 116°51′W. Delete Miramar RBn 31°53′N, 117°03′W. Change El Centro VORTAC name to Imperial & ident ELC to IPL. Add Palm Springs VOR freq 115.5 ident PSP, class L–VOR, MV 15°E 33°52′12″N, 116°25′43″W. Delete Oceanside RBn 33°14′N, 117°24′W. Add Riverside ctl zone 3 mi radius of arpt with NW extsn.

SAN FRANCISCO
55th Edition, June 25, 1964

Extend V244 airway direct from Stockton to Coaldale (068°M of Stockton). Change San Francisco VOR freq 111.8 to 111.2. Delete Fremont RBn 37°34′N, 122°02′W. Extend R–2517 S portion aprxly 3 mi E. Extend R–2516 aprxly 4 mi N. Delete Willett arpt 36°15′N, 119°56′W.

SAVANNAH
56th Edition, September 17, 1964

Delete Estill arpt 32°43′N, 81°15′W. Delete Santee Cooper arpt 33°33′N, 80°26′W. Add obstn 473′ MSL 32°02′53″N. 81°59′08″W. Add obstn 631′ MSL 32°-39′15″N, 83°01′48″W. Add obstn 700 MSL 32°09′56″N, 82°40′33″W. Add obstn 750′ MSL 32°32′42″N, 82°-22′54″W. Add obstn 830′ MSL 33°14′29″N, 82°41′46″W. Add obstn 835′ MSL 32°50′52″, 83°20′22″W. Add obstn 1250′ MSL 34°03′00″N, 78°04′56″W. Delete Columbia ctl twr freq 335. Twr comsnd at Owens arpt freqs 126.2 & 241.0. In northern border change Florence VORTAC freq 115.5 to 115.2 Ch 99.

SEATTLE
56th Edition, December 10, 1964

No hazardous changes.

SHREVEPORT
47th Edition, June 25, 1964

Delete Bintliff arpt 32°57′N, 91°13′W. Delete Cartl age arpt 32°09′N, 94°21′W. Delete Perry arpt 32°44′ 91°55′W. Add V245 airway direct Jackson to Natch (222°M of Jackson). Add obstn 455′ MSL 32°32′26″ 93°50′09″W. Add obstn 570′ MSL 33°36′07″N, 92 51′32″W. Add obstn 620′ MSL 32°40′03″N, 94°11′14″W Add obstn 650′ MSL 34°03′05″N, 93°41′15″W. Add obst 665′ MSL 33°13′15″N, 92°38′30″W. Add obstn 82 MSL 32°43′36″N, 94°55′02″W. Add obstn 851′ MS 32°24′24″N, 94°50′58″W. Add obstn 901′ MSL 32°5 38″N, 95°15′11″W. Add obstn 930′ MSL 33°59′16″ 94°17′43″W. Change Texarkana VORTAC freq 117 Ch 118 to 116.3 Ch 110. Add obstn 590′ MSL 32 46′57″N, 91°56′08″W.

SIOUX CITY
40th Edition, November 12, 1964

Delete Madison arpt 44°01′N, 97°03′W. Add obs 1902′ MSL 42°05′24″N, 97°01′00″.

SPOKANE
50th Edition, December 10, 1964

No hazardous changes.

TRINIDAD
40th Edition, Sepetember 17, 1964

Add V211 airway via 270°M from Durango. Add V4 airway Farmington to Durango to Gunnison. Dele Hermit Lakes arpt 37°49′N, 107°13′W. Add obstn 429 MSL 37°55′27″N, 107°13′W.

TULSA
54th Edition, October 15, 1964

Delete Sky Haven arpt 36°46′N, 91°53′W. Dele Waynesville Mem arpt 37°49′N, 92°11′W. Add obs 663′ MSL 36°03′40″N, 90°57′15″W. Add obstn 135 MSL 37°50′59″N, 94°22′22″.

TWIN CITIES
49th Edition, November 12, 1964

Add obstn 1531′ MSL 45°01′32″N, 93°02′38″W.

WASHINGTON
60th Edition, October 15, 1964

Change Kenton VORTAC freq 114.8 Ch 95 to 116.8 C 115. Change Sea Isle VORTAC freq 115.2 Ch 99 114.8 Ch 95. Delete Point Lookout RBn & FM 38 02′24″N, 76°19′16″W.

WICHITA
52nd Edition, June 25, 1964

Delete McDonald arpt 37°56′N, 101°35′W. Add obst 1953′ MSL 37°39′48″N, 98°19′00″W. Add obstn 372

MSL 37°39'01''N, 100°40'06''W. Delete Hutchinson Mun ctl twr freq 278. Revise Gage, Okla. ctl zone adding NE extsn aprxly 10 mi from arpt.

WILLISTON

38th Edition, July 23, 1964

Delete Petes Port arpt 48°01'N, 101°59'W. Add obstn 2125' MSL 49°43'15''N, 104°01'00''W. Add obstn 2690' MSL 49°42'10''N, 106°03'05''W. Add obstn 2735' MSL 49°38'40''N, 105°59'30''W. Add obstn 2930' MSL 49°-26'45''N, 107°00'45''W. Add obstn 3150' MSL 50°-00'30''N, 107°45'00''W. Add Moose Jaw term ctl area within a 50 SM radius of Moose Jaw arpt 50°20'N, 105°33'W.

WINSTON-SALEM

54th Edition, October 15, 1964

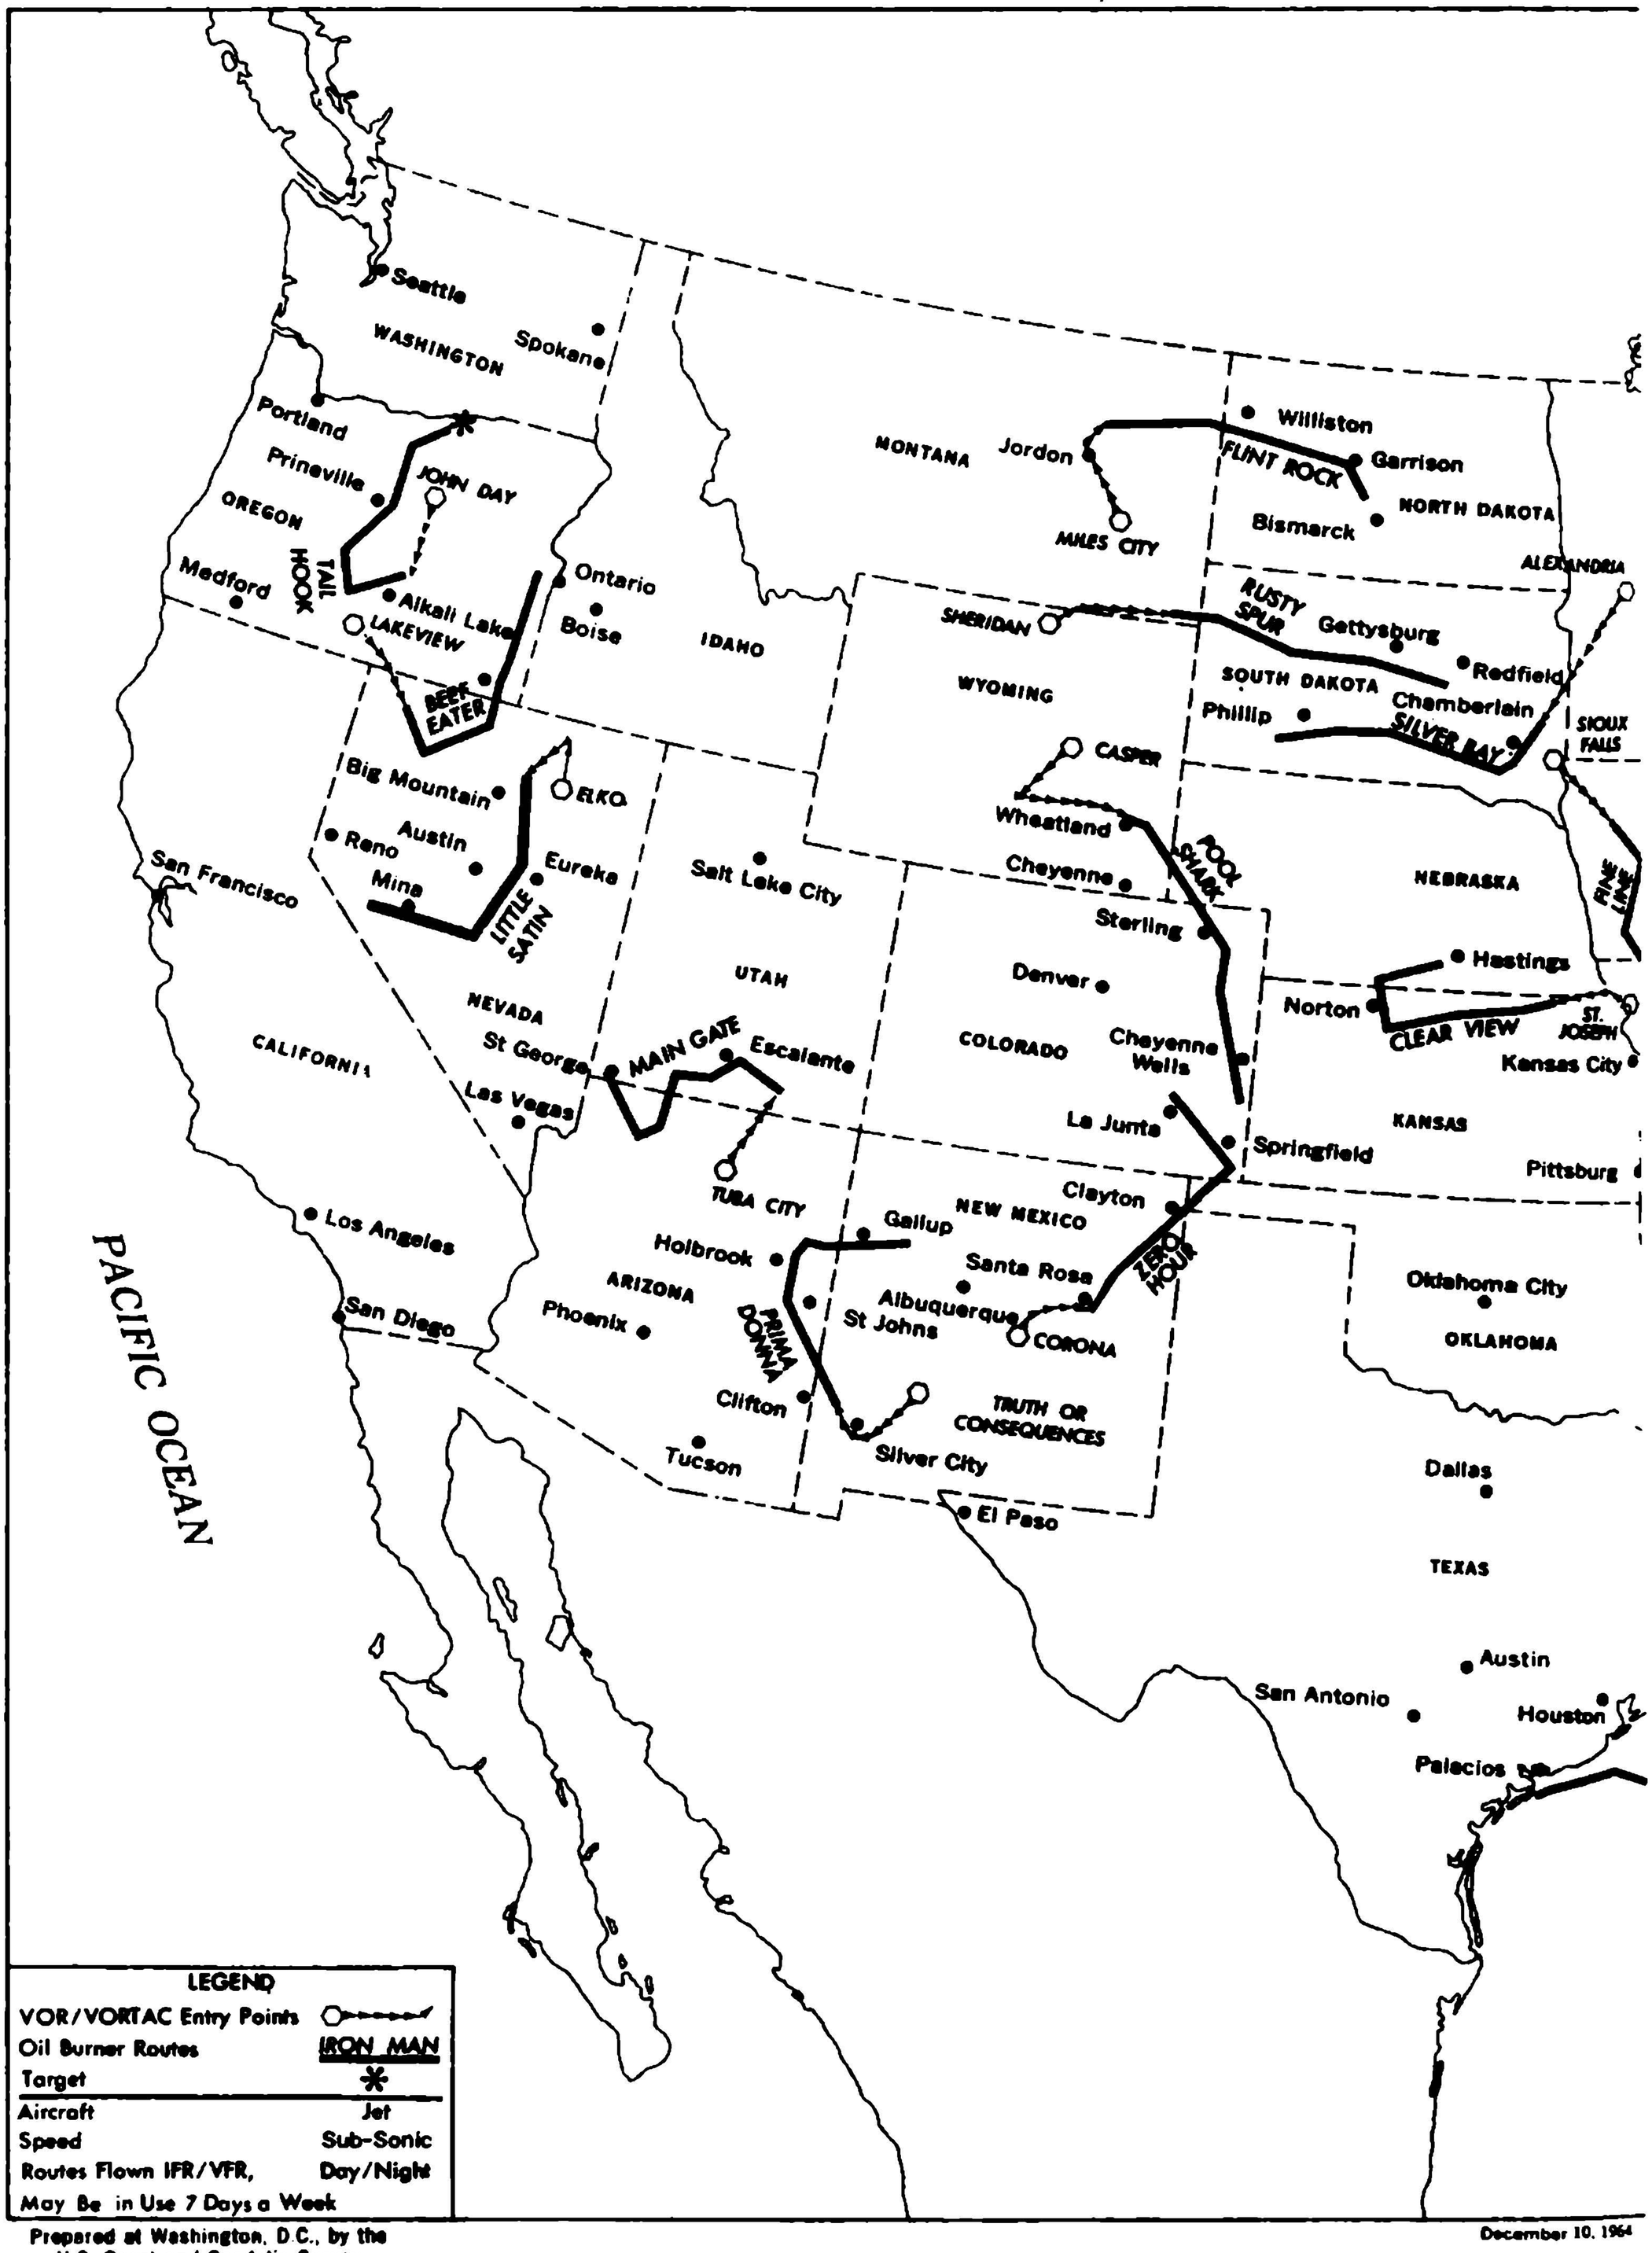
Change Bluefield VOR freq 113.3 to 115.4. Add Hot Springs (Pvt) RBn freq 224, ident HSP, class HW 37°57'00''N, 79°49'30''W. In northern border change Charleston W.Va. VORTAC freq 115.4 Ch 101 to 117.4 Ch 121.

YELLOWSTONE PARK

40th Edition, September 17, 1964

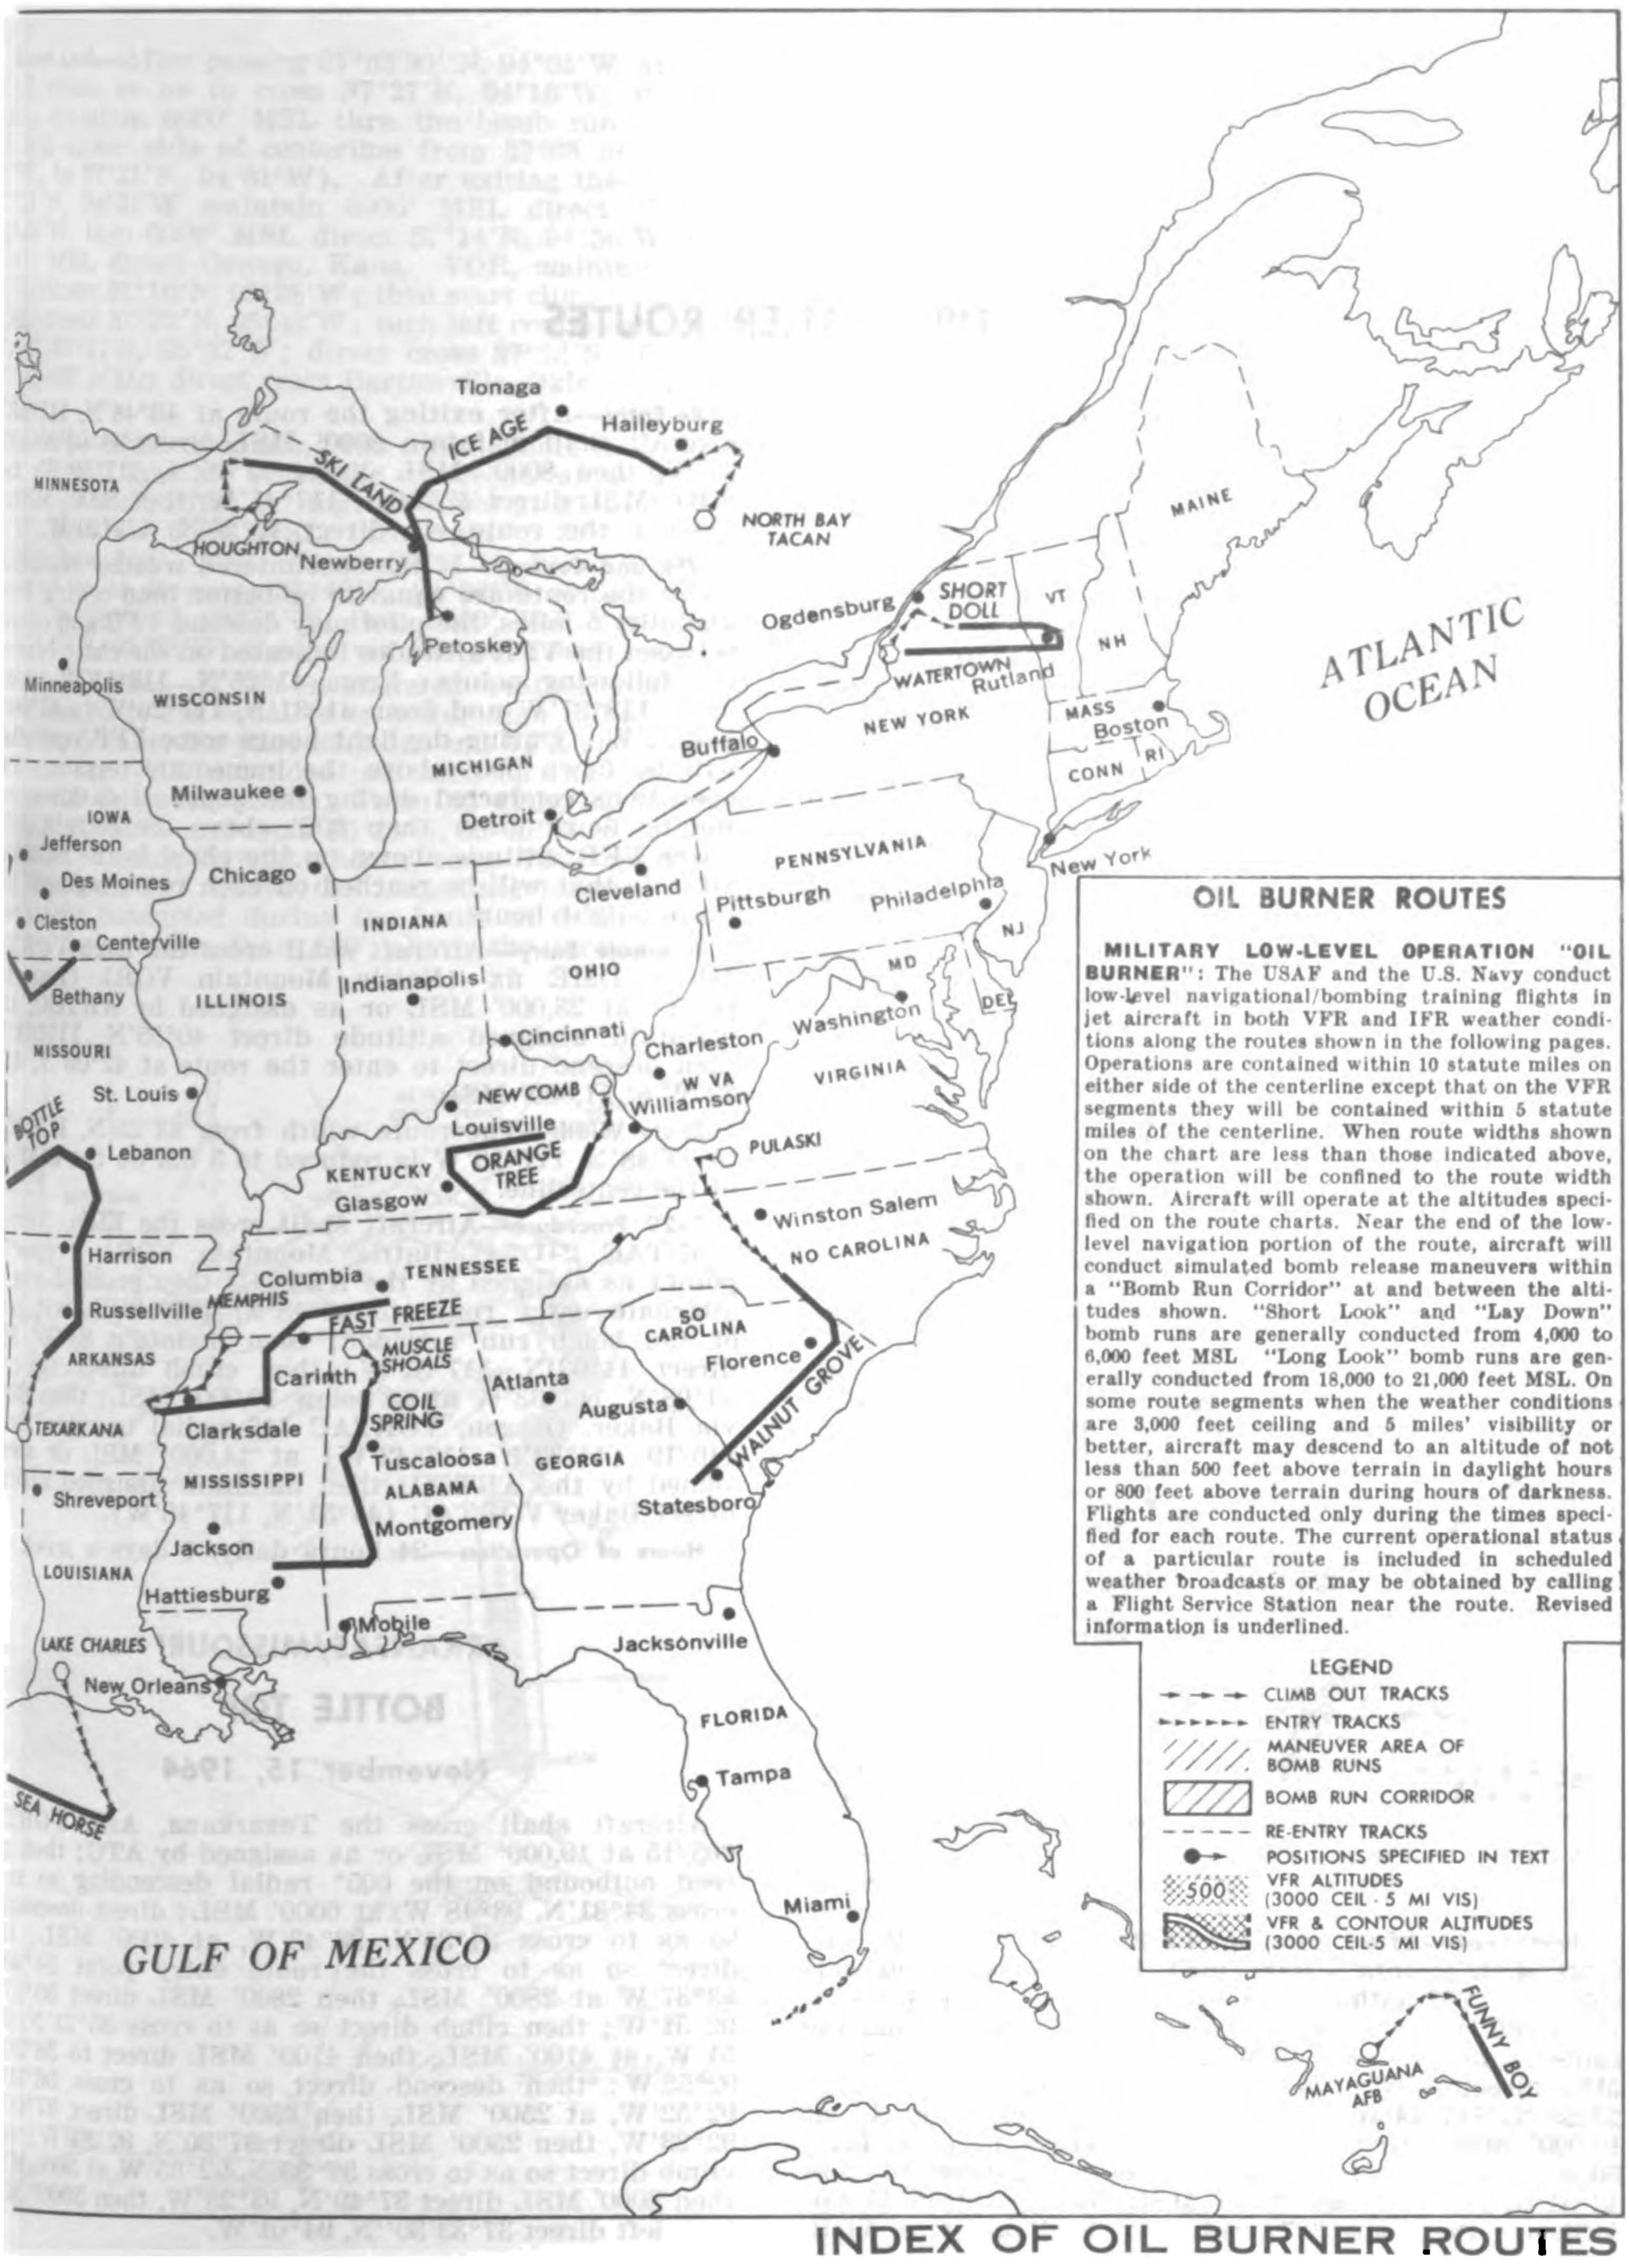
Delete West Yellowstone arpt 44°40'N, 111°07'W. In southern border change Boysen Reservoir VORTAC freq 114.9 Ch 96 to 117.8 Ch 125.

INDEX OF OIL BURNER ROUTES



Prepared at Washington, D.C., by the
U.S. Coast and Geodetic Survey

December 10, 1964



OIL BURNER ROUTES

MILITARY LOW-LEVEL OPERATION "OIL BURNER": The USAF and the U.S. Navy conduct low-level navigational/bombing training flights in jet aircraft in both VFR and IFR weather conditions along the routes shown in the following pages. Operations are contained within 10 statute miles on either side of the centerline except that on the VFR segments they will be contained within 5 statute miles of the centerline. When route widths shown on the chart are less than those indicated above, the operation will be confined to the route width shown. Aircraft will operate at the altitudes specified on the route charts. Near the end of the low-level navigation portion of the route, aircraft will conduct simulated bomb release maneuvers within a "Bomb Run Corridor" at and between the altitudes shown. "Short Look" and "Lay Down" bomb runs are generally conducted from 4,000 to 6,000 feet MSL "Long Look" bomb runs are generally conducted from 18,000 to 21,000 feet MSL. On some route segments when the weather conditions are 3,000 feet ceiling and 5 miles' visibility or better, aircraft may descend to an altitude of not less than 500 feet above terrain in daylight hours or 800 feet above terrain during hours of darkness. Flights are conducted only during the times specified for each route. The current operational status of a particular route is included in scheduled weather broadcasts or may be obtained by calling a Flight Service Station near the route. Revised information is underlined.

LEGEND

- CLIMB OUT TRACKS
- ENTRY TRACKS
- MANEUVER AREA OF BOMB RUNS
- BOMB RUN CORRIDOR
- RE-ENTRY TRACKS
- POSITIONS SPECIFIED IN TEXT
- 500 VFR ALTITUDES (3000 CEIL - 5 MI VIS)
- VFR & CONTOUR ALTITUDES (3000 CEIL-5 MI VIS)

INDEX OF OIL BURNER ROUTES

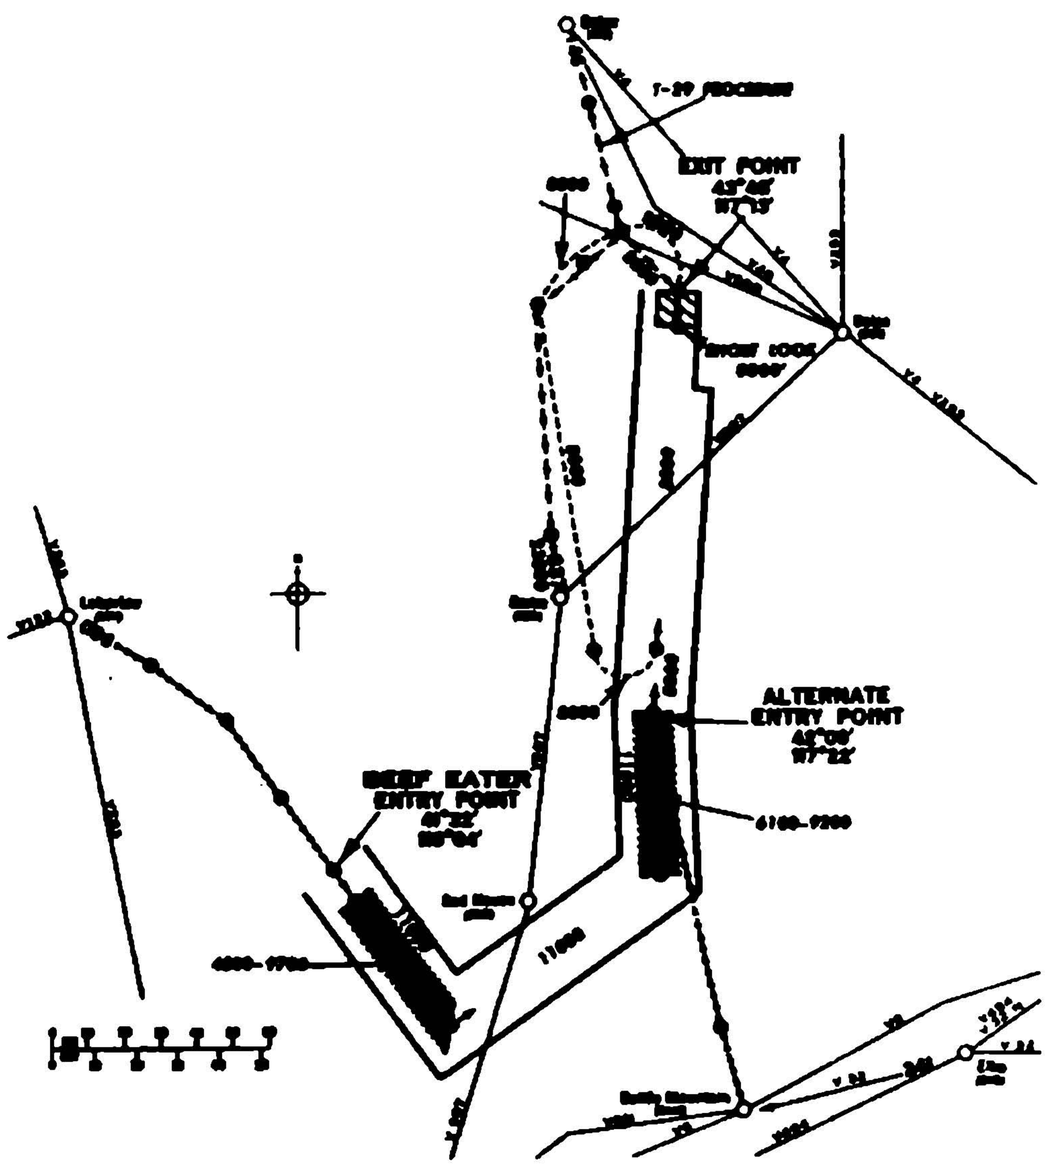
OIL BURNER ROUTES

NEVADA/OREGON

BEEF EATER

Effective May 3, 1964

Aircraft shall cross the Lakeview, Ore. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC; then maintain assigned altitude via the Lakeview 096° radial until 22 NM east of the Lakeview VORTAC (42°-20′N, 120°04′W); then descend direct to cross 42°07′N, 119°39′W at or below 23,000′ MSL; then descend direct to cross 41°49′N, 119°21′W at or above 16,000′ MSL; then descend direct to cross the entry point of the low level route at 41°32′N, 119°04′W at 11,000′ MSL, then 11,000′ MSL direct 40°55′N, 118°27′W, then 11,000′ MSL direct 41°31′N, 117°20′W, then 11,000′ MSL direct 42°09′N, 117°22′W; then descend to cross 42°26′N, 117°20′W at 8000′ MSL, then 8000′ MSL direct 43°40′N, 117°13′30″W.



Short Look—After passing 43°40′N, 117°13′30″W aircraft shall maintain 8000′ MSL thru the bomb run corridor (5 SM either side of centerline from 43°40′N, 117°13′30″W to 43°48′N, 117°13′W). After exiting the route at 43°48′N, 117°13′W aircraft shall maintain 8000′ MSL direct 44°03′N, 117°31′W; then climb direct to cross 43°55′N, 117°44′W (reporting point—Beef Eater 1) at 10,000′ MSL; then climb direct to cross 43°45′N, 117°-59′W at or above 14,000′ MSL; then climb direct to cross 42°51′N, 117°54′W at 23,000′ MSL, then maintain 23,000′ MSL via the Rome 337° radial to the Rome, Ore. VOR

Re-Entry—After exiting the route at 43°48′N, 117°13′ aircraft shall maintain 8000′ MSL direct 44°03′N, 117 31′W, then 8000′ MSL direct 43°45′N, 117°59′W, the 8000′ MSL direct 42°24′N, 117°41′W, then 8000′ MSL re-enter the route via direct 42°26′N, 117°20′W.

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and opera between the VFR altitudes indicated on the chart betwe the following points: From 41°25′N, 118°57′W to 40 55′N, 118°27′W and from 41°31′N, 117°20′W to 42°09′ 117°22′W. During daylight hours some VFR operatio will be flown 500′ above the immediate terrain. VF operations conducted during the hours of darkness wi not be flown lower than 800′ above the terrain. Th lower VFR altitude shown on the chart is the minimu altitude that will be reached on each route segment du ing daylight hours.

Alternate Entry—Aircraft shall cross the Elko VORTA 241/54 DME fix (Battle Mountain VOR) (reportin point) at 23,000′ MSL or as assigned by ARTCC, the maintain assigned altitude direct 40°55′N, 117°01′W then descend direct to enter the route at 42°09′N, 117 22′W at 11,000′ MSL.

Route Width—The route width from 43°25′N, 117°15′ to 43°48′N, 117°13′W is reduced to 5 SM on the east sid of the centerline.

I–29 Procedure—Aircraft shall cross the Elko, Nevad VORTAC 241/54 (Battle Mountain VOR) (reportin point) as assigned by the ARTCC; then proceed via th alternate entry route to 43°48′N, 117°13′W exit poin of the bomb run corridor; then maintain 8,000′ MS direct 44°03′N, 117°31′W; then climb direct to cros 44°08′N, 117°33′W at or below 10,000′ MSL; then direc via Baker, Oregon, VORTAC 146 radial to cross Bak 146/19 (44°32′N, 117°42′W) at 14,000′ MSL or as a signed by the ARTCC; then maintain assigned altitud direct Baker VORTAC (44°51′N, 117°48′W).

Hours of Operation—24 hours daily, 7 days a week.

ARKANSAS/MISSOURI

BOTTLE TOP

November 15, 1964

Aircraft shall cross the Texarkana, Ark. VORTA 005/15 at 19,000′ MSL or as assigned by ATC; then pr ceed outbound on the 005° radial descending so as t cross 34°31′N, 93°48′W, at 6000′ MSL; direct descendin so as to cross 34°35′N, 93°43′W, at 4000′ MSL; the direct so as to cross the route entry point 34°40′ 93°37′W at 2800′ MSL, then 2800′ MSL direct 35°17′ 92°51′W; then climb direct so as to cross 35°21′N, 92° 51′W, at 4100′ MSL, then 4100′ MSL direct to 36°26′ 92°55′W; then descend direct so as to cross 36°30′ 92°52′W, at 2500′ MSL, then 2500′ MSL direct 37°06′ 92°23′W, then 2500′ MSL direct 37°30′N, 92°34′W; the climb direct so as to cross 37°33′N, 92°35′W at 300′ MSL then 3000′ MSL direct 37°49′N, 93°23′W, then 3000′ MSL turn left direct 37°33′30″N, 94°01′W.

Short Look—After passing 37°33'30''N, 94°01'W, aircraft shall climb so as to cross 37°27'N, 94°16'W, at 6000' MSL, maintain 6000' MSL thru the bomb run corridor (5 SM either side of centerline from 37°33'30''N, 94°-01'W, to 37°21'N, 94°31'W). After exiting the route at 37°21'N, 94°31'W maintain 6000' MSL direct 37°16'N, 94°49'W, then 6000' MSL direct 37°14'N, 94°56'W, then 6000' MSL direct Oswego, Kans. VOR, maintain 6000' MSL direct 37°16'N, 95°28'W; then start climb to 23,000' MSL direct 37°22'N, 95°42'W; turn left continuing climb direct 37°17'N, 95°52'W; direct cross 37°13'N, 95°53'W at 16,000' MSL; direct cross Bartlesville, Okla. at 23,000' MSL.

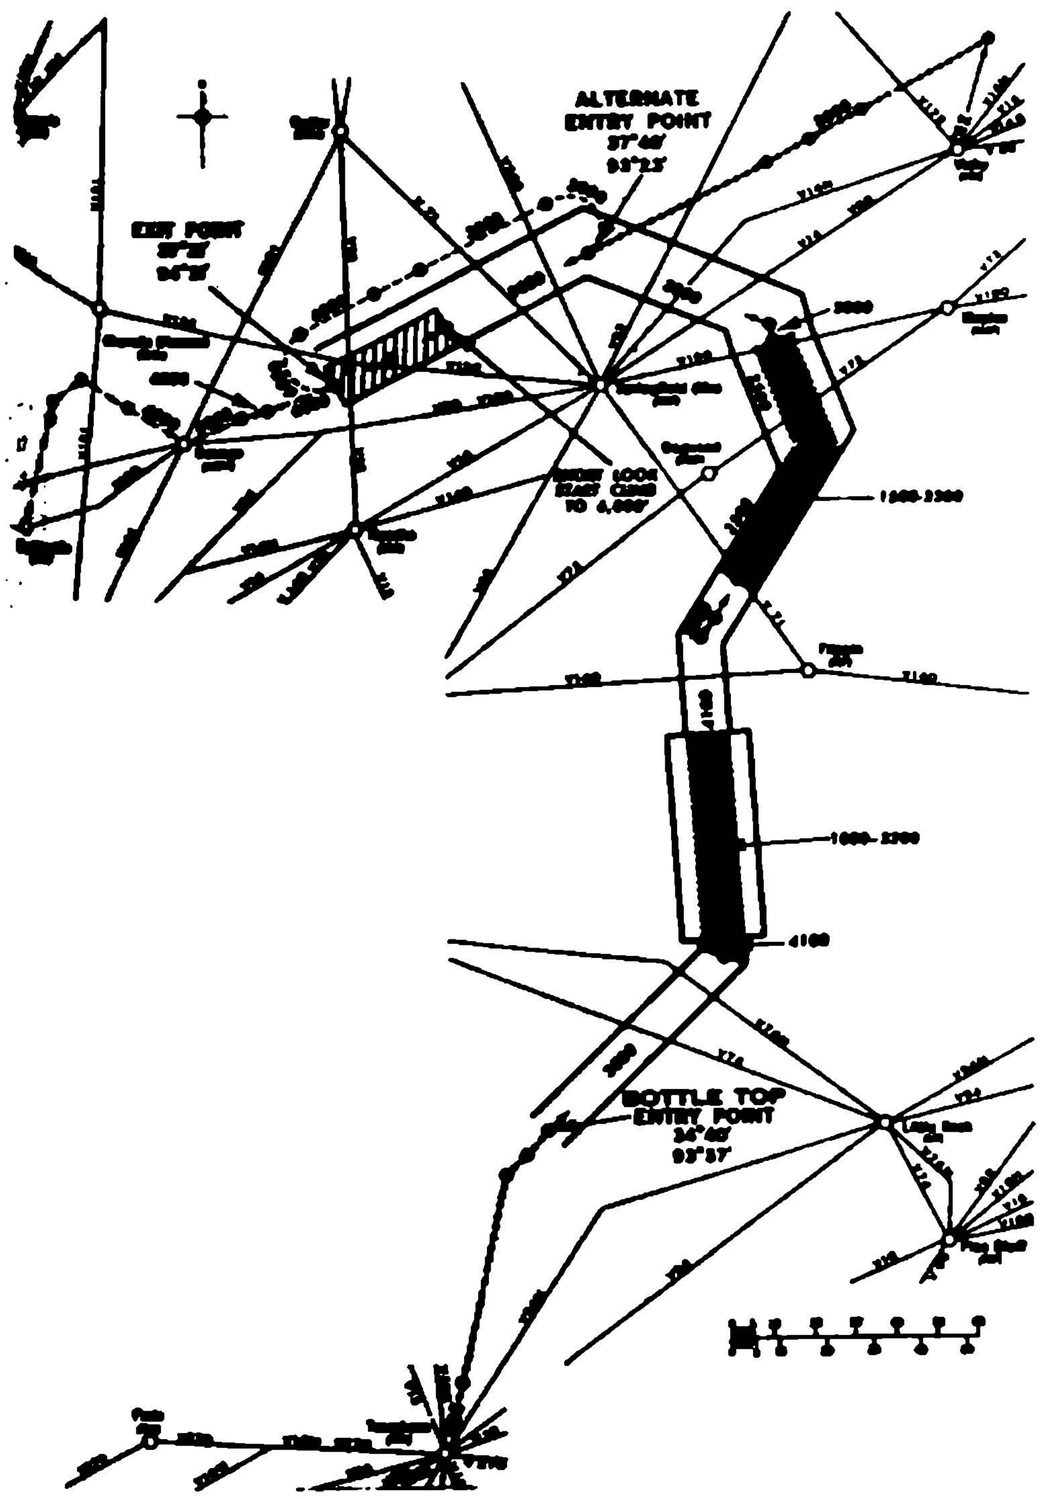
Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 37°21'N, 94°-31'W, maintain 6000' MSL, turn right to 37°32'N, 94°-41'W, then 6000' MSL direct 37°41'N, 94°20'W; then descend so as to cross 37°46'N, 94°08'W at 3000' MSL direct to 38°00'N, 93°34'W, then 3000' MSL turn right to 37°49'N, 93°23'W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 35°17'N, 92°51'W to 36°05'N, 92°53'W and from 36°38'N, 92°45'W to 37°30'N, 92°34'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Vichy, Mo. VOR-TAC 012/25 at 15,000' MSL or as assigned by ATC. Descend direct so as to cross 38°19'N, 92°08'W at 8000' MSL; then at 8000' MSL direct to 38°13'N, 92°22'W; then descend so as to cross 38°08'N, 92°34''W at 4000' MSL; then continue descent so as to cross 37°49'N, 93°23'W at 3000' MSL. Thence via published route.

Route Width—The route width from 34°40'N, 93°37'W to 35°21'N, 92°51'W and from 36°05'N, 92°53'W to 37°-06'N, 92°23'W is reduced to 5 SM either side of centerline and 5 SM on the south side of centerline from 37°33'N, 92°35'W to 37°21'N, 94°31'W.

Hours of Operation—0100Z to 1400Z, 7 days per week."



KANSAS/MISSOURI/NEBRASKA

CLEAR VIEW

Effective September 6, 1964

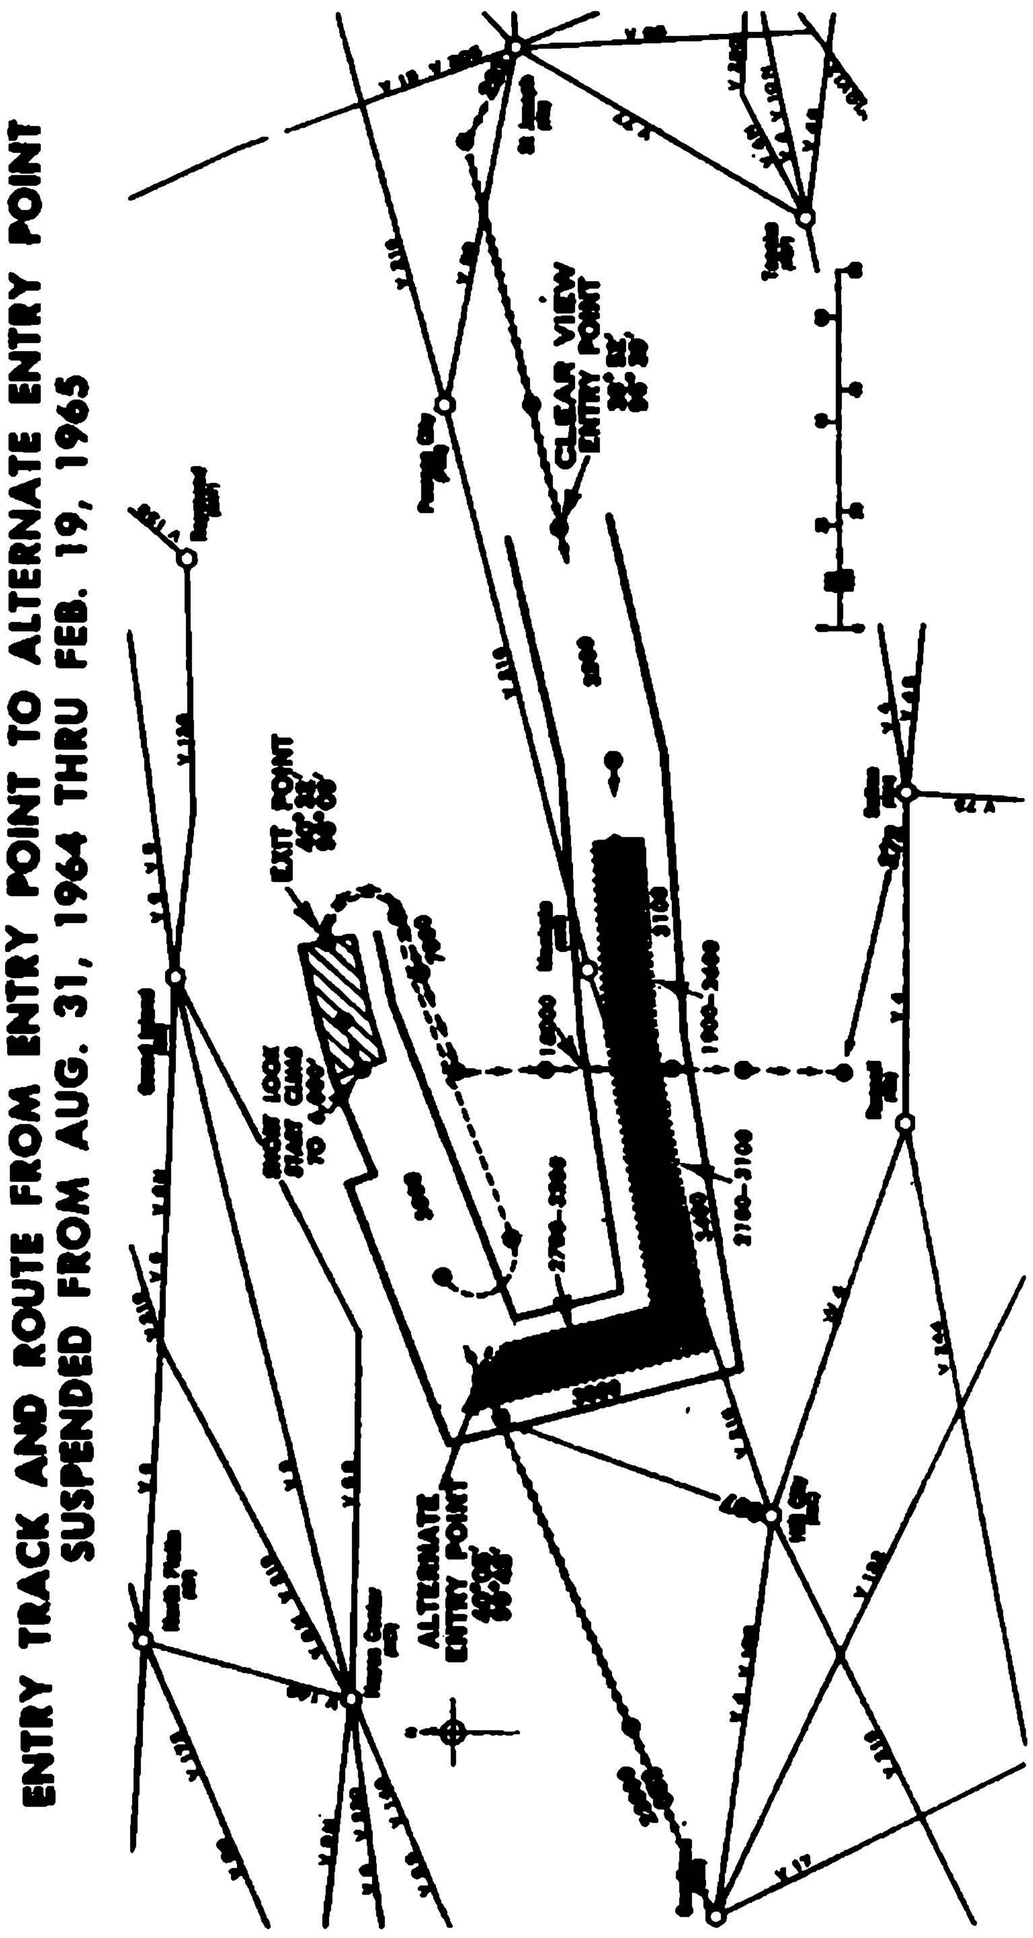
Aircraft shall cross the St. Joseph, Mo. VOR at FL 240 or above, then proceed northwest on the St. Joseph VOR 293° radial, maintain FL 240 or above until 17 NM northwest of St. Joseph VOR; turn left direct 39°56'N, 96°12'W crossing this point at 9000' MSL, descend to 3200' MSL direct to the route entry point at 39°52'N, 96°39'W, maintain 3200' MSL direct 39°43'N, 97°30'W, descend to 3100' MSL direct 39°40'N, 98°30'W, climb to 3400' MSL direct 39°31'N, 99°34'W, climb to 3800' MSL direct 40°05'N, 99°45'W; maintain 3800' MSL direct 40°26'N, 98°37'W.

Short Look—After passing 40°26'N, 98°37'W, proceed direct to 40°29'N, 98°27'W climbing so as to cross this point at 6000' MSL; maintain 6000' MSL through the bomb run corridor (5 SM either side centerline from 40°26'N, 98°37'W to 40°32'N, 98°09'W); after exiting the route at 40°32'N, 98°09'W, turn right climbing to cross 40°20'N, 98°03'W at 7000' MSL; then at 7000' MSL direct 40°16'N, 98°16'W; then start climb so as to cross 40°10'N, 98°37'W at or below 14,000' MSL; then turn left climbing so as to cross 39°54'N, 98°37'W at 18,000' MSL; then at 18,000' MSL direct 39°33'N, 98°-37'W; then climb so as to cross 39°21'N, 98°37'W at or below 23,000' MSL, then start climb so as to cross the Salina VORTAC 272/48 at FL 250.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 40°32'N, 98°-09'W, turn right climbing to 7000' MSL to 40°20'N, 98°03'W, maintain 7000' MSL direct 40°00'N, 99°14'W; turn right descending to 3800' MSL to 40°12'N, 99°22'W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 39°42'N, 97°48'W to 40°05'N, 99°45'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Goodland, Kansas VOR at 23,000' MSL; and proceed northeast on the Goodland VOR 053° radial maintaining 23,000' MSL until 35 NM nrtheast of Goodland VOR, then descend so as to reach 5500' MSL by the Hill City, Kansas VOR 007/49 NM fix; then descend to 3800' MSL direct 40°05'N, 99°45'W, thence via the published route.



Route Width—The route width from 99°00′W to the route exit point is five statute miles on the north side of the route centerline and 10 statute miles on the south side of the route centerline.

Hours of Operation—0000Z to 2359Z Monday through Saturday.

ALABAMA/MISSISSIPPI

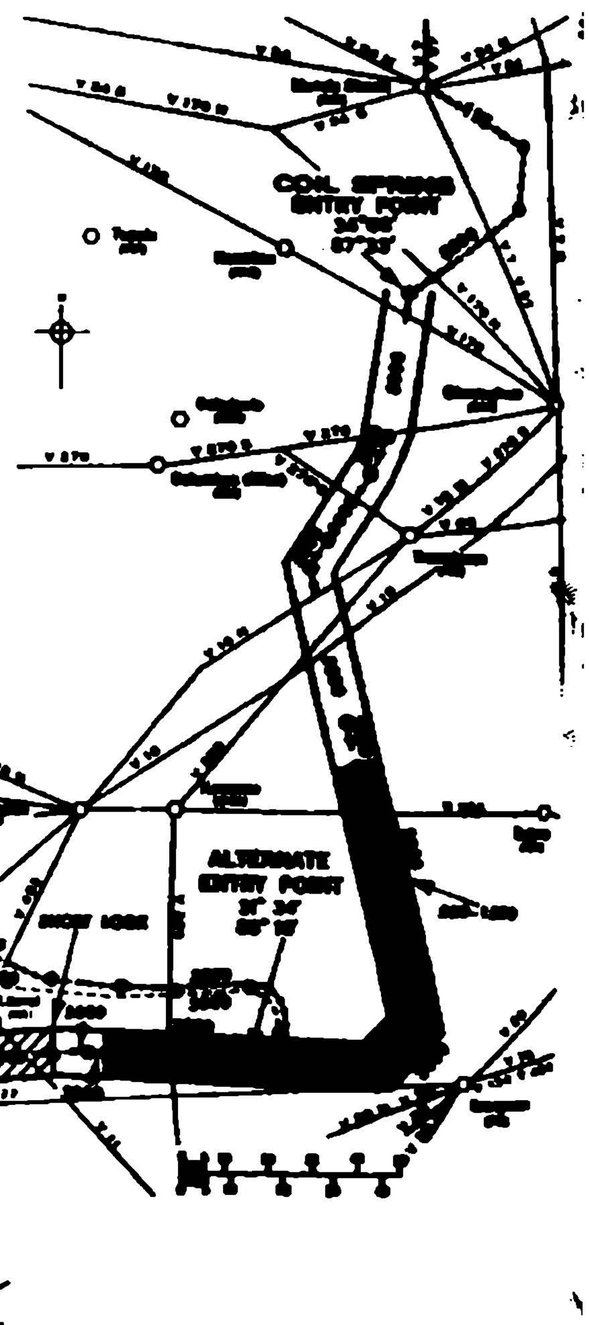
COIL SPRING

Effective October 18, 1964

Aircraft shall cross Muscle Shoals, Alabama VOR at 20,000′ MSL, or as assigned. Descend via Muscle Shoals VOR 115° radial, cross Muscle Shoals VOR 115°/24 NM at 12,000′ MSL; turn right, descend to cross 34°19′N, 87°06′W at 8000′ MSL, maintain 8000′ MSL direct to the route entry point at 34°08′N, 87°33′W, direct 33° 35′N, 87°38′W, direct 33°28′N, 87°42′W; descend direct to cross 33°15′N, 87°52′W at 5000′ MSL, maintain 5000 MSL direct 33°10′N, 87°56′W, direct 32°40′N, 87°48′W descend to cross 32°31′N, 87°45′W at 2000′ MSL, maintain 2000′ MSL direct 31°41′N, 87°31′W, turn right t 31°33′N, 87°40′W, maintain 2000′ MSL direct 31°36′N 88°42′W; climb direct to cross 31°36′N, 88°46′W at 3000 MSL, direct to cross 31°36′N, 88°55′W at 5000′ MSL In addition to the above, aircraft may climb to 3000 MSL after 31°33′N, 87°40′W and maintain 3000′ MSI to 31°36′N, 88°55′W during the hours 0600Z–1200Z.

Short Lock—After passing 31°36′N, 88°55′W aircraf shall operate through the bomb run corridor at 5000 MSL. In addition, aircraft may operate through th bomb run corridor at 3000′ MSL during the hours 0600Z 1200Z. (The bomb run corridor is 5 SM either sid centerline from 31°36′N, 88°55′W to 31°35′N, 89°14′W. After exiting the route at 31°35′N, 89°14′W, aircraf shall cross 31°36′N, 89°30′W at 5000′ MSL; start climl direct to cross 31°37′N, 89°56′W at 14,000′ MSL (re porting point), maintain 14,000′ MSL direct 31°33′N 90°25′W; start climb direct 31°32′N, 90°36′W, turn right to intercept Jackson, Miss. VORTAC 205° radial 56 NM fix (31°42′N, 90°44′W) at or below 23,000′ MSL, thence via 205° radial to cross 36 NM fix at FL 250, maintain FL 250 or as assigned to Jackson VORTAC.

Re-Entry—Aircraft scheduled to execute an additiona bomb run shall, after exiting the route at 31°35′N 89°14′W, turn right, cross 31°42′N, 89°22′W at 5000 MSL, maintain 5000′ MSL, turn right to 31°49′N, 89° 14′W, direct 31°48′N, 88°27′W; direct 31°48′N, 88°10′W turn right, cross 31°40′N, 88°08′W at 3000′ MSL; continue turn, cross 31°34′N, 88°10′W at 2000′ MSL; thence via published route.



VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 32°31'N, 87°-45'W to 31°36'N, 88°42'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum that will be reached on each segment during daylight hours.

Alternate Entry—Aircraft shall cross McComb, Miss. VOR (31°18'15"N, 90°15'29"W) at 23,000' MSL, or as assigned: maintain 23,000' MSL or as assigned via the McComb VOR 028° radial to 13 NM fix; start descent, cross McComb VOR 028° radial 41 NM fix at 15,000' MSL; cross 45 NM fix at 14,000' MSL; turn right, cross 32°01'N, 89°35'W at 10,000' MSL, maintain 10,000' MSL, turn right, 32°01'N, 89°27'W, direct 31°49'N, 88°55'W; descend direct, cross 31°48'N, 88°39'W at 6000' MSL; direct, cross 31°48'N, 88°27'W at 5000' MSL, maintain 5000' MSL direct 31°48'N, 88°10'W; turn right cross 31°40'N, 88°03'W at 3000' MSL continue turn, cross 31°34'N, 88°10'W at 2000' MSL; thence via the published route.

Route Width—The entire route is reduced to 5 SM either side of route centerline.

Hours of Operation—24 hours per day, 7 days a week.

DUCK FLAT

ALASKA

Effective June 16, 1963

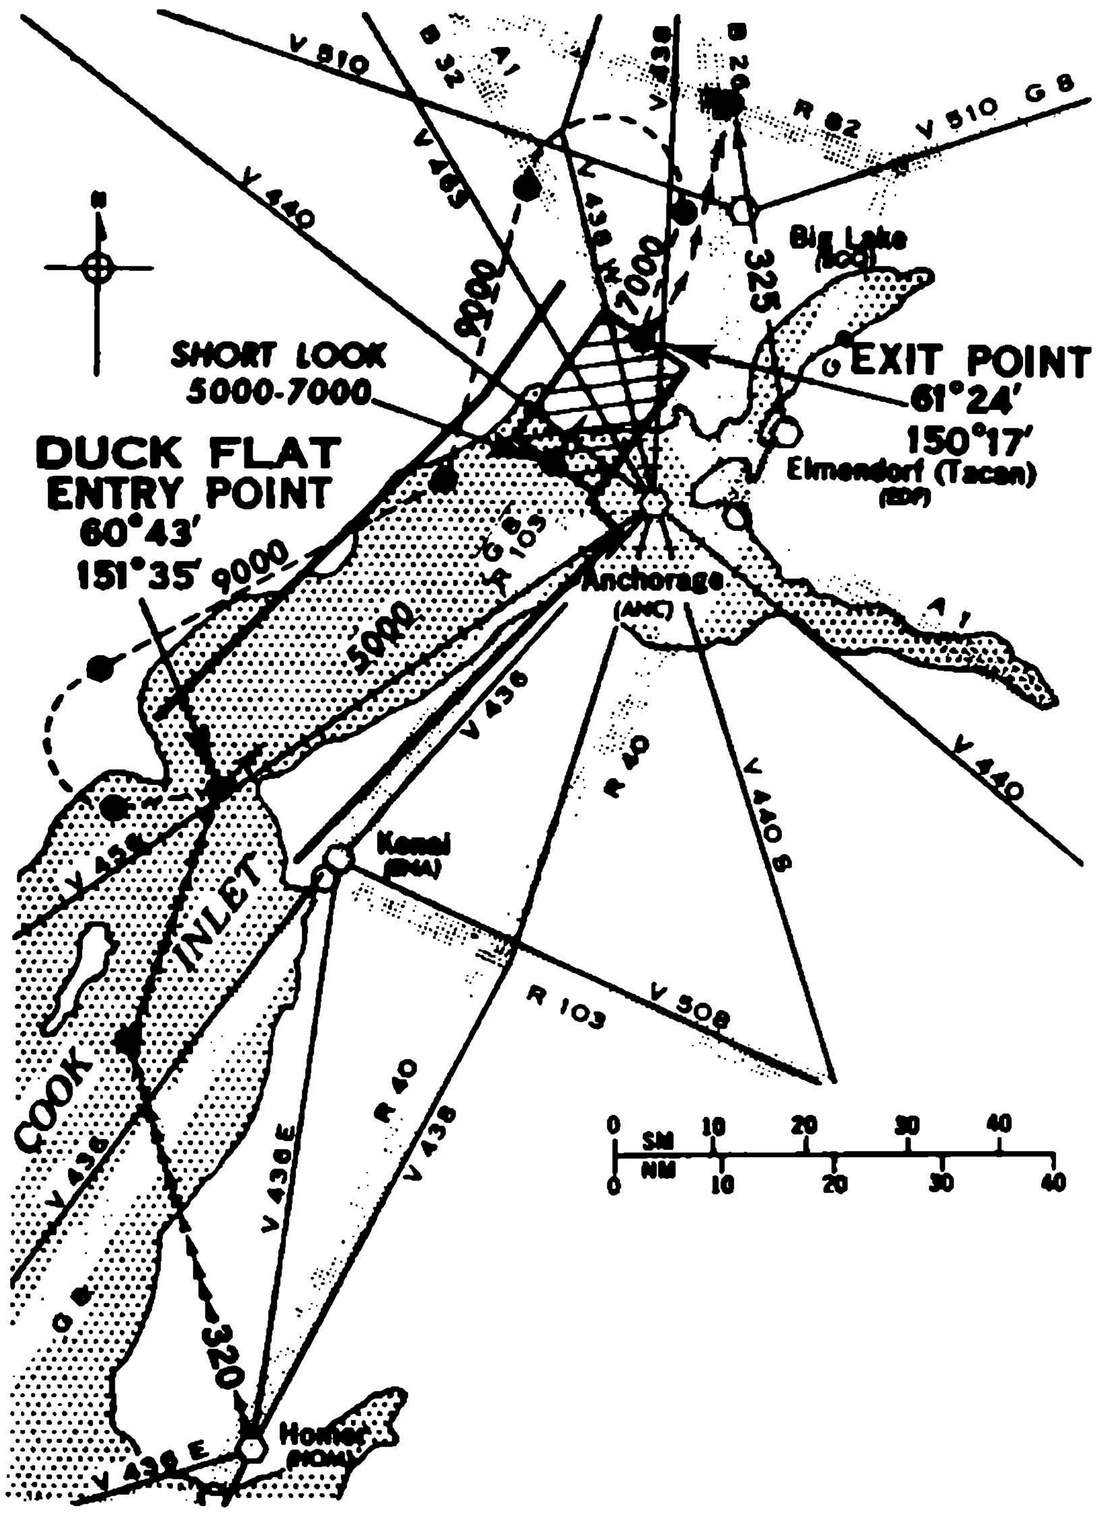
Aircraft shall cross the Homer, Alaska VOR (reporting point) at FL 250 or as assigned by ARTCC, descend via the 320° radial of the Homer VOR to 60°20'N, 151°50'W, continue descent to cross the route entry point at 60°-43'N, 151°35'W at 5000' MSL, maintain 5000' MSL to 61°13', 150°34'W.

Short Look—After passing 61°13'N, 150°34'W aircraft shall maintain between 5000' MSL and 7000' MSL through the bomb run corridor (5 smi either side centerline from 61°13'N, 150°34'W to 61°24'N, 150°17'W). After passing 61°24'N, 150°17'W (reporting point), the route exit point, aircraft shall climb to or maintain 7000' MSL direct to the Elmendorf TACAN 325° radial 30 NM fix (Willow Intersection).

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 61°24'N, 150°17'W, maintain 7000' MSL to 61°35'N, 150°08'W, then turn left climbing to 9000' MSL direct to 61°38'N, 150°38'W, then 9000' MSL to 61°13'N, 150°54'W, then 9000' MSL direct 60°53'N, 151°57'W, then a left descending turn to cross 60°41'N, 151°54'W at 7000' MSL or above, direct to reentry the Duck Flat route at 60°43'N, 151°35'W at 5000' MSL.

Route Width—The route width is reduced to 5 smi southeast of centerline from 61°13'N, 150°34'W to 61°24'N, 150°17'W.

Hours of Operation—2000Z to 2400Z Monday through Friday.



ALABAMA/MISSISSIPPI/TENNESSEE

FAST FREEZE

Effective January 4, 1965 through March 27, 1965

Aircraft shall cross the Memphis, Tennessee, VORTAC at FL 250 or as assigned by ARTC; then maintain FL 250 or assigned altitude via the 201° radial of the Memphis VORTAC to the 26 NM DME fix (34°39'N, 90°-08'W); then descend direct so as to cross 34°17'N, 90°21'W (201/50 NM DME fix of Memphis VORTAC) at FL 200; then descend direct so as to cross 34°14'N, 90°40'W at 16,000' MSL; then descend direct to 34°08'N, 91°16'W; then turn left descending to 33°54'N, 91°13'W; then continue descend direct so as to cross 33°55'N, 91°-05'W at 1700' MSL (low level entry point); then at 1700' MSL direct to 34°03'N, 89°12'W; then at 1700' MSL direct to 34°47'N, 89°11'W; then at 1700' MSL direct to 35°05'N, 88°48'W; then at 2200' MSL direct to 35°13'N, 88°39'W; then at 2200' MSL direct to 35°19'N, 87°47'W.

Short Look and Lay Down—After passing 35°19'N, 87°-47'W aircraft shall maintain between 2200' MSL and 3000' MSL through the bomb run corridor (5 statute miles either side of centerline from 35°19'N, 87°47'W to 35°24'N, 87°03'W). After exiting the route at 35°-24'N, 87°03'W, aircraft shall turn right climbing so as to cross 35°14'N, 86°47'W at 6000' MSL; then at 6000' MSL to 35°05'N, 86°38'W; then climb direct so as to cross 34°58'N, 86°30'W at 10,000' MSL or above; then

climb direct so as to cross 34°43′N, 86°13′W at (026/71 NM DME fix of Birmingham, Alabama, VORTAC) at 15,000′ MSL; then climb direct so as to cross 34°18′N, 86°30′W (025/43 NM DME fix of Birmingham, Alabama, VORTAC) at FL 220 or above; then climb direct so as to cross 34°09′N, 86°36′W (025/33 NM DME fix of Birmingham, Alabama, VORTAC) at FL 240.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after passing 35°24′N, 87°03′W, turn right and climb so as to cross 35°13′N, 86°55′W at 6000′ MSL; then continue turn at 6000′ MSL to 35°10′N, 87°01′W; then at 6000′ MSL direct to 35°05′N, 87°46′W; then descend direct so as to cross 35°04′N, 87°56′W at 3000′ MSL; then at 3000′ MSL turn right to 35°10′N, 88°-06′W; then turn right descending so as to cross 35°17′-30″N, 87°59′W at 2200′ MSL; then at 2200′ MSL direct to 35°19′N, 87°47′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 34°00′N, 90°00′W to 35°13′N, 88°39′W. During daylight hours, some VFR operations will be flown 500 feet above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800 feet above t terrain. The lower VFR altitude shown on the chart the minimum altitude that will be reached on each rou segment during dayight hours.

Alternate Entry—Aircraft shall cross the 175/83 N DME fix of the Memphis, Tennessee, VORTAC (33°39′ 89°53′W) at FL 200 or as assiged by ARTC; then d scend direct to 33°39′N, 89°22′W (158/86 NM DME f of the Memphis VORTAC); then continue descent dire so as to cross 33°50′N, 89°18′W at 10,000′ MSL or belo then descend direct so as to cross 34°03′N, 89°12′W 6000′ MSL; then descend direct so as to cross 34°19′ 89°12′W at 1700′ MSL; then at 1700′ MSL direct 34°47′N, 89°11′W; then at 1700′ MSL direct 35°05′ 88°48′W; thence via the published route.

Route Width—The route width is reduced to 5 statu miles on either side of centerline from 33°55′N, 91°05′ to 35°24′N, 87°03′W.

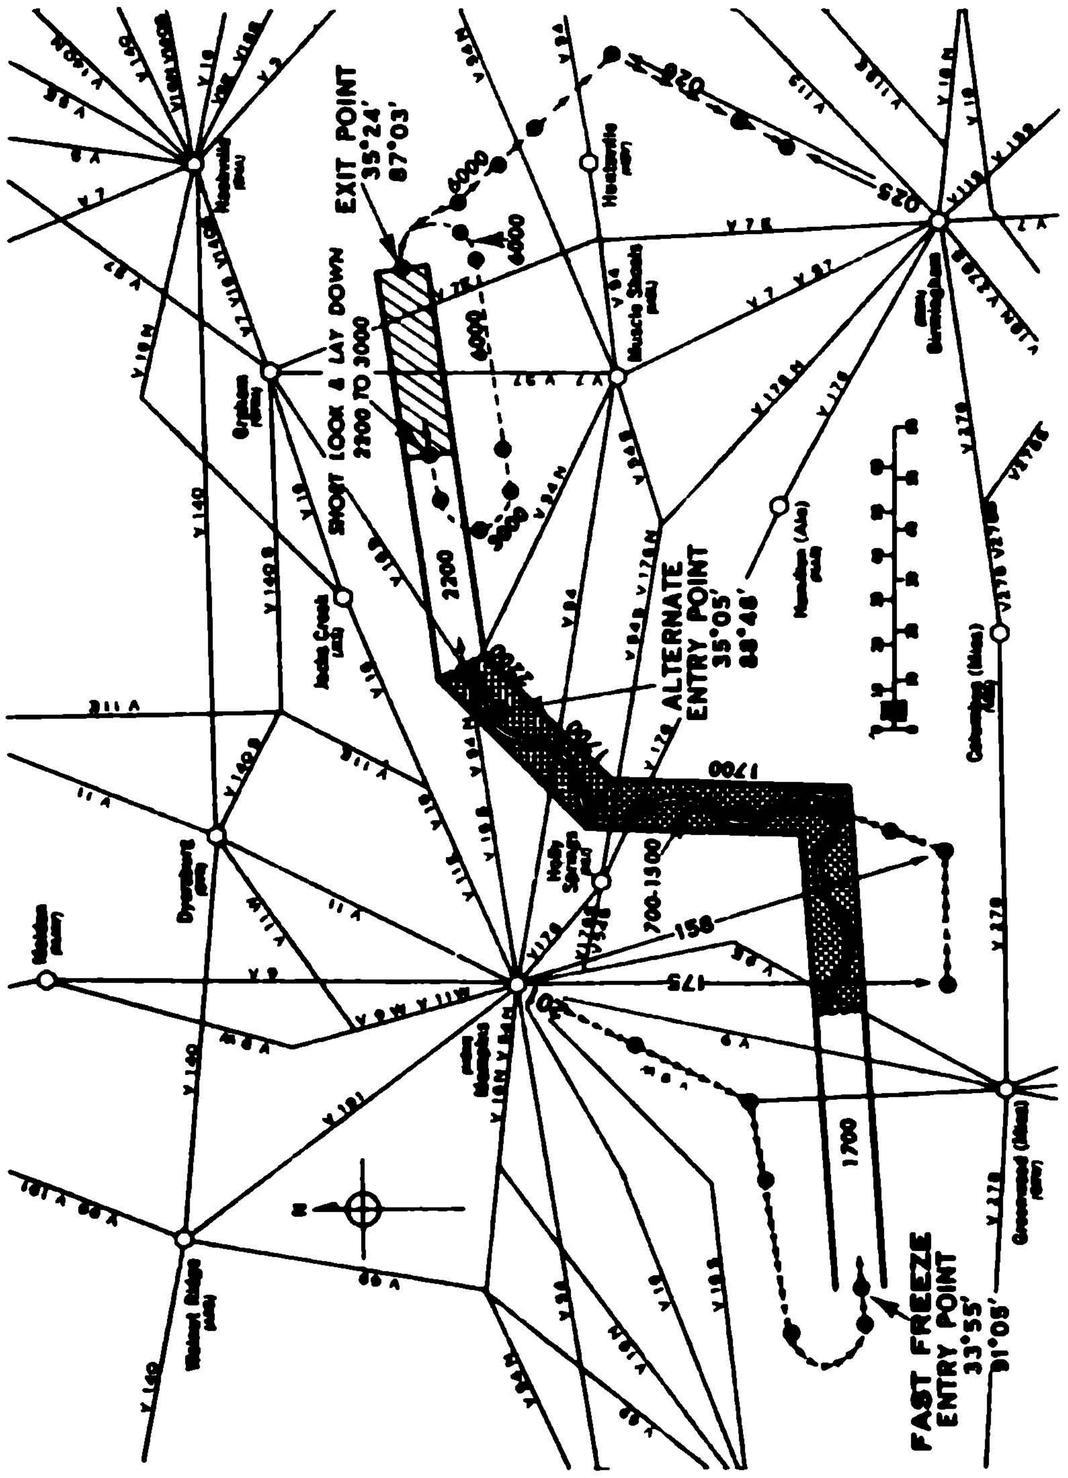
Hours of Operation—24 hours daily, 7 days per week

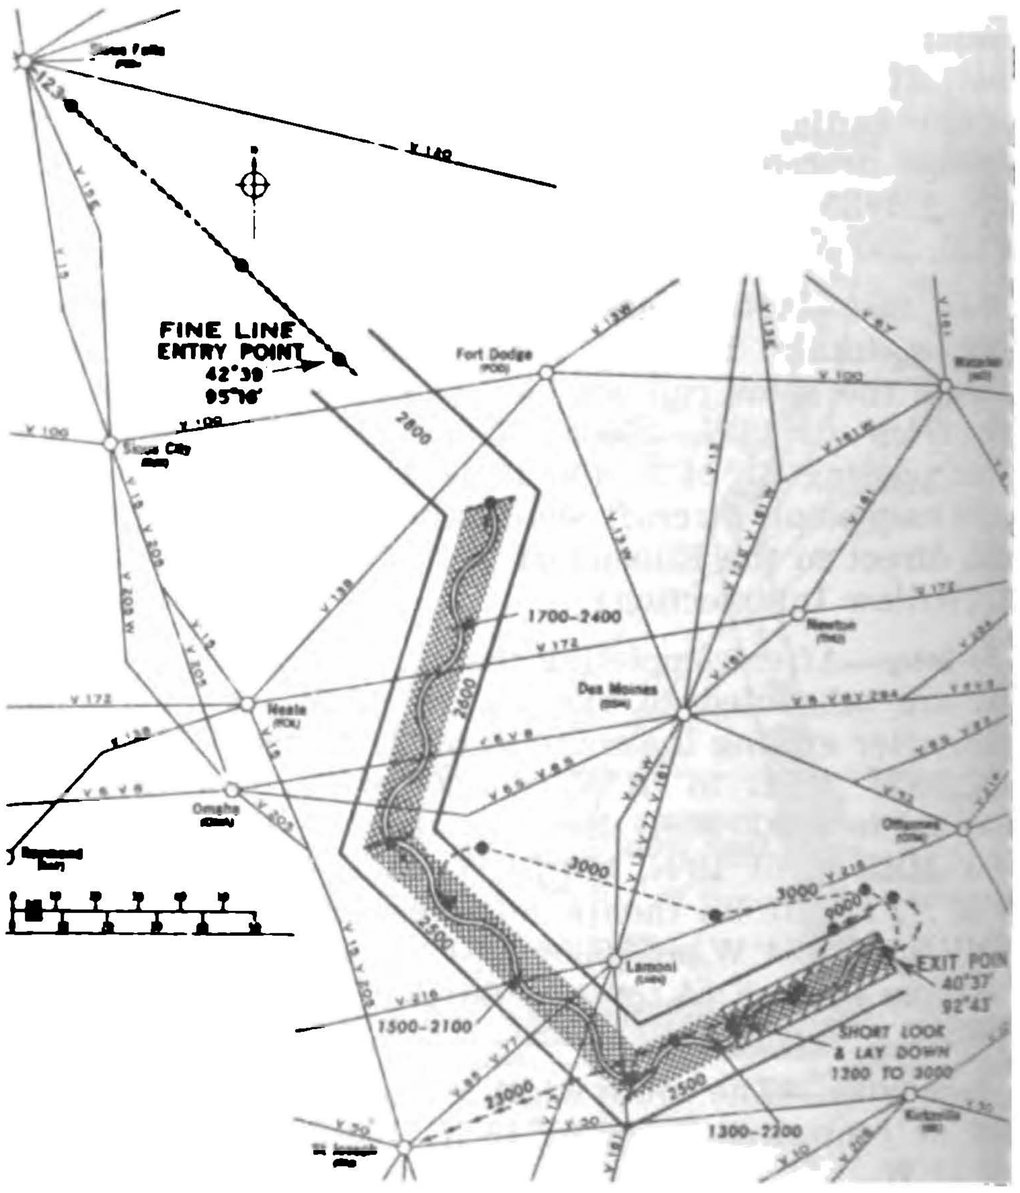
IOWA/MISSOURI

FINE LINE

Effective August 31 thru February 19, 1965

Aircraft shall cross the Sioux Falls, South Dako VORTAC at 23,000′ MSL or as assigned by ARTCC a proceed via the 123° radial maintaining 23,000′ MSL assigned altitude until 13 NM southeast; then desce via the 123° radial of the Sioux Falls VORTAC so to cross 42°58′N, 95°44′W at 11,000′ MSL or below; th descend direct so as to cross the route entry point 4 39′N, 95°16′W at 2800′ MSL; then at 2800′ MSL dire to 42°10′N, 94°33′W; then at 2600′ MSL direct to 41 00′N, 95°01′W; then at 2500′ MSL direct to 40°12′ 93°53′W; then at 2500′ MSL direct to 40°22′N, 93°27′





Short Look and Lay Down—After passing 40°22′N, 93°-27′W, aircraft shall maintain between 1300′ MSL and 3000′ MSL through the bomb run corridor (5 SM either side of centerline from 40°22′N, 93°27′W to 40°37′N, 92°43′W). The minimum IFR altitude through the corridor is 2500′ MSL. After exiting the route at 40°37′N, 92°43′W, aircraft shall turn left climbing so as to cross 40°48′N, 92°41′W at 9000′ MSL; then continue left turn maintaining 9000′ MSL to 40°42′N, 92°58′W; then climb so as to cross 40°30′N, 93°08′W at 14,000′ MSL or below; then continue climb direct to 40°28′N, 93°09′W; then climb direct so as to cross 40°19′N, 93°42′W at 23,000′ MSL; then at 23,000′ MSL direct to the St. Joseph, Missouri VORTAC.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after passing 40°37′N, 92°43′W, turn left and climb to or maintain 3000′ MSL to 40°50′N, 92°49′W; then at 3000′ MSL direct to 40°45′N, 93°30′W; then at 3000′ MSL direct to 40°59′N, 94°35′W; then turn left descending to intercept the Oil Burner Route at 40°48′N, 94°44′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 42°10′N, 94°33′W to 40°37′N, 92°43′W. During daylight hours, some VFR operations will be flown 500 feet above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800 feet above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Hours of Operation—24 hours daily 7 days per week.

FLINT ROCK

MONTANA/NORTH DAKOTA

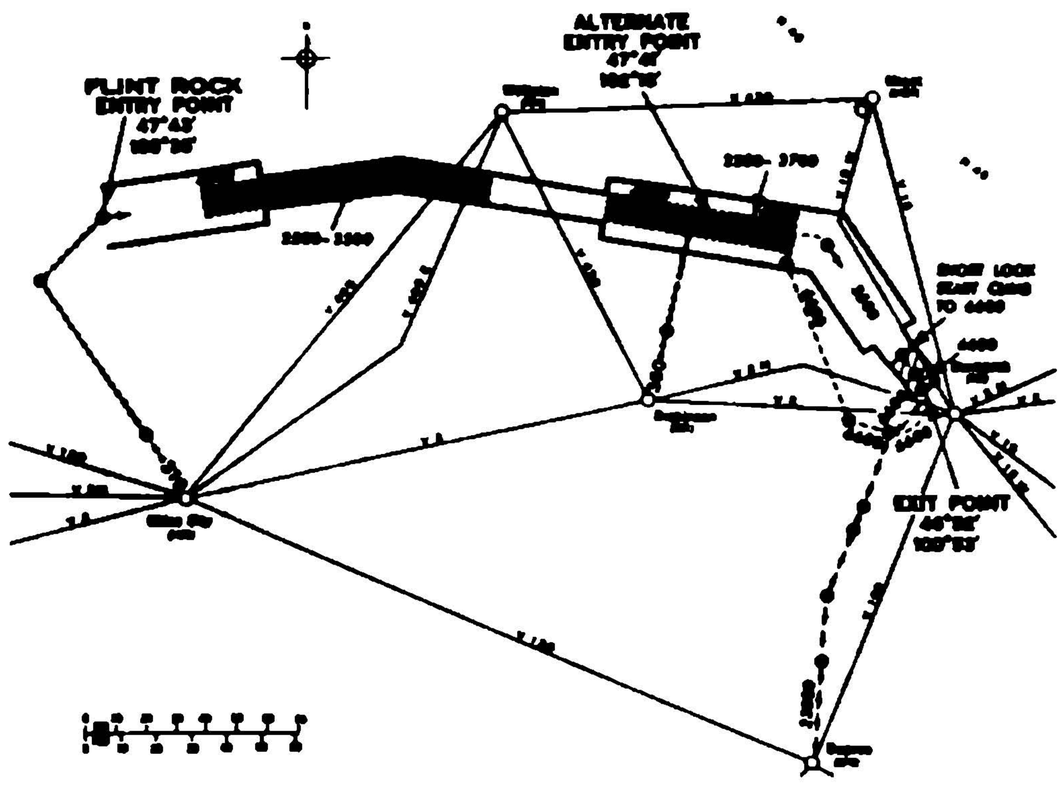
Effective June 14, 1964

Aircraft shall cross the Miles City, Mont. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC, and proceed via the 310° radial, maintaining 23,000′ or as assigned, to 46°40′N, 106°14′W; then descend to cross 47°24′N, 107°00′W at or above 6000′ MSL; then continue descent so as to cross the route entry point, 47°43′N, 106°35′W, at 4000′ MSL; then at 4000′ MSL direct 47°57′N, 104°30′W; then at 4000′ MSL direct 47°35′N, 101°31′W; then descend to 3500′ MSL direct 47°02′N, 101°02′W.

Short Look—After passing 47°02′N, 101°02′W aircraft shall climb so as to cross 46°56′N, 100°56′W at 6600′ MSL; then at 6600′ MSL direct to the exit point 46°52′N, 100°53′W (bomb run corridor 5 SM either side of centerline from 47°02′N, 101°02′W to the exit point 46°52′N, 100°53′W); then maintaining 6600′ MSL turn right direct 46°39′N, 101°07′W; then start climb to 23,000′ MSL direct to 45°53′N, 101°35′W; direct to Dupree VORTAC, climbing so as to cross 46°19′N, 101°19′W at or above 11,000′ MSL, crossing 46°13′N, 101°23′W at or below 19,000′ MSL; crossing 45°53′N, 101°35′W at 21,000′ MSL, and to reach 23,000′ MSL at a point 30 nautical miles northeast of the Dupree VORTAC.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an adltional Short Look bomb run shall, after passing 46°52′N, 100°53′W maintain 6600′ MSL direct 46°39′N, 101°07′W: then at 6600′ MSL make a right turn direct to 46°43′N, 101°24′W: then at 6600′ MSL direct 47°30′N, 101°49′W: then a right decending turn so as to reenter the route at 47°-35′N, 101°31′W at 3500′ MSL, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°48′N, 105°53′W to 47°53′N, 103°53′W and from 47°47′N, 103°03′W to 47°37′N, 101°45′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.



Alternate Entry—Aircraft shall cross the Dickinson, No. Dakota VORTAC (reporting point) at 15,000′ MSL, or as assigned by ARTCC; then proceed via the 360° radial of Dickinson VORTAC at 15,000′ MSL, or assigned flight level/altitude, direct to a point 20 NM north of the Dickinson VORTAC; then descend so as to cross 47°42′-30′′N, 102°27′W at 6000′ MSL; then a descending right turn so as to cross 47°41′N, 102°18′W at 4000′ MSL, thence via the published route.

Route Width—The route width is reduced to 5 SM on either side of centerline from 47°50′N, 105°30′W to 47°-47′N, 103°03′W and from 47°07′N, 101°06′W to 46°52′N, 100°53′W.

Hours of Operation—0000Z to 2400Z, 7 days weekly.

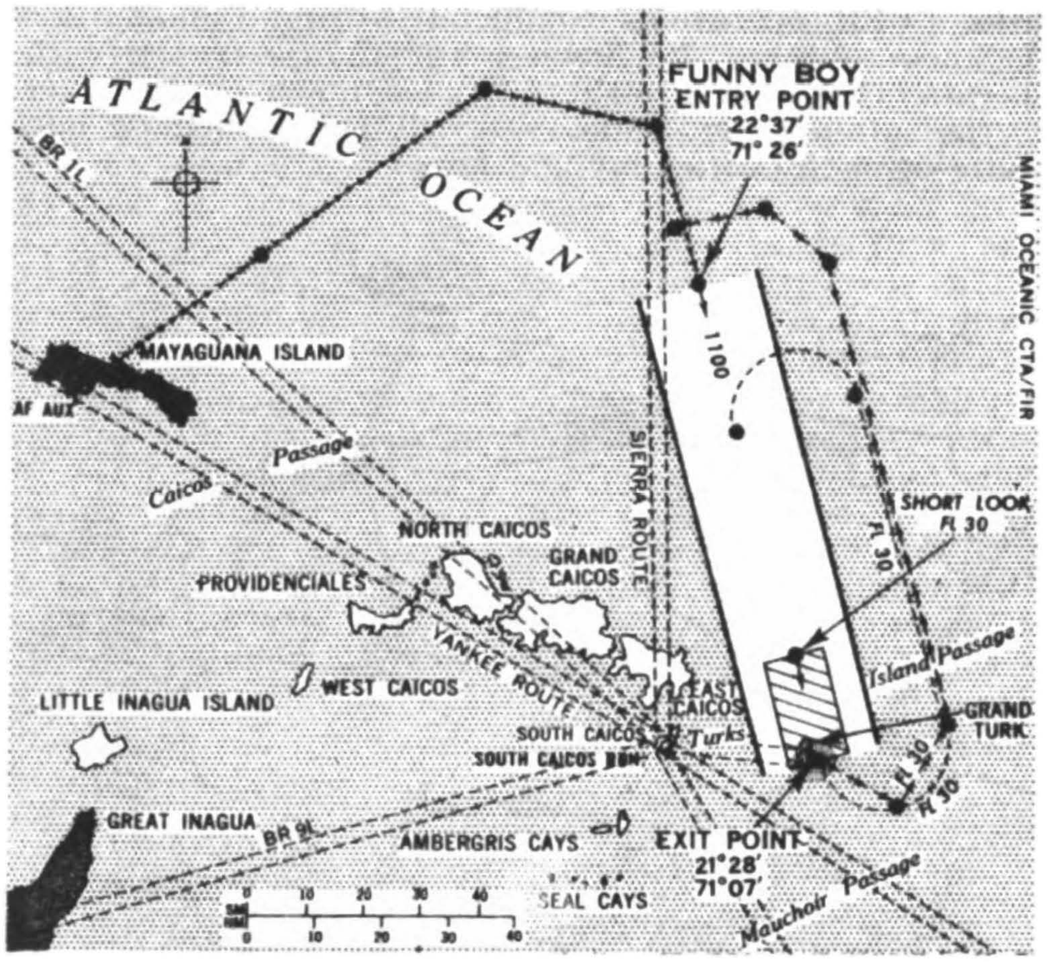
FUNNY BOY

Effective December 1, 1963

Aircraft shall cross 22°23′N, 73°02′W (Mayaguana AFB) at FL 270 or as assigned; maintain FL 270 or as assigned 22°41′N, 72°35′W (reporting point); start descent, cross 23°05′N, 72°00′W at FL 150; right turn, cross 23°00′N, 71°33′W at FL 90 or below; cross 22°37′N, 71°26′W at 1100′ MSL; the route entry point, maintain 1100′ MSL direct 21°43′N, 71°11′W.

Short Look—After passing 21°43′N, 71°11′W aircraft shall climb to FL 30 and maintain FL 30 through the bomb run corridor (5 SM either side of centerline from 21°43′N, 71°11′W to 21°28′N, 71°07′W). After exiting the low level route at 21°28′N, 71°07′W, maintain FL 30, direct 21°21′N, 70°54′W; direct 21°33′N, 70°47′W; start climb cross 22°40′N, 71°06′W at FL 250 or above; left turn to 22°48′N, 71°16′W; cross 22°45′N, 71°30′W at FL 290 or as assigned.

Re-Entry—After completing the initial bomb run, aircraft scheduled to execute an additional bomb run shall, after exiting the low level route at 21°28′N, 71°07′W; maintain FL 30; direct 21°21′N, 70°54′W; direct 21°-33′N, 70°47′W; direct 22°21′N, 71°01′W; left turn descend to cross 22°16′N, 71°20′W at 1100′ MSL; thence via "Funny Boy" route.



Hours of Operation—0000Z to 2359Z Monday through Saturday.

GOLDEN HOUR

GEORGIA/SOUTH CAROLINA

Effective July 1, 1964

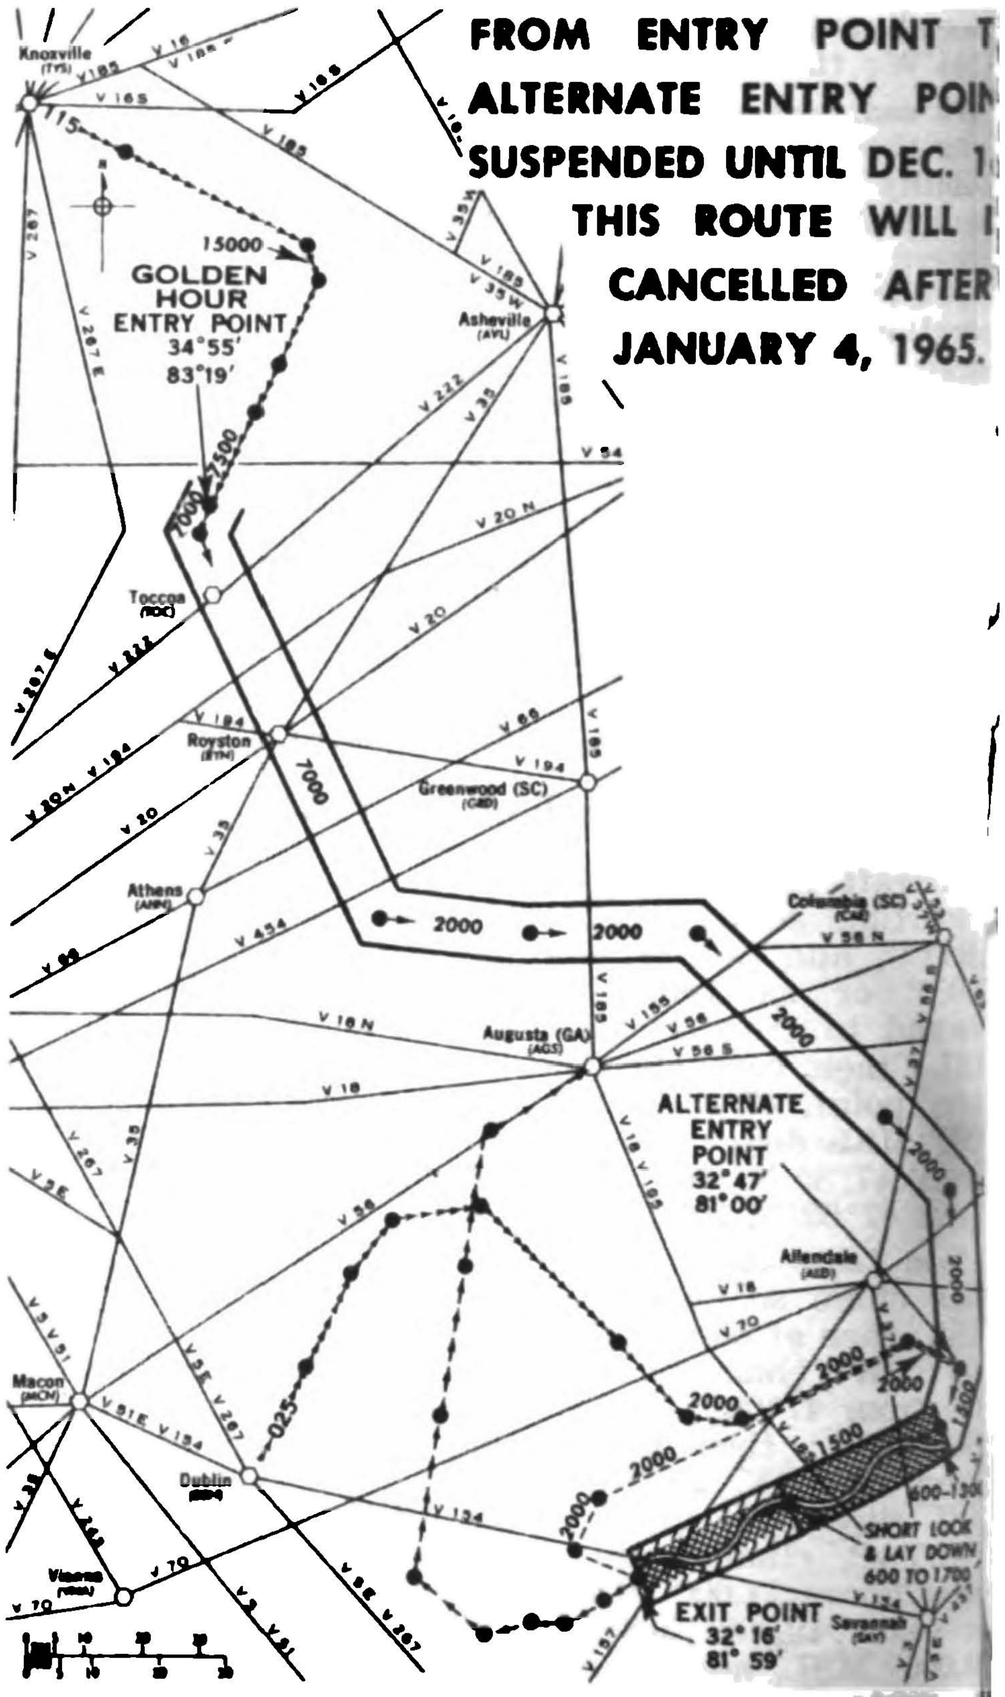
Aircraft shall cross the Knoxville, Tennessee VORTAC at FL 250 or as assigned; maintain assigned flight level via Knoxville VORTAC 115° radial until 16 miles southeast; start descent, cross 35°34′N, 83°02′W at 15,000′ MSL; right turn, direct 35°29′N, 83°00′W; cross 35°16′N, 83°07′W at 9000′; cross 35°09′N, 83°11′W at 7500′; maintain 7500′, enter low level route at 34°55′N, 83°19′W; descend, cross 34°51′N, 83°21′W at 7000′, maintain 7000′ direct 33°54′N, 82°47′W; left turn, descend to cross 33°-52′N, 82°20′W at 2000′, maintain 2000′ direct 33°52′N, 81°50′W; direct 33°25′N, 81°16′W; direct 33°14′N, 81°-02′W; direct 32°47′N, 81°00′W; right turn descend cross 32°38′N, 81°04′W at 1500′ MSL direct 32°27′N, 81°32′W.

Short Look and Laydown—After passing 32°27′N, 81°32′W aircraft shall maintain between 600′ and 1700′ MSL through bomb run corridor (5 SM either side of center line from 32°27′N, 81°32′W to 32°16′N, 81°59′W). The minimum IFR altitude thru the bomb run corridor shall be 1500′ MSL. After exiting the route at 32°16′N, 81°-59′W, aircraft shall climb and cross 32°13′N, 82°05′W at 2000′ MSL then climb and cross 32°10′N 82°12′W at 3000′ MSL, then climb and cross 32°10′N, 82°18′W at 6000′ MSL then climb and cross 32°08′N, 82°26′W at 7000′ MSL; cross 32°17′N, 82°39′W at 11,000′ MSL; right turn, cross 32°40′N, 82°35′W at 13,000′ MSL; cross 33°02′N, 82°31′W at 20,000′ MSL; cross 33°22′N, 82°-27′W at FL 250 or as assigned; maintain FL 250 or as assigned direct Augusta, Ga. VOR.

Re-Entry—Aircraft scheduled to execute an additiona bomb run shall, after exiting the low level route a 32°16′N 81°59′W aircraft shall climb to cross 32°20′ 82°10′W at 2000′ MSL; maintain 2000′ MSL right tur to 32°28′N, 82°06′W; direct 32°51′N, 81°11W right tur to intercept the Golden Hour Route at 32°47′N, 81°00′W

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility five miles, the pilot may descend VFR and ope ate between the VFR altitudes indicated on the cha between the following points: from 32°38N, 81°04′W 32°16′N, 81°59′W. During daylight hours some VF operations will be flown 500′ above the immediate te rain. VFR operations conducted during the hours darkness will not be flown lower than 800′ above th terrain. The lower VFR altitude shown on the cha is the minimum altitude that will be reached on ea route segment during daylight hours.

ENTRY TRACK AND ROU FROM ENTRY POINT T ALTERNATE ENTRY POIN SUSPENDED UNTIL DEC. 1 THIS ROUTE WILL B CANCELLED AFTER JANUARY 4, 1965.



Alternate Entry—Aircraft shall cross the Dublin, Ga VOR (32°31′05″N, 83°08′W) at FL 260 or as assigned start descent via Dublin VOR 025 degree radial: cros 32°47′N, 82°59′W at 23,000′ MSL; cross 33°01′N, 82° 51′W at 18,000′ MSL; cross 33°09′N, 82°44′W at 15,000 MSL; right turn cross 33°11′N, 82°28′W at 13,000′ MSL right turn, cross 32°51′N, 82°03′W at 5000′ MSL cros 32°40′N, 81°50′W at 2000′ MSL maintain 2000′ MSL lef turn to 32°39′N, 81°40′W direct 32°51′N, 81°11′W righ

turn to intercept the Golden Hour Route at 32°47′N, 81°00′W.

Route Width—The entire low level route width is reduced to 5 statute miles either side of centerline.

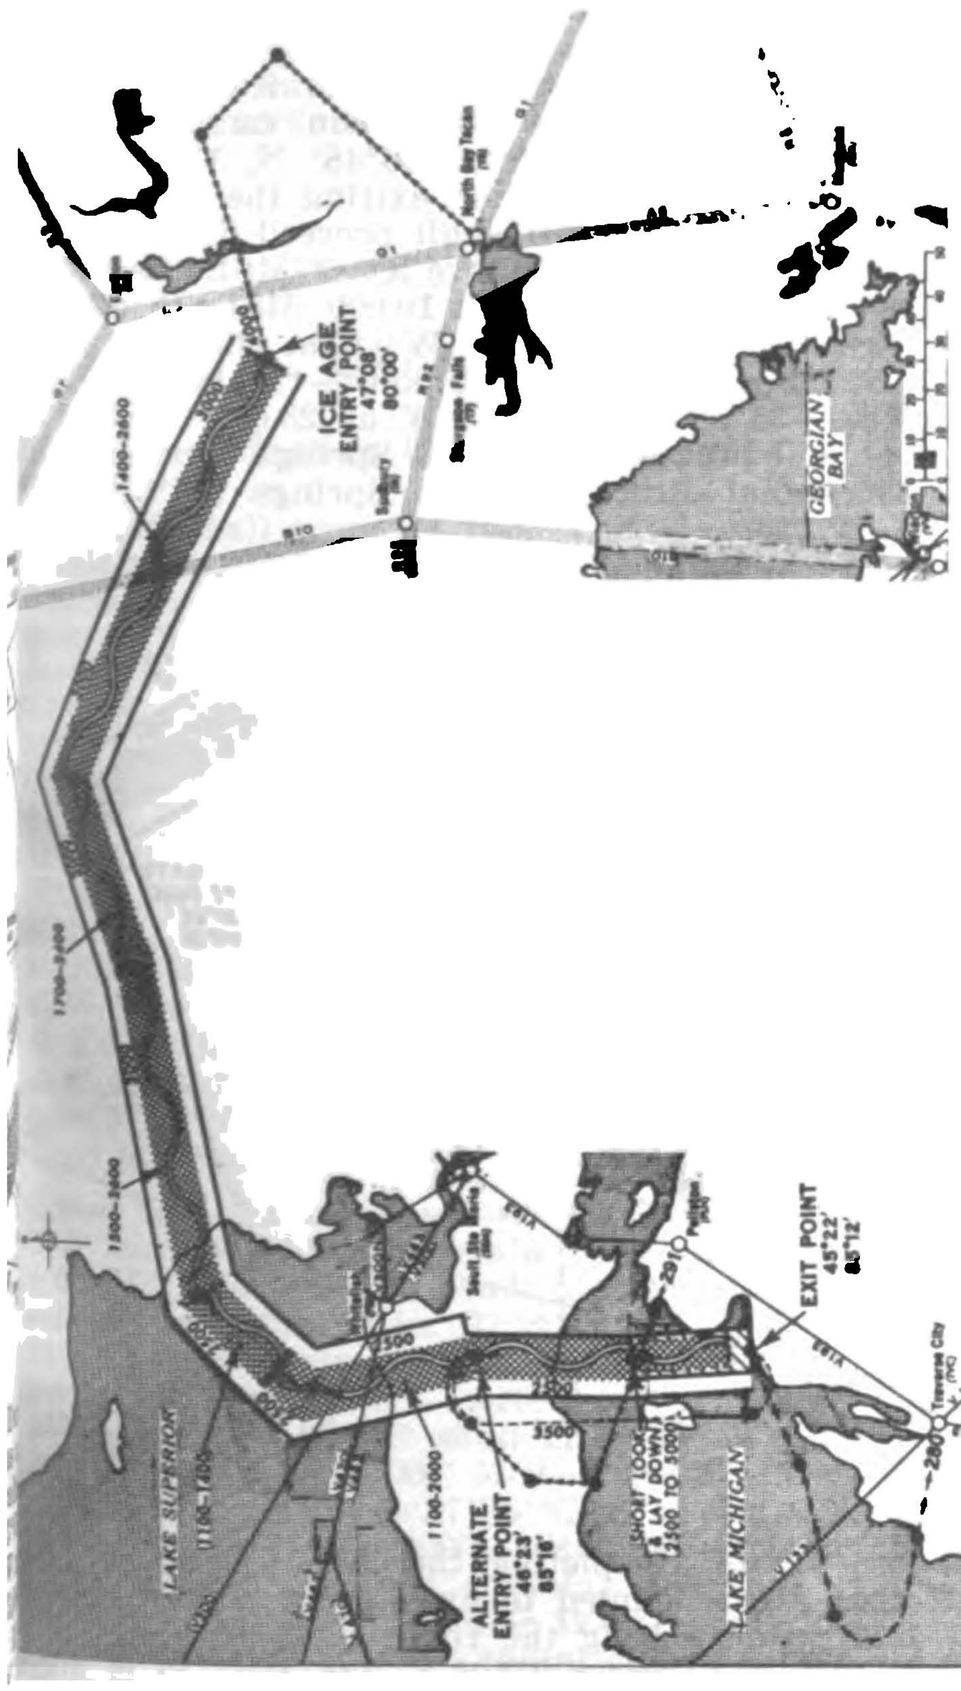
Hours of Operation—Primary Entry, 1900Z to 1300Z Monday thru Sunday; Alternate Entry, 0000Z to 2359Z, Monday thru Sunday.

MICHIGAN/ONTARIO, CAN.

ICE AGE

Effective September 6, 1964

Start descent over North Bay Ont. TACAN from FL 250 or as otherwise assigned to 17,000′ MSL direct 47°-04′N, 78°25′W, descend to 10,000′ MSL direct to 47°22′N, 78°49′W, descend to 4000′ MSL direct to 47°15′N, 79°-25′W, maintain 4000′ MSL direct to low level entry point at 47°08′N, 80°00′W (aircraft shall maintain an altitude below 3500′ AGL on the low level route while in Canadian airspace), descend so as to cross 47°22′N, 80°35′W at 3000′ MSL, then maintain 3000′ MSL direct 47°58′N, 82°15′W, then at 3000′ MSL direct to 47°40′N, 83°16′W, then at 3000′ MSL direct 47°23′N, 85°00′W, then descend direct 47°06′N, 85°22′W at 2500′ MSL (termination of Canadian portion of route). Aircraft shall enter the U.S.A. at 47°06′N, 85°22′W at 2500′ MSL, direct 47°00′N, 85°30′W at 2500′ MSL, direct 46°23′N, 85°16′W at 2500′ MSL, direct 45°48′N, 85°15′W at 2500′ MSL.



Short Look and Lay Down—After passing 45°48′N, 85°-15′W aircraft shall maintain between 2500′ MSL and 5000′ MSL through the bomb run corridor (5 SM either side of centerline from 45°48′N, 85°15′W to 45°22′N, 85°12′W. The minimum IFR altitude through the bomb run corridor is 2500′ MSL); after passing 45°22′N, 85°-12′W then turn right climbing so as to cross 45°10′N, 85°47′W at 10,000′ MSL; then climb direct so as to cross 45°01′N, 86°33′W at 12,000′ MSL. Turn left to intercept 280° radial of the Traverse City VOR climbing so as to cross Traverse City VOR 280/25 at 21,000′ MSL. Continue climbing via the Traverse City VOR 280° radial so as to cross the Traverse City VOR at FL 250.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 45°22′N, 85°12′W turn right climbing so as to cross 45°21′N, 85°32′W at 3,500′ MSL, then at 3,500′ MSL direct to 46°23′N, 85°-37′W; then turn right descending so as to cross 46°23′N, 85°16′W at 2500′ MSL; thence via the "Ice Age" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°08′N, 80°00′W to 45°27′N, 85°13′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mich. VOR at 20,000′ MSL, or as assigned by ARTCC; then proceed via the 291° radial of the Pellston VOR at 20,000′ MSL or assigned altitude until crossing the Pellston VOR 291/15; then descend direct so as to cross 45°55′N, 85°55′W at 8000′ MSL; then continuing descent turn right direct so as to cross 46°09′30″N, 85°55′W at or below 4000′ MSL; then continue descent so as to cross 46°23′N, 85°37′W at 2500′ MSL, then at 2500′ MSL turn right to 46°23′N, 85°16′W; thence via the "Ice Age" route.

Route Width—The route width is reduced to 5 statute miles east of centerline from 46°23′N, 85°16′W to 45°-22′N, 85°12′W.

Hours of Operation—0000Z to 2400Z, 7 days a week.

NEVADA

LITTLE SATIN

Effective May 3, 1964

Aircraft shall cross 41°40′N, 115°49′W (Elko VOR-TAC 340°/55 NM DME fix) (reporting point) at 23,000′ MSL or as assigned by ARTCC; then descend direct to cross the route entry point, 40°59′N, 116°30′W (Battle Mountain VOR 019°/31) at 14,000′ MSL, then 14,000′ MSL direct 40°10′N, 116°17′W; then descend to 13,000′ MSL direct 39°42′N, 116°10′W, then 13,000′ MSL direct 38°57′N, 116°26′W, then 13,000′ MSL direct 38°34′N, 116°40′W, then 13,000′ MSL direct 38°31′N, 118°12′W.

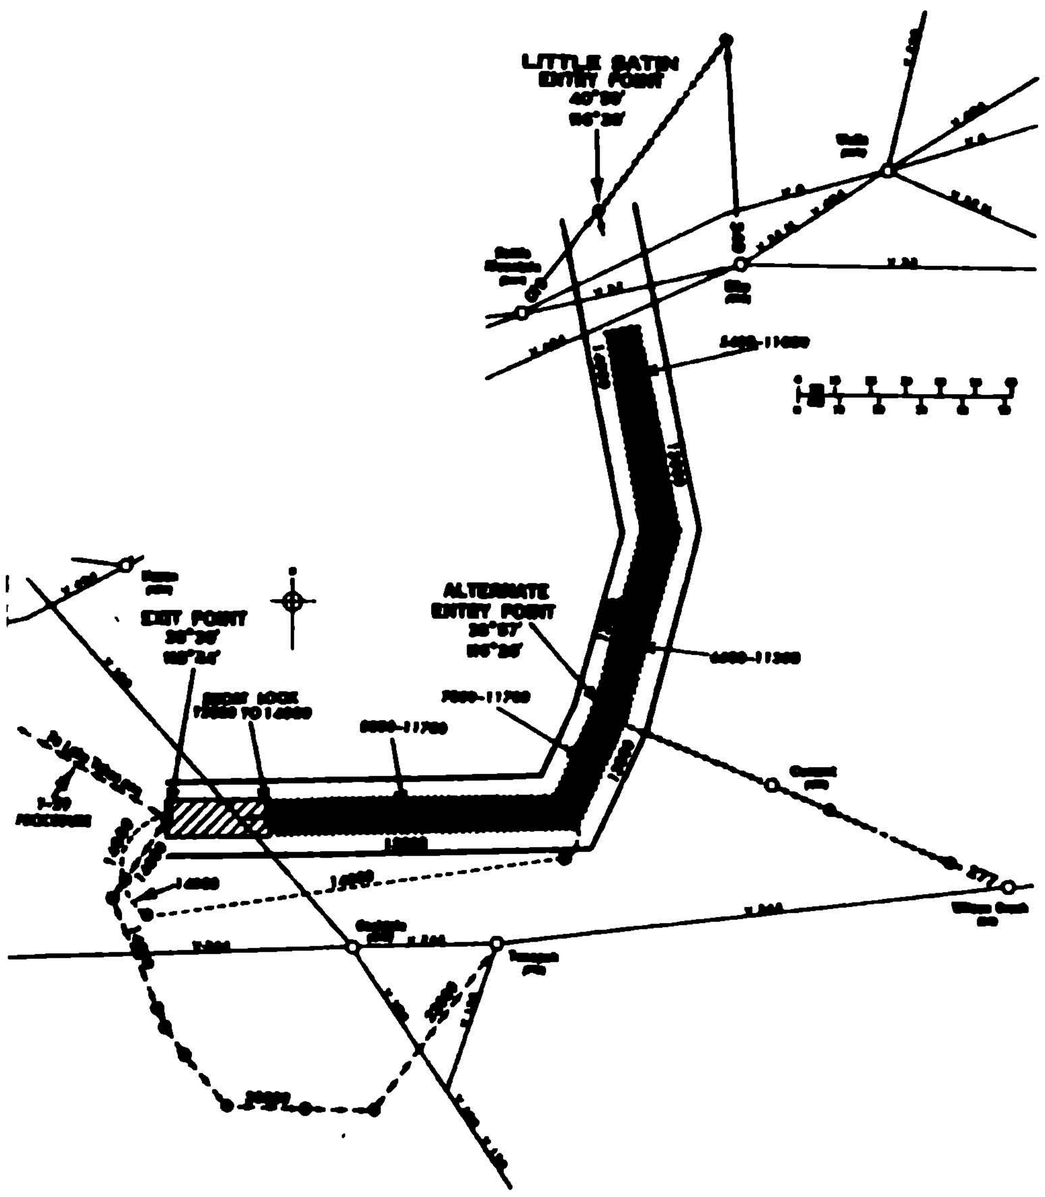
Short Look—After passing 38°31′N, 118°12′W aircraft shall operate between a maximum altitude of 14,000′ 38°57′N, 116°26′W, then 13,000′ MSL direct 38°34′N, bomb run corridor (5 SM either side of centerline from 38°31′N, 118°12′W to 38°30′N, 118°44′W). After exiting

the route at 38°30′N, 118°44′W aircraft shall maintain 14,000′ MSL direct 38°10′N, 119°00′W, then 14,000′ MSL direct 37°43′N, 118°46′W (reporting point "Little Satin 2"); then climb direct to cross 37°40′N, 118°43′W at or above 14,300′ MSL and 37°33′N, 118°37′W at or above 15,000′ MSL; then climb to 20,000′ MSL direct 37°21′N, 118°25′W, then 20,000′ MSL direct to 37°21′N, 118°-00′W (reporting point "Little Satin 3"); then climb direct to cross 37°21′N, 117°40′W at 23,000′ MSL, then 23,000′ MSL direct to Tonopah, Nev. VOR.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°30′N, 118°44′W, maintain 14,000′ MSL direct 38°15′N, 118°57′W, then 14,000′ direct 38°06′N, 118°50′W (reporting point "Little Satin 1"), then 14,000′ MSL direct 38°23′N, 116°40′W; then descend to 13,000′ MSL direct to re-enter the route at 38°34′N, 116°40′W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′ visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 40°30′N, 116°22′W to 38°31′N, 118°12′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Wilson Creek, Nev. VOR (reporting point) at 23,000′ MSL or as assigned by ARTCC, then maintain assigned flight level via the Wilson Creek VOR 277° radial until 15 NM northwest of the Wilson Creek VOR (38°21′N, 114°41′W); then descend direct to cross 38°34′N, 115°18′W at or below 15,000′ MSL; then descend direct via the Currant, Nev. VOR to cross 38°57′N, 116°26′W at 13,000′ MSL, thence via the published route.



T–29 Procedure—Aircraft shall cross Wilson Creek Nevada, VOR (38°15′N, 114°23′W) (reporting point) a assigned by the ARTCC; then proceed via alternate entr route to 38°30′N, 118°44′W exit point of the bomb ru corridor; then climb to 14,000′ MSL or as assigned b the ARTCC direct Lake Tahoe, California, VOR (39°11 N, 120°16′W).

Hours of Operation—24 hours daily, 7 days a week.

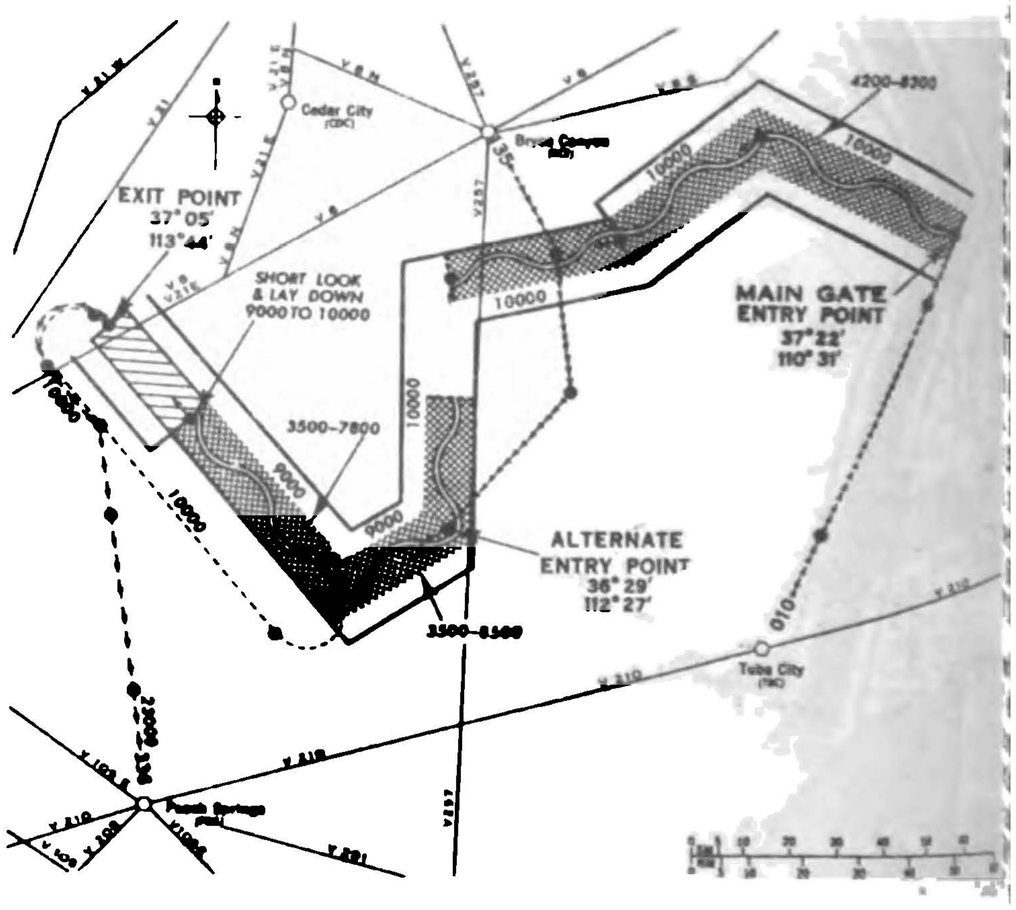
ARIZONA/UTAH

MAIN GATE

Effective May 17, 1964

Aircraft shall cross the Tuba City, Arizona VOR (36 07′30″ N, 111°16′ W) (reporting point) at 23,000′ MS or as assigned by ARTCC; then maintain assigned altitude via Tuba City 010 radial until 23 nautical mil north (36°28′ N, 111°04′ W); then descend direct t cross 37°10′ N, 110°39′ W at or above 12,000′ MSI then direct to cross 37°22′ N, 110°31′ W at 10,000′ MS (entry point of the low level route) then 10,000′ MS direct 37°41′N, 111°17′; then 10,000′ MSL direct 37 22′ N, 111°48′ W; then 10,000′ MSL direct 37°15′ N 112°27′ W; then 10,000′ MSL direct 36°29′ N, 112°2 W; then descend direct to cross 36°17′ N, 112°51′ W a 9,000′ MSL; then 9,000′ MSL direct 36°48′ N, 113°2 9000′ MSL; then 9000′ MSL direct 36°48′N, 113°25′W

Short Look and Lay Down—After passing 36°48′ N, 113° 25′W, aircraft shall operate between 9,000′ MSL an 10,000′ MSL through the bomb run corridor (5 SI either side of centerline from 36°48′ N, 113°25′ W t 37°05′ N, 113°44′ W). After exiting the route at 37 05′ N, 113°44′ W, aircraft shall proceed direct to cro 37°06′ N, 113°47′ W at or above 9,200′ MSL; then dire to cross 36°57′ N, 113°57′ W at 10,000′ MSL; then 10,00 MSL direct 36°46′ N, 113°45′ W; then climb via dire 36°30′ N, 113°42′ W (reporting point—"Main Gate 1") s as to cross 35°58′ N, 113°36′ W at 23,000′ MSL; the intercept and proceed via Peach Springs, Arizona VOI TAC 336 radial direct to Peach Springs (35°37′30″ N 113°32′ W).



Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bom run shall after exiting the route at 37°05′N, 113°44′W proceed direct to cross 37°06′N, 113°47′W at or abov 9200′ MSL; then direct to cross 36°57′N, 113°57′W a

10,000' MSL; then 10,000' MSL direct 36°09'N, 113°05'W; then descend direct to cross 36°17'N, 112°51'W at 9000' MSL; then via published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visbility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 37°22'N, 110°31'W to 37°15'N, 112°27'W and from 36°52'N, 112°27'W to 36°48'N, 113°25'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft cross the Bryce Canyon, Utah VOR (37°41'30"N, 112°18'W) (reporting point) at 23,000' MSL or as assigned by ARTCC; then proceed direct via Bryce Canyon 135 radial until 25 NM southeast (37°19'N, 112°02'W); then descend direct to cross 36°54'N, 112°-00'W at 14,000' MSL; then direct to cross 36°29'N, 112°-27'W at 10,000' MSL; thence via published route.

Hours of Operation—Twenty-four hours per day, seven days a week.

Route Width—The route width is reduced to 5 statute miles on the north side of course from 37°22'N, 111°48'W to 37°15'N, 112°27'W; 5 statute miles east side of course from 37°15'N, 112°27'W to 36°29'N, 112°27'W and 5 statute miles southwest of course from 36°17'N, 112°51'W to 36°48'N, 113°25'W.

KENTUCKY/TENNESSEE

ORANGE TREE

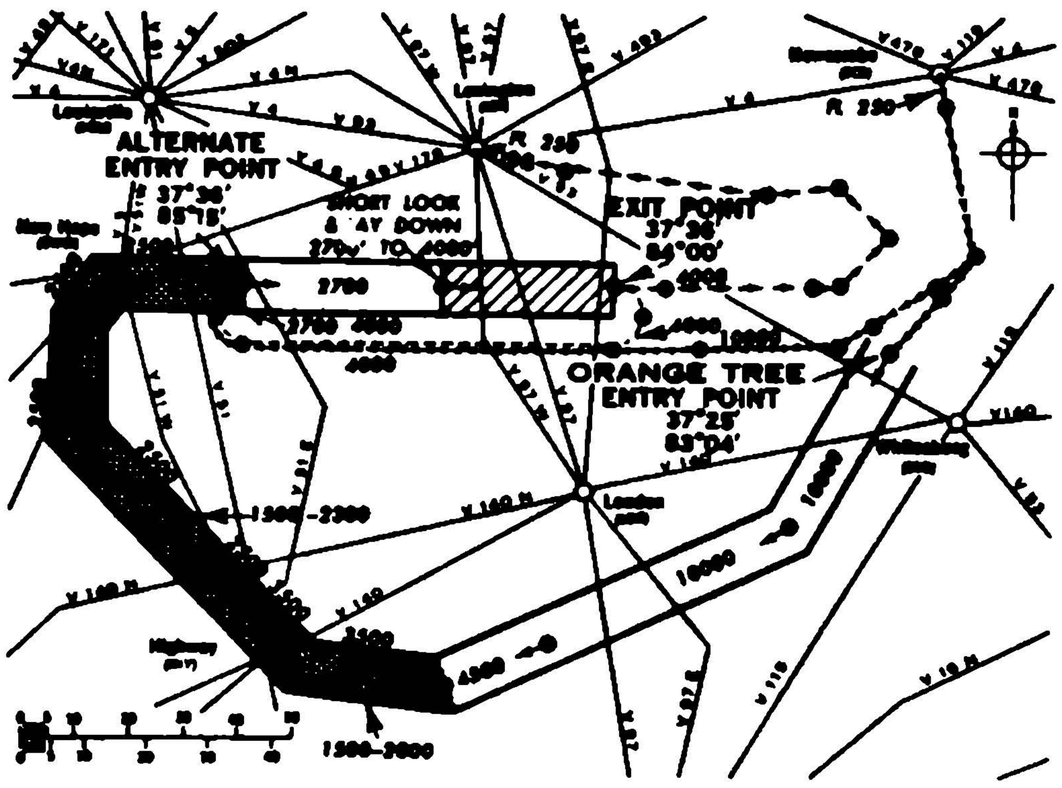
Effective November 1, 1964

Aircraft shall cross the Newcomb, Ky. VOR at FL 250; maintain FL 250 direct 38°05'N, 82°53'W; then start descend so as to cross 37°41'N, 82°48'W at 17,000' MSL; cross 37°34'N, 82°55'W at 14,000' MSL; then continue descent so as to cross 37°41'N, 82°48'W at 17,000' MSL; 83°04'W at 10,000' MSL, then at 10,000' MSL direct 36°-57'N, 83°25'W, then at 10,000' MSL direct 36°38'N, 84°13'W; then start descent so as to cross 36°31'N, 84°33'W at 4500' MSL; then descend so as to cross 36°-31'N, 84°36'W at 3500' MSL, then at 3500' MSL direct 36°34'N, 85°03'W, then at 3500' MSL direct 36°46'N, 85°16'W; then descend so as to cross 36°51'N, 85°22'W at 2500' MSL, then at 2500' MSL direct 37°11'N, 85°-47'W, then at 2500' MSL direct 37°30'N, 85°46'W, then at 2500' MSL turn right to 37°35'N, 85°42'W, then at 2500' MSL direct 37°36'N, 85°17'W; then climb so as to cross 37°36'N, 85°15'W at 2700' MSL, then at 2700' MSL direct to 37°36'N, 84°35'W.

Short Look and Lay Down—After passing 37°36'N, 84°-35'W aircraft shall maintain between 2700' MSL and 4000' MSL through the bomb run corridor (5 SM either side of centerline from 37°36'N, 84°35'W to 37°36'N, 84°00'W; the minimum IFR altitude thru the bomb run corridor is 2700' MSL). After exiting the route at 37°-36'N, 84°00'W aircraft shall cross 37°36'N, 83°50'W at 4000' MSL; then at 4000' MSL direct 37°36'N, 83°20'W; then start climb direct 37°36'N, 83°15'W; cross 37°44'N, 83°05'W at or below 9000' MSL; continue climb direct 37°52'N, 83°15'W; then climbing direct so as to cross 37°51'N, 83°30'W at or below 17,000' MSL; then via the Lexington VORTAC 098° radial climbing so as to cross 37°56'N, 84°11'W (Lexington VORTAC 098/14) at FL 250, then at FL 250 direct to Lexington VORTAC.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 37°36'N, 84°00'W, turn right so as to cross 37°31'N, 83°55'W at 4000' MSL, then at 4000' MSL continue right turn to 37°26'N, 84°-00'W, then at 4000' MSL direct 37°26'N, 85°15'W; then turn right descending so as to cross 37°31'N, 85°20'W at 2700' MSL, then at 2700' MSL continue right turn to 37°36'N, 85°15'W, thence via the "ORANGE TREE" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 36°31'N, 84°33'W to 37°36'N, 85°15'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.



Alternate Entry—Aircraft shall cross the Newcomb, Ky. VOR at FL 250, then at FL 250 direct 38°05'N, 82°53'W; then start descent so as to cross 37°41'N, 82°48'W at 17,000' MSL; cross 37°35'N, 82°56'W at 14,000' MSL; cross 37°29'N, 83°08'W at 10,000' MSL; then at 10,000' MSL direct 37°26'N, 83°15'W; direct 37°26'N, 83°42'W; then start descent so as to cross 37°26'N, 84°00'W at 4000' MSL; then at 4000' MSL direct to 37°26'N, 85°-15'W; then turn right descending so as to cross 37°31'N, 85°20'W at 2700' MSL; then at 2700' MSL direct to 37°36'N, 85°15'W; thence via the established route.

Route Width—The route width is reduced to 5 statute miles on either side of centerline throughout the entire route.

Hours of Operation—0000Z to 2400Z, 7 days weekly.

COLORADO/NEBRASKA/WYOMING

POOL SHARK

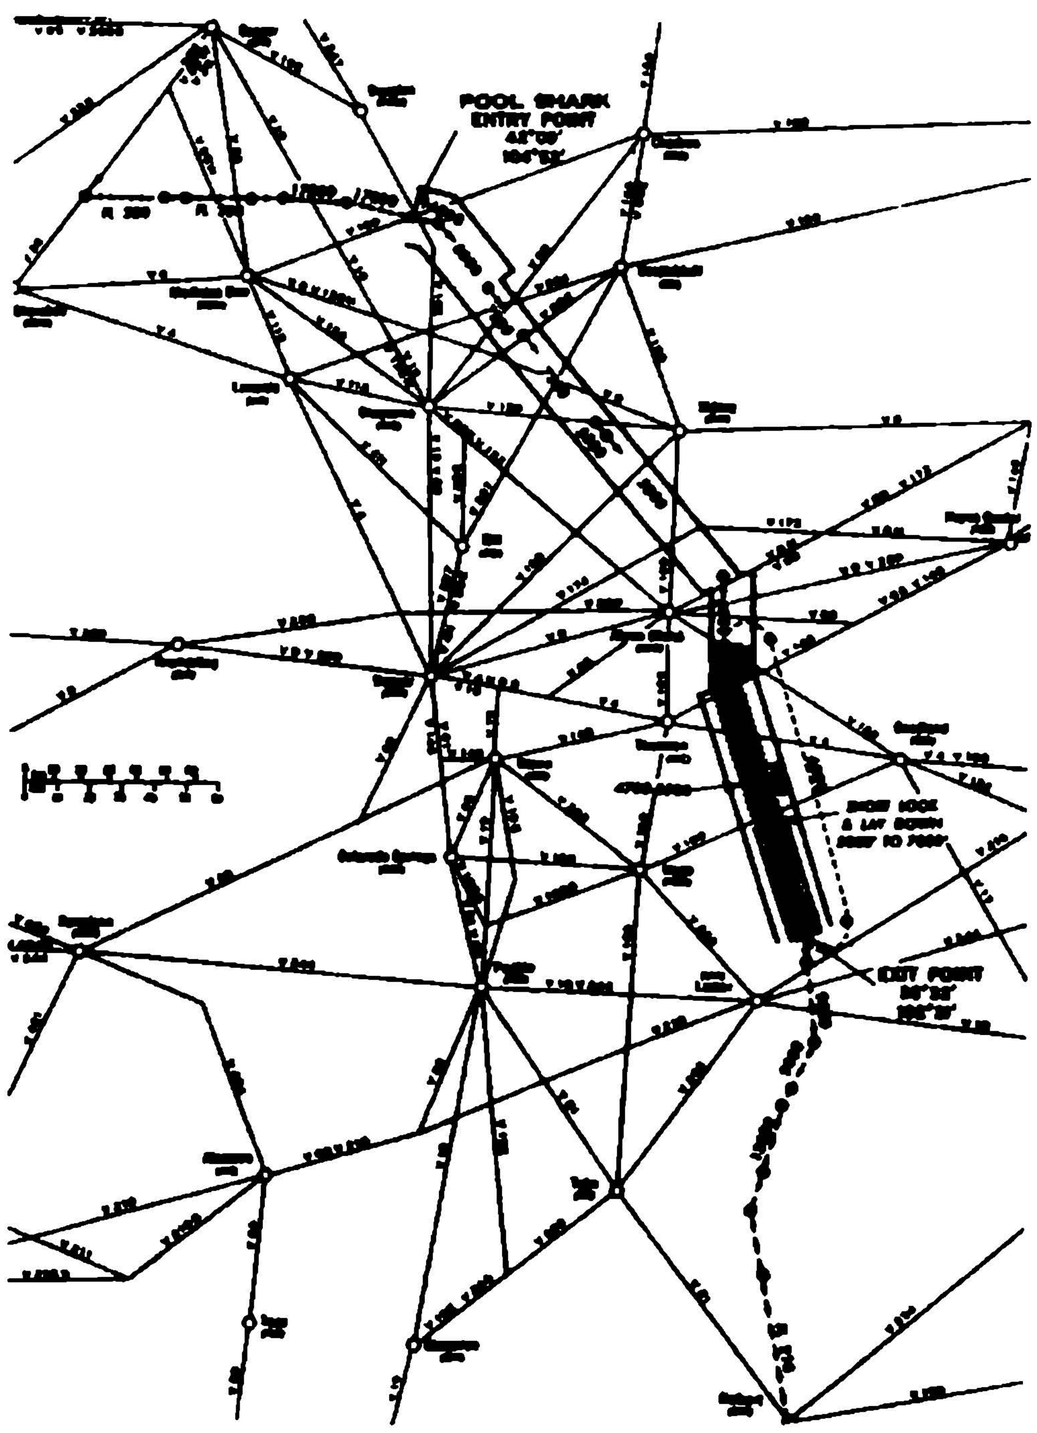
Effective January 4, 1965 through June 26, 1965

Aircraft shall cross 42°14'N, 107°07'W (Casper, Wyoming, VORTAC 201/63) at FL 220; then direct 42°14'N, 106°35'W; then descend direct to cross 42°14'N, 106°26'W at FL 200; then maintain FL 200 direct 42°-

14′N, 105°59′W; then descend direct to cross 42°14′N, 105°46′W at 17,000′ MSL; then maintain 17,000′ MSL direct 42°13′N, 105°20′W, then maintain 17,000′ MSL direct to the route entry point at 42°09′N, 104°53′W, then descend direct to cross 42°07′N, 104°42′W at 16,000′ MSL; then descend direct to cross 41°47′N, 104°22′W at 8000′ MSL; then descend direct to cross 41°33′N, 104°-08′W at 7300′ MSL; then direct 41°07′N, 103°39′W; then descend direct to cross 41°03′N, 103°35′W at 5800′ MSL; then 5800′ MSL direct 40°20′N, 102°49′W; then 5800′ MSL direct 39°47′N, 102°49′W; then 5800′ MSL direct 39°05′N, 102°33′W.

Short Look and Lay Down—After passing 39°05′N, 102°-33′W, aircraft shall maintain between 5800′ MSL and 7000′ MSL through the bomb run corridor (5 SM either side of centerline from 39°05′N, 102°33′W to 38°32′N, 102°21′W). After exiting the route at 38°32′N, 102°-21′W; aircraft shall climb direct to cross 38°24′N, 102°-20′W at 9000′ MSL; then maintain 9000′ MSL direct 37°59′N, 102°18′W; then 9000′ MSL direct 37°45′N, 102°27′W; then climb direct to cross 37°40′N, 102°31′W at 12,000′ MSL; then 12,000′ MSL direct 37°20′N, 102°-39′W; then climb direct to cross 37°09′N, 102°44′W at or above 16,000′ MSL; then climb direct to cross 36°-49′N, 102°40′W at FL 210; then maintain FL 210 direct to Dalhart, Texas, VORTAC.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°32′N, 102°21′W, turn left to cross 38°35′N, 102°04′W at 6000′ MSL; then 6000′ MSL direct to 40°00′N, 102°31′W; then turn left to cross 40°00′N, 102°49′W at 5800′ MSL, thence via the published route.



Alternate Entry—None.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart bewteen the following points 40°00′N, 102°49′W to 38°-32′N, 102°21′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Route Width—The route width is reduced to 5 SM on the NE side of the centerline from 41°47′N, 104°22′W to 40°20′N, 102°49′W, and to 5 SM on the west side of centerline from 40°20′N, 102°49′W to 39°47′N, 102°49′W.

Hours of Operation—24 hours daily, 7 days per week.

ARIZONA/NEW MEXICO

PRIMA DONNA

Effective October 5 thru December 23, 1964

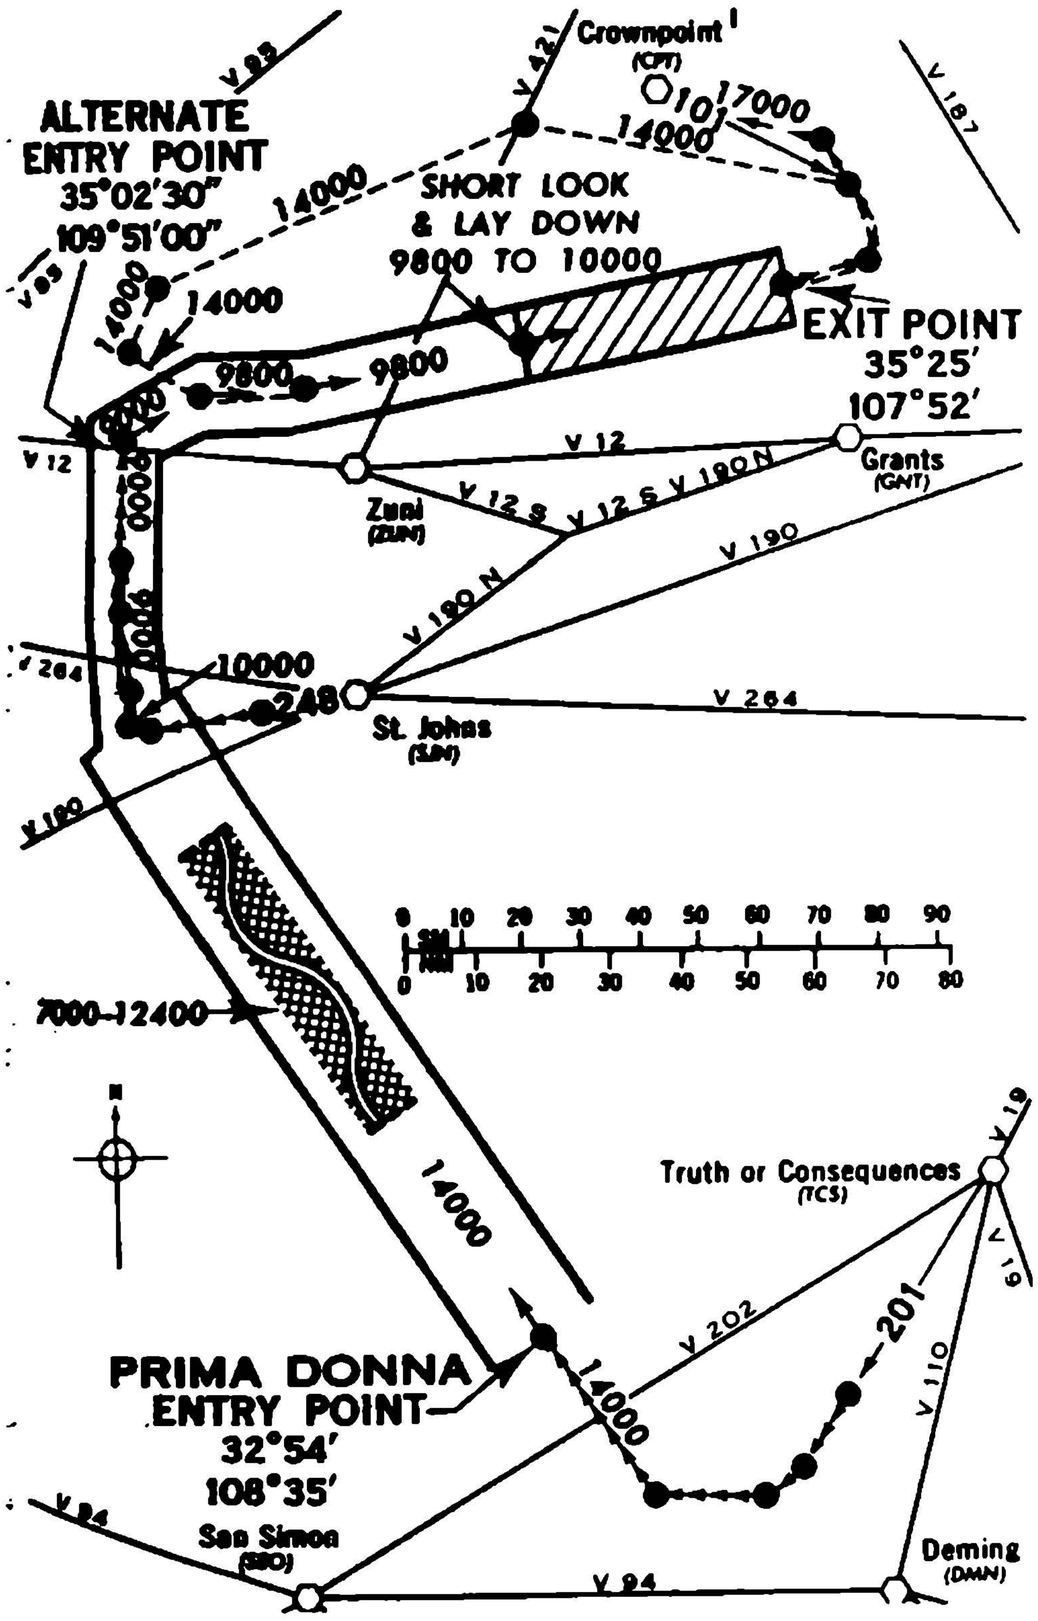
Aircraft shall cross the Truth or Consequences, N. Mex VORTAC 201° radial, 38 NM fix (32°45′N, 107°42′W) at FL 250 or as assigned by Albuquerque ARTC Center, descend southwestbound via the Truth or Consequences N. Mex. 201° radial to 32°35′N, 107°50′W, turn right to 32°31′N, 107°57′W direct to cross 32°31′N, 108°16′W at 14,000′ MSL; maintain 14,000′ MSL direct to 32°54′N 108°35′W, (Route entry point); maintain 14,000′ MSL direct to 34°22′N, 109°49′W; start descent to cross 34°-26′N, 109°49′W at or above 10,000′ MSL; direct to cross 34°38′N, 109°50′30″W at 9000′ MSL; maintain 9000′ MSL direct to 35°02′30″N, 109°51′W, turn right at 9000′ MSL to 35°09′30″N, 109°37′W; climb direct to cross 35°-10′N, 109°18′W at 9800′ MSL; maintain 9800′ MSL direct to 35°17′N, 108°38′W.

Short Look and Lay Down—After passing 35°17′N, 108°-38′W, aircraft shall maintain between 9800′ MSL and 10,000′ MSL through the bomb run corridor (5 SM either side of centerline from 35°17′N, 108°38′W to 35°25′N 107°52′W). After exiting the route at 35°25′N, 107°52′W aircraft shall climb direct to cross 35°28′N, 107°37′W at 11,000′ MSL; turn left climbing to intercept the Crownpoint, N. Mex. VOR 101° radial, then climb via the Crownpoint VOR 101° radial so as to cross 35°39′N 107°40′W at 15,000′ MSL; then climb direct so as to cross 35°42′N, 107°46′W at 17,000′ MSL; then at 17,000′ MSL direct to the Crownpoint VOR.

Re-Entry—After completing the initial short look bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 35°25′N, 107°-52′W, climb to 11,000′ MSL direct to 35°28′N, 107°37′W turn left climb to cross 35°39′N, 107°40′W, at 14,000′ MSL, maintain 14,000′ MSL direct to 35°48′N, 108°38′W 14,000′ MSL direct to 35°24′N, 109°45′W, turn left at 14,000′ MSL to 35°15′N, 109°50′W, turn left at 14,000′ MSL to 35°09′30″N, 109°37′W; descend direct to cross 35°10′N, 109°18′W at 9800′ MSL thence via published route.

VFR and Contour—If the encountered weather conditions along the route are equal or better than ceiling 9000′, visibility 5 miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 33°26′N, 109°01′W to 34°05′N, 109°34′W. During daylight hours, some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum that will be reached on each segment during daylight hours.

Alternate Entry—Aircraft shall cross the St. Johns, Arizona VORTAC at 15,000′ MSL or as assigned by Albuquerque ARTC Center, maintain assigned altitude via the St. Johns VORTAC 248° radial to the 13 NM DME fix; then descend via the St. Johns 248° radial to cross 34°21′30″N, 109°44′30″W at 10,000′ MSL; then at 10,000′ MSL turn right to 34°38′N, 109°50′30″W; then descend direct so as to cross 34°44′N, 109°51′W at 9000′ MSL; then at 9000′ MSL direct to 35°02′30″N, 109°51′W; thence via the published route.



Route Width—The route width from 34°22′N, 109°49′W to 35°25′N, 107°52′W is reduced to 5 SM on both sides of course.

Hours of Operation—1900Z to 1500Z, 7 days per week.

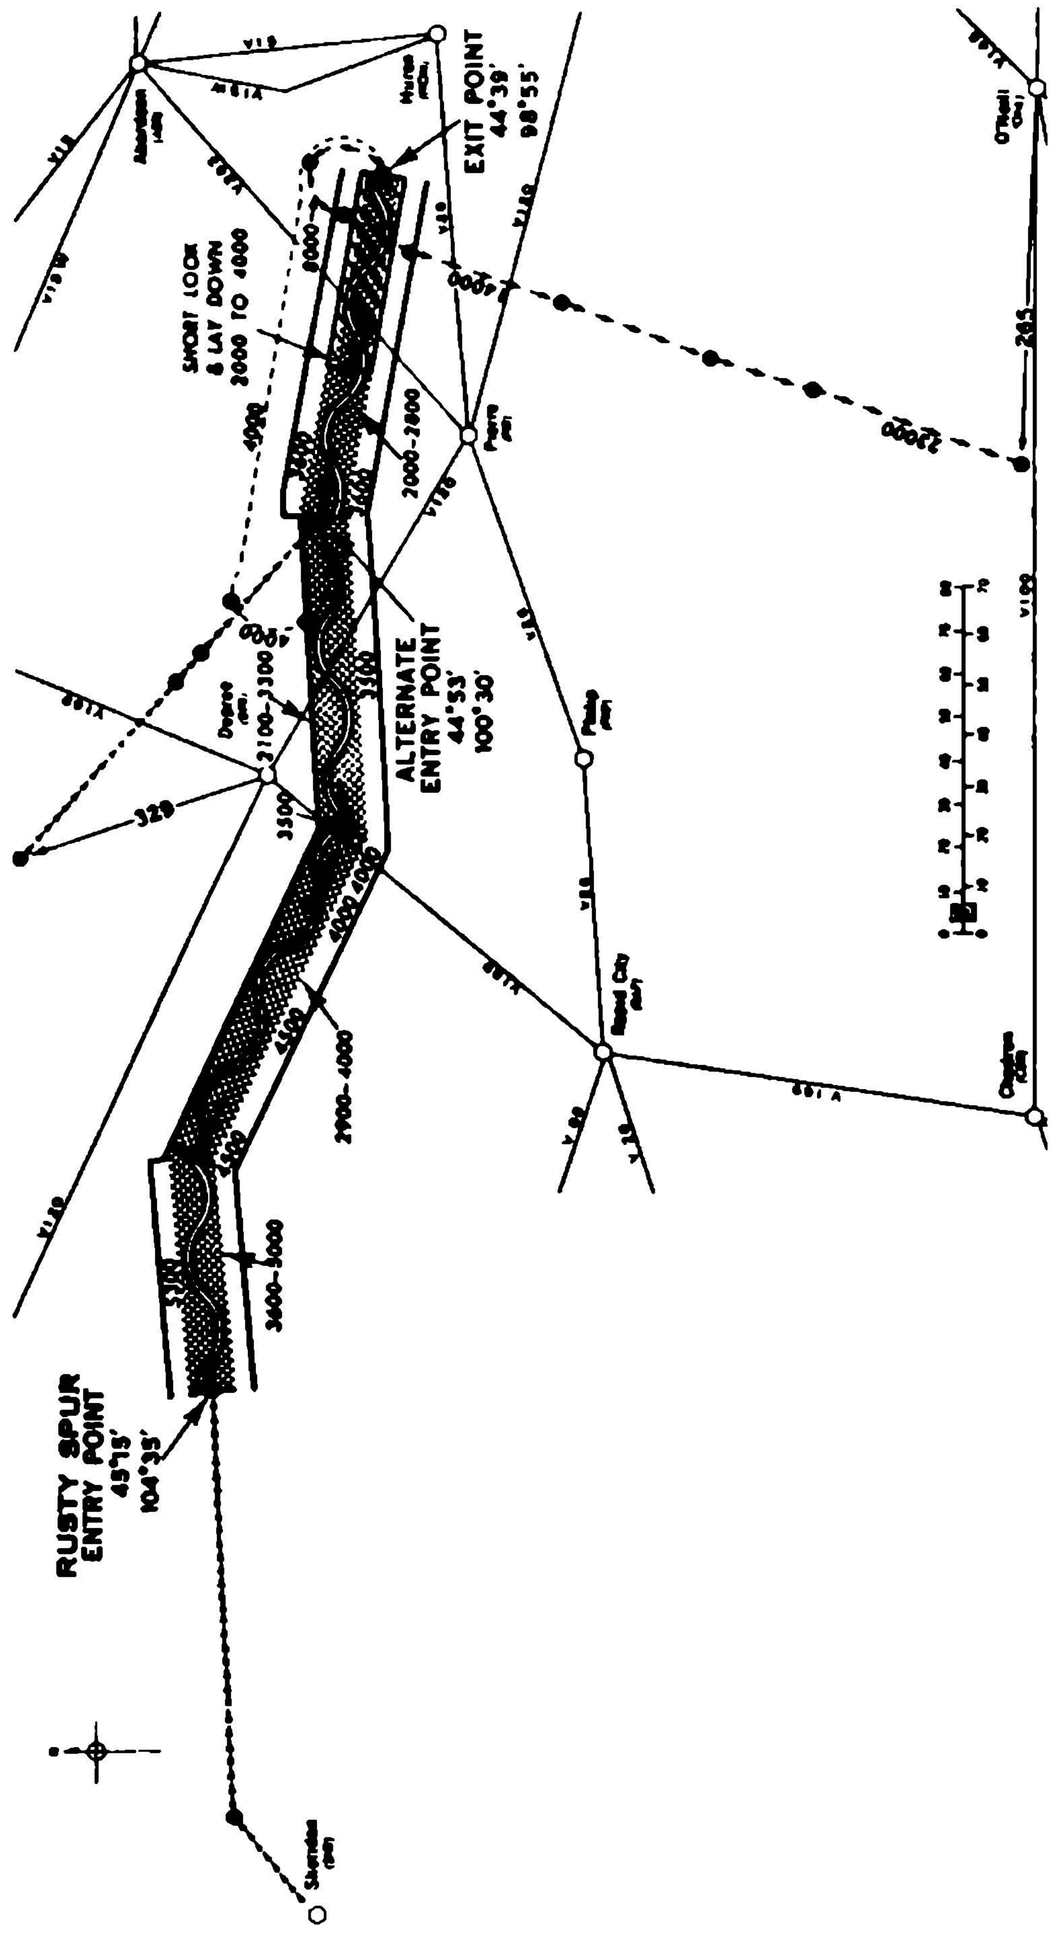
MONTANA/SOUTH DAKOTA

RUSTY SPUR

Effective October 18 thru December 23, 1964

Aircraft shall cross the Sheridan, Wyoming VORTAC at 23,000′ MSL or assigned by ARTCC; maintain 23,000′ MSL or assigned altitude direct to 45°08′N, 106°36′W; then start descent so as to cross the route entry point at 45°15′N, 104°35′W at 5300′ MSL; then at 5300′ MSL direct to 45°20′N, 103°30′W; then descend so as to cross 45°18′N, 103°23′W at 4500′ MSL; then at 4500′ MSL direct 44°57′N, 102°20′W; then descend direct so as to cross 44°55′N, 102°14′W at 4000′ MSL; then at 4000′ MSL direct to 44°50′N, 102°00′W; then descend direct so as to cross 44°50′N, 101°55′W at 3500′ MSL; then at 3500′ MSL direct to 44°53′N, 100°30′W; then climb so as to cross 44°53′N, 100°23′W at 3600′ MSL; then at 3600′ MSL direct to the entry point of the bomb run corridor at 44°47′N, 99°49′W.

Short Look and Lay Down—After passing 44°47′N, 99°49′W, aircraft shall maintain between 2000′ MSL and 4000′ MSL through the bomb run corridor (5 SM either side of centerline from 44°47′N, 99°49′W to 44°39′N, 98°55′W), the minimum IFR altitude through the bomb run corridor is 3600′ MSL. After exiting the route at 44°39′N, 98°55′W, aircraft shall turn left climbing so as to cross 44°52′N, 98°51′W at 8000′ MSL; then at 8000′ MSL continue left turn direct 44°47′N, 99°06′W; then start climb direct so as to cross 44°35′N, 99°17′W at 14,000′ MSL; then at 14,000′ MSL; direct 44°05′N,



99°33′W then start climb direct O'Neil, Nebraska VORTAC 265/74 (42°35′N, 100°21′W); crossing 43°36′N, 99°49′W at or above 20,000′ MSL; crossing 43°16′N, 100°00′W at 23,000′ MSL; then maintain 23,000′ MSL to O'Neil 265/74.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall after passing 44°39′N, 98°55′W turn left and climb to or maintain 4000′ MSL to 44°52′N, 98°51′W; then at 4000′ MSL direct to 45°11′N, 100°55′W; then at 4000′ MSL turn left to 44°57′N, 101°00′W; then at 4000′ MSL direct 44°53′N, 100°30′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 45°15′N, 104°35′W to 44°39′N, 98°55′W. During daylight hours, some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached during daylight hours.

Alternate Entry—Aircraft shall cross the Dupree, South Dakota VORTAC 329/53 (45°55′N, 102°06′W) at 20,000′ MSL or below as assigned by ARTCC; then descend direct so as to cross 45°23′N, 101°16′W at 16,000′ MSL; then descend so as to cross 45°18′N, 101°08′W at or above 14,000′ MSL; then descend direct so as to cross 44°53′N, 100°30′W at 3500′ MSL; thence via the published route.

Route Width—The route width is reduced to 5 SM on the north side of centerline from 45°20′N, 103°30′W to 44°53′N, 100°30′W.

Hours of Operation—24 hours daily, 7 days per week.

TEXAS

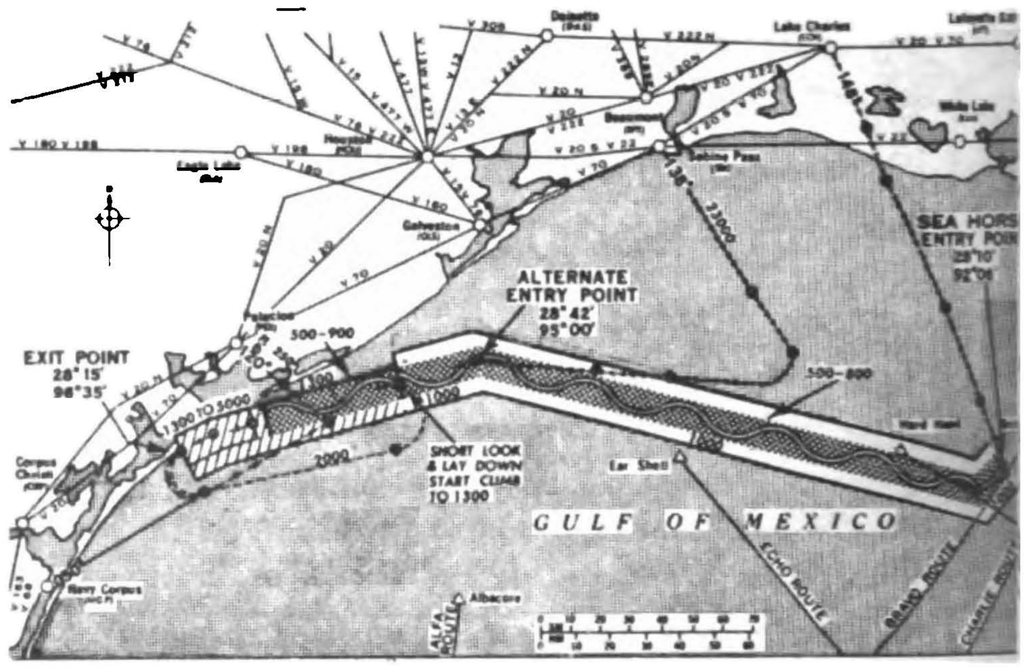
SEA HORSE

Effective July 12, 1964

Aircraft shall cross the Lake Charles, La., VOR at 23,000′ MSL, or as assigned; maintain 23,000′ MSL or as assigned via the Lake Charles VOR 148° radial to to 25 NM fix; start descent, cross 29°31′N, 92°47′W at 19,000′ MSL, descend direct to cross 28°55′N, 92°28′W at 15,000′ MSL, descend direct to cross 28°28′N, 92°15′W at 8000′ MSL or below, descend direct to cross 28°10′N, 92°06′W at 1000′ MSL (Low level entry point). Maintain 1000′ MSL, turn right to 28°03′N, 92°16′W, direct to 28°42′N, 95°00′W, direct to 28°35′N, 95°25′W.

Short Look and Lay Down—After passing 28°35′N, 95°-ridor (5 SM either side of centerline from 28°23′N, 25′W climb to 1100′ MSL direct 28°23′N, 96°12′W. After passing 28°23′N, 96°12′W aircraft shall maintain between 500′ and 5000′ MSL through the bomb run corridor (5 SM either side of centerline from 28°23′N, 96°12′W direct 28°20′N, 96°25′W direct 28°15′N, 96° 35′W). (The minimum IFR altitude through the bomb run corridor is 1100′ MSL) to 28°15′N, 96°35′W, the route exit point, turn left to intercept the Navy Corpus VOR 050 radial (reporting point); then climb via the Navy Corpus VOR 050 radial to intercept the Palacios, Texas VOR 120 radial at 18,000′ MSL or above. Climb via the Palacois VOR 120 radial so as to reach FL 250 at a point 18 NM southeast of the Palacios VOR, cross the Palacios VOR at FL 250.

Re-Entry—After completing the initial Short Look bom run, aircraft that are scheduled to execute an addition bomb run shall, after exiting the route at 28°15′N, 96 35′W turn left to intercept the Navy Corpus VOR 05 radial at 2000′ MSL, maintain 2000′ MSL direct 28 22′N, 95°26′W; turn left descending so as to cross 28 35′N, 95°25′W at 1100′ MSL, thence via the publish route.



VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and opera between the VFR altitudes indicated on the chart b tween the following points: From 28°10′N, 92°06′W t 28°24′N, 96°09′W. During daylight hours, some VF operations will be flown 500′ above the immediate te rain. VFR operations conducted during the hours darkness will not be flown lower than 800′ above th terrain. The lower VFR altitude shown on the chart the minimum altitude that will be reached during da light hours.

Alternate Entry—Aircraft shall cross the Sabine Pas VOR at 23,000′ MSL or as assigned, then via Sabine Pas VOR 138° radial maintaining 23,000′ MSL until the 4 NM fix (29°02′N, 93°33′W). Start descent direct to cros 28°44′N, 93°19′W at 16,000′ MSL turn right, descend t cross 28°37′N, 93°58′W at 4000′ MSL; descend direc to cross 28°39′N, 94°21′W at 1000′ MSL direct 28°42′N 95°00′W thence via published route.

Route Width—The route width is reduced to 5 SM nort of the centerline from 28°35′N, 95°25′W to 28°15′N 96°35′W.

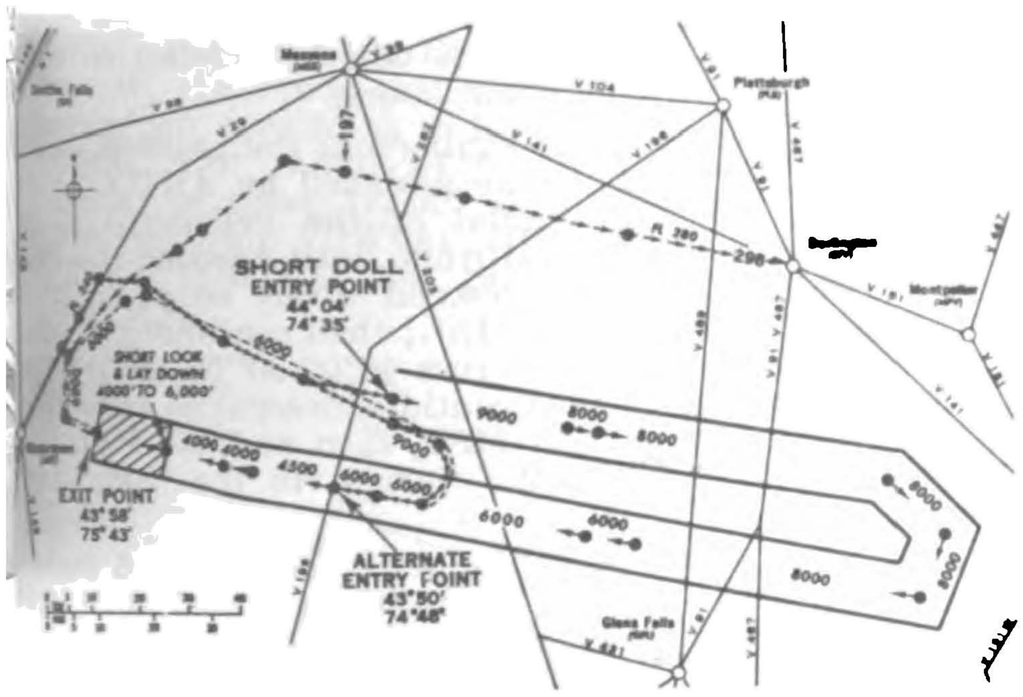
Hours of Operation—24 hours daily, seven days per week

NEW YORK/VERMONT

SHORT DOLL

Effective September 6, 1964

Aircraft shall cross 43°57′N, 76°04′W (Watertown, New York VOR) at FL 290; descend, cross 44°11′N, 75°52′W at FL 250 or above ; cross 44°16′N, 75°47′W at FL 240; direct 44°22′N, 75°42′W; cross 44°22′N, 75°30′W at 19,000′; cross 44°13′N, 75°12′W at 14,000′; cross 44°07′N, 74°54′W below 12,000′; cross 44°04′N, 74°35′W, the entry point to the low level route, at 9000′; maintain 9000′ direct 43°59′N, 73°58′W; descend, cross 43°58′N, 73°52′W at 8000′; maintain 8000′ direct 43°-50′N, 72°52′W; direct 43°41′N, 72°40′W; direct 43°31′N, 72°46′W; direct 43°40′N, 73°45′W; descend, cross 43°-42′N, 73°56′W at 6000′ MSL; direct 43°50′N, 74°48′W; descend, cross 43°52′N, 75°05′W at 4500′ MSL; descend, cross 43°53′N, 75°11′W at 4000′ MSL, maintain 4000′ MSL direct to the entry point of the bomb run corridor at 43°55′N, 75°25′W.



Short Look and Lay Down—After passing 43°55′N, 75°-25′W aircraft shall operate through the bomb run corridor between 4000′ and 6000′ MSL (the bomb run corridor is 5 SM either side of centerline from 43°55′N, 75°25′W to 43°58′N, 75°43′W). After exiting the low level route at 43°58′N, 75°43′W aircraft shall cross 44°-00′N, 75°51′W at 6000′ MSL, maintain 6000′ MSL direct 44°10′N, 75°51′W; direct 44°27′N, 75°22′W; climb, cross 44°30′N, 75°17′W at 13,000′ or below; cross 44°41′N, 74°58′W at 15,000′ or above (Burlington, Vt. VOR 298 radial); direct (via Burlington VOR 298 radial) cross 44°39′N, 74°45′W at 19,000′ (Massena, N.Y. VOR 197 radial); continue climb, cross 44°35′N, 74°19′W at 23,000′; cross 44°29′N, 73°45′W at FL 280, maintain FL 280, direct 44°24′N, 73°11′W (Burlington, Vt. VOR).

Re-Entry—After completing the bomb run, aircraft scheduled for an additional bomb run shall, after exiting the route at 43°58′N, 75°43′W; cross 44°00′N, 75°51′W at 6000′; maintain 6000′ direct 44°10′N, 75°51′W; direct 44°19′N, 75°35′W; direct 44°20′N, 75°30′W; direct 43°-57′N, 74°26′W; right turn to 43°47′N, 74°30′W; thence via the "Short Doll" route.

Alternate Entry—Aircraft shall cross 43°57′N, 76°04′W (Watertown, N.Y. VOR) at FL 290; descend, cross 44°-11′N, 75°52′W at FL 250 or above; cross 44°16′N, 75°-47′W at FL 240, direct 44°22′N, 75°42′W; cross 44°22′N, 75°30′W at 19,000′; cross 44°13′N, 75°12′W at 14,000′; cross 44°07′N, 74°54′W below 12,000′; cross 44°00N, 74°35′W at 9000′; maintain 9000°, direct 43°57′N, 74°-26′W; right turn to 43°47′N, 74°30′W; descend, cross 43°48′N, 74°39′W at 7000′ or below; cross 43°50′N, 74°-48′W at 6000′; thence via the "Short Doll" route.

Route Width—The entire low level route is reduced to 5 SM either side of centerline.

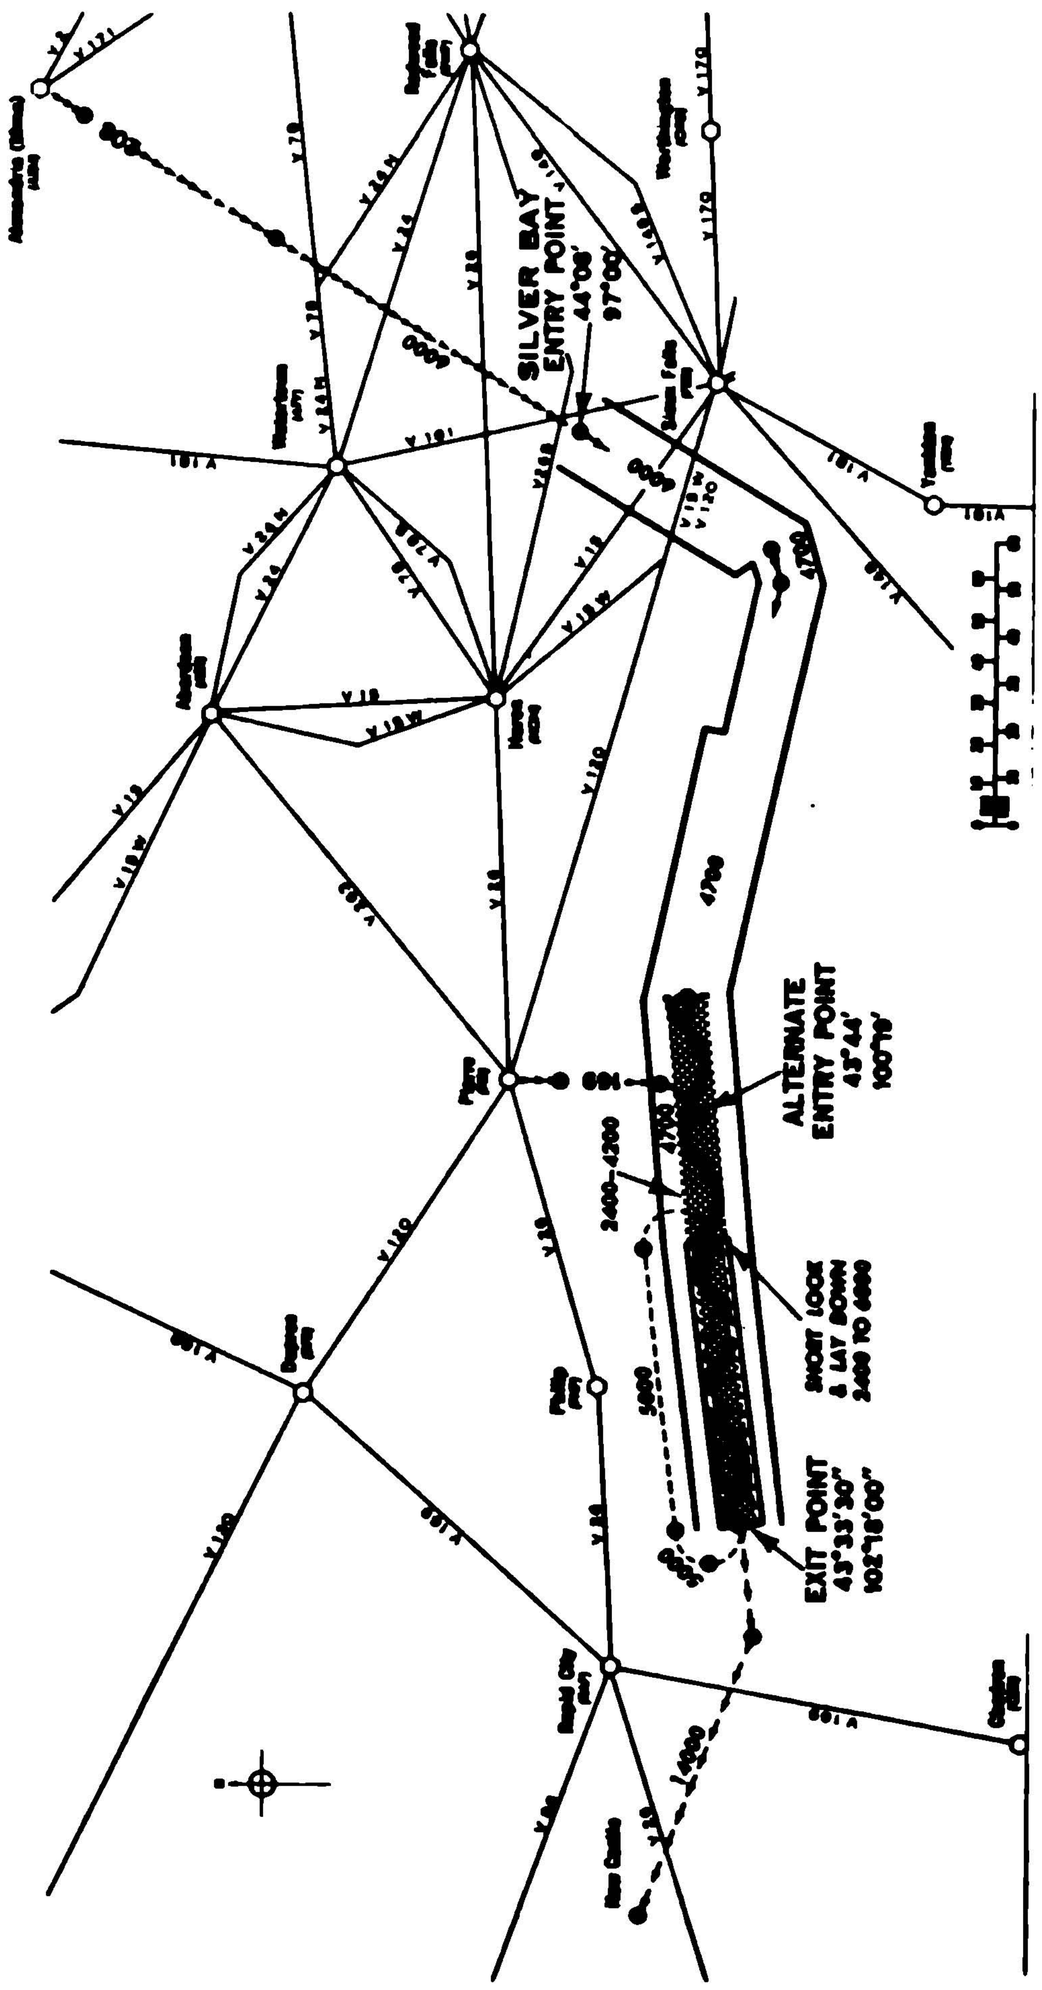
Hours of Operation—0000Z to 2359Z, Monday thru Sunday.

SOUTH DAKOTA

SILVER BAY

Effective October 18, 1964

Aircraft shall cross the Alexandria, Minn. VOR at 20,000′ MSL or as assigned by ARTCC and proceed via the Alexandria VOR 208° radial maintaining 20,000′ MSL or assigned altitude until 10 NM SW; then descend direct so as to cross 45°10′N, 96°00′W at 6000′ MSL; then at



6000′ MSL direct 44°08′N, 97°00′W (low level entry point); then at 6000′ MSL direct 43°29′N, 97°35′W; then turn right descending so as to cross 43°27′N, 97°45′W at 4700′ MSL; then at 4700′ MSL direct 43°47′N, 99°45′W; then at 4700′ MSL direct to 43°42′N, 100°56′W.

Short Look and Lay Down—After passing 43°42′N, 100°-56′W, aircraft shall maintain between 2400′ MSL and 6000′ MSL through the bomb run corridor (5 SM either side of centerline from 43°42′N, 100°56′W to 43°33′-30″N, 102°18′W). The minimum IFR altitude through the corridor is 4700′ MSL. After exiting the route at 43°33′30″N, 102°18′W aircraft shall climb so as to cross 43°30′N, 102°50′W at 14,000′ MSL; then at 14,000′ MSL direct to 43°51′N, 104°13′W. (New Castle, Wyoming)

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall after exiting the route at 43°33′30″N, 102°18′W turn right and climb or descend so as to cross 43°40′N, 102°29′W, at 5000′ MSL; then at 5000′ MSL continue turn to 43°47′N, 102°20′W; then at 5000′ MSL direct 43°55′N, 100°58′W; then turn right descending so as to intercept the Silver Bay route at 43°42′N, 100°56′W at 4700′ MSL; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 43°47′N, 99°45′W to 43°33′30″N, 102°18′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operation conducted during the hours of darkness will not be flonw lower than 800′ above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pierre, South Dakota VOR (reporting point) at 15,000′ MSL or below as assigned by ARTCC; then proceed via the Pierre VOR 169° radial maintaining 15,000′ MSL or assigned altitude until 10 NM south (44°13′N, 100°10′W); then descend direct to 43°52′N, 100°10′W; then turn right descending so as to cross 43°44′N, 100°19′W at 4700′ MSL; thence via the published route.

Route Width—The route width is reduced to 5 SM north of centerline between 43°29′N, 97°35′W to 43°35′N, 98°-30′W.

Hours of Operation—24 hours daily seven days per week.

MICHIGAN

SKI LAND

Effective September 6, 1964

Aircraft shall cross the Houghton, Michigan VOR at 20,000′ MSL or as assigned by ARTCC; then descend direct so as to cross 47°10′N, 89°20′W at 11,000′ MSL; then turn right continuing descent so as to cross the route entry point at 47°40′N, 89°20′W at 2400′ MSL, then at 2400′ MSL direct 47°52″N, 89°20′W, then at 2400′ MSL direct 47°48′N, 88°55′W; then descend to 2000′ MSL direct 47°35′N, 87°25′W; then descend to 1700′ MSL direct 46°49′N, 86°06′W; then climb so as to cross 46°42′N, 85°52′W at 2200′MSL, then at 2200′ MSL direct 46°23′N, 85°16′W; then climb to 2500′ MSL direct 45°-48′N, 85°15′W.

Short Look and Lay Down—After passing 45°48′N, 85°15′W aircraft shall maintain between 2500′ MSL and 5000′ MSL through the bomb run corridor (5 SM either side of centerline from 45°48′N, 85°15′W to 45°22′N, 85°-12′W. The minimum IFR altitude through the bomb run corridor is 2500′ MSL); after passing 45°22′N, 85°12′W then turn right climbing so as to cross 45°10′N, 85°47′W at 10,000′ MSL; then climb direct so as to cross 45°01′ 86°33′W at 12,000′ MSL. Turn left to intercept 28 radial of the Traverse City VOR climbing so as to cro Traverse City VOR 280/25 at 21,000′ MSL. Contin climbing via the Traverse City VOR 280° radial so to cross the Traverse City VOR at FL 250.

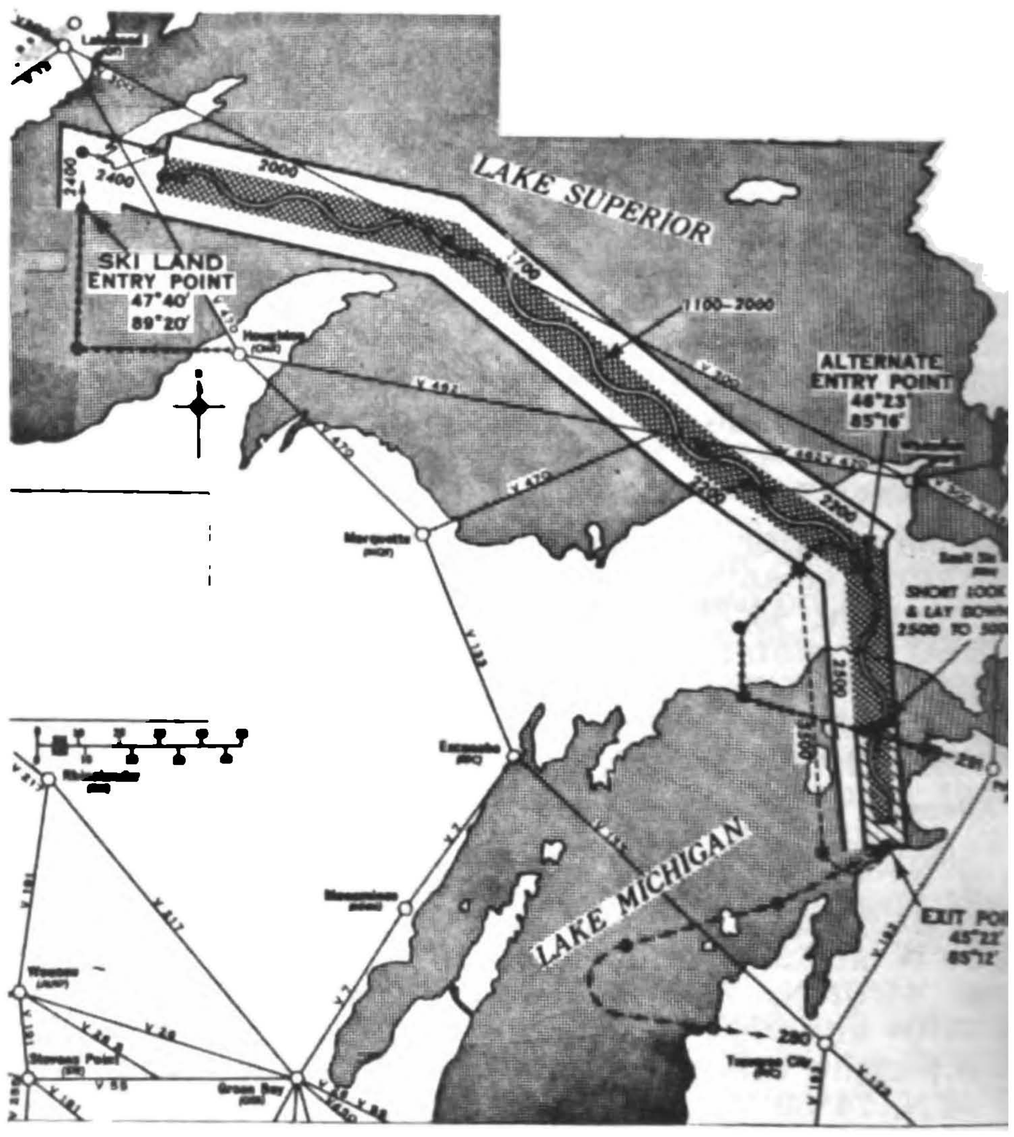
Re-Entry—After completing the initial bomb run aircra that are scheduled to execute an additional bomb r shall, after exiting the route at 45°22′N, 85°12′W, tu right climbing so as to cross 45°21′N, 85°32′W at 350 MSL, then at 3500′ MSL direct to 46°23′N, 85°37′W then turn right descending so as to cross 46°23′N, 85 16′W at 2500′ MSL; thence via the "Ski Land" route.

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and op ate between the VFR altitudes indicated on the chart b tween the following points: From 47°48′N, 88°55′W 45°27′N, 85°13′W. During daylight hours some VF operations will be flown 500′ above the immediate te rain. VFR operations conducted during the hours darkness will not be flown lower than 800′ above t terrain. The lower VFR altitude shown on the cha is the minimum altitude that will be reached on ea route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mic VOR at 20,000′ MSL, or as assigned by ARTCC; th proceed via the 291° radial of the Pellston VOR 20,000′ MSL or assigned altitude until crossing the Pe ston VOR 291/15; then descend direct so as to cro 45°55′N, 85°55′W at 8000′ MSL; then continuing desce turn right direct so as to cross 46°09′30″N, 85°55′W or below 4000′ MSL; then continue descent so as to cro 46°23′N, 85°37′W at 2500′ MSL, then at 2500′ MSL tu right to 46°23′N, 85°16′W; thence via the "Ski Lan route.

Route Width—The route width is reduced to 5 statu miles west and north of centerline from 47°40′N, 8 20′W to 47°48′N, 88°55′W, and east of centerline fro 46°23′N, 85°16′W to 45°22′N, 85°12′W.

Hours of Operation—0000Z to 2400Z, 7 days a week.



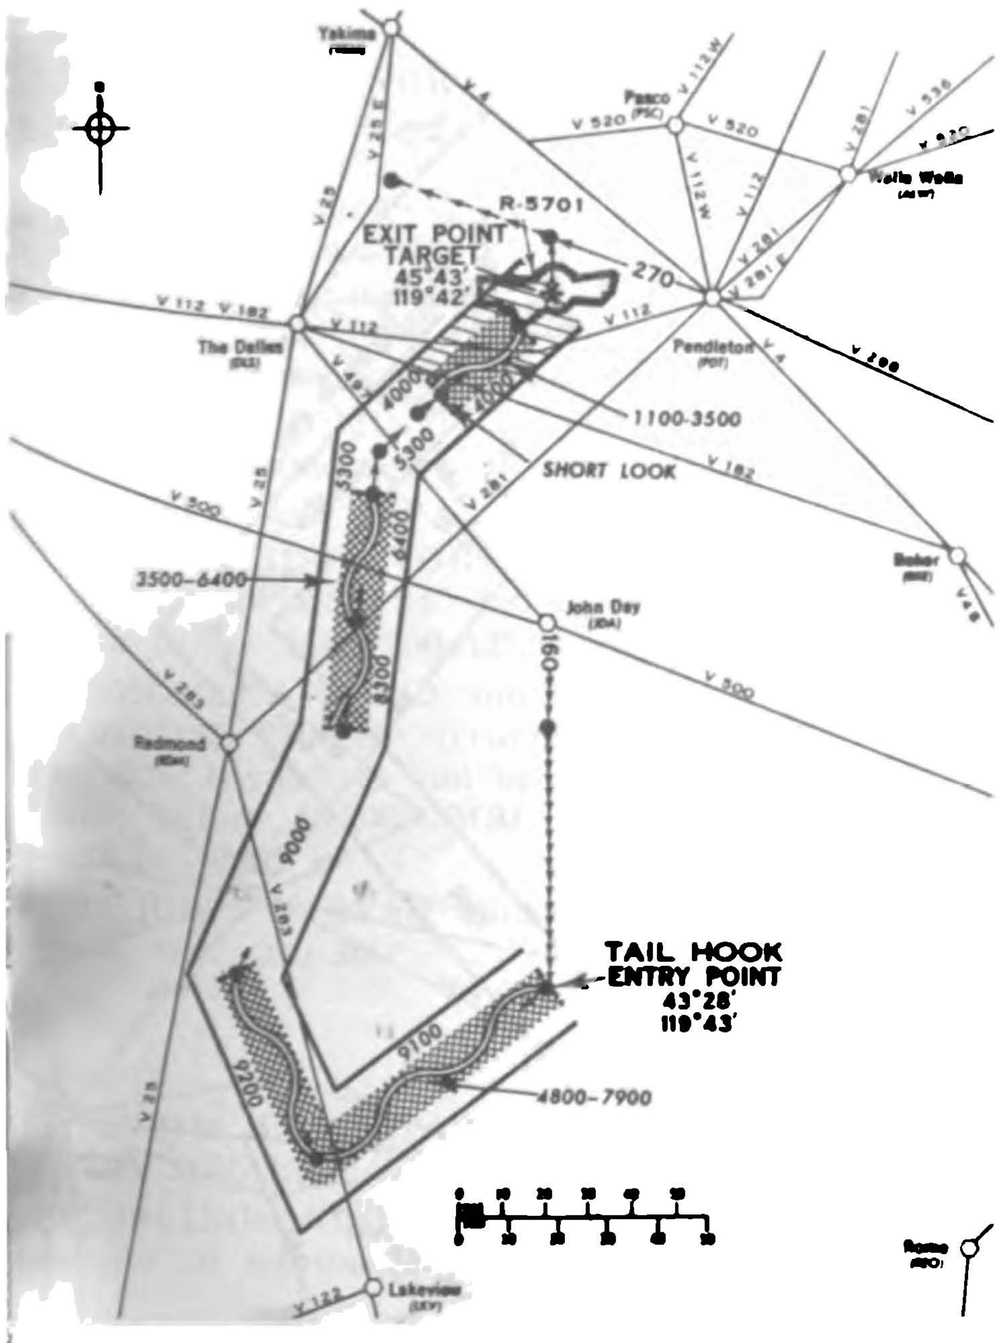
OREGON

TAIL HOOK

Effective February 12, 1963

Aircraft shall cross the John Day, Oregon VOR (reporting point) at 23,000′ MSL, or as assigned by Seattle ARTCC; then proceed via the John Day VOR 160° radial, maintaining assigned altitude until 20 nautical miles south of the John Day VOR (44°19′N, 119°43′W); then descend to 9100′ MSL to the entry point of the low level route at 43°28′N, 119°43′W; then 9100′ MSL direct to 42°54′N, 120°45′W; then climb to 9200′ MSL direct to 43°31′N, 121°08′W; then descend to 9000′ MSL direct to 44°18′N, 120°39′W; then descend to 8300′ MSL direct to 44°40′N, 120°36′W; then descend to 6400′ MSL direct to 45°05′N, 120°31′W; then descend to 5300′ MSL direct to 45°13′N, 120°30′W; then 5300′ MSL direct to 45°20′N, 120°19′W; then descend so as to cross 45°23′N, 120°13′W at 4000′ MSL.

Short Look—After passing 45°23′N, 120°13′W, aircraft shall maintain 4000′ MSL until within Restricted Area R-5701; after crossing RBS target located at 45°43′N, 119°42′W, the route exit point, aircraft shall make a climbing left turn so as to intercept the Pellston, Oregon VORTAC 270° radial 34 nautical mile fix (reporting point) at or above 11,000′ MSL; then climb westbound on the Pendleton VORTAC 270° radial so as to cross the Pendleton VORTAC 270° radial 68 nautical mile fix at 23,000′ MSL.



VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′ visibility five miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 43°28′N, 119°43′W to 43°31′N, 121°08′W, from 44°18′N, 120°39′W to 45°05′N, 120°31′W, and from 45°23′N, 120°13′W to restricted area R-5701. During daylight hours, VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness shall not be flown lower than 800′ above terrain. The lower VFR altitude shown on the chart is the minimum altitude that shall be reached on each route segment during daylight hours.

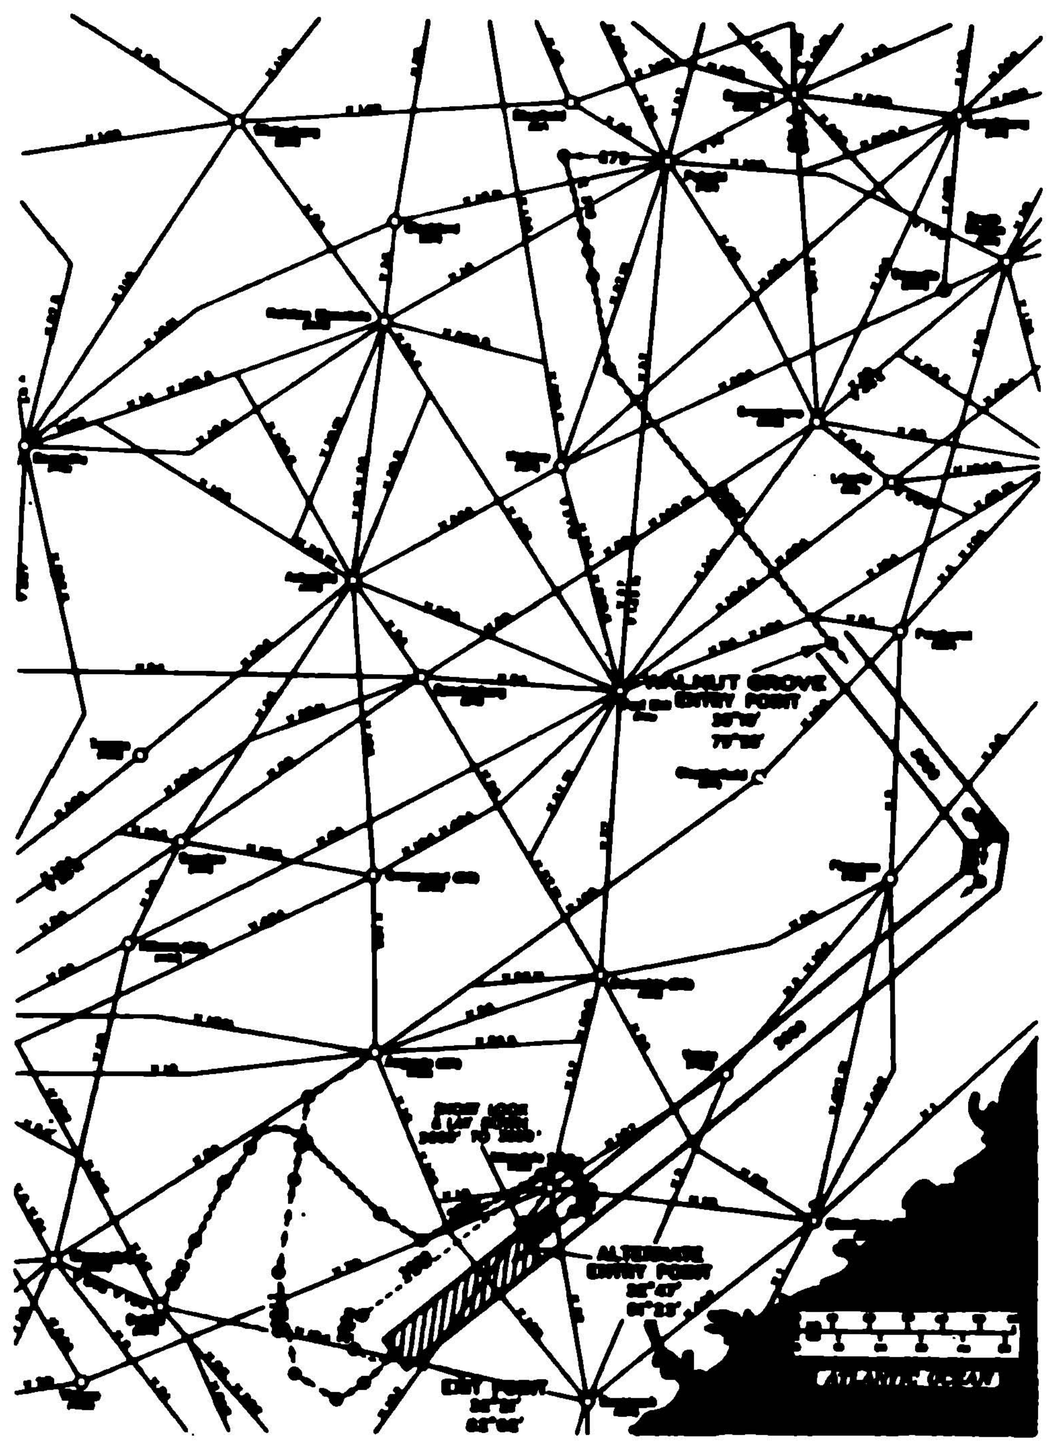
Hours of Operation—1600Z to 2400Z Monday thru Friday and 0000Z to 0800Z Tuesday thru Saturday.

GEORGIA/NORTH CAROLINA/SOUTH CAROLINA

WALNUT GROVE

Effective January 4, 1965

Aircraft shall cross the Pulaski, Virginia VORTAC 275/25 DME fix (37°06′N, 81°14′W) at FL 210 or as assigned by ARTC; then maintain and cross 36°47′N, 81°08′W at FL 210; then descend direct so as to cross 36°43′N, 81°07′W at FL 180 or above; then descend direct so as to cross 36°37′N, 81°06′W at or below 14,000′ MSL; then descend direct so as to cross 36°15′N, 81°00′W at 5000′ MSL; then at 5000′ MSL direct to 35°10′N, 79°55′W (low level entry point); then at 5000′ MSL direct to 34°29′N, 79°16′W; then descend direct so as to cross 34°23′N, 79°11′W at 2000′ MSL; then at 2000′ MSL turn right to 34°13′N, 79°13′W; then at 2000′ MSL direct to 32°47′N, 81°23′W.



Short Look and Lay Down—After passing 32°47′N, 81°23′W aircraft shall maintain between 2000′ MSL and 3000′ MSL through the bomb run corridor (5 SM either side of center line from 32°47′N, 81°23′W to 32°21′N, 82°-02′W). After exiting the route at 32°21′N, 82°02′W, aircraft shall climb to or maintain 3000′ MSL to 32°-14′N, 82°10′W; then climb direct so as to cross 32°10′N, 82°18′W at 6000′ MSL; then climb direct so as to cross 32°16′N, 82°30′W at 11,000′ MSL; maintain 11,000′ direct 32°40′N, 82°35′W; then climb direct so as to cross 33°02′N, 82°31′W at FL 180; cross 33°10′N, 82°29′W at FL 200; cross 33°22′N, 82°27′W at FL 230 or as assigned; then at FL 230 or as assigned direct to the Augusta, Georgia VOR.

Re-Entry—Aircraft that are scheduled to execute an additional bomb run shall, after exiting the low level route at 32°21′N, 82°02′W, turn right and descend or maintain 2000′ MSL to 32°22′N, 82°13′W; then at 2000′ MSL continue turn to 32°30′N, 82°11′W; then at 2000′ MSL direct to 33°04′N, 81°20′W; then at 2000′ MSL turn right to 33°04′N, 81°10′W; continue turn to 32°-55′N, 81°11′W; then at 2000′ MSL direct to 32°47′N, 81°23′W; thence via the published route.

Alternate Entry—Aircraft shall cross the Dublin, Georgia VOR (32°31′N, 83°08′W) at FL 260 or as assigned; then descend direct via the Dublin VOR 025° radial so as to cross 32°47′N, 82°59′W at FL 230; cross 33°01′N, 82°51′W at 17,000′ MSL; cross 33°09′N, 82°44′W at 15,000′ MSL; turn right to cross 33°11′N, 82°28′W at 13,000′ MSL; cross 32°54′N, 82°06′W at 3000′ MSL; then descend direct so as to cross 32°48′N, 81°54′W at 2000′ MSL; then at 2000′ MSL direct to 33°04′N, 81°20′W; then at 2000′ MSL turn right to 33°04′, 81°10′W; continue turn to 32°55′N, 81°11′W; then at 2000′ MSL direct to intercept the Walnut Grove route at 32°47′N, 81°23′W.

Route Width—The entire route width is reduced to 5 SM either side of centerline.

Hours of Operation—Primary entry 1900Z to 2300Z and from 0100Z to 1400Z, 7 days per week; alternate entry 24 hours per day, 7 days per week.

COLORADO/KANSAS/NEW MEXICO
OKLAHOMA/TEXAS
ZERO HOUR

Effective November 1, 1964

Aircraft shall cross 34°22′N, 105°40′30″W (Corona, New Mexico VOR) (reporting point) at FL 250 or as assigned by ATC, then descend direct to cross 34°33′N, 105°33′W at or below 23,000′ MSL; then descend direct to cross 34°40′N, 105°28′W at 22,000′ MSL; then descend direct to cross 34°45′N, 105°12′W at or below 18,000′ MSL; then descend direct to cross 34°53′N, 104°48′W at 10,000′ MSL; then descend direct to cross the route entry point at 34°47′N, 104°29′W at 7000′ MSL, maintain 7000′ MSL direct to 35°24′N, 104°08W, then 7000′ MSL direct to 36°37′N, 102°50′W; then descend direct to cross 36°49′N, 102°35′W at 6000′ MSL, maintain 6000′ MSL direct to 37°03′N, 102°17′W, then 6000′ MSL direct to 37°52′N, 103°10′W.

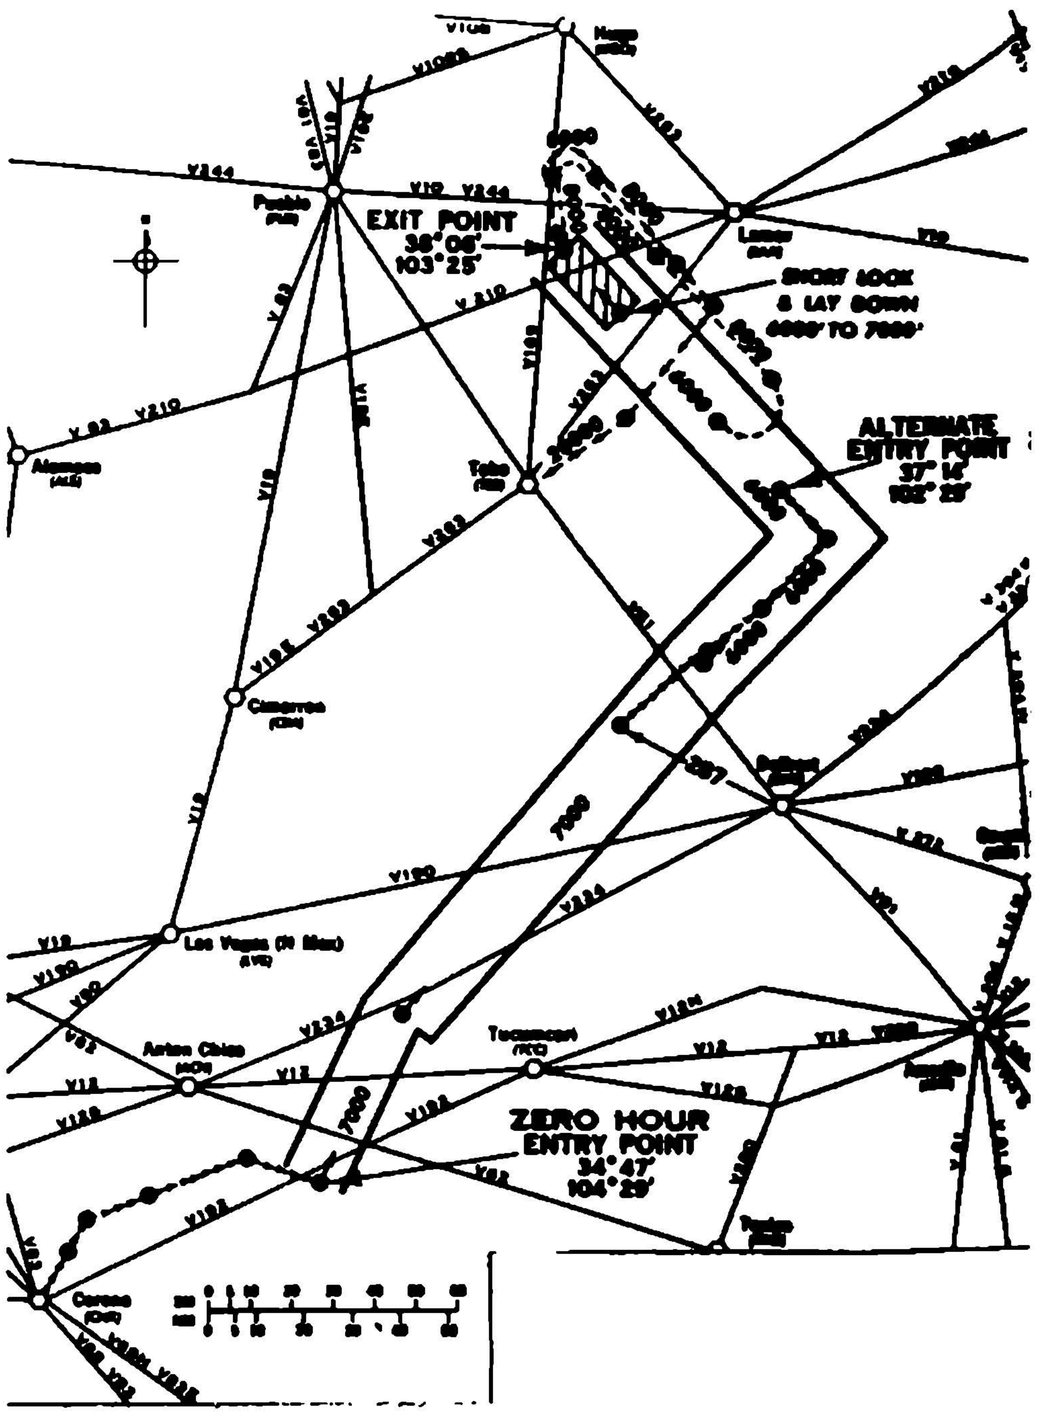
Short Look and Lay Down—After passing 37°52′N, 103°-10′W aircraft shall maintain between 6000′ and 7000′ MSL thru the bomb run corridor (5 SM either side of centerline from 37°52′N, 103°10′W to 38°06′N, 103°25′W). After exiting the route at 38°06′N, 103°25′W climb direct to cross 38°09′N, 103°26′W at 8000′ MSL, maintain 800 MSL direct to 38°22′N, 103°27′W, then 8000′ MSL direc to 38°21′N, 103°17′W; then 8000′ MSL direct 38°02′N 102°55′W; then direct to cross 37°53′N, 102°45′W a 9000′ MSL; then climb direct to cross 37°30′N, 103°08′W at FL 200; then maintain FL 200 direct to Tobe VOR TAC.

Re-Entry—After completing the initial Short Look bom run aircraft that are scheduled to execute an additiona bomb run shall, after exiting the route at 38°06′N, 103° 25′W, climb direct to cross 38°09′N, 103°26′W at 800 MSL, maintain 8000′ MSL direct to 38°22′N, 103°27′W then 8000 MSL direct to 38°21′N, 103°17′W, then 800 MSL direct to 38°04′N, 103°00′W, then 8000′ MSL direc to 37°38′N, 102°31′W; then turn right descending to cro 37°29′N, 102°45′W at 6000′ MSL, thence via the pub lished route.

Alternate Entry—Aircraft shall cross 36°23′N, 103°13′W (Dalhart VORTAC 287/37) (reporting point) at 15,00 MSL, maintain 15,000′ MSL direct to 36°39′N, 102°49 30″W; then descend direct to cross 36°49′N, 102°35′W at 11,000′ MSL, maintain 11,000′ MSL direct to 37°03′N 102°17′W; then descend direct to cross 37°14′N, 102° 29′W at 6000′ MSL, thence via the published route.

Route Width—The route width from 34°47′N, 104°29′W to 35°24′N, 104°08′W is reduced to 5 SM on the east sid of centerline.

Hours of Operation—24 hours daily, 7 days per week



RESTRICTIONS TO ENROUTE NAVIGATION AIDS

Radio Facility Restrictions are cited until cancelled by the Associated Station.

ALABAMA

MOBILE, BROOKLEY AFB RDO: VOR unusable below 2000' MSL beyond 30 nmi due reduced coverage.

ARIZONA

BUCKEYE RDO: VOR unusable below 7000' MSL beyond 40 nmi 320–345° acct reduced coverage.

PEACH SPRINGS RDO: VORTAC' unusable below 10,000' MSL beyond 40 nmi from 195-230° account reduced coverage.

PHOENIX RDO: VORTAC' azimuths unusable beyond 10 nmi below 10,000' MSL 152–165° and 200 210° and VOR portion beyond 6 nmi below 7000' MSL 078-125° acct crs roughness.

PRESCOTT RDO: VORTAC' unusable beyond 40 nmi below 11,000' MSL 145-155° and 175-200°; below 17,000' MSL 200–225°; below 12,000' MSL 225–235° account crs roughness. VOR excessive crs vagaries within 30 nmi from FL 240 thru 410 rely on To-From indicator for stn passage. Disregard VOR momentary excursion of crs 055° thru 070° 14 to 18 nmi all alts due terrain reflections.

PRESCOTT RDO: Hi alt J-6 btn Prescott, and Grants, N. Mex unusable below FL 280 account. Change over point 131 nmi E

SAN SIMON RDO: VORTAC' unusable beyond 40 nmi below 15,000' MSL 145–190°; below 14,000' 190–255°; below 10,500' MSL 350–145° account reduced coverage.

TUCSON RDO: TACAN unusable beyond 6 nmi below 14,500 MSL 240–295° account crs roughness. VORTAC' unusable beyond 40 nmi below 15'000 MSL from 320-045°; below 16,500' MSL 045–065°; below 15,000' MSL 065–080°.

YUMA RDO: VORTAC' unusable beyond 40 nmi below 9000', MSL 280–300°.

ARKANSAS

FT. SMITH RDO: TACAN azimuth unusable below 10,000' MSL 137–245° acct roughness.

GROTON RDO: H facil unusable beyond 15 nmi.

NEW HAVEN RDO: VOR unusable beyond 20 nmi at MOCA.

DISTRICT OF COLUMBIA

WASHINGTON RDO: DCA VOR unusable beyond 3 nmi 010–045°; beyond 10 nmi 045–055°; beyond 1 nmi 055–070°; beyond 20 nmi 070–180°; beyond 32 nmi 180–210°; beyond 30 nmi 210–260°; beyond 20 nmi 260–300° beyond 35 nmi 300–340° account roughness and scalloping. Change over point established 16 nmi from Baltimore VOR on V–157.

FLORIDA

KEY WEST RDO: VOR unusable below 14,500 from 095–340° beyond 15 nmi.

ST. PETERSBURG RDO: TACAN azimuth portion of VORTAC unusable 12–30 nmi below 5000′ MSL 310–325°; 30–40 nmi above 5000′ MSL 310–320° acct roughness.

SANFORD NAS RDO: H fac freq 296kc inop UFN.

WEST PALM BEACH RDO: TACAN azimuth unusable from 018 rad thru 040 rad in excess 12 mi from facil and below 3500' MSL due roughness and unlocks.

GEORGIA

AUGUSTA RDO: VOR unusable 357–002° acct roughness. V185 tmprly authorized 180° rad Greenwood to Augusta VOR. MEA 2300' MSL due restriction.
COLUMBUS, LAWSON AAF RDO: VOR unusable beyond 17 nmi.
FULTON RDO: VOR unusable all radials except 220–280° acct roughness.
MACON RDO: FSS freqs 122.2, 126.7, 255.4 unusable below 2500' in SE quad beyond 35 mi.
ROME RDO: VOR rads 124–134° unusable account roughness.

IDAHO

BOISE RDO: VORTAC unusable beyond 40 nmi below 14,000' MSL 360–050° account reduced coverage.
BURLEY RDO: VORTAC unusable beyond 40 nmi below 14,000' MSL from 130–140° and below 12,000' MSL from 140–150° acct reduced coverage.
LEWISTON RDO: VOR coverage 080° clockwise to 170° limited 30 mi at MEA.
MULLAN PASS RDO: H facil momentary ADF disturbance may be experienced within 15 nmi stn 230–250°. 40 nmi coverage at MOCA except unusable beyond 40 nmi below 11,000' MSL from 310-010° and from 200- 230° and below 12,000' MSL from 290–310°.
POCATELLO RDO: VOR unusable beyond 40 nmi below 11,000' MSL from 060–085° and below 13,000' MSL from 085–120° acct reduced coverage.
TWIN FALLS RDO: VOR unusable beyond 40 nmi below 12,000' MSL 115–150° acct reduced coverage.

ILLINOIS

CHAMPAIGN RDO: TACAN radials 231–239° unusable below 14,000'.
CHICAGO O'HARE RDO: VOR unusable 060–072°, 091–100°, 290–305°, 340–360°. TACAN azimuth and DME unusable 004–014°, 135–156°, 285–315°, 340–350°.
CHICAGO HEIGHTS RDO: VOR portion unusable beyond 20 nmi below 8000' MSL 330–350°. TACAN azimuth portion unusable 085–150° and 315°–350°.
DECATUR RDO: VOR unusable above 12,000' MSL beyond 40 nmi E due to freq interference with RID VOR.
JOLIET RDO: VOR unusable 040-070° below 3000' MSL beyond 35 nmi. TACAN azimuth unusable below 3000' MSL beyond 15 nmi all azimuth; unusable 063–067° below 6000' MSL.
PEOTONE RDO: VOR 341–010° rads unusable beyond 33 mi below 3000' MSL

INDIANA

FORT WAYNE RDO: TACAN azimuth unusable 050–065° account unlocks. TACAN azimuth 324/339° unusable beyond 12 mi account crs roughness.
INDIANAPOLIS RDO: TACAN azimuth unusable from 163–224° due excessive alignment errors.
KNOX RDO: VOR coverage restricted to 37 nmi at MEA. Possible interference btn Mansfield, Ohio and Knox VOR above 10,000' MSL beyond 45 nmi E of Knox VOR.

IOWA

FORT DODGE RDO: TACAN azimuth portion unusable 080-100° acct crs roughness.
MASON CITY RDO: TACAN azimuth portion of VORTAC not to be used for apchs or coup'ed flight acct momentary crs roughnes which may occur at all azimuths and all ranges below 14,500' MSL.
NEOLA RDO: Voice comms with Omaha, Nebr FSS unusable below 4500' on V 172 and V-172N btn 20 and 46 nmi E VORTAC, excp rcvr 122.1 and tsmts 117.1 rec.
SIOUX CITY RDO: TACAN azimuth portion of VORTAC unusable beyond 17 nmi below 14,500' MSL 280–300° acct crs roughness. TACAN shutdown for tune up until aprxly Nov 20. During shutdown the facility will be operg on test basis not to be used for navigation.
WATERLOO RDO: TACAN azimuth and DME portion of VORTAC unusable beyond 15 nmi at all alts 355–005° account unreliable crs and distance indications. Not to be used for apchs to rnwy 18 acct roughness.

KANSAS

HILL CITY RDO: TACAN azimuth unusable beyond 15 nmi below 5000' MSL from 350 010° due roughness.

LOUISIANA

ALEXANDRIA RDO: TACAN azimuth portion of VORTAC restricted from 345° clockwise thru 030° beyond 30 mi below 2500' acct crs roughness.
LAKE CHARLES RDO: TACAN azimuth portion not usable below 2500' MSL from 270-285° within 25 nmi acct crs roughness.
SHREVEPORT-DOWNTOWN RDO: VOR unusable 070 100° and 180–280°.
SHREVEPORT RDO: TACAN azimuth unusable beyond 8 nmi below 9700' MSL 300–315°.

MAINE

LIMESTONE-LORING AFB RDO: USAF VOR inop indef.
MILLINOCKET RDO: VOR unusable beyond 35 nmi 330-340° at MOCA.

MARYLAND

FREDERICK RDO: VOR unusable below 2000' beyond 25 nmi from 055–190°.
PATUXENT RDO: VOR unusable below 1500' MSL; beyond 35 nmi from 245–300° acct reduced coverage.
SNOW HILL RDO: VOR unusable below 1500' beyond 12 nmi 315-003°/ below 1500' beyond 25 nmi 005-020° and below 1300' beyond 20 nmi 210–225° acct roughness. Changeover point on V-139 btn Snow Hill and Cape Charles 20 mi SW Snow Hill.

MASSACHUSETTS

BEDFORD RDO: VOR unusable below 3000' MSL beyond 10 nmi 270-225° and below 13,000' MSL beyond 10 nmi 225–270°.

BOSTON RDO: VOR unusable beyond 26 nmi all azimuths at MOCA.
SHUTESBURY RDO: VOR ident SHT freq 109.2 for use only with published procedures. Not for use as enroute navaid.
WESTFIELD RDO: VOR unusable beyond 35 nmi from 270° clockwise to 320° at MOCA.

MICHIGAN

BATTLE CREEK RDO: TACAN rads 275 thru 290° unusable 13,500′ MSL and below beyond 15 nmi due crs roughness. TACAN azimuth rads 326 thru 336° unusable due crs roughness.
CARLETON RDO: TACAN portion of VORTAC unusable beyond 12 nmi below 4500′ MSL 335–345° acct roughness.
FLINT RDO: VORTAC unusable 300-320° beyond 6 nmi below 10,000′ account roughness and unlocks. TACAN azimuth unusable 320–030° beyond 6 nmi, below 10,000′ account roughness and unlocks.
GAYLORD RDO: State owned and operd VOR operg 24 hrs daily, VFR use only. Class: L–BVOR Freq: 109.2 mc. Ident: GLR. Lctd lat 45°00′48″, long 84—41′30″, Gaylor Arpt. Revg freqs 122.1, 126.7 mc. Monitoring category (1).
MARQUETTE RDO: VOR unusable 200–335° below 2900′ beyond 25 mi; 335–350° below 2900′ beyond 30 mi; 200–350° below 4400′ beyond 40 nmi.
MT. PLEASANT RDO: Non-Federal VOR operg 24 hrs daily VFR use only. Class: L–BVOR Freq: 109.8 mc. Ident: MOP. Lctd lat 43°37′, long 84°44′. Monitoring category (1) Revg 122.1 and 126.7 mc.
WHITE CLOUD RDO: VOR unusable below 2000′ from 300–090° clockwise beyond 35 mi.

MINNESOTA

INTERNATIONAL FALLS RDO: H facility shutdown UFN.
MINNEAPOLIS RDO: TACAN azimuth unusable below 14,000′ MSL beyond 18 nmi from 167 thru 180° acct crs roughness.
WINONA RDO: VOR unusable as enroute IFR aid.

MISSOURI

KANSAS CITY RDO: Riverside VOR unusable beyond 15 mi below 2400′ MSL; beyond 30 mi below 4000′; 125–170°, 252–260° and 300–310° unusable all distances and alts.
MARYLAND HEIGHTS RDO: VOR coverage restricted to 35 nmi from 150° clockwise to 219° at MEA.

MONTANA

BILLINGS RDO: TACAN azimuth has momentary crosspointer excursions within 10 nmi at MEA 050–060° btn 20 and 35 nmi at MEA 290–305° which may be encountered at higher alts and greater ranges.
BOZEMAN RDO: VOR unusable beyond 40 nmi below 20,000′ MSL 010–035°; below 18,000′ MSL 035–090° acct reduced coverage.
BUTTE RDO: VOR unusable beyond 40 nmi below 15,000′ MSL 005 thru 030°, 13,000′ MSL 030 thru 075°; 15,000′ MSL 160 thru 230°; 11,000′ MSL 355 thru 005° acct reduced coverage.
DILLON RDO: VORTAC unusable beyond 40 nmi below 11,000′ MSL from 340–350° below 9000′ MSL 010–020°; below 12,000′ MSL 020–040°; below 14,000′ MSL 040-080°; below 12,000′ MSL 080–090°; below 14,000′ MSL 090–130° below 18,000′ MSL 130–145° account reduced coverage. TACAN azimuth has momentary cross pointer excursions btn 25 and 30 nmi at MEA 145 thru 155° which may be encountered at higher alts and greater range.
DRUMMOND RDO: VOR unusable beyond 40 nmi below 11,000′ MSL from 055–070°, below 14,000′ MSL from 110–125°, below 17,000′ MSL from 125–150°, below 13,000′ MSL from 150–210°, below 14,000′ MSL from 210–270°, below 12,000′ MSL from 270–055° acct reduced coverage. Possible momentary flag activity on V–2 nine miles E of Drummond VOR. Verify station passage by to/from indication.
GLASGOW AFB RDO: USAF VOR unusable for civil use below 6800′ MSL beyond 10 nmi 235–245° account crs roughness.
GREAT FALLS RDO: TACAN azimuth portion of VORTAC unusable below 12,000′ MSL beyond 20 nmi from 040–060° acct crs roughness. About Oct 31 UHF/DF will be decomsnd.
HELENA RDO: VOR unusable beyond 40 nmi below 10,000′ MSL 360–065°; 11,000′ 065–090°; 16,000′ 110–120°; 18,000′ 120–180°; 17,000′ 180–205°; 14,000′ 205–220°; 12,000′ 220–240; 11,000′ 240–305°; 10,000′ 305–320° account reduced coverage.
LIVINGSTON RDO: VORTAC unusable beyond 40 nmi below 9000′ from 070 thru 090° below 13,000′ from 250 thru 280°; below 17,000′ from 340 thru 010° and below 16,000′ from 010 thru 040°.
MILES CITY RDO: VORTAC operg with following restrictions TACAN azimuth portion not to be used for coupled flight 345–005° within 15 nmi at MEA and below account momentary course roughness which may occur at greater ranges and altitudes.
MISSOULA RDO: VORTAC unusable beyond 15 nmi 345–060°; beyond 22 mi 060–095°; below 10,000′ beyond 20 mi 095–165°; below 12,000′ beyond 20 mi 165–270°; below 12,000′ beyond 20 mi 165–270°; below 12,000′ beyond 20 mi 285–315°; not usable 315–345° beyond 34 mi, TACAN below 14,000′ VOR below 11,000′, acct reduced coverage. Possible momentary VOR flag activity on V–2 nine miles E of MSO VOR/TAC. Verify station passage by to/from indication.
WHITEHALL RDO: VOR unusable below 14,500′ MSL beyond 30 nmi from 000–040°; below 12,000′ MSL beyond 30 nmi from 041–055°; below 14,500′ MSL beyond 30 nmi 120–160°; below 14,500′ MSL beyond 20 nmi from 215–230°; below 14,500′ MSL beyond 30 nmi from 231–285°, below 13,500′ MSL beyond 30 nmi from 286–359° acct crs roughness and TACAN unlocks. TACAN unusable for apchs 268° rad to Silver Bow County/Butte Airport.

NEBRASKA

GRAND ISLAND RDO: TACAN unusable beyond 20 nmi below 7000′ 360–025°; from 0 to 10 nmi below 12,000′ 055–085°; from 0 to 20 nmi below 12,000′ 255–285°.
HAYES CENTER RDO: TACAN azimuth unusable 30 nmi 225–245° due roughness.

OMAHA RDO: Voice comms with Omaha, Nebr. FSS unusable below 3000' on V-66-88 btn 36 and 55 nmi E of VORTAC, except tsmtg 116.3 mc.

NEVADA

BEATTY RDO: VOR restricted below 8000' beyond 27 nmi, 035–360°; below 10,000' beyond 10 nmi, 360–030°.

BOULDER RDO: VOR restrictions 300 to 310° below 8000' MSL beyond 15 nmi due to scalloping.

CALDALE RDO: VOR usable dist: 300–015° and 030–090° limited to 25 nmi at MOCA.

ELY RDO: VOR operg with following restrictions except on established airways and routes: unusable beyond 20 nmi below 11,500' MSL from 120–170° and 240–320°; below 14,000' MSL 170–220° and 320–340°; below 15,000' MSL from 220–240°; below 12,000' MSL from 340–010°; beyond 10 nmi below 13,000' MSL from 010–120°.

HAZEN RDO: VOR unusable 300–320° beyond 30 nmi below 9500'.

LAS VEGAS RDO: VORTAC unusable beyond 40 nmi below 9500' MSL from 190° to 220° below 12,500' MSL from 200° to 255°, below 14,500' MSL from 255° to 270°, below 16,000' MSL from 270–290° acct of reduced coverage.

LIDA RDO: VOR unusable below 11,000' due roughness.

MORMON MESA RDO: VORTAC unusable beyond 40 nmi below alts 12,000' MSL from 055 to 100°; 14,000' MSL from 100 to 110°; 17,000' MSL from 110 to 135°; 16,000' MSL from 285 to 340° account reduced coverage.

RENO RDO: H facility unusable 170°–270° beyond 20 nmi, 270°–300° beyond 30 nmi and 300–010° beyond 3 nmi. VOR unusable 200–230° beyond 30 nmi below 13,000'. TACAN unusable below 14,500' beyond 30 nmi btn 210–230°.

TARKS RDO: H facility unusable btn 175–185° beyond 18 nmi.

TONOPAH RDO: VOR unusable below 13,000' MSL beyond 40 nmi below 13,000' 005–030° acct reduced coverage.

WELLS RDO: VORTAC unusable beyond 40 nmi 18,000' MSL 005–030°; below 22,500, 185–210°; below 15,000, 335–350°; and below 12,000', 350–005° account reduced coverage.

NEW HAMPSHIRE

KENE RDO: VOR unusable 070–085° beyond 20 nmi at MOCA.

LEBANON RDO: VOR unusable below 6000' MSL beyond 35 nmi, 110–115° acct reduced coverage.

NEW JERSEY

ATLANTIC CITY RDO: VOR unusable beyond 35 mi from stn to MOCA. TACAN has momentary cross pointer excursions within 10 nmi at MOCA, which may be encountered at higher alts and greater ranges. TACAN apch rnwys 13 and 31 for mil jet acft approved; otherwise unsuitable for instrument apch procedure.

ROBBINSVILLE RDO: VOR unusable beyond 30 nmi from 020° clockwise to 065° at MOCA due interference undisclosed source. TACAN azimuth and DME portion unusable below 1500' MSL; beyond 35 nmi from 030–10° and beyond 30 nmi 100–110°. TACAN azimuth unusable below 1500' MSL beyond 15 nmi from 335–345°.

NEW MEXICO

CIMARRON RDO: VOR coverage restricted to awys 40 nmi at MEA exep V 19, N of CIM 35 nmi.

COLUMBUS RDO: VOR 078° rad restricted to 20,000' MSL for 40 nmi.

GRANTS RDO: TACAN portion unusable beyond 20 nmi 175–210°, 315–360° and 011–035° at MOCA acct loss of signal, the portion 001–010° unusable acct loss of signal. VOR portion unusable beyond 30 nmi 310–360°, 20 nmi 360–025°, 30 nmi 150–175°, 20 nmi 175–210°, 35 nmi 240–265° at MOCA.

NEW YORK

BINGHAMTON RDO: Erratic ADF action 4–13 nmi SSE of facil at min inst alt.

CLERMONT RDO: VOR unusable beyond 35 nmi 045–050° and 30 nmi 070–140° at MOCA. About Jan 7, 1965, VOR name and ident will be changed to Kingston, IGN.

DEER PARK RDO: VOR unusable below 1500' MSL beyond 35 nmi from 070–180° below 1500' MSL beyond 30 nmi from 180–240° below 2000' MSL beyond 20 nmi from 240–350° below 2000' MSL beyond 30 nmi from 350–040° due reduced coverage. TACAN unusable below 1500' beyond 15 nmi from 088–098° due roughness.

DUNKIRK RDO: VOR unusable below 4000' MSL beyond 22 nmi from 120–180° acct reduced coverage.

GLENN FALLS RDO: TACAN azimuth unusable beyond 35 nmi from 305° to 315°; beyond 30 nmi 315–350°. DME unusable beyond 35 nmi 305–315°, beyond 30 nmi 315–320°, beyond 25 nmi 320–325°, beyond 30 nmi 325–350° at MOCA.

HAMPTON RDO: TACAN azimuth and DME unusable below 1500' MSL beyond 35 nmi 280–325°; below 2000' MSL beyond 30 nmi 325–355° account reduced coverage.

HUGUENOT RDO: VOR unusable below 6500' beyond 20 nmi 210–230° due reduced coverage.

ITHACA RDO: VOR unusable beyond 25 nmi 360–150°.

NEW YORK, KENNEDY RDO: VOR unusable below 1500' beyond 30 nmi 015–303°; below 1500' beyond 26 nmi 030–045°; below 2000' beyond 24 nmi 045–060°; below 1500' beyond 24 nmi 060–075°; below 1500' beyond 30 nmi 075–100°; below 1500' beyond 28 nmi 100–150°; below 1500' beyond 26 nmi 150–165°; below 1500' beyond 30 nmi 165–215°; below 1500' beyond 26 nmi 215–270°; below 2000' beyond 26 nmi 270–340°; below 2000' beyond 30 nmi 340–350°; below 1500' beyond 35 nmi 350–015°. MRA Northport Int 2500' MSL acct ers roughness.

NEW YORK RDO: La Guardia VOR (freq 113.1 mc) unusable clockwise beyond 20 mi 015–025°; 35 nmi 025–045°; 30 nmi 065–075°; 25 nmi 075–135°; 35 nmi 135–145°; 15 nmi 165–205°; 35 nmi 205–215°; 30 nmi 215–220°; 25 nmi 220–230°; 30 nmi 230–240°; 20 nmi 240–250°; 10 nmi 250–260°; 20 nmi 260–270°; 25 nmi 270–285°; 30 nmi 285–295°; 35 nmi 295–305°; 35 nmi 315–325°; 25 nmi 325–005° at MOCA.

ROCHESTER RDO: VOR unusable beyond 12 nmi btn 045 to 065° at MOCA. VOR subject to shutdown except Sundays and holidays acct arpt constr. Whenever weather conditions go below ceiling 800′ and/or visibility 2 mi VOR will return to service.

NORTH CAROLINA

CHARLOTTE RDO: VOR normal excp 045° rad unusable beyond 20 nmi due roughness.

ELIZABETH CITY RDO: VOR unusable 026–042° and 085–100°, unusable 276–312° below 5000′. V–472 tmpry authorized 130° rad FKN ECG VOR MEA 2500′ MSL due restrictions.

GOLDSBORO, SEYMOUR JOHNSON AFB RDO: VOR rads 290° thru 320° and 100 thru 130° unusable due roughness, scalloping and bends.

NORTH DAKOTA

FARGO RDO: TACAN azimuth has momentary cross pointer excursions within 22 nmi at MEA and below which may be encountered at higher alts and greater ranges.

OHIO

AKRON RDO: VOR portion VORTAC unusable 030–080° acct crs roughness. From V–72 utilize published YNG VOR rad from Akron to YNG. SW–bnd determine stn passage at Akron by To-From indicator. MEA 2500′ MSL.

BRIGGS RDO: VOR unusable 330–010° and 120–145°, unusable above 10,000′ MSL 305–325° acct roughness. For V–8, V–75, V–92, V–103 utilize published Wheeling VOR 310° radial BSV to Wheeling VOR 3000′ MEA.

JEFFERSON RDO: VORTAC 109° rad V1506 unusable beyond 40 nmi acct interference with Georgetown VOR, changeover point 40 nmi from JFN and 82 nmi from Keating VOR, MAA FL 240.

MANSFIELD RDO: VOR unusable above 8000′ MSL beyond 20 nmi from stn 150–220° due co-channel interference 108.8 mc from Rainelle, W.Va. VOR.

MONTGOMERY CO RDO: VOR unusable beyond 30 nmi 070° clockwise to 085°, 135–155°; 225–250°; 280–295° at MOCA. All other azimuths unusable.

STRONGVILLE RDO: VOR unusable beyond 35 nmi from 080–200° at MOCA.

OREGON

NEWPORT RDO: VORTAC coverage 40 nmi at MOCA excp unusable beyond 40 nmi below 8000′ MSL 350–150°; 6000′ MSL 150–170°; 6000′ MSL 320–350° acct reduced coverage.

PORTLAND RDO: VORTAC 332° rad of the TACAN azimuth and the DME on the same 332° rad not usable beyond 40 nmi at 6,000′.

REDMOND RDO: VORTAC unusable below 11,000′ MSL 190–210°; below 13,000′ MSL 210–240°.

ROSEBURG RDO: VOR coverage 40 nmi at MOCA excp 11,500′ MSL 070–085°; above 12,500′ MSL 100–125° beyond 35 nmi; 320° rad unusable beyond 35 nmi 12,500′ MSL 085–125°; 10,500′ MSL 125–130°; 6000′ MSL 215–285°. Unusable below 7000′ MSL.

PENNSYLVANIA

ALLENTOWN RDO: VOR unusable below 3500′ MSL beyond 26 nmi from 020 to 060° account crs roughness. TACAN azimuth unusable below 3500′ MSL beyond 26 nmi from 335 to 060° account crs roughness.

ALTOONA RDO: VOR unusable below 3500′ MSL beyond 18 nmi 070–100° below 3500′ MSL beyond 3 nmi 100–160° below 4500′ MSL beyond 30 nmi 290–310° all altitudes beyond 15 nmi 310–350° below 4000 MSL beyond 30 nmi 350–010° due reduced coverage.

BRADFORD RDO: H fac unusable beyond 15 nmi 9 to 180° acct excessive needle oscillation.

HARRISBURG RDO: VOR unusable beyond 26 nmi from 105–140°; beyond 30 nmi 140–165° beyond 3 nmi 195–230° at MOCA. TACAN azimuth unusable beyond 35 nmi 195–230° 15 nmi 230–265° and 33 345° at MOCA. TACAN distance unusable beyon 30 nmi 325–360° beyond 35 nmi 360° beyond 35 nm 360–025° at MOCA.

HAZLETON RDO: Non-Federal H facil hrs of oper limited to 0700–1900 UFN.

HUGHESVILLE RDO: H facil has erratic ADF actio 2–4 nmi from stn in E quad at min instr alt.

IMPERIAL RDO: VOR unusable from 150 to 170° belo 8000′ and from 345 to 360° below 14,500′ MSL a count crs roughness. For V40/41 btn IRL and AB VORTAC below 8000′ MSL utilize AGC 330° rad.

LANCASTER RDO: VOR unusable below 5000′ MS beyond 15 nmi, below 6000′ MSL beyond 25 nmi fro 320–340° acct crs scalloping.

LATROBE RDO: VOR unusable all alts all azimut beyond 20 nmi due crs vagaries.

PITTSBURGH, ALLEGHENY RDO: H facil brgs u reliable SW quad beyond 20 mi all alts due to exce sive needle oscillations.

THORNHURST RDO: VORTAC unusable beyond 1 nmi below 6000′ MSL 300–330°. TACAN portion VORTAC may be shut down until aprxly Dec 12 f mod.

YARDLEY RDO: VOR unusable below 1700′ MSL b yond 17 nmi 250–265°; beyond 10 nmi 265–280°; b yond 17 nmi 280–290° account crs roughness. TACA unusable below 2400′ MSL beyond 15 nmi, below 50 MSL beyond 30 nmi 225–275° acct roughness and DM unlock.

RHODE ISLAND

PROVIDENCE RDO: VOR unusable beyond 30 nm below 3000′ acct reduced coverage from 220–310°.

SOUTH DAKOTA

DUPREE RDO: TACAN azimuth unusable below 45 MSL 185–195° from 15 to 25 nmi acct crs roughnes

MITCHELL RDO: VOR restricted to VFR use on UFN.

MOBRIDGE RDO: State owned and operd VOR oper 0700–1900, VFR use only. Class: L–VOR. Freq 108.6, receivers 122.1. Ident MBG. Lctd lat 45°33′ 07″, long. 100°21′56″.

TEXAS

AMARILLO RDO: TACAN unusable beyond 15 nmi b low 7,000′ MSL 110–235° acct roughness.

AUSTIN RDO: VOR unusable beyond 35 nmi below 3500' MSL 290-320°.
BROWNWOOD RDO: VOR coverage restricted to 25 nmi at min instr alt 015-085°.
EL PASO RDO: TACAN unusable beyond 30 nmi at MOCA from 265° clockwise thru 300°.
FORT WORTH, GREATER SOUTHWEST RDO: TACAN portion of VORTAC unusable beyond 30 nmi below 4000' MSL.
GALVESTON RDO: TACAN unusable beyond 20 nmi below 3000' MSL 040–075 °acct crs roughness.
HOUSTON RDO: TACAN azimuth unusable due crs roughness.
LUBBOCK RDO: TACAN azimuth unusable from rad 140–190° below 8000' beyond 15 nmi.
PALACIOS RDO: TACAN unusable 265-330° acct roughness.
WACO RDO: TACAN unusable beyond 15 nmi below 5000' MSL 175–195°.
WICHITA FALLS RDO: TACAN azimuth inop indefinitely due crs roughness.
WINK RDO: TACAN portion unusable beyond 17 nmi below 7000' MSL 030-080°.

UTAH

CEDAR CITY RDO: VOR unusable beyond 40 nmi below 17,500' MSL 035-090°; below 22,000' MSL 090–100°; below 24,000' MSL 100-140°; below 20,000' MSL 140–150°; below 17,000' MSL 150-170° account reduced coverage.
DELTA RDO: VOR unusable beyond 40 nmi below 16,000' MSL 040-080° acct reduced coverage.
HANKSVILLE RDO: VORTAC coverage restricted from 160 thru S to 190° 26nmi at 14,000' MSL.
LUCIN RDO: VOR unusable beyond 40 nmi below 15,000' MSL 180–220°; below 12,000' MSL 280-310°; below 11,000' MSL 310–330° account reduced coverage.
MILFORD: Jet Route 107 from Milford, Utah VOR to Rock Springs, Wyo. VOR continuous navigation signal coverage does not exist over the entire route segment below 28,000'. VOR moderate to hvy roughness over mountain ridges on 072 rad 10 mi out.
OGDEN RDO: VORTAC unusable beyond 40 nmi below 21,000' MSL 36–055°; below 16,500' MSL 055 thru 075°; below 22,000' MSL 075 thru 130° account reduced coverage.
PROVO RDO: VOR unusable beyond 40 nmi below 15,000' MSL 010-035°; below 16,000' MSL 035–050°; below 15,000 MSL 275–285°; below 14,000' MSL 285–295° acct reduced coverage. Roughness exists over mountain ridges N thru E btn 15 and 20 nmi.
SALT LAKE CITY RDO: VORTAC unusable beyond 40 nmi below 19,000' MSL 010–020°; below 20,000' MSL 020–030°; below 23,000' MSL 030–060°; below 24,000' MSL 060–080°; below 19,000' MSL 080–095°; below 17,000' MSL 095–125°; below 16,000' MSL 125–140°; below 16,000' MSL 195–210°; below 10,000' MSL 280–290°; below 16,000' MSL 350-010° acct reduced coverage.

VERMONT

BURLINGTON RDO: VOR unusable beyond 35 nmi from 080° clockwise to 105°; 25 nmi 115–135°; 30 nmi 135–155° at MOCA.
MONTPELIER RDO: VOR unusable beyond 30 nmi 205-220°; beyond 25 nmi 220-235°; beyond 30 nmi 234–280° at MOCA.

VIRGINIA

BROOKE RDO: TACAN azimuth and distance unusable beyond 30 nmi 230° clockwise to 270° MOCA.
HERNDON RDO: VOR portion of VORTAC unusable below 2500' MSL. Beyond 30 nmi from 050-075°; beyond 20 nmi from 075-095°; beyond 35 nmi from 105-120°; beyond 20 nmi from 165°–215° acct of crs roughness. V39 E 209° usable 5000' and above beyond 20 nmi.
LAWRENCEVILLE RDO: VOR unusable below 1800' MSL beyond 8 nmi 215-250°; 14,500' MSL to 24,000' MSL 215-270° account roughness. MEA V-155 3000' MSL btn LVL VOR and Franklinton, N.C. Int. MEA V-454, 5000' MSL btn LVL VOR and LIB VOR. Changeover point 82 nmi from LIB VOR.
LINDEN RDO: TACAN azimuth and DME unusable below 3500' beyond 25 nmi 140-180°; below 5000' 180 225° acct reduced coverage.
MONTEBELLO RDO: VOR unusable 110-220° beyond 35 nmi at MOCA. 058 rad unusable above 14,500'.
PULASKI RDO: VORTAC unusable beyond 35 nmi from 015° clockwise to 060° at MOCA.
QUANTICO MCAS RDO: Use LFR as H facil only.
ROANOKE RDO: Woodrum VOR unusable beyond 30 nmi from 360 to 285°, 20 nmi 286-360° at MOCA. H facil unusable beyond 40 nmi from 240 to 010° below 6000' due excessive needle oscillation.

WASHINGTON

BELLINGHAM RDO: Intermittent roughness may be observed on V–23 below 6000' MSL from 49 nmi thru 40 nmi S of VOR.
NEAH BAY RDO: H facil unusable 100-130° below 6500' MSL acct terrain.
OLYMPIA RDO: VORTAC unusable below 7500' MSL at 40 nmi 210–260°. TACAN unusable below 15,000' MSL 260-270° at 40 nmi; below 9500' MSL at 35 nmi 270–280° account reduced coverage. VOR 348° rad unusable below 4500' MSL beyond 24 nmi.
PASCO RDO: VOR unusable below 6500' MSL beyond 40 nmi 150–210°; below 5500' MSL 210–270° acct reduced coverage. Coverage within R-6715 from 270–320° not flt checked.
PORT ANGELES RDO: VOR coverage 40 nmi: 220–110° at 7000'; 110–140° at 14,500'; 140–150° at 20,500'; 150–170 °at 29,000'; 170–190° at 20,500; 190–220° at 16,000'.
SEATTLE RDO: LFR NW crs has splits and multiples beyond 20 nmi. VOR unusable beyond 10 nmi 158° clockwise 165°. 309° rad unusable below 14,000 within 40 nmi.
WALLA WALLA RDO: VOR coverage at 40 nmi restricted below 6000', 355–020° and 148–176°; below 7500' from 130–150°; below 10,500' from 020–060° and 110–130°; below 12,700' from 065–110°.
WENATCHEE RDO: VOR unusable beyond 20 nmi below 20,000' MSL 000–020° beyond 30 nmi below 20,000' MSL 020–075° beyond 40 nmi below 14,000' MSL 075-090° below 18,000' MSL 090–190° below 19,000' MSL 190–240°.

WEST VIRGINIA

BECKLEY RDO: VOR unusable beyond 20 nmi 325–350° below 5000′ acct crs roughness, excluding 335° rad at Montgomery Int. Voice reception Charleston FSS unreliable below 7500′ MSL 40 nmi radius Beckley VOR 030–180°. Reception satisfactory with acft over VOR or MEA.

LA CROSSE RDO: VOR unusable 100–150° and 230–060° below 3300′ MSL beyond 20 mi.

MILWAUKEE RDO: Timmerman VOR unusable beyond 35 mi 300–310° below 3400′ MSL acct reduced coverage. Alarm status MKE VOR indicated by transmission of unkeyed 1020 cycle ident signifying unusability for nav and indicating imminent equipment transfer shutdown.

WYOMING

BOYSEN RESERVOIR RDO: VOR has momentary cr excurisions and roughness all radials.

SHERIDAN RDO: VORTAC unusable beyond 35 nm below 16,000′ MSL 195–225°.

VOR RECEIVER CHECK POINTS

The list of VOR airborne check points and ground check points is given on the following pages.

NOTE: The information is provided in the following order: Facility name (plus airport name, if needed); bearing in degrees magnetic from the VOR; location of the check point (distances in nautical miles); and altitude (in feet MSL, if any).

AIRBORNE

Abilene, Tex. (Municipal): 047°; 10.1 nmi silos in center of Ft. Phantom alternate for lgt acft 099° 9 nmi ctl twr and bcn.

Alexandria, La. England AFB): 329°; over water tank.

Alexandria, La. (Esler): 152°; over hangar 3.6 nmi from VOR.

Alexandria, Minn.: 223.5°; over apch end of rnwy 22.

Allendale, S.C.: 342°; over N/S rnwy on Barnwell Co. Arpt.

Anniston, Ala.: 082°; in center of segmented circle, distance 9.5 nmi; 2000'.

Appleton, Ohio: 238°; over ctl twr Columbus, Ohio-Port Columbus Airport; 2500'.

Asheville, N.C. (Mun): 278°; over ctl twr 13.6 nmi from VOR; 3000'.

Athens, Ga.: 308°; 3 nmi over center of three rdo twrs.

Atlanta, Ga.: Lctn #1—012°; over end rnwy 09. Lctn #2—020°; over end rnwy 27.

Augusta, Ga. (Bush Field): 141°; directly over No. 17 of rnwy #17; 300'.

Augusta, Me. (State): 257°; over LFR, 1.8 nmi from AUG VOR; 1500'.

Austin, Tex. (Mueller Mun): 178°; Freeway Int aprxly 0.9 nmi N of Mueller Mun Arpt.

Bakersfield, Calif. (Meadows Fld): 127°; over apch end rnwy 30; 1200'.

Bangor, Me.: 072°; over FSS Bldg., Old Town Arpt; 1000'.

Bartlesville, Okla. (Phillips): 161°; over Phillips oil tank—white ½ mi E of arpt trml.

Baton Rouge, La. (Ryan): 064°; over tank S side of arpt.

Beatrice, Nebr.: 360°; over RR at Princeton, Nebr.; 2500'.

Beaumont, Tex. (Jefferson County): 056°; water twr aprxly 0.4 mi NE of NE end of rnwy 2.

Bellingham, Wash.: 145°; N end of rnwy 16–34; 660'.

Big Spring, Tex.: 199°; over the rdo bcn; 1000' AGL.

Billings, Mont. (Municipal): 073°; Intersection of rnwys 4–22 and 9–27; 4600'.

Blackstone, Va.: 123°; beacon lgt Lawrenceville, Va. Arpt; 1500'.

Bloomington, Ill. (Mun): 030°; lctd 11 nmi NE of BMI VOR at railroad crossing river; 2000'.

Boise, Idaho (Air Trml): 086°; over dam outlet S end Lucky Peak Reservoir, 8.5 nmi from VOR; 5000'.

Bozeman, Mont.: 145°; over BZN rdo bcn; 5000'.

Brownsville, Tex. (Rio Grande Valley Intl): 244°; water twr in bldg area of arpt.

Brownwood, Tex: 167°; over arpt bcn.

Brunswick, Ga. (McKinnon): 023°; at arpt rotating beacon.

Burlington, Iowa: 296°; over rdo twr 3 nmi NNW Burlington Arpt.

Burlington, Vt. (Municipal): 030°; over arpt control twr 4.4 nmi from VOR; 2000'.

Butler, Mo.: 073°; over FSS bldg.

Butte, Mont.: 004°; intersection of rnwy 29–33; 6500'.

Carleton, Mich. (Detroit-Wayne-Major): 031°; the E/W and NW/SE rnwys SE of new ctl twr; 2200'.

Casper, Wyo. (Air Trml): 201°; over intersection rnwys 21–25–30; 6300'.

Centralia, Ill. (Mun): 027°; at apch end of rnwy 36.

Chadron, Nebr.: 014°; railroad intersection 1.5 nmi N arpt bndry.

Champaign, Ill.: 175°; over grain elevator 8 nmi S at Pesotum, Ill.; 2000'.

Cleveland, Ohio (Cleveland-Hopkins): 079°; over Cleveland LFR distance 13.5 nmi; 1500'.

Colorado Springs, Colo. (Peterson Fld): 320°; over microwave twr, 6.8 nmi.

Colts Neck, N.J.: 084°; over awy bcn twr at NE corner of Red Bank, N.J. Arpt.

Concord, N.H. (Mun): 132°; over rdo twr (old LFR) 5.0 nmi.

Corpus Christi, Tex. (Intl): 187°; over grain elevator 1 nmi E of arpt.

Cotulla, Tex.: 255°; rotating bcn on the Cotulla Intl Arpt.

Crescent City, Calif. (McNamara Fld): 104°; over Tankfarm E side of town; 1000'.

Crestview, Fla.: 104°; over center of arpt; 900'.

Crossville, Tenn (Meml Arpt): 333°; 11 nmi over metal hangar.

Cut Bank, Mont.: 312°; over center rnwy 31; 4800'.

Daggett, Calif.: 224°; over center twr LFR; 2500'.

Danville, Ill. (Vermillion Co.): 194°; int of rnwys 21 and 17; 1700'.

Dayton, Ohio (Mun): 131°; over new trml bldg, 10.76 nmi; 2500′.

Daytona Beach, Fla. (Mun): 157°; over remote ctld air/gnd facility antenna.

Decatur, Ala. (Pryor): 002°; over intersection of rnwy and taxiway 236° from HSV; 1000′.

Defiance, Ohio (Bryan-Defiance Mem'l): 074°; over Admin Bldg, 6.5 nmi from DFI VOR; 1300′.

Delta, Utah: 346°; at apch end of rnwy 34; 4900′.

Denver, Colo.: 189°; over EGW rdo bcn; 5800′.

Des Moines, Iowa: 356°; center twr of DSM LFR, 4.2 nmi from VOR.

Douglas, Ariz. (Bisbee-Douglas Intl): 119°; over intersection rnwy 12–30 and 17R–35L; 4700′.

Dublin, Ga. (Municipal): 067°; over SW end NE/SW rnwy.

Dubois, Idaho (Municipal): 335°; FAA Communications Bldg; 5200′.

Eagle Lake, Tex.: 181°; over center of football fld 0.5 nmi SW of Eagle Lake Arpt.

El Dorado, Ark. (Goodwin): 228°; trml bldg E side of arpt.

Ellensburg, Wash. (Bowers): 255°; center, W end of rnwy 7–25; 2300′.

Emporia, Kans.: 046°; over schoolhouse Neosho Rapids, Kans., 8.5 nmi 2500′.

Ephrata, Wash.: 200°; centerline, SW end of rnwy 2–20; 1500′.

Evergreen, Ala.: 100.7° ; arpt bcn lgt twr lctd on Evergreen (Middleton) Arpt., 15.3 nmi from VOR.

Fargo, N.Dak. (Hector): 360°; lctd apch end Hector Fld rnwy 35.

Farmington, Mo.: 195°; over center of Open Air Theater NE of the town of Fredericktown and 7.0 nmi from VOR; 2300′.

Fayetteville, Ark.: 183°; VORTAC; white circle on arpt; 2500′.

Fayetteville, N.C.: 239°; over water twr at Parktown, N.C. 8.0 nmi; 1200′.

Fillmore, Calif.: 210°; at CAV rdo bcn 1800′.

Findlay, Ohio: 048°; over the Ohio Oil Company Admin Bldg at 2000′; aprxly 5 nmi from FDY VOR.

Flint, Mich. (Bishop): Pontiac VOR 332°; over apch end rnwy 9; 2200′.

Flying Cloud, Minn.: 349°; 4.5 nmi over smokestack at Glen Lake Sanatorium; 2000′.

Fort Leonard Wood, Mo. (Forney AAF): 351°; water twr N side E–W hvy dist 4.9 nmi from transmitter.

Fort Smith, Ark.: 232°; water tank at N edge of arpt; 1300′.

Fortuna, Calif.: 358°; over intersection of rnwys Arcata Arpt; 500′.

Fortuna, Calif. (Rohnerville): 128°; over apch end of rnwy 11; 1400′.

Fresno, Calif. (Air Trml): 133°; over apch end rnwy 11; 500′.

Gage, Okla.: 094°; over LFR; 3000′.

Galveston, Tex.: 110°; arpt terminal bldg.

Garden City, Kans.: 100°; Cimarron, Kans. at RR tracks and Main St.

Gardner, Mass.: 169°; hangar mrkd "WORCESTER" on roof, Worcester Arpt; 1000′.

Gila Bend, Ariz.: 193°; over apch end of rnwy 35 of Gila Bend Aux. Fld; 1500′.

Goodland, Kans. (Mun): 083°; over water twr NE edge of town of Brewster, Kans., 16 nmi; 4000′.

Gordonsville, Va.: 305°; over intersection of rnwy and center txwy Charlottesville-Abermarle Arpt., 16 nmi from GVE–VOR; 2000′.

Grand Forks, N. Dak.: 315°; over Int N/S and E/W rnwys: 1900′.

Grand Island, Nebr.: 141°; over smoke stack 5.5 nmi from VOR; 3100′.

Grand Junction, Colo. Walker Fld): 059°; int rnwys 29 and 22; 6500′.

Grants, N. Mex.: 295°; in flt over FSS adj to rnwy; 7000′.

Great Falls, Mont.: 026°; center NE end rnwy 3–21; 3900′.

Hallsville, Mo.: 225°; 14 nmi Int of E/W and N/S rnwys over Columbia Mun Arpt., Mo.; 2000′.

Harlingen, Tex.: 149°; over rot bcn on Mun Arpt.

Harrisburg, Pa. (York State): 109°; over triangle formed by rnwys: 2000′.

Hattiesburg, Miss. (Mun): 149°; over water twr and rotating lgt bcn on arpt.

Hayes Center, Neb.: 258°; 28 nmi over center of town of Enders, Neb.; 4500′.

Hibbing, Minn.: 311°; over FSS Bldg; 2400′.

Hickory, N.C.: 225°; over end rnwy 24.

Hill City, Kans.: 057°; Hill City Arpt bcn lgt 23 nmi from the VOR.

Hobart, Okla.: 352°; centerline of N/S rnwy 100′ above the elevation of the rnwy.

Hobbs, N. Mex. (Lea County): 030°; over circle on runup pad apch end rnwy 3.

Hoquaim, Wash. (Bowerman): 037°; W end and center rnwy 6; 500′.

Houghton, Mich. (County Mem'l): 241°; WHDF com. bdcst twr 3.5 nmi from VOR; 2100′.

Houlton, Me.: 042°; over Admin Bldg on E side of flt and 5.5 nmi from VOR; 1500′.

Houma, La.: 117°; over intersection of rnwys 17–35 and 11–29.

Houston, Tex. (Andrau): 276°; arpt bcn on arpt; 500′.

Houston, Tex.: 099°; over intersection of E/W txwy and parking ramp of Ellington Field.

Huron, S. Dak. ((Howes): 153°; lctd over HON/SBH: 2000′.

Hutchinson, Kans.: 032°; apch end rnwy 3 Hutchinson Mun Arpt.

Imperial, Calif.: 313°; apch end of rnwy 32; 200′.

International Falls, Minn.: 142°; RR bridge over stream of Ericsburg, Minn 5.4 nmi; 2200′.

Jackson, Miss. (Hawkins): 189°; over arpt intersection of rnwys 11–29 and 34L–16R.

Jackson, Tenn. (McKellar): 267°; over bcn twr above arpt; 1000′.

Joliet, Ill.: 102°; over centerline of NW end of NW/SE rnwy; 1500′.

Ceeler, Mich.: 266°; over intersection of N/S and E/W rnwys at Ross Fld, Benton Harbor, Mich.; 1600'.

Kennebunk, Me.: 061°; over Portland Arpt control twr 18.5 nmi from Kennebunk VOR; 1500'.

Kirksville, Mo.: 138°; over water twr at La Plata, Mo. (8.2 nmi from VOR).

Lakeside, Ind.: 097°; over int NW/SE and NE/SW rnwys Marion Mun Arpt., Ind., 17.5 nmi from VOR; 1000'.

La Crosse, Wis.: 321°; 5 nmi LFR; alt 1800'.

Lafayette, Ind.: 135°; over Purdue Univ Stadium, 2100'.

Lake Charles, La. (Mun): 253°; over rotating bcn on ctl twr, 6.2 nmi.

Lamoni, Iowa ((Lamoni): 041°; over hwy "Y" 1 nmi W of Leon, Iowa.

Laredo, Tex.: 315°; over arpt bcn 9.5 DME.

Laurel, Miss. (Municipal): 025°; over water twr and rotating lgt bcn on arpt.

Lewistown, Mont.: 072°; above center of rnwy 7; 5200'.

Lexington, Ky. (Blue Grass): 305°; arpt ctl twr 7.6 nmi from LEX VOR; 2500'.

Liberal, Kans.: 056°; elevator 8.5 nmi NE Liberal, Kans. along Railroad.

Litchfield, Mich.: 051°; NE/SW rnwy Reynolds Fld, Jackson, Mich.; 2000'.

Livingston, Mont.: 199°; over ant of Livingston "H" facility; 5700'.

London, Ky.: 027°; trml bldg 3.7 nmi from LOZ VOR; 2700'.

Lufkin, Tex.: 328°; rotating bcn on Angelina Co. Arpt.

Macon, Ga. (Mun): 246°; 4.0 nmi from VOR over water tank; 2000'.

Malden, Mo.: 349°; RR crossing 0.5 nmi E of Dexter, Mo.

Manchester, N.H. (Grenier Fld-Manchester Mun): 341°; over former USAF arpt ctl twr E side 17–35 rnwy. 5.0 nmi; 1500'.

Marquette, Mich.: 120°; 5.5 nmi over NW tip of Pelesier Lake; 2000'.

Marshall, Tex.: 320°; water twr N of arpt.

Marshall, Mo. (Memi): 321° BWR; over MHL VORTAC Bldg; 2000'.

Marysville, Calif. (Yuba County): 067°; intersection of rnwys; 1500'.

Massena, N.Y. (Richards): 297°; Admin Bldg; 1500'.

McComb, Miss. (Pike County): 248°; revolving arpt bcn.

Medford, Oreg.: 212° (VOR); over rdo twr, 4.8 nmi 3000'.

Merced, Calif.: 289°; (Castle VOR); over end rnwy 30; 650'.

Midland, Tex. (Air Trml): 170°; over apch ends of rnwys 22 and 28; 1000'.

Miles City, Mont.: 30°; to apch end of rnwy 4.

Millinocket, Me. (Mun): 317°; over FSS Bldg; 1500'.

Milwaukee, Wis. (General Mitchell); 123°; over MKE LFR.

Minneapolis, Minn. (Crystal Arpt): 166°; over apch end rnwy 13L. 4.9 nmi VORTAC; 1500' nmi.

Minot, N. Dak.: 241°; apch end rnwy 26; 1900'.

Montebello, Va. (Preston Glenn near Lynchburg, Va.): 192°; intersection all rnwys; 2500'.

Montgomery, Ala. (Dannelly): 319°; over water twr, distance 6.1 nmi from VORTAC.

Muskegon, Mich. (County): 256°; over Muskegon LFR; 1500'.

Myrtle Beach, S.C. (AFB): 061°; over apch end rnwy 5 Crescent Beach Arpt.; 500'.

Napa, Calif. (County): 045°; over rotating bcn on arpt: 500'.

Naperville, Ill.: 328°; over RR underpass lctd ½ nmi NE of the DuPage County Arpt: 2000'.

Nashville, Tenn.: 242°; WSM rdo twr near Brentwood, Tenn., 10.2 nmi from VOR.

Neola, Iowa: 047°; over grain elevator Harlon, Iowa: 2500'.

Neosho, Mo.: 343°; center triangle formed by the intersection of 3 rnwys of Joplin, Mo., Mun Arpt.

Newbern, N.C.: 259°; Int of E/W rnwys Oak Grove (navy) arpt.

New Orleans, La. (Mun): 081°; over rotating bcn trml bldg on New Orleans Mun Arpt.

New Orleans, La. (Lakefront Arpt): 070°; over Lakefront twr.

Newton, Iowa: 142°; lctd apch end NW/SE rnwy.

Norfolk, Nebr.: 095°; over racetrack town of Stanton, Nebr.; 2000'.

North Bend, Oreg.: 254°; intersection rnwy 22–31; 750'.

North Platte, Nebr. (Lee Bird): 82.6°; over water twr Brady, Nebr.; 4000'.

Oklahoma City, Okla. (Will Rogers): 100°; rdo bcn stn; 1800'.

Oklahoma City, Okla. (Wiley Post): 041°; OKC VOR int rnwys 17–35 and 12–30; 1800'.

Omaha, Nebr. (Eppley Fld): 309°; centerline of SE end of NW/SE rnwy.

O'Neil, Nebr.: 115°; at intersection of E/W road and the railroad ½ nmi SE of Inman, Nebr.

Ontario, Calif. (Intl: 347°; over and parallel with txwy btn rnwy 21 and 25; 2300'.

Oshkosh, Wis.: 017°; WOSH Commercial Rest twr 3.5 nmi from VOR.

Ottumwa, Iowa (Mun); 303°; int of rnwys 32 and 22.

Peck, Mich.: 163°; over apch end rnwy 3 on St. Clair Co. Arpt; 2200'.

Philip, S.D.: 156°; over 2712' twr 5 nmi from VOR; 3300'.

Phoenix, Ariz.: 256°; centerline rnwy 8R–26L; 2800'.

Picayune, Miss.: 140°; over rotating lgt bcn on arpt.

Pinehurst, N.C.: 086°; over windsock on top of hangar at Southern Pines, Pinehurst-Southern Pines Arpt.

Big Spring, Tex. (Howard County) : 142°; NW corner of taxistrip to rnwy 16.

Binghamton, N.Y. (Broome County) : 077°; 400′ S of ctl twr on S ramp south.

Bismark, N. Dak.: 275°; intersection of N/S taxi strip and the apch end of rnwy 13.

Blythe, Calif. (Riverside Co.) : 048°; on ramp 500′ in front of FSS Bldg.

Boise, Idaho (Air Trml) : 084°; center N/S taxiway between rnwys 28L–10R and 28R–10L on fld.

Bowling Green, Ky. (Bowling Green-Warren County) : 021°; taxiway in front of Admin Bldg.

Bradford, Pa. (McKean Co. Arpt) : 323°; NE txwy 282° from rnwy 32 centerline.

Bristol, Tenn. (Tri-City) : 282°; SW end of ramp in front of trml bldg.

Brownsville, Tex. (Rio Grande Valley Intl) : 248°; apch end rnwy 13L.

Carlsbad, N. Mex.: 334°; immediately W of FSS and twr bldg on ramp.

Chattanooga, Tenn. (Lovell) : 332°; centerline S taxiway at point 175′ NE of centerline rnwy 32.

Cheyenne, Wyo.: 199°; on yellow line on taxi strip immediately SE or apch end rnwy 8.

Chicago (West Chicago), Ill. (Du Page Co.) : 067°; 5.2 nmi on SW corner of N parking ramp at int of txwy to rnwy 15 and txwy paralleling rnwy 15–33.

Childress, Tex.: 353°; intersection of edge of ramp at center taxi strip.

Cincinnati, Ohio: (See Covington, Ky.).

College Station, Tex.: 095°; on W edge of parking ramp on Easterwood Arpt.

Columbia, S.C. (Owens Fld) : 022°; compass rose on parking ramp.

Columbia, S.C. (Mun) : 331°; circle 450′ S of ctl twr alt 244′.

Columbus, Ga. (Muscogee Co.) : 145°; pointed circle W end of main ramp area.

Columbus, Miss. (Lowndes County) : 095°; at center taxiway between parking ramp and rnwy.

Covington, Ky. (Greater Cincinnati) : 043°; rnwy 27 E of intersection rnwys 27 and 22.

Crestview, Fla.: 104°; on center of concrete circle on rnwy.

Cross City, Fla. (Site 58, MEM–TPA) : 298°; taxiway near wind indicator and rotating bcn lgt.

Dalhart, Tex.: 170°; SE corner of main ramp.

Dallas, Tex. (Addison) : 159°; intersection of center and parallel taxiways.

Danville, Va. (Mun) ; 338°; S of trml bldg center of intersection of txwy to rnwy 6 and txwy to rnwy 2.

Dickinson, N. Dak.: 182°; intersection of E/W txwy and N/S txwy.

Dodge City, Kans.: 150° center of NW end of NW/SE rnwy.

Dothan, Ala. 186°; intersection of ramp and taxi strip NW of trml bldg.

Dubuque, Iowa: 335°; on ramp in front of terminal bldg.

Duluth, Minn.: 012°; center of intersection formed by taxi strips leading to rnwys 31 and 2 just off SE corner of ramp.

Duncan, Okla. (Halliburton Fld) : 328°; trml ramp.

Dyersburg, Tenn.: 250°; intersection of ramp and center taxi strip.

East Hartford, Conn. (Rentschler) : 347°; letd at taxi strip near N side of ctl twr.

Eau Claire, Wis.: 180°; center of concrete ramp 150′ W of Admin Bldg.

Elizabeth City, N.C. (CGAS) : Lctn #1—028°; letd on taxiway leading from CG ramp.

Elko, Nev.: 329°; on apron just off NE end of rnwy 5–23.

Elmira, N.Y. (Chemung County) : 066°; midpoint of short taxistrip between rnwy 10 and 6 at W side of arpt,

aprxly 198′ S of C/L rnwy 10 and 374′ N of C/L rnwy 6.

Erie, Pa. (Erie-Port Erie) : 059° ; txwy apchg rnwy 6.

Eugene, Oreg. (Mahlon-Sweet) : 068° ; apch to apron immediately W of the Amin Bldg.

Fayetteville, N.C. (Grannis) : 305° ; on rnwy turnoff in front of ctl twr.

Florence, S.C.: 235° ; on taxiway W of the end of rnwy 18.

Fort Benning, Ga. (Lawson AAF) : Lctn #1—021° ; run up area on txwy at apch end of rnwy 20. Lctn #2—019° ; run up area on txwy W ctl twr at intersection or rnwy 02–20 and 14–32. Lctn #3—055° ; run up area on txwy S of ctl twr at junction with rnwy 14. Lctd #4—130° ; run up area on txwy at apch end of rnwy 32.

Fort Dodge, Iowa: 118° ; 6.1 nmi from VOR on W edge of trml bldg.

Ft. Lauderdale, Fla (Hollywood Intl Arpt) : 120° ; on ramp in front of Trml Bldg.

Fort Myers, Fla. (Page) : 172° ; N side of Trml ramp.

Fort Riley, Kans. (Marshall AAF) : 030° ; on SE corner of tie down area and taxiway apchg rnwy 4.

Fort Rucker, Ala. (Cairns AAF) : Lctn #1—019° ; run up area on txwy apch end rnwy 13. Lctn #2—035° ; NW of Int rnwy 13 and 18. Lctn #3—040° ; run up area on txwy Int rnwy 13 and 18. Lctn #4—059° ; run up area on txwy N of apch end rnwy 26. Lctn #5—063° ; run up area on txwy S apch end rnwy 26. Lctd #6—058° ; run up area on txwy at Int rnwy 24 and 36. Lctn #7—078° ; run up area on txwy W of apch end rnwy 36. Lctn #8—062° ; on run up area txwy N of apch end rnwy 6.

Fort Stockton, Tex.: 116° ; on ramp N of terminal.

Goldsboro, N.C. (Seymour Johnson AFB) : 028° ; run up pad at apch end rnwy 8.

Green Bay, Wis. (Austin-Straubel) : 141° ; intersection of circular taxi strip, W of Admin Bldg., and taxi strip leading to intersection of S and SE rnwys.

Greenwood, Miss.: 060° ; central taxiway adj to ramp.

Greenwood, S.C. (County) : 251° on taxiway apch end of rnwy 9.

Gulfport, Miss.: 098° ; on arpt.

Harrison, Ark.: 131° ; Int taxiway and ramp.

Helena, Mont. (City-Co.) ; taxiway adj to apch end rnwy 26.

Hobbs, N. Mex. (Lea County) : 030° ; on runup pad apch end rnwy 3.

Hot Springs, Ark.: 245° ; taxiway adj to rnwy 5.

Houston, Tex.: 292° ; NE end rnwy 12.

Hyannis, Mass. (Barnstable Mun) : 243° ; lctd on rnwy apron for rnwy 24.

Idaho Falls, Idaho (Fanning Fld) : 007° ; junction of N/S txwy and rnwy 16–34, at NE corner of arpt.

Ithaca, N.Y. (Tompkins Co.) : 202° ; at bend in txwy, 375′ from centerline of NW/SE rnwy.

Jamestown, N. Dak.: 258° ; junction of taxi strip leading from hangar with SW taxi strip.

Johnstown, Pa. (Cambria County) : 155° ; taxiway to rnwy 33.

Junction, Tex. (Kimble County) : 143° ; N edge of parki ramp.

Key West, Fla. (Boca Chica) : 091° ; W just N of ap end of rnwy 7.

Key West, Fla. (Int'l) : 131° ; NW portion of ramp.

Kinston, N.C. (Stallings) : 230° ; 500′ in front of Adm Bldg.

Klamath Falls, Oreg.: 294° ; 154′ N of txway in front Admin Bldg., and 36′ from E edge of ramp.

Lafayette, La.: Lctn #1—350° ; on taxiway at N end N rnwy. Lctn #2—343° ; on taxiway at S end N/S rnw

La Grange, Ga.: 106° ; on compass rose at taxi strip int section aprxly 500′ due S of Admin Bldg.

Lancaster, Pa.: Intersection or ramp and txwy leading intersection of rnwys.

Lansing, Mich. (Capital City) : 053° ; center of apch e rnwy 5.

Laramie, Wyo. (Brees) : 100° ; on loading ramp.

Laredo, Tex. (AFB) : Lctn #1—137° ; off end of ra on taxiway 2, 4.8 nmi. Lctn #2—131° ; off S end ramp on taxiway 6, 4.0 nmi.

Laredo, Tex.: 315° ; on ramp adj to apch bcn.

Las Vegas, Nev. (McCarran Fld) : 351° ; on run-up ar W side rnwy 19.

Las Vegas, N. Mex.: 231°, concrete ramp N of FSS Bl

Lawton, Okla.: 349° ; on trml apron at the point int secting the S taxi strip.

Little Rock, Ark. (Adams) : 314° ; on taxi strip adj junction rnwy 14.

Longview, Tex. (Gregg County) : 125° ; txwy adj to rn 13 to end of rnwy 13.

Louisville, Ky. (Bowman) : 329° ; taxiway W of rnwy

Louisville, Ky. (Standiford) : 301° ; taxiway between ra and rnwy 19.

Lubbock, Tex.: 111° ; W edge of ramp N of trml bldg.

Lufkin, Tex.: (Angelina Co. Arpt) : 328° ; Intersection ramp and taxiway in front of Trml Bldg.

Mansfield, Ohio (Mun) : 133° ; at intersection of NW a SW taxiways.

Marfa, Tex. (Alpine) : 108° ; S edge of ramp in front FSS.

Marianna, Fla.: 310° ; ESE end taxiway 6.

Marshall, Tex. (Harrison Co Arpt) : 318° ; Int of E a N/S taxiway in front of N ramp.

Martinsburg, W. Va.: 281° ; near apch end of rnwy 35.

Mason City, Iowa: 356° ; on centerline S end of N/S rnw

McAlester, Okla. (Mun) : 350° ; taxistrip at terminal ram

McAllen, Tex. (Miller Int'l) : Lctn #1—040° ; at int section E/W txwy and N/S txwy. Lctn #2— 012 in front airline trml on gate two loading spot,.

Melbourne, Fla. (Eau Gallie) : 146° ; 220′ E of FSS.

Meridian, Miss. (Ky) : 121° ; from run up ramp for rnw 23.

Midland, Tex. (Air Trml) : Lctn #1—188° ; center warm up pad for rnwy 10. Lctn #2—178° ; int txw C and ramp in front of Trml Bldg.

Mineral Wells, Tex.: 307° ; intersection of txwy and N rnwy.

Missoula, Mont. (County) : 340° ; 5′ from edge of ramp front of Admin Bldg.

Mobile, Ala. (Bates): 108°; apch end of rnwy 9.
Monroe, La. (Selman): 033°; arpt ramp in front of twr structure adj to the txwy leading to intersection of rnwys 17–35 & 4–22.
Muscle Shoals, Ala.: 289°; eastern end of E/W rnwy 11–29 equi-distance from end and both sides of rnwy.
Nantucket, Mass. (Memorial): 241°; taxiway apchg rnwy 24.
Needles, Calif. (Site 25B, LAX-AMA): 253°; on ramp in front of Admin Bldg.
New Bern, N.C.: 088°; on compass rose at ramp.
New Orleans Intl, La. (Moisant Fld): 235°; center of perimeter txwy 100′ S of rnwy 10.
Norfolk, Va. (Mun): 031°; center of txwy "E", 250′ NW of centerline of rnwy 22.
Oakland, Calif. (Metro-Oakland Int'l): 081°; middle of pad between rnwys 27L and 27R.
Olympia, Wash.: 347°; on ramp in front of Admin Bludg.
Orlando, Fla. (Herndon): 300°; midpoint of N/S taxiway on W bndry of arpt.
Paducah, Ky. (Barkley): 040°; on txwy apchg end of rnwy 22.
Palacious, Tex.: 119°; intersection NW end NW/SE rnwy and S txwy strip.
Panama City, Fla. (Bay Co. Arpt): 195°; N/S txwy 1050′ N or Term bldg.
Paris, Tex. (Cox Fld): 348°; intersection of N/S and E/W txwys.
Parkersburg, W. Va. (Wood County): Lctn #1—209°; run-up area N side of rnwy 28. Lctn #2—207°; on txwy near intersection rnwys 16 and 21.
Pasco, Wash.: 020°; S of int ofN/S txwy and rnwy 20L.
Paso Robles, Calif.: 248°; 150′ S of Admin Bldg on parking ramp, indicated by circle and sign.
Pecos, Tex. (Mun): 133°; on ramp adj to center taxiway.
Pellston, Mich. (Emmet Co.): 239°; intersection of centerlines of N/S rnwy and E/W txwy of arpt.
Pendleton, Oreg.: 076°; 200′ W of Admin Bldg.
Peoria, Ill. (Greater Peoria): 098°; at SW corner of service ramp E side of fld.
Philadelphia, Pa. (North Philadelphia): 215°; on taxi strip between ramp and rnwy 10.
Phillipsburg, Pa. (Black Moshannon-State): 252°; rnwy intersection.
Pierre, S. Dak.: 250°; in front of municipal hangar.
Pine Bluff, Ark. (Grider): 179°; center txwy at junction N/S rnwy.
Ponca City, Okla.: 101°; taxi strip at junction to trml ramp.
Pontiac, Mich.: 114°; center of warmup pad S of apch end rnwy 27.
Pueblo, Colo.: 244°; painted circle with arrow on ramp W of Admin Bldg.
Quincy, Ill. (Quincy-Baldwin Fld): 030° at intersection of NE/SW and NW/SE taxi strips N of trml bldg.
Raleigh, N.C.: 244°; end rnwy 5.
Rapid City, S. Dak.: 320°; in front of Admin Bldg adj to center taxi strip.
Raymond, Nebr. (Lincoln AFB/Mun): 174° run up pad of rnwy 35R along centerline of N/S txwy.
Redding, Calif. (Mun): 310°; intersection txwy and rnwy 12.
Redmond, Oreg.: 086°; on ramp in front of Admin Bldg 60′ W of centerline of txwy to rnwy 10–28.
Reno, Nev.: 240°; lctd on concrete runup mat for rnwy 16.
Riverton, Wyo. (Mun): 178°; txwy between Admin Bldg and rnwy.
Roanoke, Va. (Woodrum): 069°; filled area rnwy 27.
Rochester, Minn.: 030°; of taxiway that enters apch end of rnwy 31.
Rochester, N.Y. (Monroe Co.): 149°; on ramp in front of ctl twr 415′ from centerline rnwy 1–19 and 305′ from centerline of rnwy 7–25.
Rock Springs, Wyo.: Lctn #1—266°; in center of turnaround E end rnwy 25. Lctn #2—261°; in center of turn-around W end rnwy 7.
Rockford, Ill.: 112°; apex of txwys at center of arpt.
Rocky Mount, N.C.: 263°; right 3 rnwy 33, marker.
Rome, Ga. (Russell Fld): Intersection of taxiways 200′ S of the terminal bldg.
Saginaw, Mich. (Tri-City): 280°; lctd on NE parking ramp 12′ from field edge near center txwy.
St. Petersburg, Fla. (Pinellas County Int'l): 255°; parking ramp 500′ SE of ctl twr.
St. Thomas, V.I. (Charlotte Amalie, Truman): 118°; on center point of arpt txwy on line 3 mi WNW.
Salinas, Calif. (Mun): 257°; rgt shoulder rnwy 21, directly in front of trml bldg.
Salisbury, Md. (Salisbury-Wicomico County): 243°; ramp front of ctl twr.
San Angelo, Tex. (Mathis): 236°; E edge of ramp in front of twr.
San Antonio, Tex. (Stinson Mun): Lctn #1: 329R, run up area at apch end rnwy 9. Lctn #2: 335R, on W end ramp opposite hangars 1 and 2.
San Jose, Calif. (Mun): 095°; on ramp in front of trml bldg.
San Juan, Puerto Rico (Intl): 081°; lctd on taxiway NE trml bldg.
Santa Barbara, Calif.: 198°; gate 2 in front of trml bldg over Figure 2 painted on apron.
Santa Catalina, Calif.: 346°; SW corner apch end rnwy 4 Santa Catalina Arpt.
Santa Fe, N. Mex. (New Municipal): 334°; at junction main intersection txwy and ramp.
Sarasota, Fla. (Bradenton): 172°; on ramp 800′ N trml bldg.
Scottsbluff, Nebr. (Mun: 240°; NE edge ramp opposite trml bldg and W of txwy leading to rnwy 30 aprxly 3000′ from apch end.
Seattle, Wash. (Seattle-Tacoma Int'l): 028°; 30′ near edge of ramp S and W of Admin Bldg.
Sioux City, Iowa: 314°; painted circle directly in front of new twr.
Sioux Falls, S. Dak.: 148°; in line with E edge of txwy W of ctl twr, 75′ S from N edge of parking ramp.
South Bend, Ind. (St. Joseph Co.): 178°; center of western N/S txwy 200′ N of N edge of trml ramp.

Spartanburg, S.C. (Municipal): Lctn #1—192°; at compass rose on ramp.

Springfield, Ill. (Capital): 214°; in front of twr at intersection NW/SE and NE/SW taxi strips.

Springfield, Mo.: 191°; at bend in N/S txwy 400′ S of N end of taxi strip.

Stinson, Tex. (Mun Arpt): Lctn #1, 329°; runup area at apch end runway 09. Lctn #2, 335°: on W end of ramp opposite hangars 1 and 2.

Thermal, Calif.: 328°; ramp 250′ in front of hangar.

Topeka, Kans. (Philip Billard Arpt): 212°; N/S taxiway W of tetrahedron.

Truth or Consequences, N. Mex.: 155°; on SE/NW txwy adj to wind cone.

Tucumcari, N. Mex.: Lctn #1—255°; over square metal plate lctd on hangar ramp paved area. Lctn #2—266°; over painted orange circle, lctd on taxi strip 100′ off end of rnwy 8.

Tuscaloosa, Ala. (Van De Grauff): 241°; point lctd on centerline of txwy midway between ramp and rnwy.

Twin Falls, Idaho (Joslin): 030°; on parking strip apron 300′ SW of Admin Bldg.

Vero Beach, Fla.: 112°; on taxiway adj to wind sock adj to rnwy 11–29.

Vichy, Mo.: 241°; on center line of NE/SW rnwy 125′ from NE end Rolla National Arpt.

Victoria, Tex. (Victoria Co.-Foster): 126°; apch end rnw 13L.

Walla Walla, Wash. (City-County): 025°; ctr of txwy ap rnwy 20, mrkd.

Walnut Ridge, Ark.: 050°; taxi strip at parking apron a to tetrahedron.

Watertown, N.Y. (Mun): 048°; ramp in front of Admi Bldg.

Watertown, S. Dak.: 184°; lctd SE corner of ramp ne taxiway leading to rnwy 12–30.

Wausau, Wis. (Alexander): 338°; 100′ N of wind tee, 3 from S edge of concrete trml ramp where concre ramp terminates and blacktop ramp begins.

Wenatchee, Wash. (Pangborn Fld): 45°; front of Admi stration Bldg.

Westfield, Mass.: 304°; from center of compass rose lc end of rnwy 15.

Wheeling, W. Va. (Wheeling-Ohio County): 219°; txwy E side of ramp.

Wichita Falls, Tex. (Sheppard AFB): 093°; civilian par ing ramp, outer edge of ramp, NE corner, 5.2 nmi fr VORTAC.

Woodring, Okla.: 348°; ramp W of Term. Bldg.

Youngtown, Ohio: 182° compass rose end of rnwy 18.

Zanesville, Ohio: 010°; on arpt 270′ NE of intersection NE/SW and NW/SE taxistrips on centerline of NE SW taxistrip.

VFR AIRPORT TRAFFIC PATTERNS

(In accordance with Agency Order AT 7100.14A)

Airports	*Runways*	*Departure Procedures*	*Traffic Patterns Alts.*
tlanta, Ga.	9, 27	No turns until 3 mi, 2500' for *large acft.	
	15, 21	No turns by *large acft over more populated areas until 3 mi, 2500'.	
etts AAF, Tobyhanna Supply Depot, Pa.	14	Right hand tfc pattern.	
urlington Mun., Vt.		Single engine.	1140' MSL
		Multi engine.	1340' MSL
aldwell-Wright, Fairfield, N.J.	27	Acft shall not start crosswind leg until well past the school lctd ¼ mi to the right of the extended rnwy centerline and ¼ mi from the arpt.	
	32	Acft shall bear right as soon as practicable after take-off to avoid flying over the Fairfield township school lctd ¼ mi NW of arpt and slightly left of the extended rnwy centerline.	
hicago-Midway, Ill.		Turbine powered acft climb as rapidly as possible.	2000' AGL
hicago-OHare I'ntl Arpt., Ill.		Turbine powered acft climb as rapidly as possible.	2000' AGL
ardner, Kans.	East	Recommend alt not above 400' AGL until cross-wind leg northbound. Exit pattern NW to remain clear of tfc patterns of Olathe NAS, 3.5 mi NE.	
ansas City Fairfax Mun., Kans.		Acft under 12,500 lbs.	600' AGL
ew York, LaGuardia	13	Rgt turn and proceed over Flushing Meadow Park before turning on course.	1500'
orrance Mun., Calif.	11L	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 45 degrees from the runway departure heading and continue climb.	
	11L	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 90 degrees to the departure runway heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the right of the cross wing leg course.	
	11R	All aircraft—Climb on departure rnwy heading to 1500'.	

*Large acft—acft weighing over 12,500 lbs maximum certificated take-off weight.

Airports	*Runways*	*Departure Procedures*	*Traffic Patter Alts.*
	29R	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 45 degrees from the runway departure heading and continue climb.	
	29R	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 90 degrees to runway departure heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the left of the cross wind leg course.	
	29L	All aircraft—Upon reaching an altitude of of 500 feet MSL, make left turn from the departure runway heading to intercept an area approximately over the Pacific Coast Highway, then proceed in a westerly direction until reaching 1,500 feet MSL or the shoreline.	
Wilkes-Barre Scranton, Avoca, Pa.	16, 22	Right hand tfc pattern.

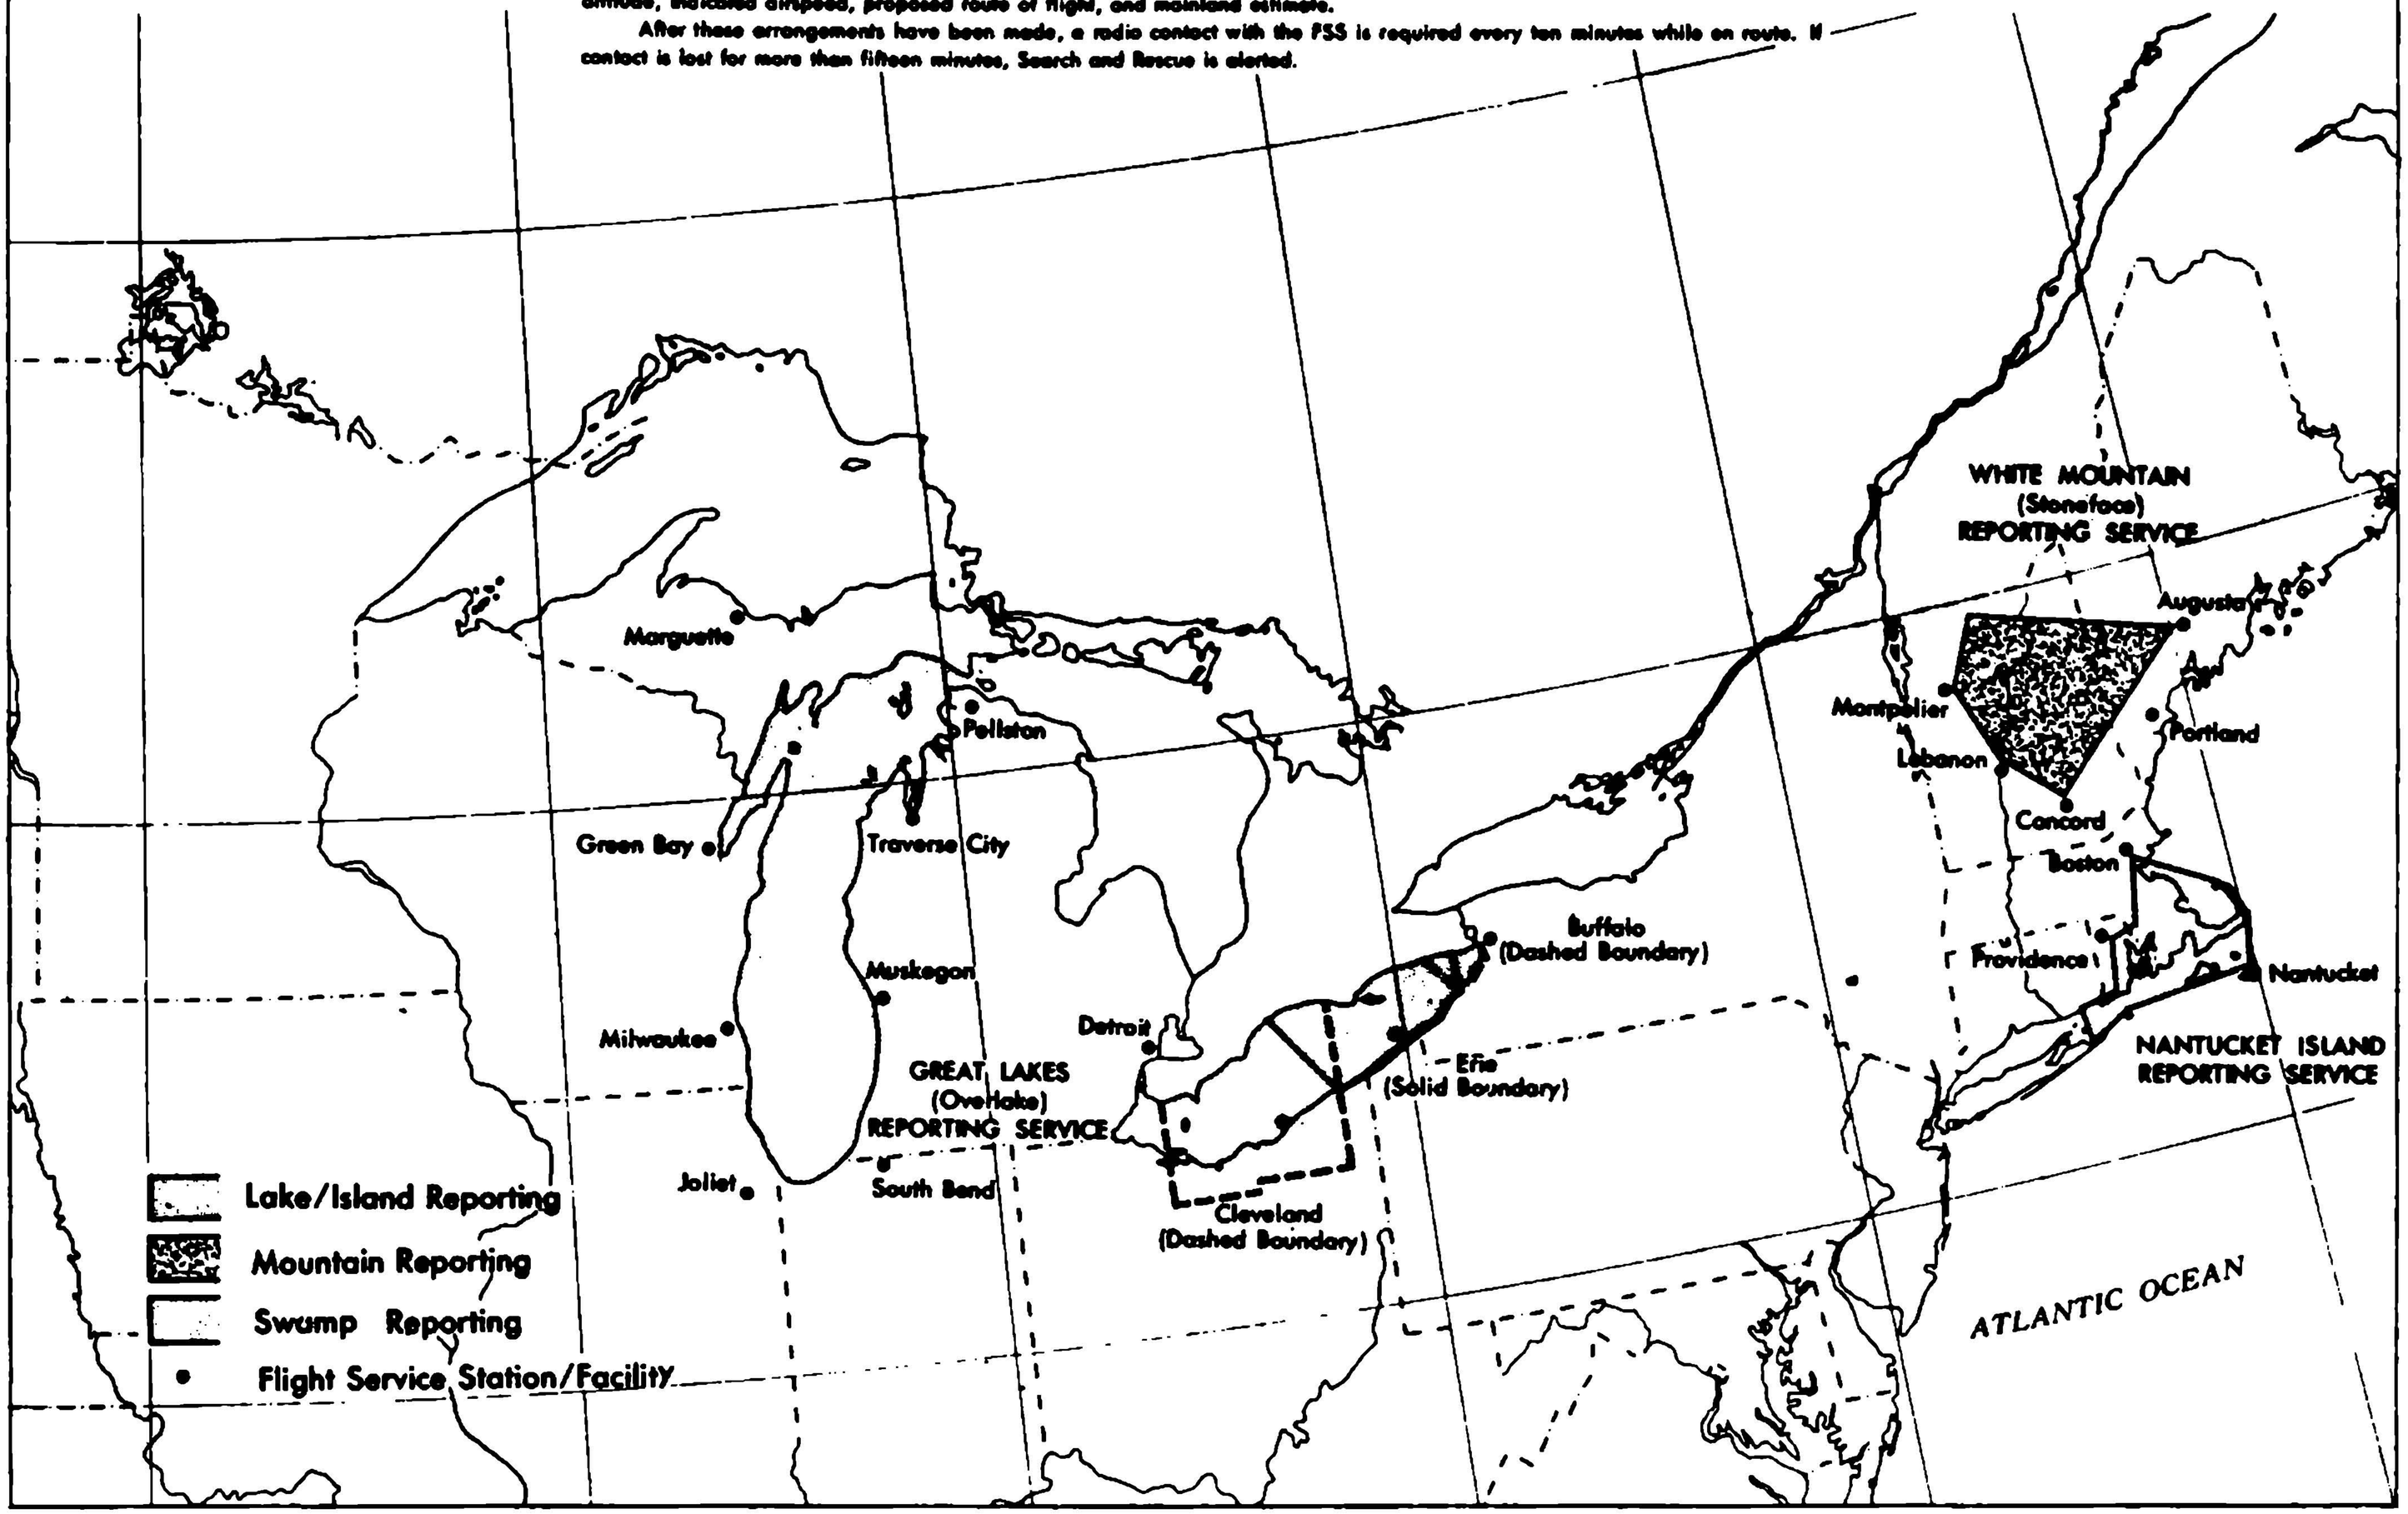
FLIGHT SERVICE STATION (FSS)

Lake, Island and Mountain Reporting Service

This service provides flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.

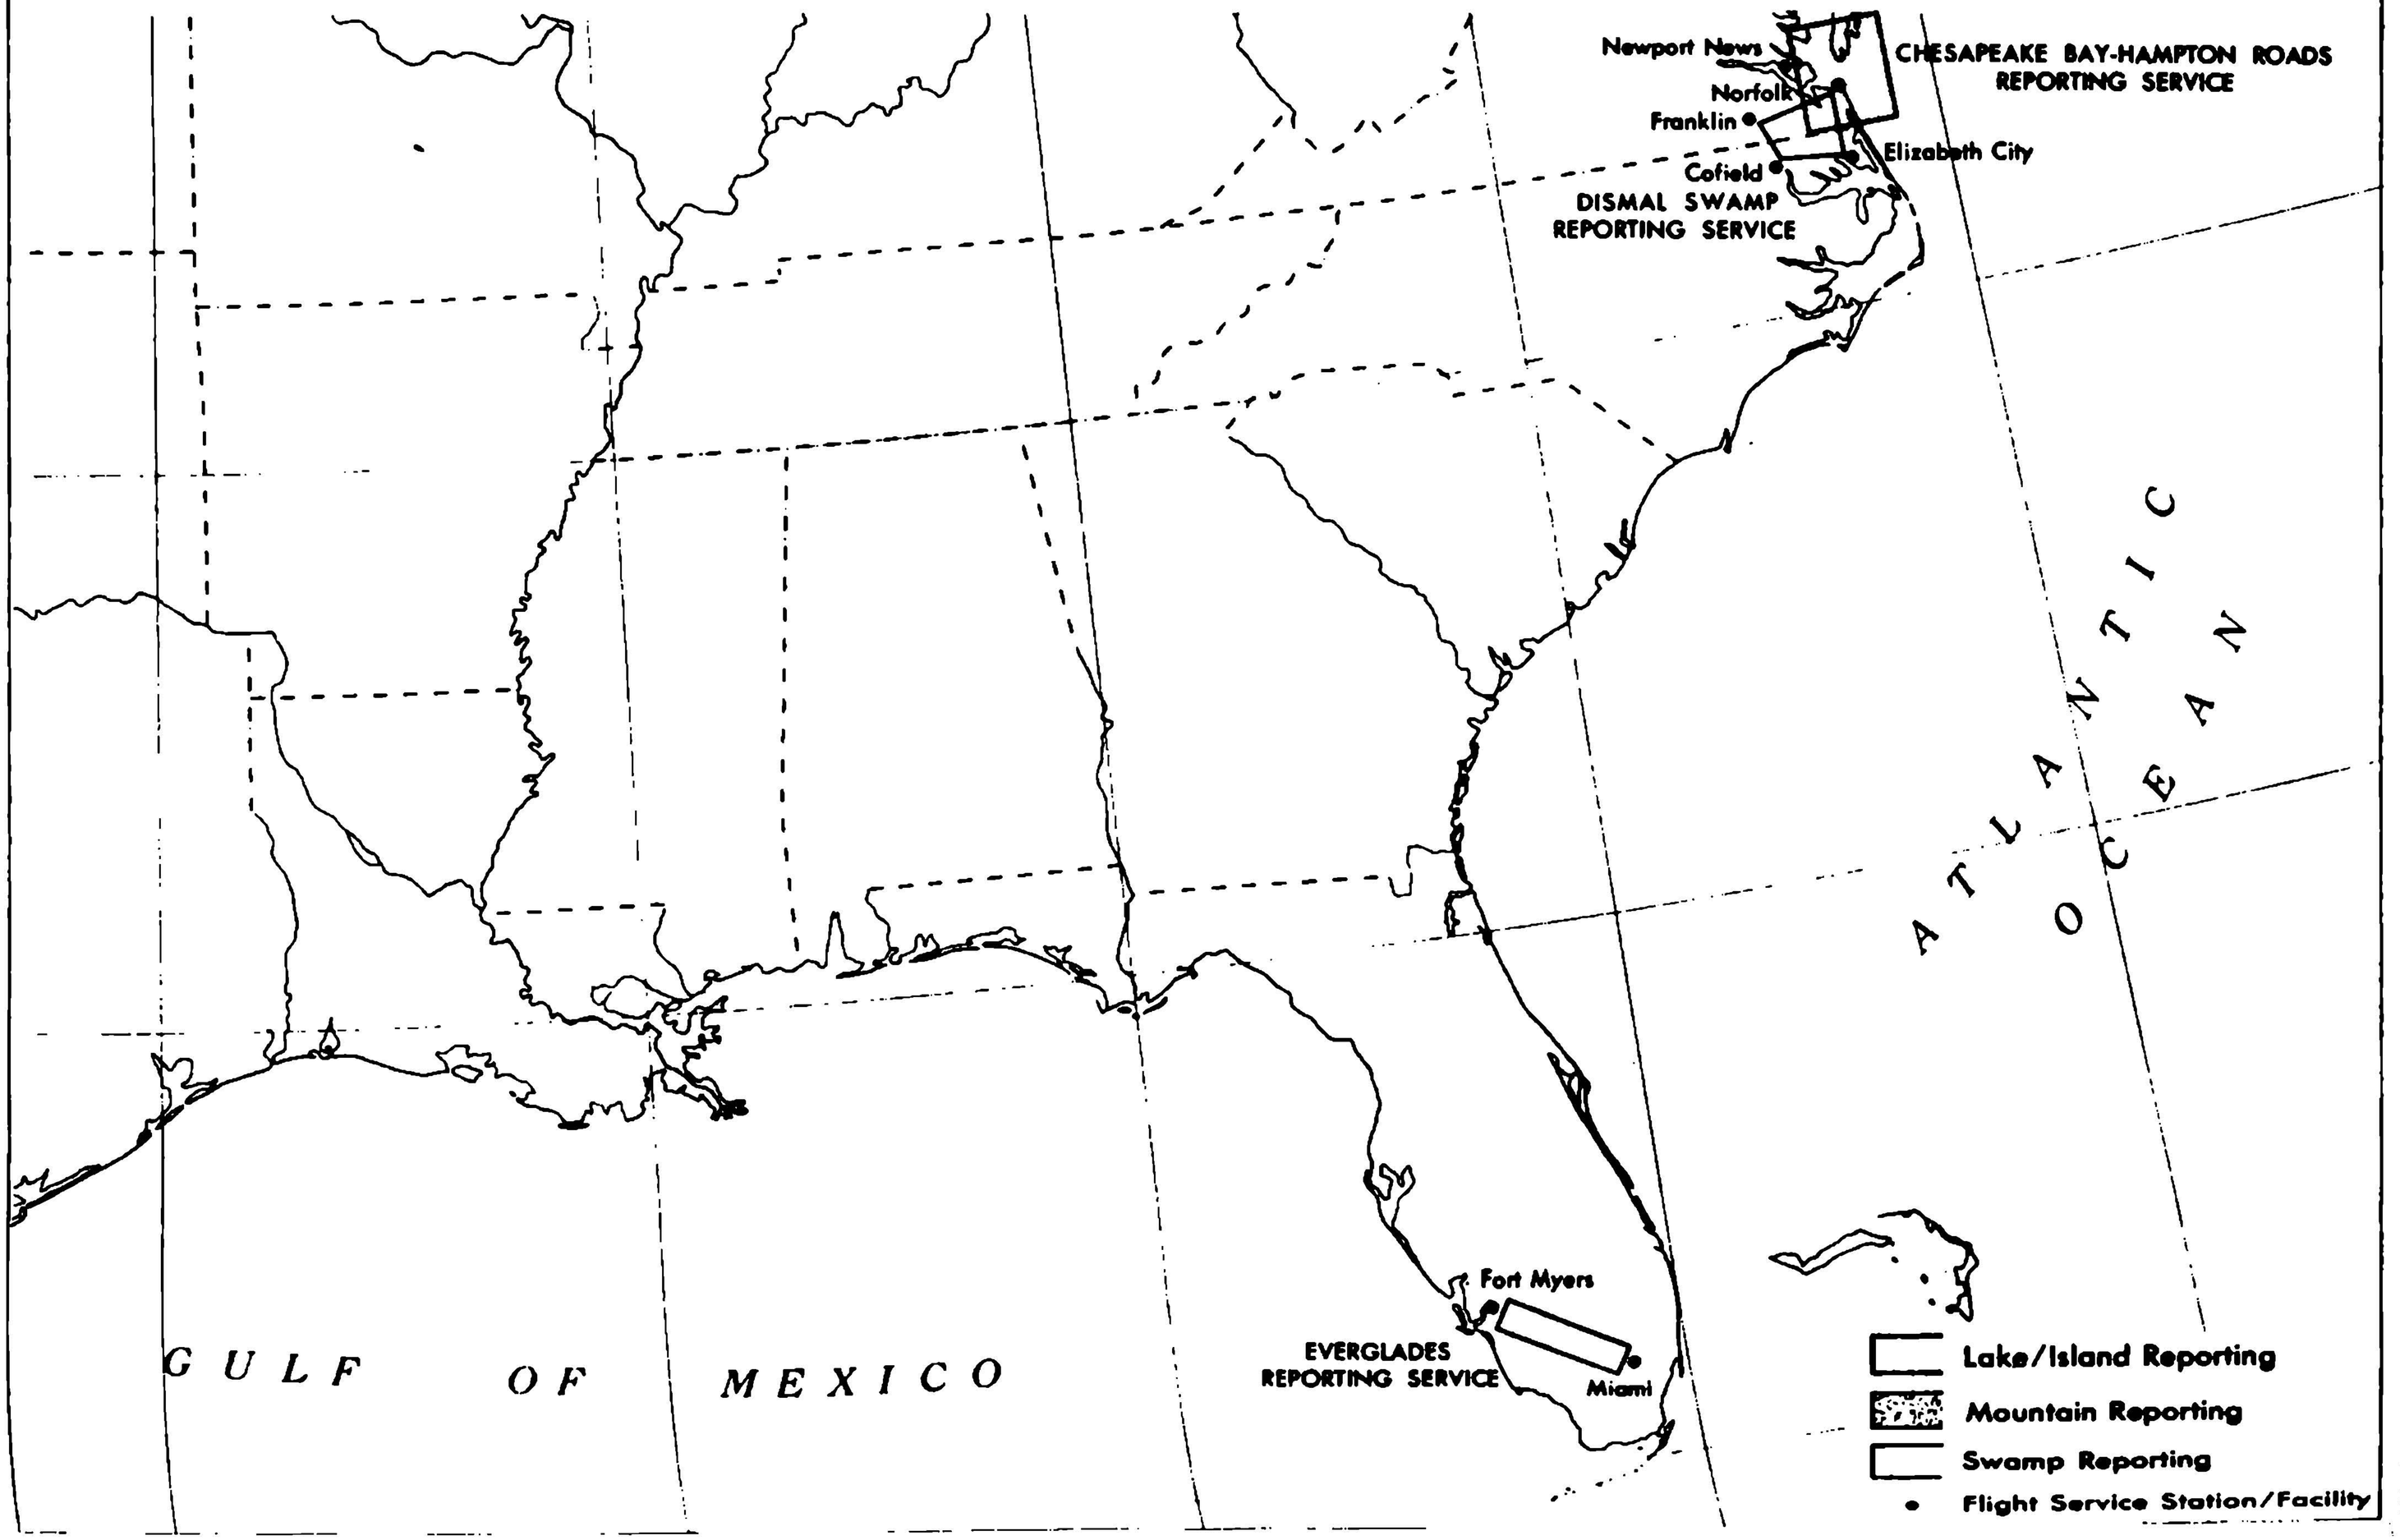
Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface", "Overlake", etc., are indicated on the following charts. To obtain this service, contact the FSS by telephone or radio giving present position, type aircraft, altitude, indicated airspeed, proposed route of flight, and mainland estimate.

After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.



FLIGHT SERVICE STATION (FSS)

Lake, Island and Mountain Reporting Service



ROCKY MOUNTAIN REPORTING SERVICE

EFFECTIVE OCTOBER 1, 1964

for VFR aircraft operating between Denver and Grand Junction via Corona Pass and via Monarch Pass. To distinguish it from similar services available in other parts of the country it will be referred to as "Rocky Mountain Reporting Service". This service cannot be offered on an area or random route basis because of the effect of our terrain extremes on reliability of communications at the relatively low cruising altitudes preferred or found necessary by most general aviation pilots. A safe altitude over the lowest terrain seems to be the rule (i.e. through or over recognized mountain passes).

The routes via Corona Pass and Monarch Pass, depicted on the chart have been flight checked and communications found to be reliable at no less than the altitudes shown.

"Rocky Mountain Reporting Service" shall be available to all VFR aircraft upon request, whether or not operating on a regular flight plan.

REQUIREMENTS

1. Aircraft must be equipped with functioning 2-way radio capable of receiving VOR and transmitting 122.1mc.
2. Pilot must fly prescribed route at an altitude no less than established MRA (Minimum Reception Altitude).
3. Pilot must arrange for accurate time of departure to be received by the FAA facility through which the service was requested.
4. Pilot must radio a position report every ten minutes as follows, whether eastbound or westbound:

   CORONA ROUTE

   To Denver Radio while operating between Denver and Corona Pass (vicinity of Moffat Tunnel, west of Tolland, Colorado).

   To Eagle Radio (through Kremmling VOR) between Corona Pass and vicinity of Glenwood Springs.

   To Grand Junction Radio between vicinity of Glenwood Springs and Grand Junction.

   MONARCH ROUTE

   To Denver Radio (through Denver or Kiowa VOR) between Denver and Lake George Intersection (Cheesman Reservoir). To Denver Radio (through Kiowa VOR only) between the Intersection and Elevenmile Reservoir, or west of Cripple Creek, Colorado.

   To Pueblo Radio between Elevenmile Reservoir or west of Cripple Creek and Salida, Colorado.

   To Grand Junction Radio (through Gunnison VOR) between Salida and Grand Junction.

   Pilots may file for all or any portion of either route, i.e. on a flight from Denver to Grand Junction, a pilot may request the service from Denver to Kremmling only.

   (If contact with the aircraft is lost for more than 15 minutes, Search and Rescue will be alerted.)
5. The service may be terminated at any time upon request of the pilot.
6. In case of aircraft radio failure, the pilot must land at nearest airfield and make telephone notification to either Denver, Eagle, Pueblo or Grand Junction Radio.

Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

SPECIAL NOTICES

Special Notices of a general nature or universal application, and other than for a specific geographical location, are grouped together under General Notices. Special Notices pertinent to a specific geographic area are grouped together under Area Notices by state, then city, airport, or location within the state. The month and year the notice is initially inserted into the manual is provided at the conclusion of each Special Notice. A solid dot ● prefixes new or revised Special Notices.

GENERAL NOTICES

MILITARY CLIMB CORRIDORS

ALL FLIGHTS desiring to traverse these areas must obtain prior approval from the Appropriate Authority and ma tain continuous listening watch on the appropriate frequency while traversing the corridor. The list of corrido appropriate authority and frequencies follows:

Corridors	Appropriate Authority	Frequencies
Bangor (Dow AFB) Maine	Dow AFB Apch Ctl	126.2; 363.8; 122.5G
Charleston AFB/Mun., S.C.	Charleston Apch Ctl	119.3; 319.8; 122.5G
Columbus (Lockbourne AFB), Ohio	Columbus Apch Ctl	123.7; 122.5G; 360.6
Falmouth (Otis AFB), Mass.	Otis RAPCON	124.7; 118.2; 122.5G
Glasgow (Glasgow AFB), Mont.	Glasgow AFB Apch Ctl	126.2; 236.6; 122.5G; 363.8
Goldsboro (Seymour Johnson AFB), N.C.	Seymour Johnson Apch Ctl	119.7; 122.5G
Grand Forks (Grand Forks AFB), N.D.	Grand Forks AFB Apch Ctl	118.1; 363.8; 122.5G
Grandview (Richards-Gebaur AFB), Mo.	Olathe RAPCON	363.8; 124.7; 122.5G
Houston (Ellington AFB), Texas	Houston Apch Ctl	118.1; 284.6; 122.5G
Klamath Falls (Kingsley Fld), Ore.	Klamath Falls Apch Ctl	118.5; 381.6
Limestone (Loring AFB), Me.	Loring AFB Apch Ctl	122.5G; 363.8
Madison (Truax Fld), Wisc.	Truax Tower	120.1; 350.3; 122.5G
Marquette Co. (K.I. Sawyer AFB), Mich.	Sawyer Apch Ctl	122.5G; 119.1; 259.3; 363.8
Merced (Castle AFB), Calif.	Castle AFB Apch Ctl	118.9; 122.5G; 379.4
Minot AFB, North Dakota	Minot AFB Apch Ctl	363.8; 118.5; 122.5G
Mt. Clemens (Selfridge AFB), Mich.	Selfridge AFB Apch Ctl	126.2; 363.8; 122.5G
New Orleans (NAS New Orleans), La.	New Orleans Center—5000' & above, IFR	126.0; 323.2
	New Orleans Apch Ctl—VFR	118.1; 122.7G; 248.7
Norfolk (Langley AFB), Va.	Norfik Apch Ctl	350.3; 125.7; 122.5G
Oscoda (Wurtsmith AFB), Mich.	Wurtsmith AFB Apch tl	126.2; 122.5G
Oxnard AFB, Calif.	Ventura Apch Ctl	124.7; 319.2; 122.5G
Portland Intl. Arpt., Oregon	Portland Intl Apch Ctl	124.9; 122.7G; 290.3
Rome (Griffiss AFB), New York	Griffiss Apch Ctl	118.5; 363.8; 122.5G
San Antonio (Kelly AFB), Tex.	San Antonio Apch Ctl	122.5G; 123.9; 126.5; 134.1; 353.5
San Rafael (Hamilton AFB), Calif.	Hamilton AFB Apch Ctl	122.5G; 126.2
Sault Ste. Marie (Kincheloe AFB), Mich.	Kincheloe Apch Ctl	118.3; 122.5G; 363.8
Victorville (George AFB), Calif.	Edwards Apch Ctl	124.4; 127.1; 137.65; 335.6; 122.5
Westhampton Beach (Suffolk AFB), N.Y.	Suffolk Apch Ctl	126.2; 122.5G; 236.6
Wrightstown (McGuire AFB), N.J.	McGuire Apch Ctl	122.5G; 110.6T; 134.1; 126.2

T—Transmits G—Guards

CIVIL USE OF MILITARY FIELDS:

U.S. Air Force, Navy and Coast Guard Fields are open civil fliers only in emergency or with prior permission; my Air Fields are open to civil aircraft on authorizan of the Air Field Commander.

For Air Force installations, prior permission should requested at least 30 days prior to first intended land- from Headquarters USAF (AFOAPDA) via the Comnding Officer of the field concerned (who has auority to approve landing rights for certain categories civil aircraft). For use of more than one Air Force tallation, requests should be forwarded direct to Hq AF (AFOAPDA), Washington, D.C. 20330.

For Naval Installations, prior permission should be reested from the Chief of Naval Operations (OP 532) the Commanding Officer of the field concerned (who the authority to approve landing rights for certain egories of civil aircraft).

For Coast Guard fields prior permission should be reested from the Commandant, U.S. Coast Guard via the manding Officer of the field.

However, with minor exceptions, authority to use Air ce and Navy fields is granted only to aircraft on ernment business, or when no suitable civil airport is ilable in the vicinity. Use of Coast Guard fields is ited to persons on government business only when re is no suitable civil airport in the vicinity.

When instrument approaches are conducted by civil craft at military airports, they shall be conducted in ordance with the procedures and minimums approved the military agency having jurisdiction over the airt.

December 1964

HEAVY TRAFFIC AROUND MILITARY FIELDS

Pilots are advised to exercise vigilance when in close proximity to most military airports. These airfields have an unusually heavy concentration of jet aircraft operating within a 25 nautical mile radius and from the surface to all altitudes. This precautionary note also applies to the larger civil airports. BE ALERT, STAY ALIVE!

December 1964

FLIGHTS ACROSS U.S. BORDERS:

All pilots contemplating flights across U.S. borders should refer to complete regulations in INTERNATIONAL FLIGHT INFORMATION MANUAL, Volume 12, April 1964. Pilots must report for inspection at time of each entry to avoid inconveniences, additional expenses and penalties.

December 1964

HELP PREVENT SMUGGLING BY AIR

All American pilots are asked to help Federal law enforcement agencies in combating the smuggling of illegal aliens and contraband into the U.S. by private aircraft. If you have information of any kind that might relate to smuggling by air, please contact the nearest U.S. Immigration and Naturalization Service or U.S. Bureau of Customs office at once. The local FAA office will pass the information along for you, if you so desire. Awards for original information are paid by Customs under certain circumstances.

December 1964

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS):

The FAA is conducting a series of operational tests at Kennedy, Chicago O'Hare, San Francisco, and Van Nuys Airports to determine the feasibility of automatically broadcasting routine, noncontrol information on the voice feature of the VOR, VORTAC, VOT or a discrete VHF frequency serving the airport. Routine noncontrol information such as ceiling, visibility, wind, altimeter, runways in use, and other pertinent information are automatically broadcast and updated as necessary. Pilots participating in these evaluations should, on initial contact with the tower or approach control, repeat the phonetic alphabet code word appended to the recorded broadcast. This will indicate that he has received the latest operational tests.

Tests are being conducted on the following navaids:

Kennedy (departure information) JFK VORTAC 115.9 mc. Arrival information: DPK VORTAC 111.2 mc; COL VORTAC 108.2 mc.

Chicago O'Hare (arrival and departure information) 124.2 mc; ORD VORTAC 111.6 mc.

Van Nuys (arrival and departure information) VOT 109.0 mc.

December 1964

SPECIAL CIVIL AIR REGULATION NO. 456

Effective immediately the provisions applicable under Special Civil Air Regulation No. 456 will apply as follows:

Air traffic clearances to aircraft of Cuban registry not engaged in scheduled International Air Service in U.S. airspace will require that flight be conducted on one of the following routes and a landing be made at Kennedy International Airport. In the event alternates are necessary due to weather, such alternates will be Logan International Airport and Dulles International Airport in that order.

Flights from Montreal to Kennedy below FL 180 will be routed via V-282, V-203, V-91, V-475, DPK. Those at FL 180 and above will be routed via St. Eustache V-91, PLB, J-75, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Montreal below FL 180 will be routed via Sound Intersection, POU, V-487. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-75, PLB, V-91, St. Eustache.

Flights from Ottawa to Kennedy below FL 180 will be routed via MSS, V-203, ALB, V-91, V-475, DPK. Those at FL 180 and above will be routed via G-1 Maxville, V-104, MSS, J-37, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Ottawa below FL 180 will be routed via Sound Intersection, POU, V-91, ALB, V-203, MSS. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-37, MSS, V-104, Maxville, G-1.

Flights from Toronto to Kennedy below FL 180 will be routed via V-368, V-252, BGM, V-270, V-34, V-475, DPK. Those at FL 180 and above will be routed via V-368, BUF, J-95, HUO, CMK, V-34, V-475, DPK. Flights from Kennedy to Toronto below FL 180 will be routed via HUO, V-126, AVP, V-36. Those at FL 180 and above will be routed via Northport Intersection, HUO, J-95, BUF, V-36.

All flights in both directions, between Kennedy and Cuba will be routed via the Tuna Intersection and the overwater Papa Route. These are the only routes which will be authorized. Reroutings which will traverse other U.S. airspace will not be authorized.

The procedures set forth herein will not apply at this time to overflights by aircraft of Cuban registry engaged in scheduled International Air Service. However, if circumstances subsequently warrant, a notam prescribing routes for such aircraft will be issued.

December 1964

Amendment 91-5 to the FAR

Amendment 91-5, effective July 17, 1964, restates the circumstances under which pilots may exceed the maximum speeds set forth in Section 91.85(c) (New) of the Federal Aviation Regulations. The last sentence of FAR 91.85(c) has been aaended to read, "However, if the minimum airspeed required or recommended in the airplan flight manual to maintain safe maneuverability or required by military normal operating procedures greater than the maximum speed prescribed in this paragraph, the aircraft may be operated at that minimum speed."

December 1

Exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations

The Department of the Air Force has been issued exemption from the provisions of Section 91.109 of F 91 of the Federal Aviation Regulations to conduct cer Radar Bomb Scoring (RBS) training missions at above Flight Level 300 within 75 nautical miles of sites listed below. A navigation aid will be listed to fine the center of the complex if such an aid is so cated. If a NAVAID is not located at the center, center will be defined by bearing/distance from a F Altitude Navigation Aid.

The NIKE/RBS Complexes used are:

Providence 280°/35NM
Windsor VORTAC
Presque Isle 087°/20NM
Kennedy VORTAC
Boston VORTAC
Rapid City 110°/33NM
Dupree VORTAC 010°/114NM
Syracuse VOR 018°/48NM

PILOT-TO-FORECASTER WEATHER SERVICE

Pilot-to-Forecaster Service (PTFS) in the general of the Washington ARTCC is provided for the pur of the direct pilot/forecaster exchange of meteorolo information when **weather conditions are critical, chan rapidly or when the direct advice of a professional avia meteorologist is considered necessary.** Routine requests weather information or pilot reports should be dire to the nearest FAA Flight Service Station (FSS).

PTFS is available on the radio frequency of 1 megacycles (mc) within communications range of following FAA FSS locations:

Washington, D.C.
Elkins, West Virginia
Richmond, Virginia
Roanoke, Virginia
Front Royal, Virginia
Rocky Mount, North Carolina

Air/ground calls should be made to "Washington F caster" for direct communications with a U.S. Wea Bureau Meteorologist who is currently familiar w weather in the area. This service is available from 12 to 0200Z (7:00 a.m. to 9:00 p.m., EST). Emerg weather service during other periods may be m available by contacting the flight service sta (when VFR) or the Washington ARTCC (when IF and requesting that "Washington Forecaster" comm cate on 122.6 mcs.

December 1

VFR PRACTICE INSTRUMENT APPROACH PROCEDURES

VFR practice instrument approach procedures at the following locations are published for and used by USAF Air Training Command pilots:

Cotulla, Tex.	Radio Beacon	JAL–907–ADF
Draughon-Miller Arpt. Temple, Tex	VOR	JAL–809–VOR
Cotulla, Tex.	VOR	JAL–907–VOR
Howard County Arpt. Big Spring, Tex.	VOR	JAL–5019–VOR
Rock Springs, Tex.	VOR	JAL–111–VOR–3
Sequin AF Aux., Tex.	Beacon	AL–5223–ADF
Vance AFB, Woodring, Okla.	VOR	JAL–135–VOR–3

These approach charts are published by the USAF Aeronautical Chart and Information Center in a loose-leaf format. Civil aviation requests for these charts should be submitted to the Director, Coast and Geodetic Survey, 14th and Constitution Avenue, N.W., Attention: Distribution Division Washington, D.C. 20230.

December 1964

MEA, MCA, MOCA, MRA, MAA

Efctv immediately: (1) MOCA for V–467 between HUO and INT 108 M SAX and 350 M LGA is 2800′ vice 1900′; (2) following flight procedures authorized: V–68 HRL to MFE MEA 1900′ vice 1500′. V–15, V–76 GLS to HOU MEA 2200′ vice 1700′; description of J16 PDT–HIA is changed as follows: MEA 27,000′ with changeover point 99 NM from HIA, 173 NM from PDT without ATC radar guidance. Navigational gap of 24 NM. MEA 23,000′ authorized with ATC radar guidance, changeover point 66 NM from HIA, 162 NM from PDT a navigational gap of 47 NM. Continuous navigational signal does not exist below 32,000′; (4) J96–505 SEA VOR to U.S. Canadian boundary unusable due to lack of navigational guidance; (5) J10 FMN to PRC is changed as follows: MEA 18,000′ authorized with ATC radar guidance. Continuous navigation coverage does not exist below 21,000 at 18,000′ signal coverage gap exist from 114 NM NE of PRC to 114 NM SW FMN. J30 DEN to ONL is changed as follows: Efctv Imediately MEA 23,000′ except 20,000′ thru 22,000′ authorized with ATC radar guidance. Continuous navigation coverage does not exist below 27,000′. At 20,000′ signal coverage gap exists from 137 NM NE DEN to 137 NM SW ONL. J54 ALS to GCK is changed as follows: MEA 19,000′ except 18,000′ authorized with ATC radar guidance. Continuous navigation coverage does not exist below 21,000. At 18,000 signal coverage gap exist from 131 NM SW GCK to 88 NM NE ALS. J60 DEN to GJT is changed as follows: MEA 18,000′ continuous navigation signal does not exist below 20,000′. At 18,000′ signal coverage gap exists from 77 NM SW DEN to 103 NM NE GJT. The following change is made to amendment 120, efctv 11/12/64: delete 2500′ MOCA on V–17W from GAG to LBL.

753-036 O - 64 - III-7

SPECIAL CIVIL AIR REGULATION NO. SR 454A

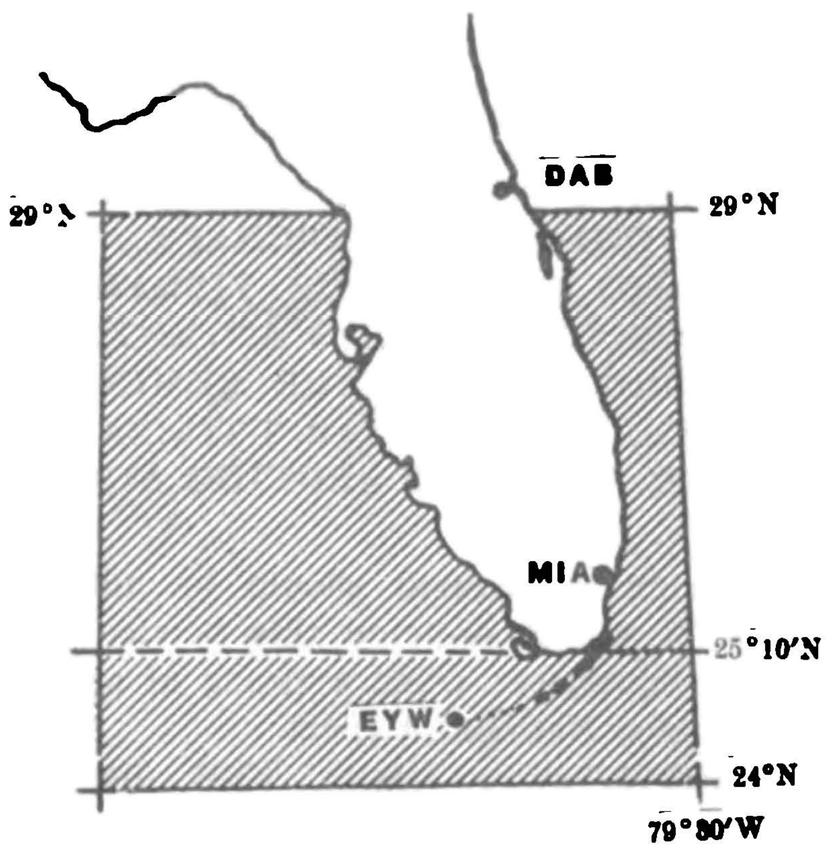
The following special rules of SR 454A are in effect. No person may operate any civil aircraft:

(1) Over water and outside the land mass of the State of Florida beginning at 29°N lat., 85°W long., thence clockwise to 29°N lat., 79°30′W long. to 24°N lat., 79°30′ W long., to 24°N lat., 85°W long., to the point of beginning or over land South of 25°10′N lat., unless:

(a) It is operated under a flight plan that has been approved by an FAA air traffic control facility; and

(b) the aircraft possesses functioning navigation and communications equipment necessary to maintain two-way radio contact with air traffic control facilities at all times during the operation, and the pilot in command monitors the radio frequencies specified by air traffic control.

SR 454A is applicable to the land mass between 25°10′N and 29°00′N whenever activated by NOTAM.



Washington DISTRICT OF COLUMBIA

TEST EVALUATION OF VFR ARRIVAL AND DEPARTURE RADAR TRAFFIC INFORMATION SERVICE

In Washington, D.C. Terminal Area

Beginning on June 23, 1961, at 0401 GMT, and until further advised, the FAA will conduct an evaluation of VFR arrival and departure radar traffic information service in the Washington, D.C., Terminal Area. Pilot participation is urged, but is not mandatory.

VFR Radar Traffic Information Area

GENERAL PROCEDURES: The Washington VFR Radar Traffic Information Area is that airspace which extends upwards to an altitude of four thousand feet, MSL inclusive, and is encompassed by a line connecting the following points: Rockville, Laurel, Shadyside RBN, Hughesville, Indian Head, Centreville, and Herndon. (See chart on facing page.)

Pilots of aircraft without radio, as well as those unable to contact VFR Arrival or Departure Information Service on assigned frequencies, are urged to conform to routing via designated VFR arrival and departure routes.

Pilots operating VFR flights destined for Washington National Airport should follow the designated arrival and departure routes listed herein in order to maintain a safe, orderly flow of air traffic in the Washington area.

All aircraft arriving or departing Washington National Airport should proceed with caution when in the vicinity of Andrews AFB.

If destination is other than Washington National Airport, so advise.

THE RADAR SERVICE DESCRIBED HEREIN IS NOT INTENDED TO RELIEVE THE PILOT OF HIS RESPONSIBILITY FOR CONTINUAL VIGILANCE TO SEE AND AVOID OTHER AIRCRAFT. IT IS PROVIDED TO AID HIM IN HIS VISUAL SURVEILLANCE BY CALLING TO HIS ATTENTION PERTINENT TRAFFIC. PILOTS ARE REMINDED THAT THE SURVEILLANCE RADAR UTILIZED BY THE CONTROLLER DOES NOT PROVIDE ALTITUDE INFORMATION.

The following procedures should be adhered to by pilots of VFR flights desiring this service and having proper radio equipment when arriving at and departing from Washington National Airport.

ARRIVAL PROCEDURES: Arriving VFR flights desiring traffic information should contact Washington Traffic Information Service on 119.3 mcs/338.2 mcs UHF when approaching from Laurel, Shadyside RBN, and Hughesville; or on 120.1 mcs/306.3 mcs UHF when approaching from Indian Head, Centreville, Herndon, and Rockville. When practicable, pilots should follow the appropriate VFR arrival route as indicated (See Chart) and maintain listening watch on traffic information frequency until further advised. Landing information will be furnished to aircraft destined for Washington, and radar traffic information will be provided until the pilot is advisesd to contact the tower.

DEPARTURE PROCEDURES: VFR flights departing from Washington Airport desiring traffic information should request the service on initial contact to Ground Control. The pilot should also advise his proposed direction of flight; e.g., "VFR Information Service, Laurel." Following take-off, the tower will advise the pilot when to contact Washington Information Service and the frequency to be used. Flights proceeding to Laurel, Shadyside RBN, and Hughesville will use 119.3 mcs/338.2 mcs UHF. Flights proceeding to Indian Head, Centreville, Herndon, and Rockville will use 120.1 mcs/306.3 mcs UHF. Pilots should depart the Washington Terminal area via the designated VFR departure route most nearly aligned with their destination. They should also maintain listening watch on the appropriate information service frequency until cleared to leave the frequency or beyond the perimeter fix.

Washington National Airport

Arrival Routes

Northeast—Report Laurel. Proceed well right of Washington-Baltimore Parkway to Beltsville, then north to Washington to Chain Bridge.

East—Report Shadyside RBN. Proceed via Brandywine to Fort Washington. Caution—Military conventional and jet traffic vicinity of Andrews AFB Control Zone.

Southeast—Report Hughesville. Proceed via Waldorf to Fort Washington. Caution—Andrews jet penetration inbound on Andrews VOR 187 degree radial descending to cross Andrews LFR at 1500 feet MSL.

Southwest—Report Indian Head. Proceed on right side of Potomac River until past Mount Vernon.

West—Report Centreville. Proceed well right of U.S. Route 29 highway to Falls Church.

Northwest—Report Herndon. Proceed well right of Potomac River to Falls Church.

North—Report Rockville. Proceed well left of Potomac River to Chain Bridge.

Departure Routes

Northeast—Proceed via west bank of Anacostia River to Riverdale and well right of Washington-Baltimore Parkway until past Beltsville Airport.

East—Proceed via Fort Washington and Brandywine to Shadyside RBN.

Southeast—Proceed via Fort Washington and LaPlata.

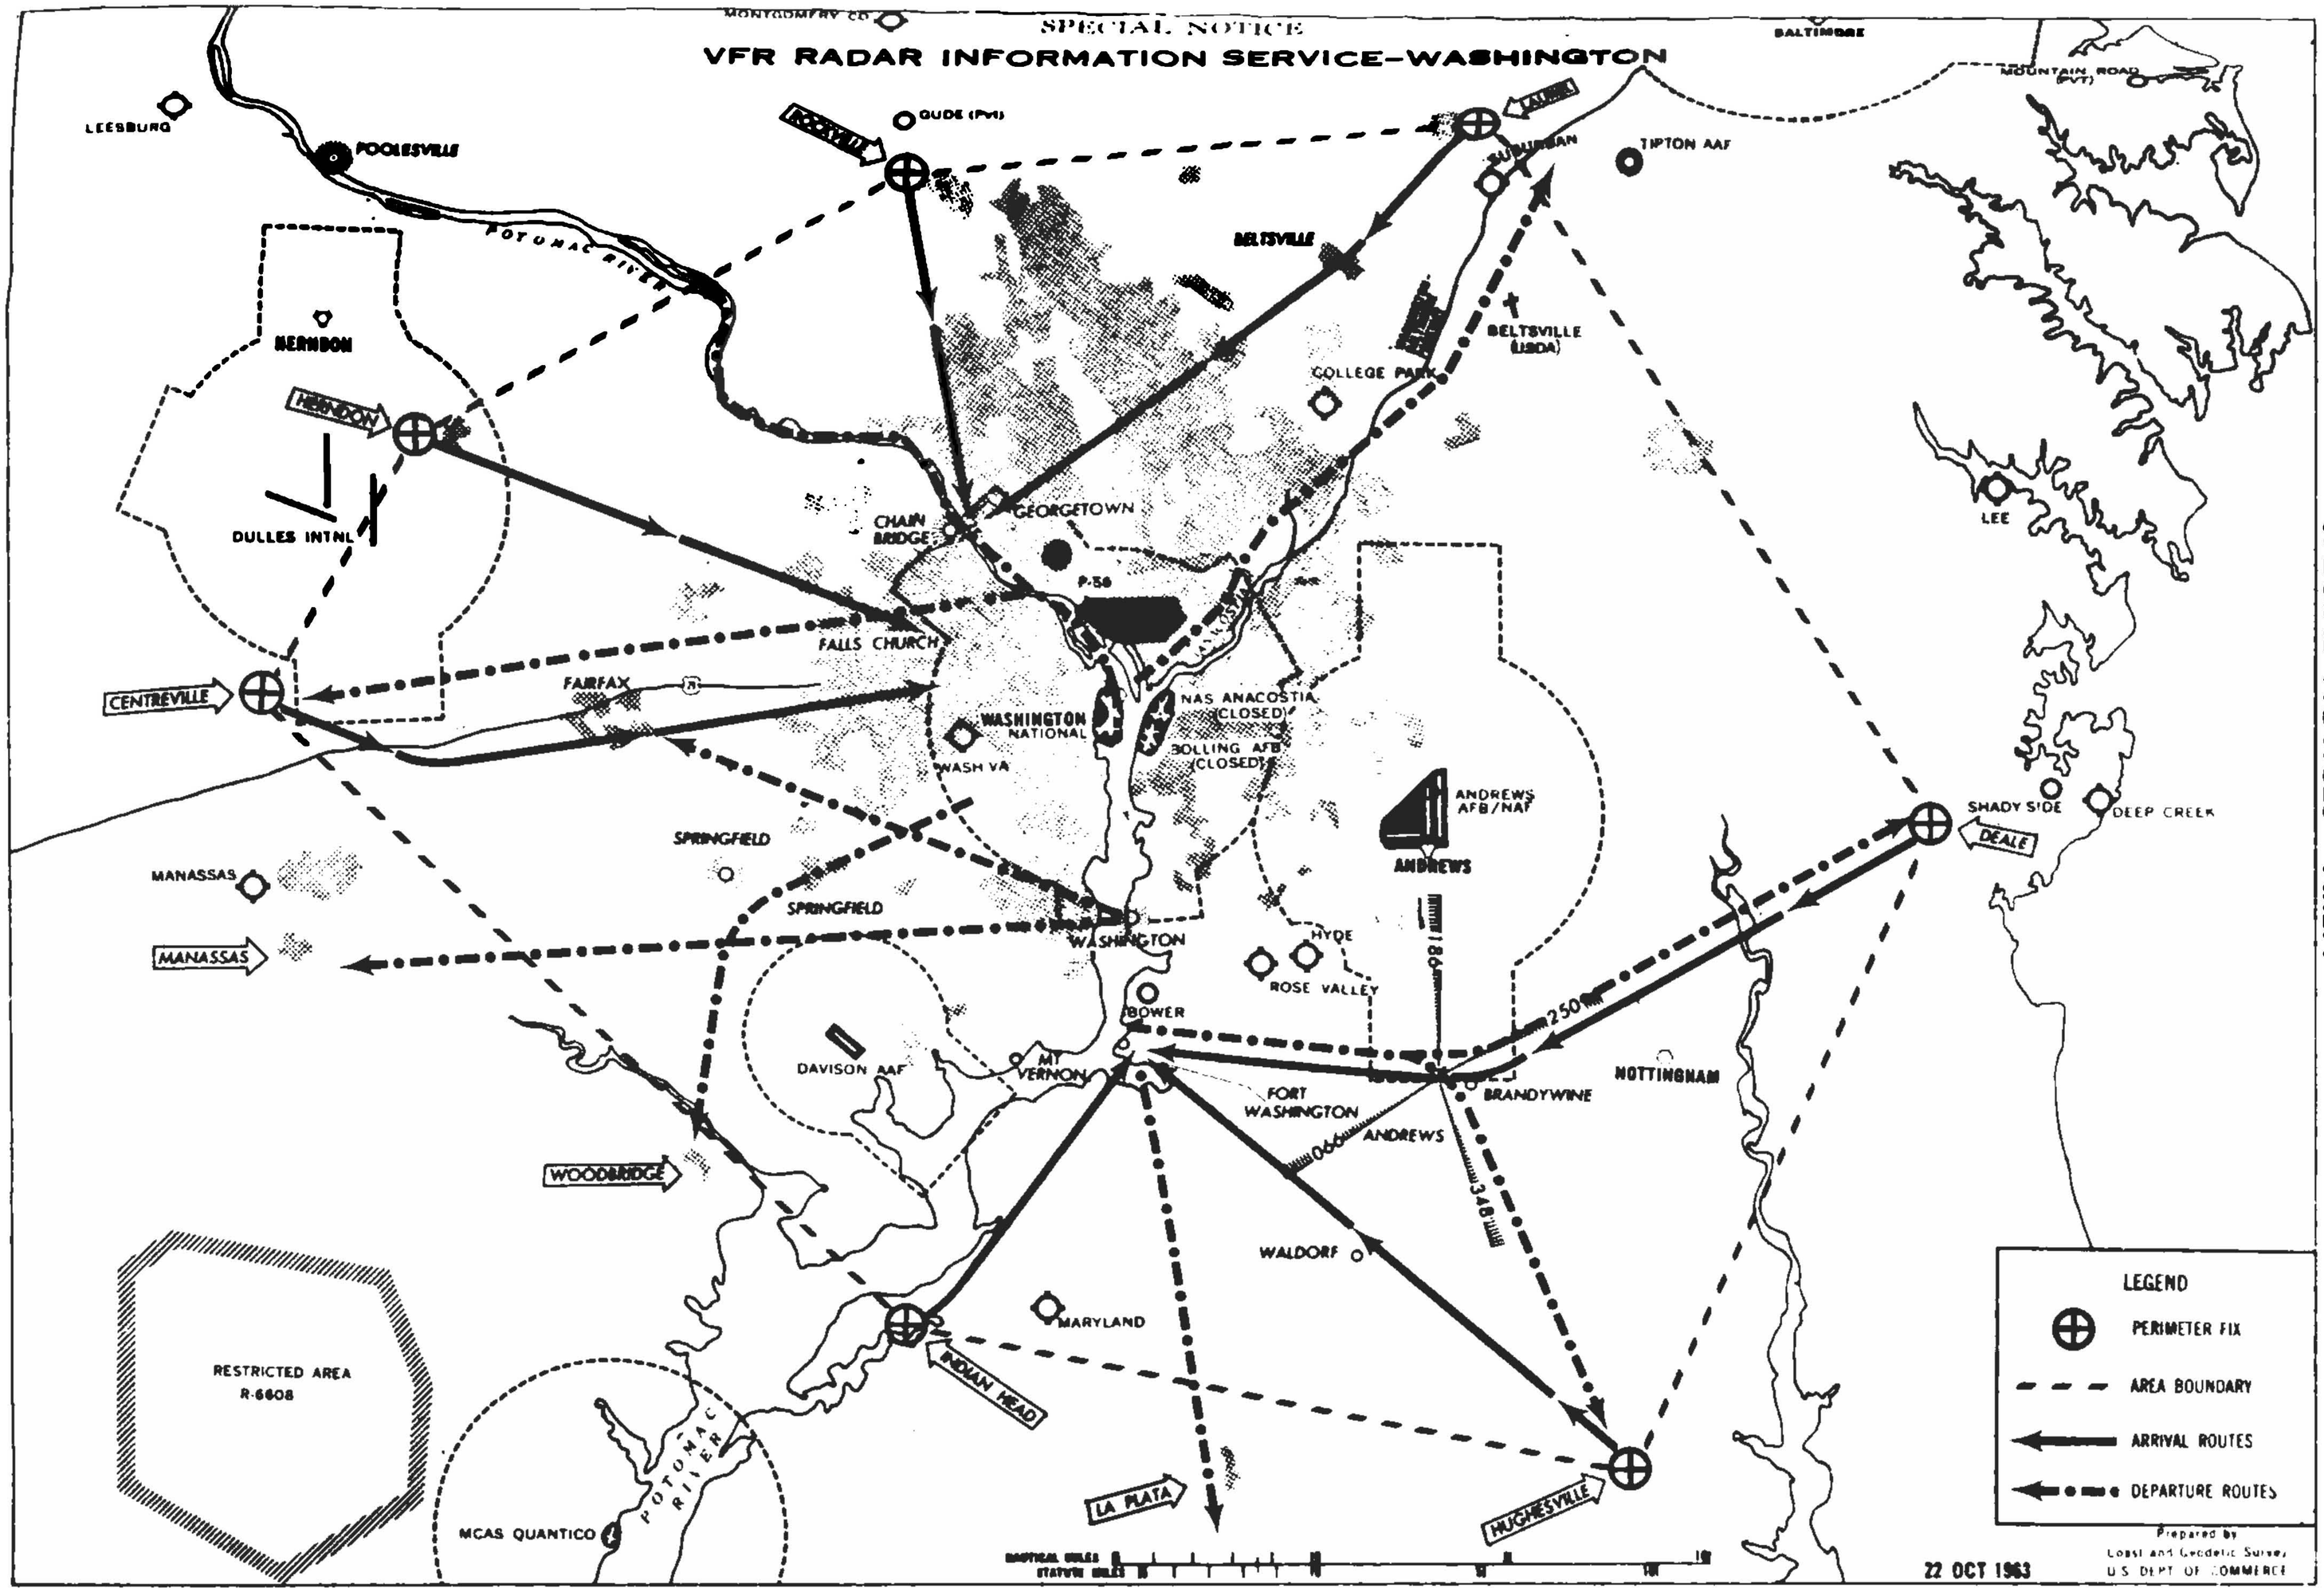
Southwest—Proceed well right of Potomac River until past Woodbridge.

West—North departures proceed well right of U.S. Route 29 highway until past Centreville. South departures proceed via Washington LFR to Manassas.

Northwest—North departures proceed via Potomac River until leaving the area. South departures proceed via Washington LFR to Fairfax.

SPECIAL NOTICE

VFR RADAR INFORMATION SERVICE—WASHINGTON



Atlanta GEORGIA

TERMINAL RADAR SERVICE AREA

(An Evaluation of Terminal Area Positive Separation)

The Air Traffic Service, FAA, has developed a program to evaluate a concept of providing a positive separation service to aircraft operating within a terminal area. The airspace area where this evaluation will be conducted will be known as a Terminal Radar Service Area (TRSA). During the evaluation period, a true positive separation environment will not be guaranteed.

This program is in consonance with the report of the Task Force on air traffic control (Project Beacon) and the subsequent Air Traffic Service analysis of the report.

A program for positive separation of aircraft operating in terminal airspace, regardless of weather conditions, must be able to satisfy the many varied requirements of both the VFR and IFR users without imposing excessive restrictions to their operations, yet it must be within the capabilities of the air traffic control system.

In consideration of these two major stipulations, the program will initially be implemented on a voluntary basis, whereby pilot participation will be encouraged rather than required. In this respect, it is obvious that considerable cooperation and effort must be expended jointly by the Federal Aviation Agency (FAA) and the airspace users, if a realistic evaluation is to be made.

Generally, the objective of this evaluation is to determine the following:

1. Airborne equipment and pilotage requirements.
2. Operating personnel, equipment, procedural and airspace requirements.
3. Impact on the over-all terminal operation.
4. Capability of the air traffic control system to provide positive separation to all aircraft operating within a terminal area.
5. Need for regulatory action.

Following a thorough and complete analysis of this evaluation, FAA in cooperation with the users, will determine the necessary requirements for implementation of a positive separation system in high activity terminal areas, wherein all aircraft would be provided separation by the ATC system, irrespective of weather conditions.

The size and shape of the TRSA will vary depending upon operational requirements. This area may be shown as a circular radius or other configuration and should be no larger than absolutely necessary to adequately perform the control functions.

Implementation

On November 15, 1962, a TRSA program was implemented at Atlanta, Georgia, as the first of selected locations to thoroughly evaluate the program.

In addition to the following details and procedures, information has been provided on appropriate charts, other aeronautical flight information publications an through representative user organizations.

The Atlanta Terminal Radar Service Area is that airspace extending upward from the surface to and including 6,000 feet MSL within the Atlanta Airport Control Zone; and, in addition, that airspace extending from 2,000 feet MSL to and including 6,000 feet MSL within a 15 statute mile radius of the Atlanta Airport, excluding Dobbins AFB Control Zone and the airspace within a 1½ mile radius of the Edwards Skyport and the Gunn Airport; EXCEPT that the base of the airspace area within the Fulton County Airport control zone is 2,500 feet MSL.

Flight Procedures

1. **IFR Flights**—Aircraft operating within the Atlan TRSA shall be operated in accordance with curre IFR procedures.
2. **VFR Flights**

a. Airports within the Atlanta TRSA:

(1) Arriving aircraft will be expected to conta Atlanta Terminal Control on specified fr quencies and in relation to geographical fix listed in d. below.

(2) Departing aircraft will be advised by the tow when to contact departure or terminal co trol and the frequency to be used.

b. Airports underlying the Atlanta TRSA:

(1) Unless flight will be conducted below the flo of the TRSA, arriving aircraft will be e pected to contact Atlanta Terminal Contr on specified frequencies and in relation geographical fixes listed in d. below.

(2) Departing aircraft will be expected to conta Atlanta Terminal Control on the frequen specified in d. below as soon as possible aft becoming airborne if it is desired that flig be conducted within the TRSA.

c. Transiting Aircraft—Aircraft desiring to tran the TRSA will be expected to contact Atlan Terminal Control on specified frequencies and relation to geographical fixes listed in d. below.

d. Frequencies and Fixes—En route aircraft shou establish communications with Atlanta Termin Control approximately 25 miles from Atlanta Ai port. Aircraft entering the TRSA north of Ai way V–18N should use 119.8 or 381.6 MC; Aircra entering the TRSA south of Airway V–18N shou use 119.3 or 343.6 MC. Aircraft not equipped f two-way communications on these frequenci should transmit on 122.7 MC and listen on th appropriate frequency specified above.

In addition to published radio fixes and oth prominent geographical fixes, the following ge

Dekalb-Peachtree Airport	"	Northeast
Stone Mountain	"	Northeast
Gunn Field	"	Northeast
City of Conveyors	"	East
City of Griffin	119.3/343.6	Southeast
City of Newnan	"	Southwest
Chattahoochee River	"	Southwest and West

ATC Procedures

1. The Atlanta TRSA is primarily a radar environment, and control will be predicated thereon. This does not preclude application of nonradar separation as required or deemed appropriate.
2. To facilitate radar identification of arriving and transiting VFR aircraft, ATC may request such aircraft to report their position in relation to fixes (prominent geographical or radio) within or outside the perimeter of the TRSA.
3. Radar headings and, if required, altitude assignments may be given to VFR flights operating within the TRSA.

NOTE.—Assignment of radar headings and/or altitudes are based on the provision that a pilot operating in accordance with VFR is expected to advise ATC if compliance with an assigned route, radar heading or altitude will cause the pilot to violate such rules.

4. Traffic information on observed but unidentified rad targets will be provided on a workload permittii basis.
5. When VFR aircraft are being held within the TRS and control is based thereon, the ATC clearance w specify the distance (radius) and, if appropriate, t direction from the geographical fix within whi holding is to be accomplished. In such cases, t pilot will be advised when to EXPECT FURTHE CLEARANCE.
6. During weather conditions equal to or better th basic VFR, 500 feet vertical separation may be e ployed between VFR flights and/or between VFR a IFR flights operating within the TRSA.
7. During weather conditions equal to or better th basic VFR, visual separation may be employed l tween VFR flights and/or between VFR and I flights operating within the TRSA when a pilot ports the other aircraft in sight and advises that can maintain his own separation from such aircra
8. When IFR flights, operating in VFR weather con tions, are being sequenced with other traffic and t pilot reports the aircraft he is to follow is in sigl the pilot may be advised to follow such traffic a may be cleared for a "visual approach."

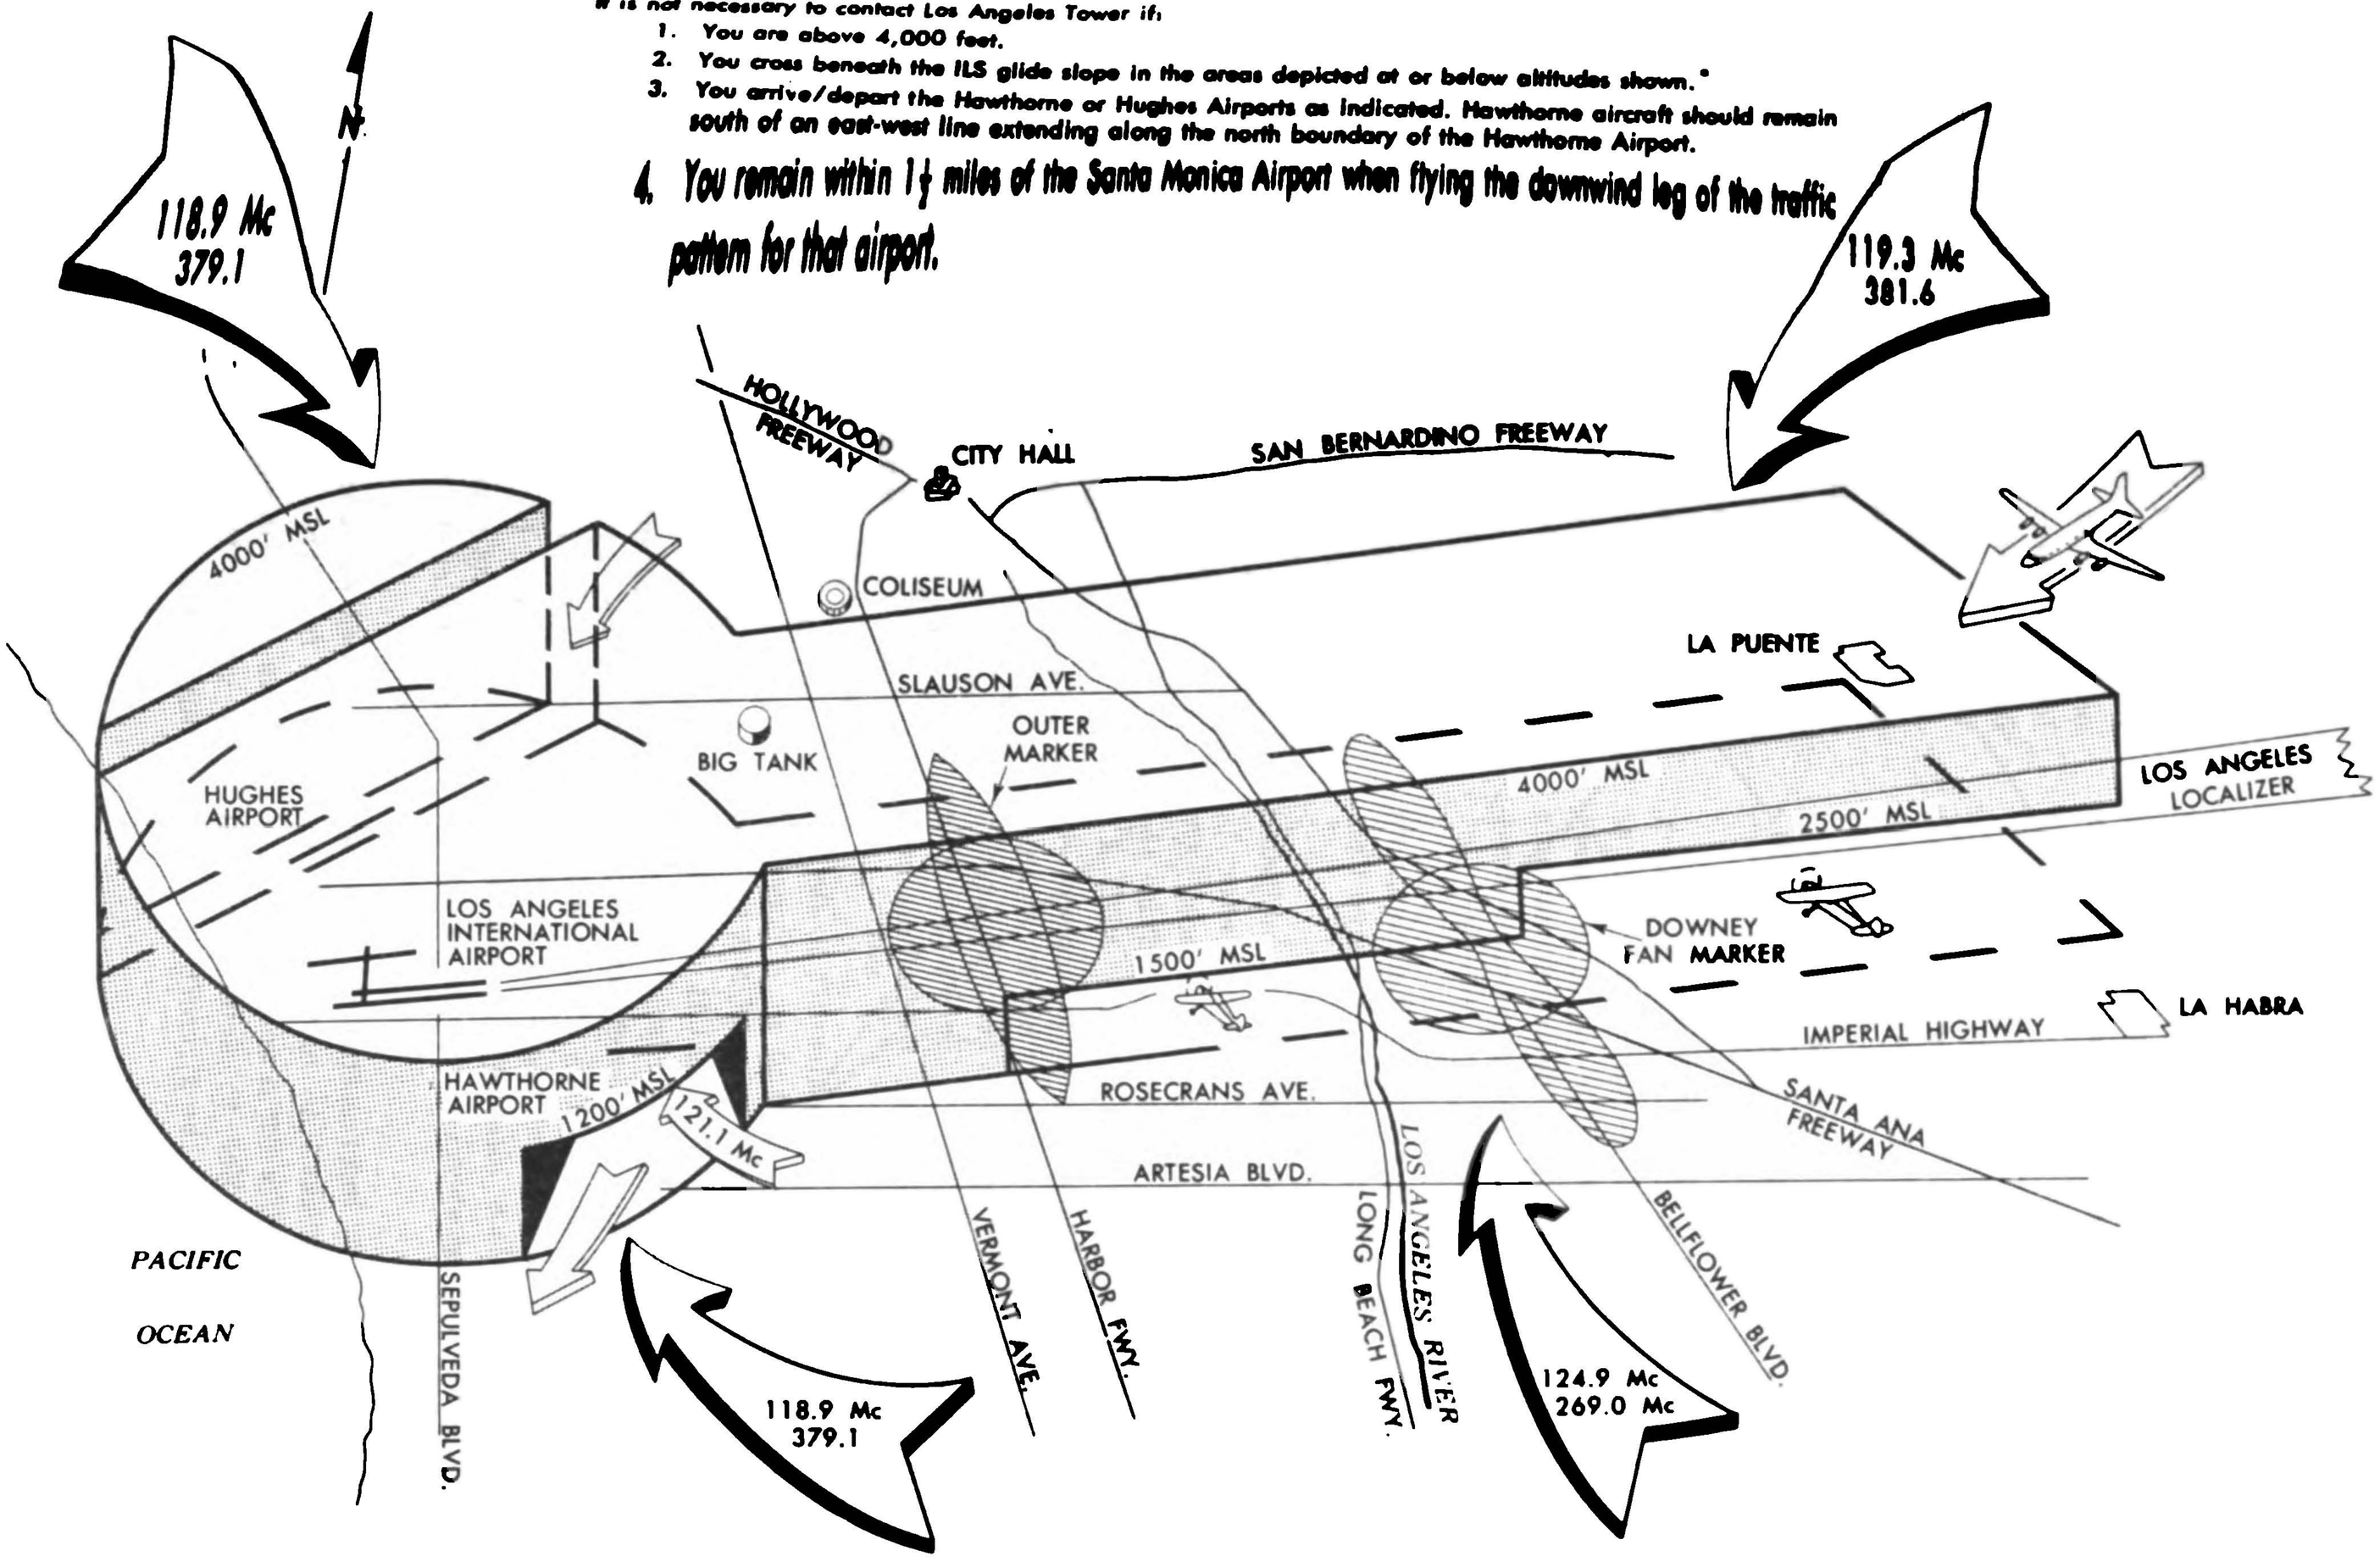
NOTE.—Basic VFR weather minima as set forth in F 91.105 shall apply within the Atlanta TRSA, except t special VFR weather minima set forth in FAR 91.107 sh continue to be applicable within control zones. Appli tion of ATC procedures and separation minima within t TRSA is not to be interpreted as relieving pilots of th responsibilities to see and avoid other traffic operating basic VFR weather conditions, to maintain appropri terrain and obstruction clearance, or to remain in weat conditions equal to or better than the established minin However, this does not preclude the pilot from requesti IFR handling, or while within the control zone, requesti clearance in accordance with special VFR.

LOS ANGELES TERMINAL AREA NOTICE

Prior to penetrating this area, VFR pilots are encouraged to contact Los Angeles Tower for traffic advisory service on the frequencies indicated for the direction of flight.

It is not necessary to contact Los Angeles Tower if:

1. *You are above 4,000 feet.*
2. *You cross beneath the ILS glide slope in the areas depicted at or below altitudes shown.**
3. *You arrive/depart the Hawthorne or Hughes Airports as indicated. Hawthorne aircraft should remain south of an east-west line extending along the north boundary of the Hawthorne Airport.*
4. *You remain within 1½ miles of the Santa Monica Airport when flying the downwind leg of the traffic pattern for that airport.*



*THIS DOES NOT CONSTITUTE AUTHORITY FOR A PILOT TO DEVIATE FROM FAR 91.79 OR OTHER APPLICABLE PROVISIONS OF THE FEDERAL AVIATION REGULATIONS.

Chicago ILLINOIS

PARALLEL ILS APPROACHES—CHICAGO O'HARE INTERNATIONAL AIRPORT

The FAA has implemented a Parallel ILS Approach System at Chicago-O'Hare International Airport. ILS, radar, communications, ATC procedures and flight procedures are employed as integral parts of a total system. Under the new system, O'Hare Approaches to Runways 14L and 14R when wind conditions permit straight-in landings, and when all components of the system are operating normally. Aircraft are radar vectored to the final approach course (localizer) of either runway and the pilot executes an ILS approach. The separation between localizer courses (6,510 feet) imposes certain requirements and techniques peculiar to parallel approaches.

REQUIREMENTS: To conduct a Parallel ILS Approach, aircraft must be equipped with a functioning 75 mc marker (or ADF), localizer, and glide slope receivers, and have the capability to simultaneously monitor both the assigned control frequency and the appropriate localizer voice frequency when advised by ATC.

ATC CONCEPT AND PROCEDURES: Arriving IFR aircraft en route to O'Hare Airport will be cleared by Chicago Center to one of four outer fixes.

(Northbrook, Beacon, Lakewood, or Acorn) established in the O'Hare Terminal Area and changed over to O'Hare Approach Control for further clearance. On initial contact, O'Hare Approach Control will advise the pilot that PARALLEL ILS APPROACHES ARE IN PROGRESS. Upon receipt of this information, **pilots who do not have required equipment** or do not wish to conduct a Parallel ILS approach, must advise O'Hare Approach Control prior to departing the outer fix. This will enable the controller to plan and provide for individual handling.

O'Hare Approach Control will clear aircraft to depart the outer fix on a specified heading and at a specified altitude FOR RADAR VECTOR TO RUNWAY 14 (RIGHT/LEFT) ILS FINAL APPROACH COURSE and will specify the appropriate localizer frequency (109.7 or 110.1). After departing the outer fix, aircraft will be descended to the appropriate ILS Intercept Altitude (2,200 or 3,200 meet m.s.l.) and provided a period of level flight prior to the ILS intercept in which the pilot may dissipate any excess speed accumulated during the descent.

Communications Check: Prior to intercepting the localizer course, the pilot will be requested to monitor the appropriate localizer voice frequency for a communications check with the monitor controller to determine that transmissions are being received in the aircraft.

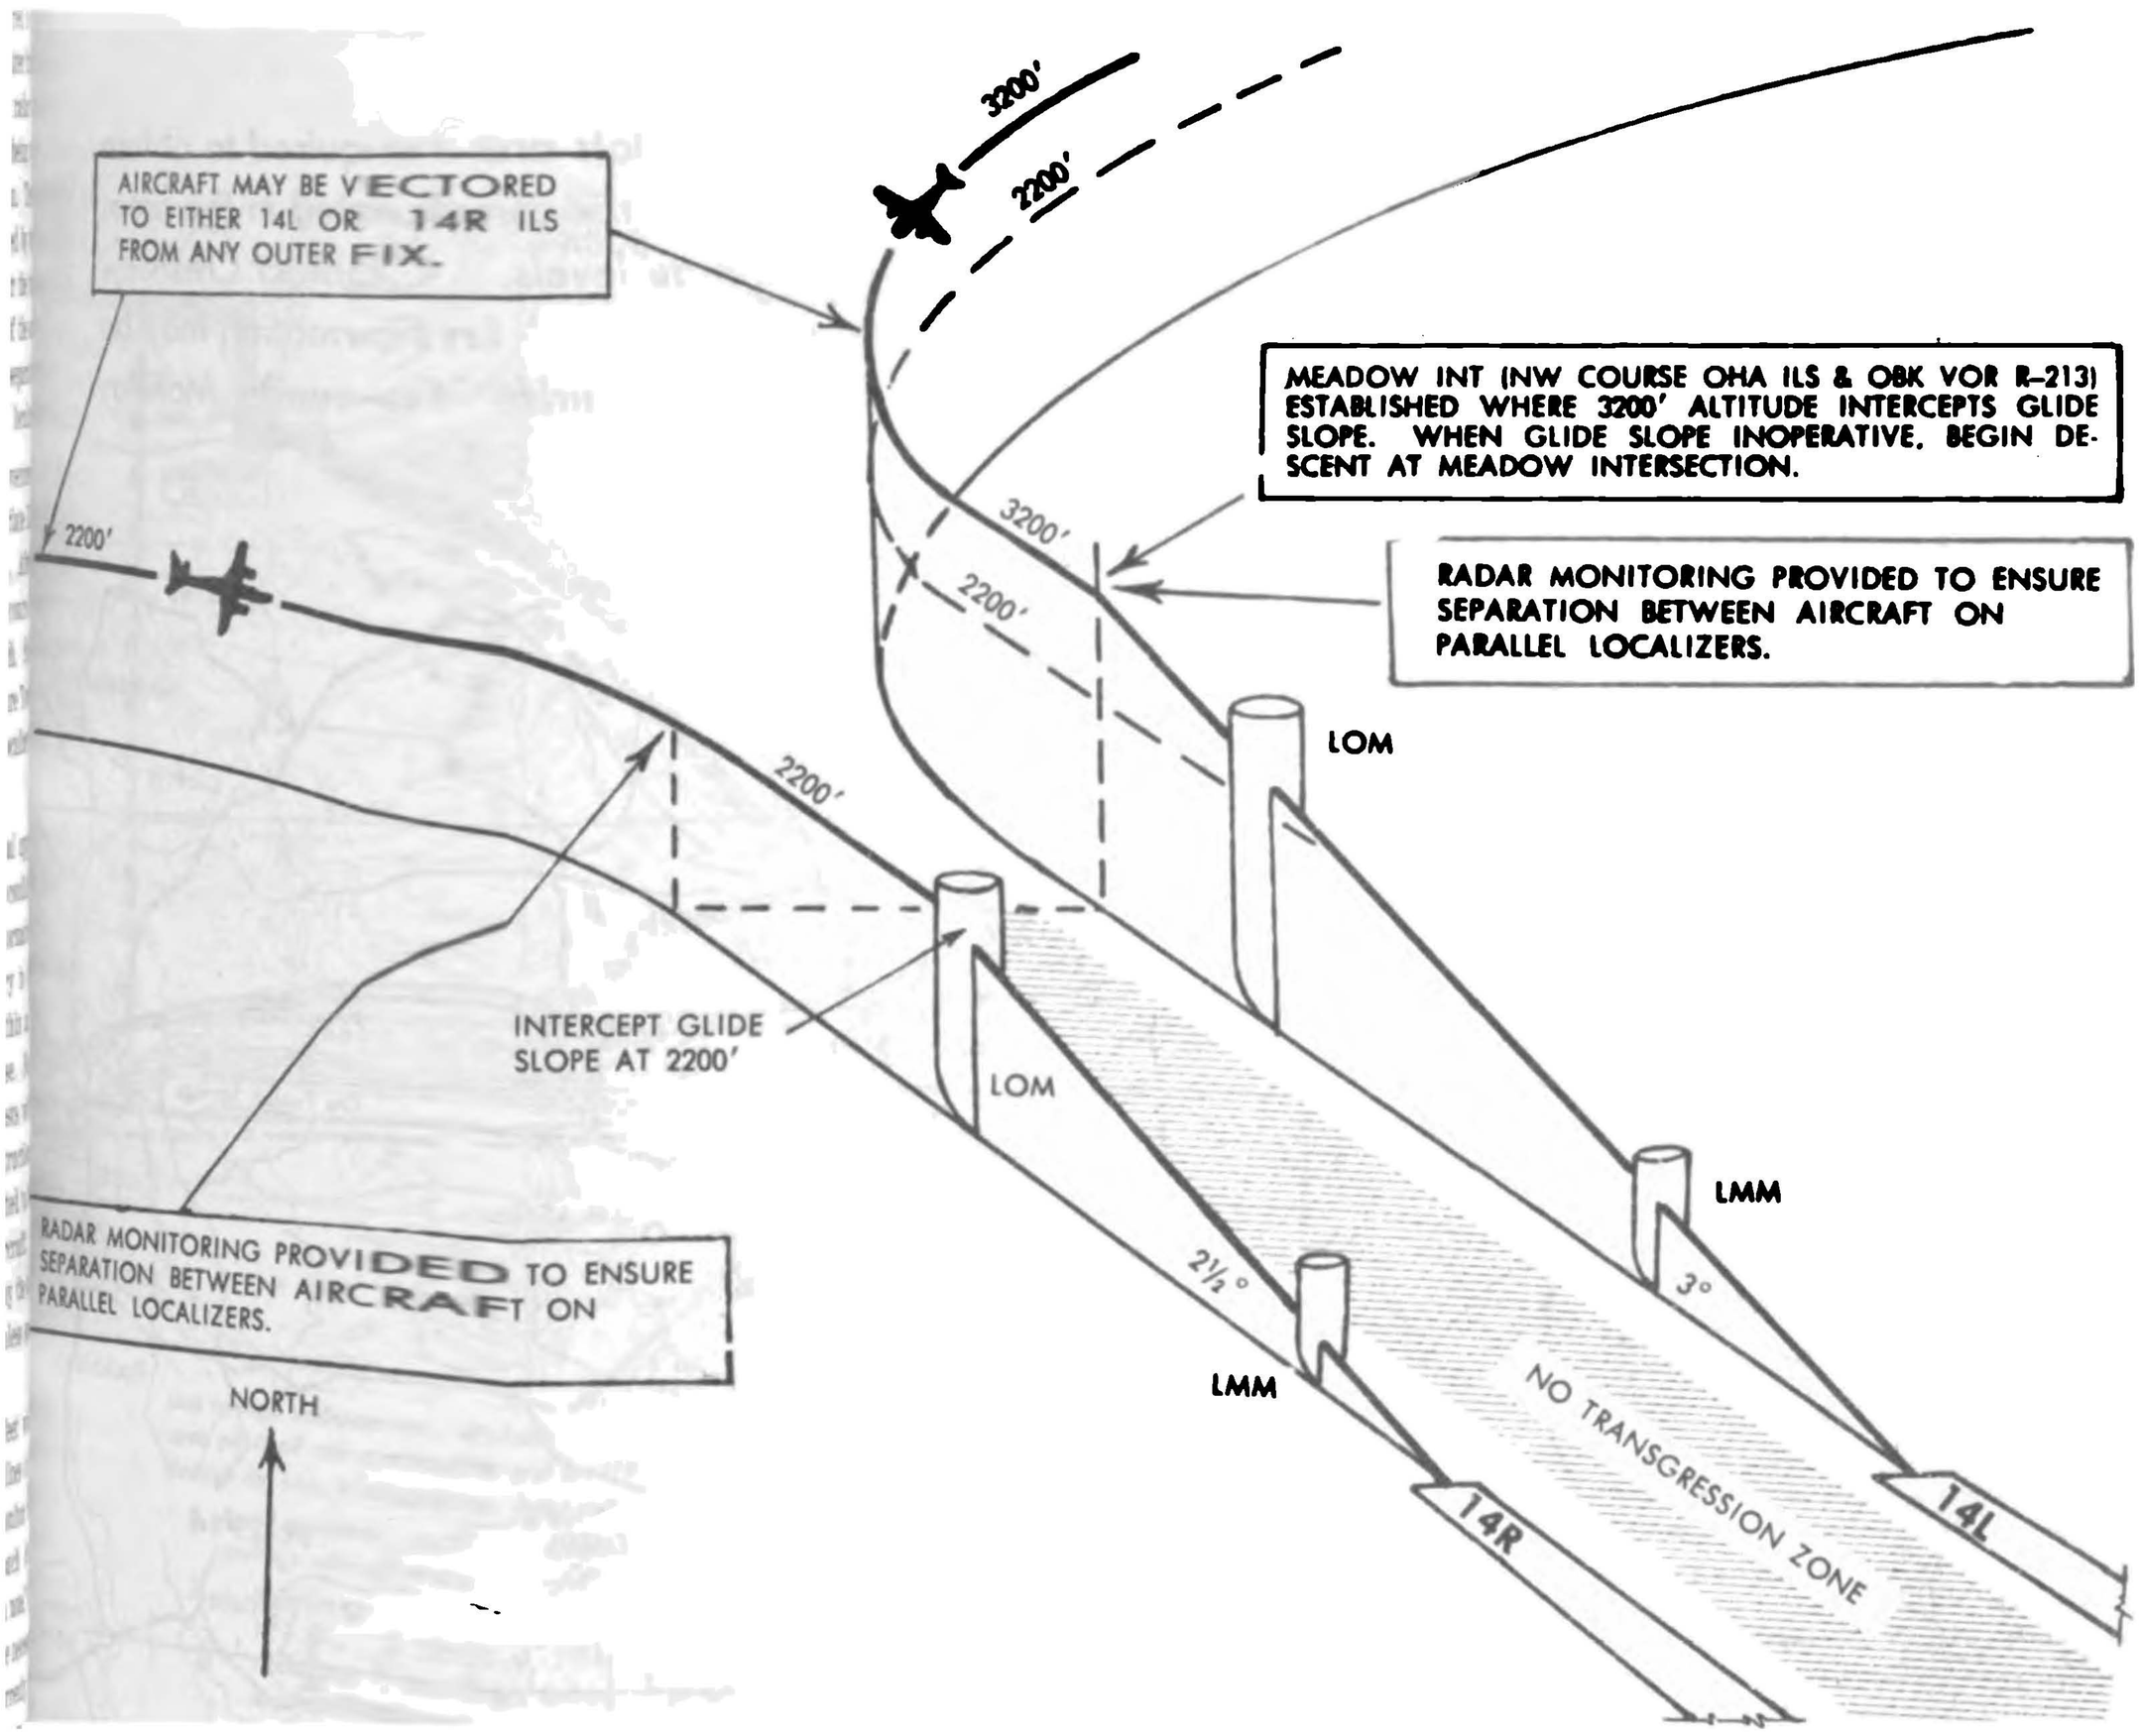
ATC Separation: Radar separation is provided betwe aircraft being vectored to, and while on, the same loc izer course throughout the entire approach. Aircra being vectored to Runway 14R will intercept that loc izer course at 2,200 feet m.s.l. Aircraft being vector to 14L will intercept that localizer course at 3,200 m.s or higher. Since aircraft may be vectored to either li localizer course from any of the four outer fixes, a mi mum of 1,000 feet vertical or 3 miles radar separati will be provided between the aircraft being vectored opposite ILS courses during the turn-on. The approp ate ILS Intercept Altitude is maintained by the aircr until intercepting the glide slope. After the turn-on a until aircraft are 2.3 miles northwest of the outer mar ers, a minimu mof 1,000 feet vertical separation is p vided between aircraft on parallel ILS localizer cours

Localizer Interception: Aircraft will be vectored so as permit the pilot to intercept the appropriate ILS locali course at an angle not greater than 20°. After assigni this final intercept heading, approach control will cle the aircraft for a parallel ILS approach. Subsequent the pilot will be changed over to O'Hare Tower and structed to monitor the appropriate localizer voice f quency (either 109.7 or 110.1 mc).

Radar Monitoring: All turn-ons and final approaches a radar monitored regardless of weather conditions. Mo tor controllers will issue advisory information and co trol instructions as may be necessary to insure th aircraft on final approach remain within an area 1,5 feet either side of the localizer course. Since the p mary responsibility for navigation rests with the pil advisory information and control instructions issued the localizer voice frequency are limited to those nec sary to insure separation between aircraft. Pilots ma not acknowledge transmissions made by the monitor co troller on localizer voice frequency unless specifically quested to do so.

A "no transgression zone" 3,510 feet wide is est lished equidistant between the centerlines of each loc izer course and displayed on the monitor radar sco Should an aircraft on final approach deviate fr course and enter the "no transgression zone," the monit controller will issue instructions as are necessary to al the course of that aircraft. Concurrently, immedi action will be taken by the controller monitoring t adjacent localizer course to cause any aircraft in pot tial conflict with the intruding aircraft to alter its fli path.

Missed Approach: The missed approach procedure dev oped for either runway is designed to provide separati from the adjacent runway. The pilot may be instruct to execute the missed approach procedure at any ti during the approach.



AIRCRAFT MAY BE VECTORED TO EITHER 14L OR 14R ILS FROM ANY OUTER FIX.

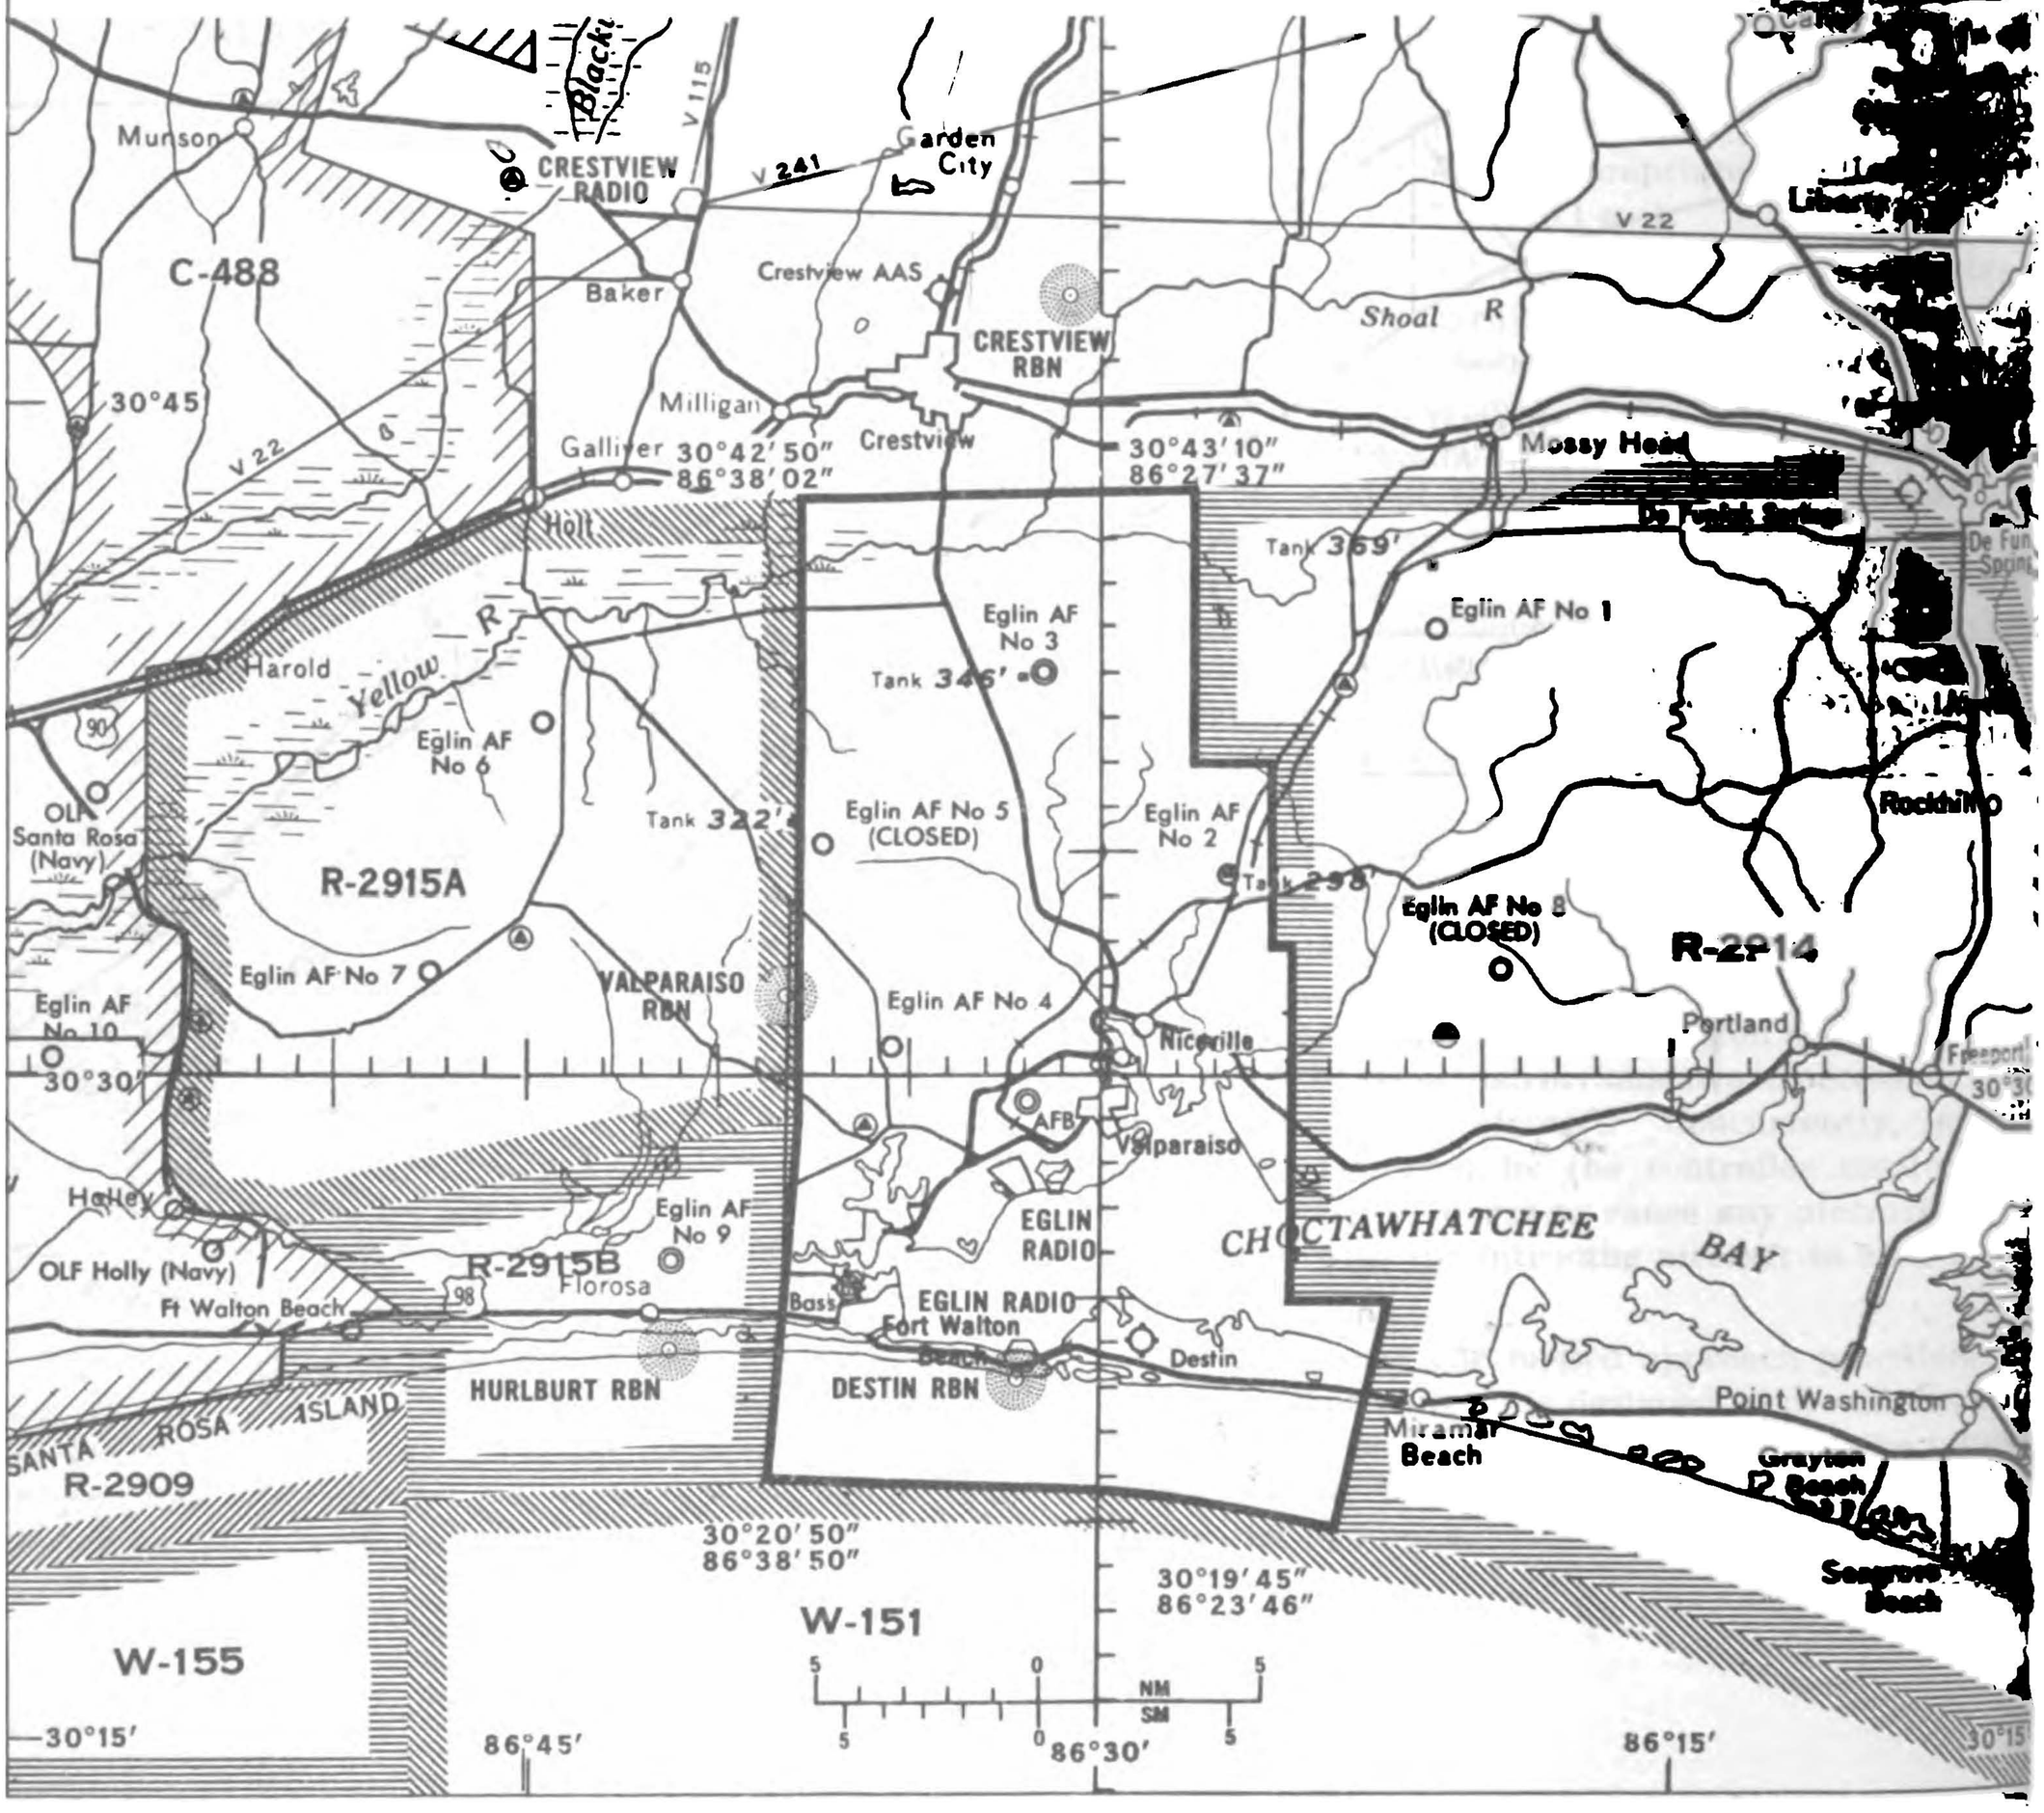
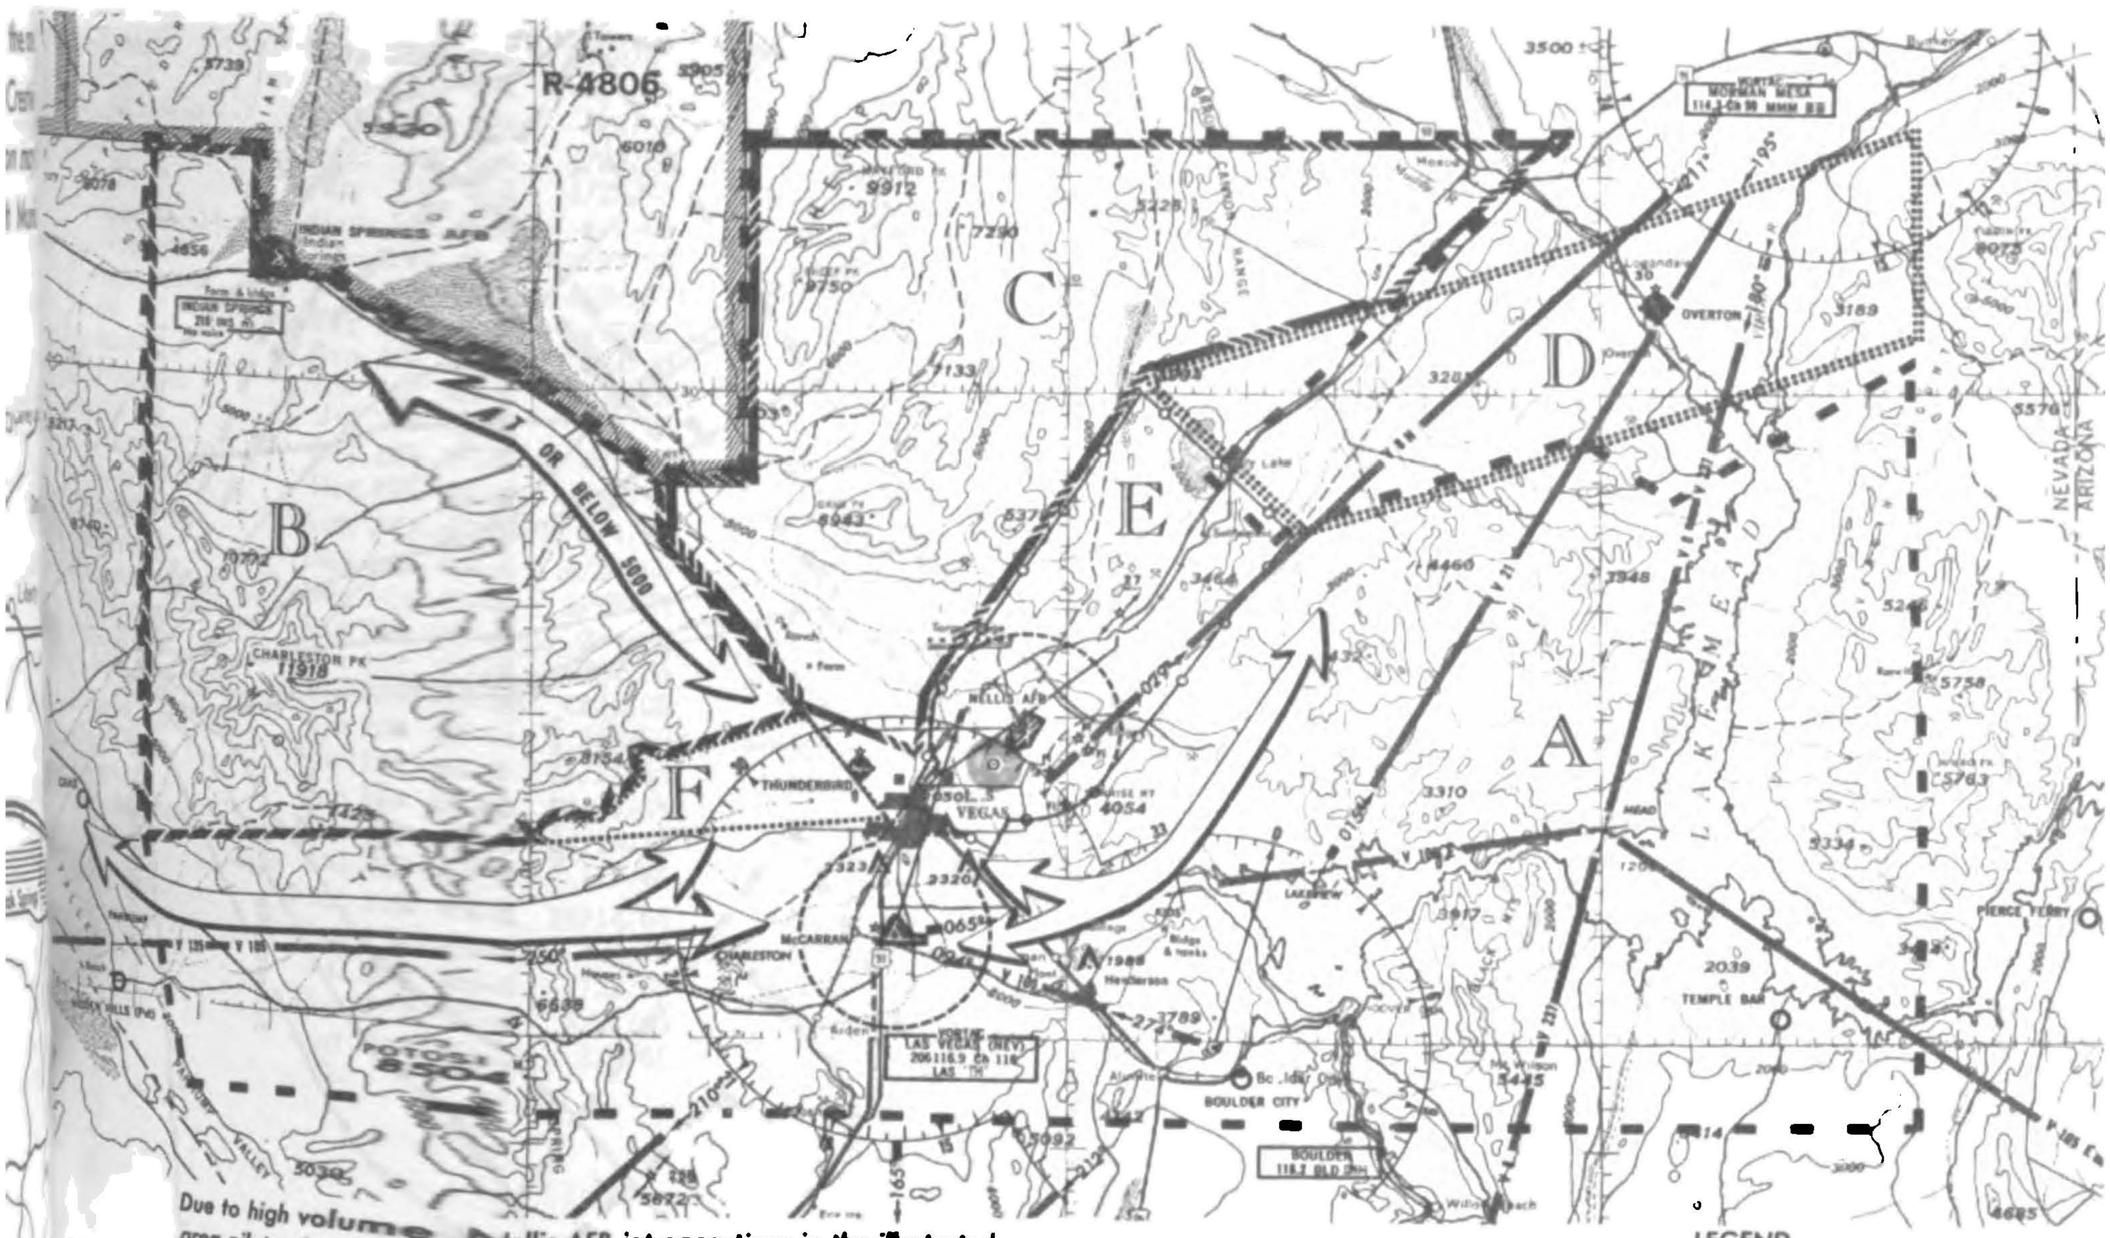
SPECIAL AIR TRAFFIC RULES (VFR OR VFR CONDITIONS)

EFFECTIVE DECEMBER 10, 1964

Prior to conducting flight operations in the area shown, pilots are required to obtain information about operating altitudes of high speed special activities conducted in the area. Normally, special activities will use not more than two altitude levels. Contact Crestview Radio, Eglin AFB RAPCON, Tallahassee Radio, or Pensacola Radio. Information may be obtained by radio or telephone. This special rule is in effect sunrise to sunset Monday through Saturday.



LAS VEGAS TERMINAL AREA NOTICE
LAS VEGAS, NEVADA



Due to high volume Nellis AFB jet operations in the illustrated area pilots of aircraft not on IFR flight plans operating into or through the Las Vegas area are encouraged to:

1. Avoid areas of jet concentration by following suggested routings shown by arrows, at appropriate altitudes and;
2. a. Arriving — contact Las Vegas Approach Control on 121.1, 125.9, 284.6 or 353.6 mcs, for radar advisories when inbound prior to reaching a point approximately 30 miles from Las Vegas or if not practical, contact Las Vegas Radio for in-flight advisories.
4. Departing — contact Las Vegas Departure Control on 119.4 or 335.5 mcs, for radar advisories immediately after departure from McCarran Field or Thunderbird Airport.

CHARLESTON, SOUTH CAROLINA

LOW LEVEL NAVIGATION ROUTES

Low level navigation routes are used for low level day and night navigation training by C-130E and C-124C aircraft under VFR conditions. The routes are used for single ship and formation flights with cargo drops at North Field, S. C., and miniature paradrops at Lane Airport, S. C. The routes are most active on Tuesday and Thursday between 2100Z-0200Z. Altitudes vary from 1250' to 4000' MSL; speeds from 130 to 250 knots for C-130's, and 130 to 170 knots for C-124's.

Federal Aviation Agency

Airman's
INFORMATION
MANUAL

SECTION III

FLIGHT DATA
AND
SPECIAL OPERATIONS

EFFECTIVE 0501Z 7 JANUARY 1965

To 0501Z 4 FEBRUARY 1965

AIRMAN'S INFORMATION MANUAL

INTRODUCTION

This Airman's Information Manual (AIM) has been developed by the Federal Aviation Agency as a pilot's operational manual replacing the Airman's Guide, Directory of Airports and Seaplane Bases, and the Flight Information Manual within the conterminous United States. The existing Alaska Airman's Guide and Chart Supplement and the Pacific Airman's Guide and Chart Supplement will continue to be published every 28 days.

The new AIM presents, in a single document, all information necessary for the planning and conduct of a flight in the National Airspace System. The content and format reflect user identified requirements and provide a "one package" approach.

The manual is divided into six sections, each composed of a specific category or family of information, fashioned into a format consistent with the operational needs of aviation. In contradistinction to previous flight information publications issued by FAA, the design concept of the AIM has provided for consolidation of similar information, segregation of air traffic control procedural information and its sequencing according to operational use, and the elimination of administrative and non-essential data.

The AIM is designed to be carried in the cockpit and may be used collectively or independently by sections. The manual is published as loose-leaf pages, and is three-hole punched to fit a standard three-ring binder.

New or amended textual or tabulated information except in the Airport/Facility Directory, is indicated by a solid dot prefixing the heading, paragraph, or line.

Each section of the AIM will be published at varying intervals during the year, depending on the stability or frequency or change of the information.

The various sections and the revision cycle of each are:

Section I	Basic Flight Manual	Semi-annually
Section II	ATC Operations and Procedures	Quarterly
Section III	Flight Data and Special Operations	Every 28 days
Section III-A	Notices to Airmen	Every 14 days
Section IV	Airport Directory	Semi-annually
Section IV-A	Airport/Facility Directory	Every 28 days

The above schedule provides a completely new manual every 6 months.

The revision cycle of Sections III and IV-A is every 28 days, the same as the IFR Enroute charts. Since the charts contains basically enroute information, the AIM serves as a supplementary publication, providing information for planning and terminal operations. Therefore, radio navigation aids are on the charts and unlike the Airman's Guide, are not tabulated in the AIM. Every effort has been made to minimize and eliminate duplication of information within publicatons and between publications and charts.

A Master Alphabetical Index of the AIM has been included in Section III because this section is issued every 28 days and thereby permits keeping the index current.

A brief description of the contents of each section in the AIM follows.

Section I—Basic Flight Manual

This section contains information of an instructional, educational, and training nature, assembled and presented in a systematic format, categorized by subject matter. The novice pilot, as well as the more experienced pilot will find here the basic fundamentals of knowledge for operating in the National Airspace System, information on adverse factors affecting safety of flight and health, and a list af available publications of general operational interest.

Section II—ATC Operations and Procedures

Section II is designed to serve as an official means of disseminating pertinent ATC information of interest to all pilots. The information governing flight operations, air traffic services, and procedures is presented in layman's language and avoids ambiguities which often result from individual interpretations of rules. Data is seqeunced in accordance with typical flight operations: Preflight, departure, enroute, arrival and landing procedures. In addition, supporting general procedures and information such as ADIZ, and SCATER procedures is included. Emergency procedures are combined and published at the end of the section.

Section III—Flight Data and Special Operations

Operational data most subject to change and which is not appropriate for inclusion within other sections of the AIM is carried in Section III. Because it contains critical flight data most subject to change, this section should be kept close at hand in the event of a divergence in enroute flight. Some of the most significant material contained in Section III is described below.

A Master Alphabetical Index giving a complete and comprehensive cross-referenced list of all aeronautical information in the AIM.

A glossary or explanation of aeronautical term or phrases used in the AIM, and a list of commonly used abbreviations.

Special Notices of pertinent current information of operational value for both preflight planning and enroute operations. These Special Notices are divided into three categories: General Notices—those of a general nature with universal application; Area Notices—those pertinent to a specific geographical area; and Regulatory Notices—these are condensations of changes to or new rules, parts, Advisory Circulars, Special Procedures and other regulatory matters of operational interest.

A Visual Navigation Chart Bulletin, as a means of updating the Sectional Charts, providing a cumulative tabulation of the major changes in aeronautical information occurring since the last chart publication date.

Detailed description tabulations and charts of Special Operations such as Oil Burner Routes and military refueling tracks.

Section III—A—Notices to Airmen

This section serves as a supplement, issued every fourteen days, to the AIM and provides operationally required data pertinent to the continuous NOTAMs carried in the daily teletypewriter NOTAM Summary (NOSUM), revisions to Oil Burner routes, and those airman advisories deemed essential to the safe conduct of flight.

Sections IV and IV–A—Airport Directory

Within Sections IV and IV–A there are provided an Airport Directory, a tabulation of ARTCC communications, frequencies, and a tabulation of Flight Service Stations.

Section IV contains the Airport Directory which is a listing of all known airports, heliports, and seaplane bases available for transient civil use within the conterminous United States, and indicates those airport services and facilities available at each. The seaplane tabulation and the heliport tabulation follow the airport tabulation. Military airports and privately owned and operated airports closed to civil aviation are not listed.

Section IV–A contains an Airport/Facility Directory providing an integrated tabulation of major airports, heliports and seaplane bases which have terminal navaids and communications facilities available at the airport. This tabulation combines all facilities and services available at each airport (heliport or seaplane base) or terminal area into a single listing.

In both Sections IV and IV–A, airports are listed alphabetically by geographical location (city or town) within each state. Airports tabulated in IV–A are cross-referenced in Section IV.

In Section IV–A, the Airport/Facility Directory is followed by the tabulation of all ARTC Center VHF communications frequencies. This, in turn, is followed by the tabulation of FSS's, which shows their telephone numbers, the number of the associated Weather Bureau Office, and other pertinent data.

Errors, Omissions, or Suggested Changes

Errors, omissions, or suggested changes should be forwarded to the Federal Aviation Agency, Air Traffic Service, Attention AT–600, Washington, D.C. 20553. Airport managers, operators and owners are urged to review data for their airport and report any errors or omissions to FAA at the address given above.

Procurement

The Airman's Information Manual is available on annual subscription for $15.00, plus $4.00 additional for foreign mailing. Requests should be directed to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Orders should be accompanied by check or money order made payable to the Superintendent of Documents.

INTRODUCTION

Section III—FLIGHT DATA AND SPECIAL OPERATIONS

Section III is published every 28 days and contains operational flight data most subject to continuous change that is not appropriate for inclusion within other sections of the Manual. Because it contains such critical flight data, this section should be kept close at hand in the event of a divergence in en route flight.

The information in Section III is presented in various tabulations or grouping arrangements appropriate to the specific items. Typical examples are: Preferred Routes, VOR Receiver Check Points, Parachute Jumping Areas, and Substitute Route Structures.

The Master Alphabetical Index of the entire Manual is provided in this Section. This complete and comprehensive index lists all items of information, cross referenced under all headings to which reference might reasonably be made, giving section and page number. Within the index, any reference involving emergency actions or procedures is printed in bold-face type.

As a means of updating the Sectional Charts produced by the Coast and Geodetic Survey, Department of Commerce, a Visual Navigation Chart Bulletin is included in Section III. This bulletin provides a cumulative tabulation of the major changes in aeronautical information that have occurred since the last publication date (normally every 6 months) of each sectional chart. Only those changes to controlled airspace and special use airspace, airports, and radio navigation facilities that present a hazardous condition or impose a restriction on the pilot are listed, thereby continually providing the VFR pilot with the essential data for keeping his sectional charts current until they are reissued.

At the end of Section III are grouped detailed tabulations and charts of special operations and areas such as Oil Burner Routes, and military low altitude refueling tracks. This arrangement provides a consolidated presentation of areas and special operations that are not designated through rule-making procedures.

GLOSSARY OF AERONAUTICAL TERMS

AIR DEFENSE IDENTIFICATION ZONE (ADIZ)—The area of airpace over land or water within which the ready identiication, the location, and the control of aircraft are reuired in the interest of national security. For operatng details see ADIZ procedures.

AIRPORT ADVISORY AREA—The area within five statute iles of an uncontrolled airport on which is located a 'light Service Station so depicted on the appropriate ectional Aeronautical Chart.

AIRPORT ADVISORY SERVICE—A service provided by a Flight ervice Station to enhance the safety of terminal opertions of airports where a station is operating but where ere is no control tower.

AIRPORT SURFACE DETECTION EQUIPMENT (ASDE)—Radar ulpment specifically designed to detect all principal atures on the surface of an airport, including vehicular affic, and to present the entire picture on a radar indiitor console in the control tower. ASDE has a maxium range of four miles, though its 16 inch diameter ope usually displays an area of only one mile radius out the control tower.

AIRPORT SURVEILLANCE RADAR (ASR)—Radar providing posion of aircraft by azimuth and range data without eleation data. It is designed for a range of 50 miles.

AIRPORT TRAFFIC AREA—The airspace within a circular nit defined by a five statute mile horizontal radius om the geographical center of an airport at which an erative airport traffic control tower is located and exnding upwards from the surface to, but not including, 000 feet above the surface.

AR ROUTE SURVEILLANCE RADAR (ARSR)—Long range radar hich increases the capability of ATC for handling heavy ı route traffic. An ARSR site is usually located at some stance from the ARTCC it serves.

AR ROUTE TRAFFIC CONTROL CENTER (ARTCC)—A facility tablished to provide traffic control service to Instruent Flight Rules (IFR) flights operating within conolled airspace and principally during the en route ıase of flight.

ALTITUDE RESERVATION (ALTRV)—Airspace utilization under escribed conditions, normally employed for the mass ovement of aircraft or other special user requirements hich cannot otherwise be accomplished. ALTRV's are pproved by the appropriate FAA facility.

APPROACH CONTROL SERVICE—Air traffic control service, ovided by a terminal area traffic control facility, for riving and or departing IFR flights and, on occasion, FR flights.

CARDINAL ALTITUDES OR FLIGHT LEVELS—"Odd" or "even" thousand-foot altitudes or flight levels. Examples: 5000, 6000, 7000, FL 250, FL 260, FL 270.

CEILING—The height above the ground or water of the lowest layer of clouds or obscuration phenomena that is reported as "broken," "overcast," or "obscuration" and not classified as "thin" or "partial."

CENTRAL ALTITUDE RESERVATION FACILITY (CARF)—An Air Traffic Service facility established to conduct the volume of coordination, planning and approval of special user requirements under the altitude reservation concept.

CONSOLAN—A low frequency, long-distance navaid used principally for transoceanic navigation.

CONTERMINOUS U.S.—Forty-eight states and the District of Columbia.

CONTINENTAL CONTROL AREA—The area, which includes that airspace within the contermious United States at and above 14,500 feet MSL, excluding airspace less than 1,500 feet above terrain, and prohibited and restricted areas (except certain specified restricted areas).

CONTINENTAL U.S.—Forty-nine states. The original 48 states and Alaska.

CONTROL AREA—Controlled airspace extending upwards from a specified height above the surface of the earth. Unless otherwise provided in appropriate cases, control areas extend upward from 700 feet above the surface until designated from 1,200 feet above the surface or from at least 500 feet below the MEA, whichever is higher, to the base of the continental control area.

CONTROL ZONE—Controlled airspace extending upwards from the surface of the earth. Control zones may include one or more airports and are normally circular areas 5 statute miles in radius with extension where necessary to include instrument approach and departure paths.

CRUISE—The term "cruise" used instead of "maintain" in an ATC clearance indicates that descent from cruising altitude may be commenced at pilot's discretion without further clearance from ATC. "Cruise" is normally used only on relatively short flights in uncongested areas, and is authorization for the flight to proceed to, and make an approach at, destination.

DISCRETE FREQUENCY—A frequency assigned a particular function.

EXPECTED APPROACH CLEARANCE TIME (EAC)—The time at which it is expected that an arriving aircraft will be cleared to commence approach for a landing.

FINAL APPROACH—IFR—The flight path of an aircraft which is inbound to the airport on an approved final instrument approach course, commencing at the point of interception of said course and extending to the airport or the point where circling for landing or missed approach is executed.

FINAL APPROACH—VFR—A flight path of a landing aircraft in the direction of landing along the extended runway center line from the base leg to the runway.

FIX—A geographical position determined visually, by reference to one or more radio navigational aids, by celestial plotting, or by another navigational device.

FLIGHT ADVISORY SERVICE—Advice and information provided by a facility to assist pilots in the safe conduct of flight.

FLIP—Flight Information Publication.

FLIGHT LEVEL (FL)—A level of constant atmospheric pressure related to a reference datum 29.92" HG. For example: Flight Level 250 is equivalent to an altimeter indication of 25,000 feet, and Flight Level 265 to 26,500 feet.

FLIGHT SERVICE STATION (FSS)—A facility operated by the FAA to provide flight assistance service.

IFR CONDITIONS—Weather conditions below the minimum prescribed for flights under VFR.

INITIAL APPROACH—Initial approaches to a facility are normally made over specified routes to the primary navigation facility. When the approach fix is not the primary navigation facility, the transition routes are specified and shown on the particular AL chart. The minimum en route altitude for the route along which the pilot has been flying is normally used as the initial approach altitude. The high level initial approach altitude is usually termed "Initial Penetration Altitude" and is considered as the altitude at which the aircraft begins a penetration. This altitude is established for each particular procedure and is indicated on the associated AL chart.

INTERROGATOR—The ground-based surveillance radar beacon transmitter-receiver which scans in synchronism with a primary radar, transmitting discrete radio signals which repetitiously request all transponders, on the mode being used, to reply. The replies received are then mixed with the primary radar video to be displayed on the same plan position indicators.

JET ROUTES—A high altitude route system, at and above 18,000 feet MSL, predicated on a network of designated high altitude VHF/UHF facilities. (For operating procedures applicable to this system see ENROUTE).

JOINT USE RESTRICTED AREA—An area wherein an aircraft may operate if prior permission has been granted by either the restricted area "using agency" or the "controlling agency." (1) The using agency organization, or military command whose activity within a restricte area necessitated the area being so designated; excep that, in the case of those Restricted Area/Military Clim Corridors which do not have a designated controllin agency, the using agency is a military air traffic contr facility which may be contacted for transit through th climb corridor. The using agency notifies the controllin agency whenever permission may be granted by th controlling agency for transit of, or flight within a re stricted area. (2) The controlling agency is a designate FAA facility which may authorize transit of a restricte area.

MAINTAIN—The altitude/flight level instructions in a ATC clearance normally require that a pilot "maintai the altitude/flight level at which the flight will opera when in controlled airspace. Altitude/flight lev changes while en route should be requested prior to t time the change is desired.

MAXIMUM AUTHORIZED ALTITUDE (MAA)—The highest al tude on a Federal airway, jet route, or other direct rou for which a MEA is designated in F.A.R. Part 95 which adequate reception of navigation aid signals assured.

MINIMUM CROSSING ALTITUDES (MCA)—The lowest altitud at certain radio fixes at which an aircraft must cro when proceeding in the direction of a higher minimu en route IFR altitude.

MINIMUM EN ROUTE IFR ALTITUDE (MEA)—The altitude effect between radio fixes which assures acceptable na gational signal coverage and meets obstruction clearan requirements between those fixes.

MINIMUM OBSTRUCTION CLEARANCE ALTITUDE (MOCA)—T specified altitude in effect between radio fixes on VO airways, off-airway routes on route segments, whi meets obstruction clearance requirements for the enti route segment and which assures acceptable navigation signal coverage only within 22 nautical miles of a VO

MINIMUM RECEPTION ALTITUDE (MRA)—The lowest altitu required to receive adequate signals to determine speci VOR/VORTAC/TACAN fixes.

MODE—The number or letter referring to the speci pulse spacing of the signal transmitted by an interro tor.

RADAR BEACON (SECONDARY RADAR)—A radar system which the object to be detected is fitted with cooperati equipment in the form of a radio receiver/transmitt (transponder). Radio pulses transmitted from t searching transmitter/receiver (interrogator) site a received in the cooperative equipment and used to tri ger a distinctive transmission from the transponde This latter transmission, rather than a reflected signa is then received back at the transmitter/receiver site.

RADAR ADVISORY SERVICE—The provision of advice or i formation based on radar observation.

RADIAL—A radial is a magnetic bearing extending from a VOR, VORTAC, or TACAN.

PRIMARY RADAR—A radar system in which a minute portion of a radio pulse transmitted from a site is reflected off an object and then received back at that site.

PROHIBITED AREA—Designated airspace within which the flight of aircraft is prohibited.

TARGET—The indication displayed on a radar scope resulting from a primary radar return or a radar beacon reply.

TRANSITION AREA—An area extending upward from 1,200 feet or higher above the surface when designated to complement control zones; from 700 feet above the surface when designated in conjunction with an airport with no control zone but for which an instrument approach procedure has been prescribed; or from 1,200 feet or higher above the surface when designated in conjunction with airway route structures or segments. Unless otherwise limited, transition areas terminate at the base of the overlying control area or Continental Control Area.

TRANSPONDER—The airborne radar beacon receiver-transmitter which automatically receives radio signals from all interrogators on the ground, and selectively replies with a specific reply pulse or pulse group only to those "interrogations" being received on the mode to which it is set to respond.

VECTOR—A heading issued to the pilot for the purpose of providing navigational guidance by means of radar.

VISIBILITY, PREVAILING—The horizontal distance at which targets of known distance are visible over at least half of the horizon. It is normally determined by an observer at or close to the ground viewing buildings or other similar objects during the day and ordinary city lights at night. Under low visibility conditions the observations are usually made at the control tower. Visibility is REPORTED IN MILES AND FRACTIONS OF MILES in the Aviation Weather Report. If a single value does not adequately describe the visibility, additional information is reported in the "Remarks" section of the report.

VISIBILITY, RUNWAY—The horizontal distance at which a stationary observer near the end of the runway can see an ordinary light (about 25 candlepower) at night or a dark object against the horizon sky in the daytime. In practice the human observer is used very little for this observation. Instead runway visibility is normally determined by a transmissometer (a photoelectric device calibrated in terms of a human observer). It is REPORTED IN MILES AND FRACTIONS OF MILES in the "Remarks" section of the Aviation Weather Report. A meter in the control tower gives the FAA traffic controller a continuous indication of the runway visibility at transmissometer locations. Runway visibility, where available, is used in place of prevailing visibility for the determination of minimums on a transmissometer runway. This program is gradually being replaced by Runway Visual Range at transmissometer locations.

VISIBILITY, RUNWAY VISUAL RANGE (RVR)—An instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end; it is based on the sighting of either high intensity runway lights or on the visual contrast of other targets—whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal, AND NOT SLANT, visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is REPORTED IN HUNDREDS OF FEET. At the present time, RVR observations are automatically furnished to FAA tower controllers at approximately 25 locations from readout equipment connected to the remote transmissometer installation. RVR provides an additional operating minimum at fields equipped with specified navigational aids. For example, at the present time the RVR minimum at Newark is 2000 ft. (in combination with a minimum descent altitude of 218' MSL) for both takeoffs and landings regardless of the reported ceiling and visibility.

VOT—VHF facility transmitting a test signal to determine the operational status of VOR receivers.

ABBREVIATIONS

Note: "s" may be added for plural, or as appropriate.

acft..... aircraft
adjt..... adjacent
admin.... administration
AGL..... above ground level

VORTAC.. collocated VOI and TACAN navigational facilities
VOT..... a VOR Receive Testing Facility
vsby..... visibility

wea..... weather
WIP..... work in progr
wt..... weight

THE NOTAM CODE

INTRODUCTION

The NOTAM Code provides for coding NOTAM information to reduce telecommunications transmission time and reduce translation difficulties in the International Service.

A NOTAM Code group contains 5 letters. The first letter is always the letter Q to indicate a code abbreviation for use in the composition of NOTAMs. The letter Q has been chosen to avoid conflict with any assigned radio call sign.

NOTAM code significations shall be amplified or completed where necessary by adding appropriate words, contractions, frequencies, location identifiers, place names, or figures. Approved abbreviations shall be used in preference to plain language whenever possible. The information necessary to complete a NOTAM code group, as indicated by a blank space, shall be given except when (1) the blank spaces are enclosed within parentheses or brackets to indicate their completion is optional; e.g., LHX QIEIK 15 MIN. Meaning: the LaJunta Colorado airport beacon is available on request at 15 minutes' notice; or (2) an alternative meaning shown in parentheses is selected and the blank space in this alternative meaning is complete; e.g., QAPOK 116.9. Meaning: the radio range on 116.9 Mc. resumed normal operation.

Expressions or words in parentheses which do not include blank spaces have the following significances:

(1) When following a blank space, signifies the explanation of information to be used in filling the preceding blank.

(2) When following a word or expression, signifies an alternative to the word or expression.

CODE GROUP FORMATION

5-letter NOTAM code groups are formed in the following manner:

(1) First Letter.—The letter Q.

(2) Second and Third Letters.—The appropriate combination of 2 letters, selected from the "2nd and 3rd letters" section of the code, identify the facility, service or danger to aircraft in flight being reported. The *second* letter has been restricted to A, E, I, O, or U. These letters also serve to classify the aid, facility, or service described: i.e., the letters A and E signify radio aids. The letter I signifies lighting facilities. The letters O and U signify airports, search and rescue, and dangers to aircraft in flight.

(3) Fourth and Fifth Letters.—The appropriate cominbation of 2 letters, selected from the "4th and 5th Letters" section, denote the operating status of the facility, service, or danger to aircraft being reported. The *fourth* letter has been restricted to A, E, I, O, or U.

DECODE

SECOND AND THIRD LETTERS

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	RADIO AIDS		
AA	. . . [*specify TWR, APP, ACC or FIC*] air traffic services receiver . . . kc/s. (*or* . . . Mc/s.).	**AY**	200 Mc/s. Distance Measuring Equipment.
AB	Inner marker, Instrument Landing System.	**AZ**	Station location marker VHF.
AC	. . . [*specify TWR, APP, ACC or FIC*] air traffic services transmitter . . . kc/s. (*or* . . . Mc/s.).	**EA**	En-route Surveillance Radar.
		EB	Broadcasting station (public).
		EC	CONSOL or CONSOLAN station.
		ED	DECCA or DECTRA.
AD	Middle marker, Instrument Landing System.	**EE**	Ground Controlled Approach System (GCA).
AE	Outer marker, Instrument Landing System.	**EF**	Terminal Area Surveillance Radar.
		EG	Gee.
AF	Fan-type marker.	**EH**	Elevation element of the Precision Approach Radar (PAR).
AG	Glide path, Instrument Landing System.	**EI**	Monitoring device associated with . . . (*specify*) radio aid.
AH	Non-directional Beacon (NDB).	**EJ**	All air-ground facilities (except . . .).
AI	Instrument Landing System (ILS).	**EK**	Precision Approach Radar (PAR).
AJ	Radio range (other than VOR) and associated voice communications.	**EL**	LORAN.
		EM	Azimuth element of the Precision Approach Radar (PAR).
AK	Radio receiving facilities.	**EN**	DME (1000 Mc/s. Distance Measuring Equipment).
AL	Localizer, Instrument Landing System.	**EO**	Beam Approach Beacon System (BABS).
AM	Locator, inner, Instrument Landing System.	**EP**	Radar responder beacon.
AN	TACAN.	**EQ**	Surveillance Radar Element (SRE) of GCA.
AO	Locator, outers, Instrument Landing System.	**ER**	Radio transmitting facilities.
AP	VOR (VHF Omnidirectional Radio Range) and associated voice communications.	**ES**	All radio-navigation facilities (except . . .).
AQ	VOR (VHF Omnidirectional Radio Range).	**ET**	Teletypewriter transmitting facility (ies).
AR	Radio range (other than VOR).	**EU**	Radio direction-finding station . . . (*frequency or type*).
AS	Radio range leg.	**EV**	VORTAC (the combination of VOR and TACAN).
AT	Attentional signal.	**EW**	Ground interrogator, SSR system.
AU	Meteorological communications . . . kc/s. (*or* . . . Mc/s.).	**EX**	Unassigned.
AV	Voice communications . . . kc/s. (*or* . . . Mc/s.).	**EY**	Ground movement radar.
AW	Unassigned.	**EZ**	Unassigned.
AX	Non-directional Beacon (NDB) and voice facility.		
	LIGHTING FACILITIES		
IA	Boundary lights.	**ID**	Channel lights.
IB	Aerodrome beacon.	**IE**	Light beacon.
IC	Unassigned.	**IF**	Floodlights.

DECODE

SECOND AND THIRD LETTERS (Contd.)

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	LIGHTING FACILITIES (Contd.)		
IG	Angle-of-approach lights.	IP	Approach light system [type . . . {*specify LSA (low intensity) or LSB (high intensity*}] (for runway number . . .).
IH	Taxiway lights.		
II	Hazard beacon.		
IJ	Threshold lights (for runway number . . .).	IQ	Runway alignment beacon.
		IR	Runway lights [type . . . {*specify LSA (low intensity) or LSB (high intensity)*}] (for runway number . . .).
IK	Flares.		
IL	All landing area lighting facilities.		
IM	Identification beacon.	IS	Strip lights [for strip . . . (*number or magnetic direction*)].
IN	Unassigned.	IT–IY	Unassigned.
IO	Obstruction lights.	IZ	Airway course lights.
	AERODROMES — SEARCH AND RESCUE — DANGERS TO AIRCRAFT IN FLIGHT		
OA	Land aerodrome.	UB	Mooring buoys.
OB	Beaching facilities.	UC	Unassigned.
OC	Water aerodrome.	UD	Prohibited, restricted or danger area designated as . . . (*name or reference identification*).
OD	Meteorological forecast service.		
OE	Meteorological observation service.		
OF	Meteorological watch service.	UE	Aircraft.
OG	Runway arresting gear.	UF	Fixed balloons.
OH	Helicopter landing area.	UG	Bombing or aerial depth charge dropping.
OI–OL	Unassigned.		
OM	All runways [except number(s) . . .].	UH	Air exercises (*or* flying displays).
ON	Stopway for runway number.	UI	Gun or missile firing.
OO	Taxiway(s).	UJ	Glider flying.
OP	Rescue vessel.	UK	Demolition of explosives.
OQ	Ocean Station Vessel.	UL	Landing direction indicator.
OR	Refueling [. . . type fuel(s) *or* . . . octane].	UM	Mooring and docking facilities.
		UN	Parachute jumping exercises.
OS	Search and rescue aircraft [*specify VLR, LRG, MRG, SRG or HEL*].	UO–UP	Unassigned.
		UQ	Apron.
OT	Crash and fire fighting facilities.	UR	Runway(s) and number(s).
OU	Unassigned	US	Strip . . . (*number or magnetic direction*).
OV	. . . [*specify TWR, APP, ACC or FIC*] air traffic service.	UT	Grass landing area.
		UU	Unassigned.
OW–OY	Unassigned.	UV	Fog dispersal equipment.
		UW–UY	Unassigned.
OZ	Warship.	UZ	Runway threshold (number . . .).
UA	Alighting area.		

DECODE
FOURTH AND FIFTH LETTERS

4th & 5th Letters	SIGNIFICATION	4th & 5th Letters	SIGNIFICATION
	HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES		
AA	Unassigned.	**EC**	Characteristics *or* identification *or* radio call sign changed to . . .
AB	Usable for length of . . . and width of . . .	**ED**	Operating frequency(ies) will be changed to . . . kc/s. (*or* . . . Mc/s.) effective . . . (*date/time*).
AC	Covered by snow to a depth of . . . NOTE.—*This snow is not compacted.*	**EE–EG**	Unassigned.
AD	Cleared of soft snow, full length and width.	**EH**	Not heard.
AE	Totally free of snow and ice.	**EI–EL**	Unassigned.
AF	Covered by [. . . (*type*)] ice to a depth of . . .	**EM**	Military operations only.
AG–AH	Unassigned.	**EN**	Not available due to . . . (*specify reason*) from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
AI	Operating without tone modulation.	**EO**	Unassigned.
AJ	Operating without coding.	**EP**	Available on prior permission (of . . .) only.
AK	Covered by compacted snow to a depth of . . .	**EQ–ER**	Unassigned.
AL	Operating on reduced power.	**ES**	Out of service from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] due to the following condition(s) . . .
AM	Snow clearance in progress [estimated time of completion is . . . (*date/time*)].	**ET**	Test operation only. NOT for operational use.
AN	Grass cutting in progress [estimated time of completion is . . . (*date/time*)].	**EU–EV**	Unassigned.
AO	Marked by . . .	**EW**	Completely withdrawn.
AP	Work is in progress [estimated time of completion is . . . (*date/time*)].	**EX**	Unassigned.
AQ	Work completed.	**EY**	Is outside the limits of its assigned ocean station.
AR	Snow clearance completed.	**EZ**	Is within the limits of its assigned ocean station.
AS	Grass cutting completed.	**IA–IB**	Unassigned.
AT	Sanding is in progress [estimated time of completion is . . . (*date/time*)].	**IC**	Report of apparent unreliability or track displacement hereby is cancelled.
AU	Appears unreliable.	**ID**	Available on request to . . .
AV	Covered by ice patches.	**IE**	Unassigned.
AW	Height of snowbanks is . . . (*figures and units*).	**IF**	Flight checked and found reliable.
AX	Braking action is . . . (A = *good*, B = *medium*, C = *poor*).*	**IG–IJ**	Unassigned.
AY	Are to avoid area, radius of danger being . . . (about the point . . .).	**IK**	Available on request (to . . .) immediately [*or* at . . . (*time period*) notice].
AZ	Will take place from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] (on the days of . . . between the hours of . . . and . . .) at . . . (*location*) (within the sector of . . . and a radius of . . .) at . . . height above . . . (*datum*).	**IL**	Hours of service are now . . .
EA	Unassigned.	**IM**	Unassigned.
EB	Location change to . . . effective . . . (*date/time*).	**IN**	Operative (*or* re-operative), activated (*or* re-activated) from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
		IO	Operating normally.

DECODE

FOURTH AND FIFTH LETTERS (Contd.)

4th & 5th Letters	SIGNIFICATION
	HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES (Contd.)
IP	Track(s) reported to be displaced (. . . degrees) (. . . direction) of published bearing(s), other tracks probably have shifted.
IQ	To be used as radio beacon only.
IR	Magnetic track(s) towards station is are now . . . [will be . . . at . . . (*date/time*)].
IS	Operative (or *re*-operative) subject to conditions/limitations already published.
IT	Aircraft restricted to runways and taxiways.
IU	Unserviceable for aircraft heavier than . . . tons.
IV	Unsafe from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
IW–IZ	Unassigned.
OA–OF	Unassigned.
OG	Operative but ground checked only, awaiting flight check.
OH–OJ	Unassigned.
OK	Resumed normal operation.
OL	Track(s) ground checked, approved for instrument flying.
OM	Shut down for maintenance from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)]—disregard all signals.
ON–OQ	Unassigned.
OR	Previously promulgated shutdown has been cancelled.
OS	Unassigned.
OT	New facility in operation.
OU	Operating without interruption for voice transmissions from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
OV–OW	Unassigned.
OX	Exercising at . . . (*date/time, location and height above the specified datum*).
OY–OZ	Unassigned.
UA	Closed to all operations from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
UB–UC	Unassigned.
UD	Closed to all night operations from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
UE	Unassigned.
UF	Closed for an unknown duration due to flood.
UG	Closed for an unknown duration [*or* until . . . (*date/time*)] due to ice or snow.
UH	Closed for an unknown duration [*or* until . . . (*date/time*)] due to thaw.
UI	Closed from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] for maintenance.
UJ–UL	Unassigned.
UM	Operating in an unmonitored status.
UN–US	Unassigned.
UT	Operative but caution advised due to following condition(s) . . .
UU	Suitable for . . . (*specify*) equipped aircraft only.
UV	Covered by slush to a depth of . . .
UW	Covered by water to a depth of . . .
UX–UZ	Unassigned.

PARACHUTE JUMPING AREAS

The following tabulation lists all known parachute jumping sites in the United States. Unless otherwise indicated, all activities are conducted during daylight hours and under VFR conditions.

ALABAMA

Fort Rucker, Cairns AAF: 5 mi radius. Week-ends and holidays 1200-SS; intermittently week-days. Up to 14,500' MSL.

Headland Mun Arpt: 1 mi E. 1200 LST to sunset. Sundays. Up to 12,000'.

ARIZONA

Marana Air Park: Daily weekends, and evenings. Up to 6,500; occasionally 10,000' MSL and 24,000' MSL.

Phoenix, Deer Valley Arpt: 4 mi WSW. Up to 14,000' MSL; 3 mi ESE. Up to 7000' MSL.

Scottsdale, Thunderbird Academy Airport: 1 mi W. Up to 10,000' MSL.

Tucson, Ryan Fld: Up to 12,000'.

ARKANSAS

Clarksville Arpt: Weekends; contact Ft. Smith Rdo for info concerning unscheduled ngt and holiday activities. Up to 13,000' MSL.

Fayetteville: 1 mi NNW Razorback Arpt. Mon thru Sat 2200GMT-sunset. Suns and holidays 1400 GMT– sunset.

Jonesboro Mun Arpt: Weekends, with unscheduled parachuting week days. For confirmation of activities contact Walnut Ridge FSS.

Russellville Arpt: 4 mi SW. Weekends. Check NOTAMS for holiday and ngt. Up to 12,000'.

CALIFORNIA

Arvin: 1½ mi SW. 0800–SS Sat and Suns. Up to 15,000' MSL.

Avenal Arpt: 0.5 mi W of rnwy, weekends and holidays 1600 to 0300Z occasional jumps week days 0000–0300Z; up to 10,000'.

Black Point: Sky diving weekends up to 12,500'.

Black Point: 6 mi NE Hamilton AFB. Mon thru Sat up to 1500' MSL.

Calistoga Arpk: Weekends.

Camp Pendleton, Oceanside (San Diego Co.): E half of V23/V165 arwys between San Clemente and Oceanside. All drops made within the Oceanside Corps Maneuver Area from 1,200 to 4,500'. Day and ngt. Current info may be obtained from FSS San Diego, Calif.

Clear Lake: Into Clear Lake at 39°05'N, 122°51'W. Mon thru Sat. Up to 4400' MSL.

El Centro NAF: 0700–1600P (1500–2400Z) Mon-Fri. Up to FL 400.

Fairoaks, Skylark Fld: Up to 13,700' MSL. Moderate weekdays, hvy weekends and holidays.

Fort Ord (Fritzsche AAF): Free fall parachute activity weekends, holidays, and occasionally wkdays, from alts ranging from 2800'–15,000', opening at absolute alts of 2000'–2500'. Center of drop zone lctd at 36°38'N, 121°46'W in Restricted Area R-2511. Ctc Fritzsche Twr for advisory info.

Fresno Air Terminal: 5½ mi NE. Sundays. From 12,500'.

Fresno, Chandler Arpt: 5 mi W. Heavy activity weekends, holidays, and occasionally weekdays. Up to 15,000'.

Hollister Mun: 1 mi NE. Weekends and occasionally week days. 12,500' MSL.

Lancaster, Wm. J. Fox Fld: Weekends and holidays, one half mile S of arpt. Up to 15,000' MSL.

Lake Berryessa: Lat 38°31', 122°12'. Mon thru Sat. Up to 2000' MSL.

Lakeside (San Diego Co.): 8 mi ENE Gillespie Fld, Santee, Calif., two mi out of ctl area. Daily, greatest activity weekends. Up to 15,000'.

Lincoln Mun Arpt: Weds 1200 to 2200 and weekends and holidays from sunrise to 2200, 1½ to 2 mi SW.

Livermore, Sky Ranch Arpt: Greatest activity on weekends.

Lodi, Linds Arpt: Weekends. 0.5 mi NE on V23 arwy btn Linden and Sacramento VORs. Up to 9,500'.

Lost Hills, Kern Co. No. 9 Arpt: Daily up to 16,000' MSL.

Milpatas, King Skylanes Arpt: 3 mi E; Weekends. From 12,500'.

Ojai, Henderson Arpt: Weekends from 14,000' MSL 3 mi SW.

Ojai, Lake Casitas: 1 mi NE. Up to 14,500' MSL. Weekends and holidays.

Piru: Tues-Fri. 2 mi E. Up to 14,500'.

San Diego, Brown Fld: NW corner of fld. Weekdays, morning hrs. Up to 15,000'.

San Diego–County Arpt (Gillespie Fld): Up to 20,000' MSL, chute opening alt aprxly 2700–3000' MSL in vcnty of arpt.

San Diego, Otay Reservoir: Weekdays and ngts. Up to 15,000'.

San Diego Co.: 5 mi ESE Brown Fld, adj Mexico. Weekdays and ngts. Up to 15,000'.

Santa Maria Arpt: Weekends and holidays. Up to 15,000' MSL. 6 NW.

Schellville, Sonoma Valley Arpt: Sunrise to sunset Suns.

Taft Arpt: About 6 mi E. Daily, up to 20,000'.

COLORADO

Aurora, Colfax Air Park: 2 mi W and 2 mi SE. Sat, Suns and holidays. Up to 18,500' MSL.

Colorado Springs, Butts AAF: Weekends btn 2300 and 20,000'.

Colorado Springs, USAF Academy Air Strip: Dalgt hrs Sat, Sun and holidays; week days 0500–0800 and 1600–1900. Up to 15,000' MSL.

Greeley, Weld Co Mun Arpt: Weekends 1500–0200. 4½ mi SSE from 7500' AGL.

Littleton, Columbine Arpt: 2 mi S. Up to 13,500' AGL.

Longmont Mun Arpt: Weekends and holidays up to 15,000'.

CONNECTICUT

Burlington, Johhnycake Arpt: Sat & Suns 1600–2200Z. Up to 5000′ AGL.

DELAWARE

Delmar-State Line Arpt: 4 mi radius. Up to 12,500′. Weekends and holidays.

Selbyville, American Skyways Arpt: Weekends and holidays. From 15,000′.

FLORIDA

Buchan Arpt: 7 mi S of Venice. Weekends and holidays. Up to 15,500′.

Clewiston, Airglades Arpt: Up to 12,000′.

Deland Mun Arpt: Up to 7,000′ daily and weekends.

Fort Lauderdale: 2 mi NE rdo bcn. Weekends and holidays. Up to 12,000′.

Homestead AFB: Occasionally. Up to 1,000′ MSL.

Howey Arpt: Weekends. Up to 10,000′.

Kissimmee Arpt: Daily and weekends. Up to 12,000′.

Marianna Mun Arpt: 5 mi radius; weekends during daylight hrs and intermittently daily Mon thru Fri and at ngt. Up to 12,500′.

Palatka, Kay Larkin Arpt: Weekends.

Santa Rosa Island: Daily. Up to 12,500′.

Venice Arpt: 7 mi S. Weekends and holidays. Up to 15,500′.

Williston Mun Arpt: Weekends.

Zephyrhills Arpt: Sundays. Up to 12,500′.

GEORGIA

Cleveland, White Co Arpt: Weekends. Up to 12,500′.

Dawson, Terrell Co Arpt: Intermittently daily and weekends. Up to 10,000′.

Stockbridge, Bellah Fld: Weekends. Up to 15,500′.

Villa Rica, Flying S Ranch: 2 mi NE. Sats and Suns. Up to 12,500′ AGL.

ILLINOIS

Aledo, Mercer Co Arpt: Evening and weekends. Up to 10,000′.

Alton, Civic Meml Arpt: Weekends, holidays and occasional weekdays. Up to 12,500′.

Breese Arpt: ½ mi N. Up to 7,000′.

Chicago, Hammond Arpt: Weekends. Up to 12,500′.

Danville, Vermillion Co Arpt: Weekends. Within 1½ mi. Up to 12,500′ MSL.

Hebron Arpt: Daily.

Kankakee, Greater Kankakee Arpt: Weekends. From 4000′.

INDIANA

Ramsey, Glen Aire Ranch Arpt: Weekends within 5 mi radius. Up to 14,500′.

Rising Sun Arpt: Sundays. Within 5 mi radius. Up to 14,500′.

Seymour, Freeman Fld: Weekends and holidays. Up to 18,000′.

IOWA

Council Bluffs Mun Arpt: 1 mi S; up to 15,000′.

Muscatine Arpt: 10 mi radius. Evening and weekends. Up to 12,500′.

KANSAS

Fort Riley Military Reservation: Sky diving operations to 10,000′, weekends and holidays.

Make Arpt: Weekends and intermittently at other times Up to 15,000′.

Salina Mun Arpt: Evenings and weekends. From 12,500′

KENTUCKY

Henderson City Co. Arpt: 149° radial EVV VOR 8.1 nmi Up to 10,000′ MSL.

Hopkinsville, Christian Co. Arpt: 4 mi NNE. Tues evening and Weekends. Up to 12,500′.

Madisonville, Athey Arpt: Suns and holidays 0700–SS. Up to 12,500′.

Thornhill: 133° radial CVG VOR 15 nmi. Weekends. Up to 12,000′ MSL.

LOUISIANA

De Ridder, Beauregard Parish Arpt: Sky diving from 12,000

Fort Polk, Polk AAF: 2 nmi radius.

Hammond Arpt: Intermittently. Up to 10,000′.

MAINE

Augusta State Arpt: Sundays, 3 mi SE.

Sanford: Unscheduled jumps from 2700′ to 12,500′.

Wiscasset Arpt: Weekends. Up to 12,000′.

MARYLAND

Cumberland, Mexico Farms Arpt: Up to 3000′. Most activity weekends.

Eldersburg, Robert E. Lee Arpt: 3 mi S EMI VOR. Up to 12,500′ MSL. Most activity weekends.

Elkton, Lovett Arpt: Weekends. Up to 3000′.

Mitchellville, Freeway Arpt: 4 mi E. Weekends and holidays Up to 12,000′.

Nottingham: 2 mi out on VOR radial 031. Weekends and Weds to 10:00 P.M. up to 20,000′.

MASSACHUSETTS

Agawam: Evenings, weekends and holidays.

Bedford, Hanscom Fld: 1600–2000Z Thur and Sat. Up to 1500′.

Fort Devens AAF: Tues and Thurs, 0800–1630 Sat, up to 13,500′ MSL, lat 42°28′, long 71°42′.

Mansfield Mun Arpt: 2–3 NM W (vcnty of old Attleboro Arpt). Up to 7,000′.

Mansfield Mun Arpt: Unscheduled. Mostly weekends and holidays. Up to 12,000′.

Maynard Ordnance Depot: Airdrops of personnel and hvy eqpmt from 500′ to 2500′ Thurs, between 1500Z and 2000Z, within 1 mi radius of 42°25′, 71°28′45″.

Montague, Turners Falls Arpt: Weekends and holidays. Up to 13,000′.

Orange Mun Arpt: 2 mi radius. Day and night. Most activity weekends and holidays; moderate weekends Up to 14,500′.

Taunton Mun Arpt: Weekends. Up to 7200′.

MICHIGAN

E. Tawas, Iosco Arpt: Up to 13,500′.

Gregory, Richmond Fld: Weekends.

Houghton Co. Memorial Arpt: NOTAMS will be issued when activated.
Marshall, Brooks Fld: Weekends. Up to 13,000′.
Monroe: 5 mi S. Weekends. Up to 15,500′.
Muskegon Northside Airport: Up to 15,000′.
Plainwell, Otsego-Plainwell Mun Arpt: Sundays.
Saginaw Arpt: Weekends. Up to 13,000′.
Wixom Arpt: 1 mi SW. 0800 to SS Sats and Suns, and holidays. Up to 18,000′.

MINNESOTA

Aitkin Mun Arpt: Weekends.
Bethel: 2 mi E. Weekends. Up to 12,000′. Summer months: Wed afternoons.
Minneapolis, Flying Cloud Arpt: 5 SM S. Up to 1500′ MSL.

MISSISSIPPI

Lucedale, Farmco Arpt: Weekends. Up to 12,000′.

MISSOURI

Houston Memi Arpt: Weekends. Up to 12,000′ MSL.
St. Louis, Lebanaster Arpt: Weekends and holidays. Up to 11,000′.

MONTANA

Hamilton Arpt: 0.4 mi E. Weekends. Up to 11,000′.
Missoula Co Arpt: Dalgt hrs. Sky divers Club altitudes to 12,000′ MSL—Miller Creek Area lat 46°47′ to 46°49′ long 114°01′ to 114°05′. U.S. Forest Service Practice Areas . . . altitudes to 1500′ AGL small areas vcnty of Lavelle Creek lat 47°00′ long 114°03′; Mill Creek lat 47°02′ long 114°12′: Sherman Creek lat 46°54′ long 114°12′; O'Brien Creek lat 46°52′, long 114°08′; Hayes Creek lat 46°49′ long 114°06′; Ninemile Creek lat 47°05′ long 114°23′; Fournier Creek lat 47°01′ long 114°11′; Miller Creek lat 46°43′ long 113°54′; Wild Horse Ridge lat 46°54′ long 114°19′.

NEBRASKA

Crete Mun Arpt: Weekends and holidays, sunrise to sunset. Up to 12,500′ AGL.
Walton: 2.5 E. Weekends and holidays. Sunrise to sunset. Up to 12,500′ AGL.

NEVADA

Carson City Arpt: Weekends. Up to 12,500′ MSL.
Las Vegas, Thunderbird Fld: 3.5 mi WSW 7 days a wk. Up to 12,500′.

NEW JERSEY

Mainstown Arpt: Daily excp Tues. From 13,000′.
Lexington, Adams Arpk: Dalgt hrs. Weekends. Up to 25,000′.
Lightstown, Applegrath Landing Strip: Weekends. Up to 12,500′.
Lakehurst NAS-West Fld: Up to 12,000′.
Lakewood Arpt: Within 2 mi radius. Up to 12,500′.
Manville Kupper Arpt: Dalgt hrs daily. Up to 25,000′.
Mt. Holly, Cameron Arpk: Weekends. Up to 12,500′.

NEW YORK

East Moriches, Spadaro Arpt: Daily. Up to 12,500′.
Fulton Arpt: Within 1 mi radius. Weekends and holidays. Up to 15,000′.

Geneva, Gormack Arpt: 3 mi SE Suns 1600Z–0200Z. Up to 9,000′.
Jefferson Arpt: Suns 1200 to 2100 EDT. Up to 12,500′.
Piqua Arpt: Up to 12,000′. Daily.
Shady Grove Arpt: 8 mi SW Akron-Canton arpt. Weekends. Up to 10,000′.
South Dayton Arpt: Up to 18,000′. Daily.
Springfield Arpt: Wed, Sat and Suns. Up to 12,500′.
Waynesville Arpt: Suns. Up to 10,000′.
Williamsburg, Fisher Arpt: Weekends. Up to 20,000′.
Wilmington, Clinton Co AFB: NW corner adjt to rnwys. Up to 2600′ MSL.
Xenia Arpt: Daily. Up to 20,000′.
Youngstown: 2 mi W and 1½ mi S of Parkman, Ohio. Tues, Thurs and weekends. Up to 13,000′.

OKLAHOMA

Oklahoma City, Richards Arpt: Weekends, holidays, occasionally weekdays. Up to 12,500′ AGL.
Stroud Mun Arpt: Within 5 mi radius of arpt. Up to 12,500′ AGL.

OREGON

Astoria, Clatsop Co. Arpt: Various alts. Holidays and weekends.
Cave Junction, Illinois Valley Airstrip: 2 mi N and 5 mi NE. Periodically June thru Sept. From 2000′ AGL.

Medford Arpt: 4 mi W. Light weekdays, moderate to hvy weekends and holidays. Various altitudes.

Portland: From various alts, moderate wkdays, hvy wkends and holidays. Jump sites 5 mi S of Hillsboro arpt: 3 mi S of Beaverton arpt; 3 mi E of Scholl Arpt, Orchards, Wash; and 7 mi NNE Scholl Arpt.

Portland: ½ mi S of Scholl, Wash.

Portland: 3 mi W of Aurora, Oreg.

Redmond, Roberts Fld: 10 mi E arpt & 4 mi SW Prineville Arpt. Daily. From 2,000'.

PENNSYLVANIA

Campbelltown, Reigles Arpt: Daily. Up to 15,000'.

Hazleton Mun Arpt: 3 mi N. Weekdays 1700 to Sunset; weekends 1200 to sunset. Up to 7500' MSL.

Johnsville NAF: Within 2 mi radius. Up to 13,000'.

Meadville, Port Meadville: Within 1.5 mi radius of fld. Weekends. Up to 12,500'.

New Hanover Arpt: Most activities weekends. Up to 12,500'.

Pottstown Arpt: Weekends. Up to 8000'.

Reading, Gen. Spaatz Arpt: Weekends. Up to 10,000'.

RHODE ISLAND

Greene Riconn Arpt: Daily. Up to 11,000'.

SOUTH CAROLINA

Fairfax Arpt: Weekends. Up to 12,500'.

Lane Arpt: Low level navigation and parachute drops every day and night, 300' to 1000'.

Moncks Corner Mun Arpt: Weekends. Up to 10,000'.

Orangeburg Mun Arpt: Weekends and holidays. Up to 12,500'.

Sumter Arpt: Daily 1800Z to sunset. From 7,200'. Sat, Sun, holidays. Up to 10,000'.

Timmonsville, Huggins Arpt: Sat, Sun and holidays. From 10,000'.

Walterboro Mun Arpt: Weekends. From 10,000'.

TENNESSEE

Chattanooga, Lovell Fld: 16 mi ESE. Continuously. Up to 10,000'.

Cleveland, Hardwick Fld: 6 mi S. 0600 to 1900 EST 7 days per wk. Up to 12,500'.

Nashville, Cornelia Fort Airpark: Weds, weekends and holidays. Up to 7500'.

Nashville, Cumberland Fld: 6 mi NW. Irregular schedule. Ctc BNA FSS for details.

Tri-City Arpt: 20 mi SSW at Decker Farm Arpt Irregular schedule. Up to 7,000'.

TEXAS

Abilene Dyess AFB: One mile E of S end rnwy. From 3300'.

Amarillo, Palo Duro Arpt: 2 mi radius. Wk ends and holidays SR to SS. Up to 16,000' MSL.

Caddo Mills Airfield: 18.5 NM due E of Dallas VOR. 0200Z thru 0500Z and 1900Z thru 2300Z Sats and Suns. Up to 2040' MSL.

Cleburne Arpt: Weekends. Up to 7,500' MSL.

Ellington AFB: 5 mi S on 350°M. Up to 1500' MSL.

El Paso: 6 nmi NW Biggs AFB. Up to 17,500' MSL.

Ganado, Calaway Arpt: Weekends. Up to 10,000'.

Houston, Crosby Arpt: 2 mi W and 8 mi W. Weekend and occasional wk days. Up to 20,000'.

Houston, Weiler Arpt: Parachuting, gliding and ballooning within 5 mi radius. Daily, day and ngt. Up to 24,000'

Lampasas Arpt: Weekends. Up to 14,000' MSL.

Mercedes, Rebel Fld: 2 mi rad. Weekends. Up to 12,500'

Midland: 3 mi N of Ector Co. Arpt, Odessa, Tex. Weekends and holidays, occasionally weekdays. Up to 15,000 MSL.

San Antonio, Lakefield Arpt: 1.5 mi W. Weekends and holidays. Up to 14,000'.

San Antonio, Stinson Fld: 4 NM S SW.

San Marcos, Camp Gary AAF: Weekends and holidays. Up to 14,500'.

Taylor Mun Arpt: Weekends.

UTAH

Bountiful, Sky Haven Arpt: Daily. Up to 13,500' MSL.

Ogden: 8 mi N. Up to 12,000' MSL. Daily.

Sandy, Alta Air Park: Daily. Up to 14,000' MSL.

Wendover, Hill AFB: Two times per mo. during daigt hr and two times per year during ngt time, 1200' W o rnwy 14–32. Up to 6000' MSL.

Wendover AF Aux Fld: Day and ngt, unscheduled. Up t 5800' MSL.

VERMONT

Bristol Arpt: 7/8 mi NW. Weekends. SR to SS. Up t 7500'.

Swanton, Austin Arpt: Weekends. Up to 6000'.

VIRGINIA

Blackstone AAF: Daily. Up to 25,000'. Occasional sk diving.

Clover Arpt: 3 mi radius. Suns. Up to 8,000'.

Forest, New London Arpt: Daily. Up to 11,000'.

Hopewell Arpt: Weekends. Up to 9000'.

Leesburg: 2 nmi N or 10 nmi Herndon VOR on 340 radial. Weekends. Up to 12,500'. Occasional ng jump.

Midland: 8 nmi from CSN VOR on 120° rad. Weekend Up to 12,000'.

New Castle Intl Arpt: Weekends and holiday. Up t 14,000'.

Oceana NAS: Daylgt hrs. 2000–2400Z daily; 1500–230 Sat, Sun & holidays. Up to 12,000'.

Pulaski, New River Valley Arpt: Weekends, holidays, an evening. Up to 13,000'.

South Boston, Tuck Arpt: Within 3 mi radius. Suns 12 to 1800 EST. Up to 10,000'.

South Norfolk Arpt: Within 5 mi radius. Weekends an evenings. Up to 13,000'.

Suffolk Mun Arpt: Weekends and holidays. Up to 12,000

Waynesboro Arpt: Wk ends 1800Z–SS. Up to 10,000'.

West Point Arpt: Weekends and holidays. Up to 12,00

WASHINGTON

Enumclaw Arpt: Weekends and holidays. Up to 15,00

Issaquah-Sky Ranch Arpt: Wed, Fri and weekends. Up t 7000'.

Moses Lake Mun Arpt: 1.5 mi NE. Daily up to 10,000'

Oak Harbor, Whidbey Island NAS: Weekends. Up to 12,500' MSL.

Puyallup, Thun Fld: Tues, Thurs and weekends. Up to 12,000'.

Richland Arpt: 3 mi W SR to 1 hr after SS. Up to 12,500' AGL.

WEST VIRGINIA

Morgantown Arpt: 3 NM SSW. Days.

WISCONSIN

Juneau (Dodge Co Arpt): Weekdays after 1700 Sat and Sun afternoons. Up to 13,500'.

Lake Geneva/Natl Sports Parachuting Center: Daily. Up to 15,000'.

Superior Arpt: 5 mi SE weekends SR–SS. Up to 12,500'.

Menomonee Falls, Aero Park Arpt: 2200–SS Mon thru Fri. Up to 12,500' MSL.

Ossee: 3 mi W. Sundays. Up to 10,000'.

PREFERRED ROUTES

A system of preferred routes has been established to guide pilots in planning their route of flight, to minimize route changes during the operational phase of flight, and to aid in the efficient orderly management of the air traffic using federal airways. The preferred routings which follow are designed to serve the needs of airspace users and to provide for a systematic flow of air traffic in the major terminal and en route flight environments. Cooperation by all pilots in filing preferred routes will result in fewer traffic delays and will better provide for efficient departure, en route and arrival air traffic control service.

The following list will hereafter appear in EACH issue of the AIRGI.

This list contains preferred routes for the low altitude stratum (below 18,000 feet MSL).

Low Altitude Stratum—A distinctive numbering system (800 Series) has been introduced to indicate some of the preferred routes in this stratum and thereby eliminate the present lengthy route descriptions. Many of the preferred routes, however, retain the common basic airway numbers or use the two systems of numbering in combination. Additional designations of "800 Series Airways" will be made where simplicity and convenience to both pilots and controllers dictate such assignments.

Preferred Route Starting and Terminating Fixes—Preferred routes generally commence and terminate at fixes on or near the perimeter of the terminal area.

Depicted on the Area Charts, produced by Coast and Geodetic Survey, are the normal routes between the airport and the preferred route starting/terminating fixes. Whenever a fix is shown in **bold-face** type, pilots should refer to the appropriate Area Chart for the routing he may expect prior to or after that fix as appropriate.

Preferred routes beginning/ending with an airway number indicate that the airway essentially overlies the airport and flights are normally cleared directly on the airway. All preferred routes are listed alphabetically under the name of the departure airport. Major airports in close proximity are listed under the principal airport and categorized as a metropolitan area, e.g., Chicago Metro Area. Official location identifiers are used in the route description for VOR/VORTAC navaids. L/MF navaids are identified by the identifier and type: e.g., MIV/LFR, DOV/Rbn. Intersection names are spelled out. Where two navaids or an intersection and a navaid follow in succession, the route is direct.

(L20, 23)=Enroute chart numbers.

STANDARD INSTRUMENT DEPARTURES (SIDs)

(Explantory information is provided in Section II–8)

ARIZONA

Sky Harbor Municipal Airport, Phoenix

Effective January 7, 1965

Cancel Tolleson Five Departure and Tempe Six Departure.

CALIFORNIA

Fresno Air Terminal

In narrative form only

PINEDALE ONE DEPARTURE

Via direct Fresno VORTAC, then via (transition) or assigned route). Castle Transition—Via Fresno 273 and astle 150 radials to Castle VOR.

BOWLES ONE DEPARTURE

Via direct Fresno radio Beacon: then a 135 magnetic earing from the Fresno radio beacon to intercept the Los anos 084 radial at or above 3,000 feet; then via Los anos 084 radial to the Fresno 141 radial. Pixley Transion—Turn right via Fresno 141 and Bakersfield 322 adials to Bakersfield. Exeter Transition—Continue via os Banos 084 radial to intercept and proceed via Fresno 23 and Portersville 323 radials to Porterville.

Ontario Intl Airport

Effective February 4, 1965

Colton One Departure—Change name to read: Colton hree Departure. College One Departure—Change name o read: College Three Departure.

CONNECTICUT

Bradley Field, Windsor Locks

In narrative form only

AVON ONE DEPARTURE

Via Poughkeepsie VOR 089 radial to Poughkeepsie OR. Cross Madison VOR 348 radial at or below 5000'. ross Bridgeport VOR 357 radial at (as assigned by TC) then via (transition) or (assigned route). Huguenot Transition: via Poughkeepsie VOR direct Huguenot ORTAC.

HARTFORD ONE DEPARTURE

Via direct Hartford VOR. Hartford VOR 258 radial o Yale intersection. Cross Madison VOR 360 radial at r below 4000 feet. Cross Yale intersection (as assigned y ATC) then via (assigned route).

STAFFORD ONE DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via direct to V146, thence via V146 to Putnam VORTAC; thence via Putnam VORTAC 100 radial to V16, V16 to Millis Intersection. Maintain at or below 8,000 feet for 3 minutes after departure; cross Putnam VORTAC at (as assigned by ATC) then via (assigned route).

MADISON ONE DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via 360° radial Hartford VOR to Hartford VOR; then direct Madison VOR; then V475 to Deer Park VOR. Maintain at or below 8,000 feet for 3 minutes after departure; cross Madison VOR at (as assigned by ATC) then via (assigned route).

Miami Intl Airport

Effective Jan. 7, 1965

MELBOURNE TWO DEPARTURE

Via the Biscayne Bay VOR 345 radial and the Vero Beach VORTAC 178 radial to the Vero Beach VORTAC. Then via (transtion) or (assigned) route. Snapper Transition—Via the Vero Beach VORTAC 043 radial to the Barracuda Intersection.

Concurrently cancel the Melbourne One Departure.

NEW YORK

Hancock Airport, Syracuse

In narrative form only

KIRKVILLE ONE DEPARTURE

Via front course Syracuse ILS and Georgetown VOR 352 radial to Georgetown VOR; cross Syracuse ILS LOM at 2,000 feet; cross Utica VOR 277 radial at 5,000 feet. Then via (assigned route). Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

MONROE ONE DEPARTURE

Via front course Syracuse ILS, Georgetown VOR 352 radial to West Monroe Intersection, cross Syracuse ILS LOM at 2,000 feet. Then via (transition) or (assigned route). Florence Transition—Via Syracuse VORTAC 050 radial and V145 to Utica VOR. Syracuse Transition—Via Syracuse VORTAC 050 radial to Syracuse VORTAC. Pulaski Transition—Via Georgetown VOR 352 radial and

V29 to Pulaski Intersection. Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

John F. Kennedy Intl Airport, New York

Effective Jan. 7, 1965

KINGSTON ONE DEPARTURE

Via vector to Kingston VOR 160 radial. Kingston VOR 160 radial to Kingston VOR. Cross LaGuardia VOR 135 radial at or below 4000 feet. Cross LaGuardia VOR 092 radial at or above 5000 feet. Cross Kennedy VORTAC 054 radial at or above 8000 feet. Then via (transition) or (assigned route). Dutchess Transition—Via Kingston VOR direct Poughkeepsie VOR.

Concurrently cancel Clermont Two Departure.

OHIO

Youngstown Mun Arpt.

In narrative form only

SALEM THREE DEPARTURE

Via Youngstown VOR 197 radial to Ellwood City VORTAC 302 radial. Cross Akron VORTAC 084 radial at 3000 or above. Then via Ellwood City VORTAC 302 radial to the Ellwood City VORTAC. Cross Ellwood City VORTAC (as assigned by ATC), then via assigned route.

Departing aircraft shall be established on the Youngstown VOR 197 radial within 10 miles of the Youngstown VOR.

•PENNSYLVANIA

Philadelphia Int'l Airport

Effective January 7, 1965

OXFORD TWO DEPARTURE

Via vector to New Castle Vortac. New Castle Vortac 305 radial and V3 to Norris intersection. Cross West Chester Vortac 155 radial at 6000 feet. Then via (assigned route).

Concurrently cancel Oxford One Departure.

RHODE ISLAND

T. F. Green Arpt., Providence

In narrative form only

WARWICK ONE DEPARTURE

Takeoff Rnwy 5L/R-34—turn right to 160 heading as soon as practicable after leaving 500'. Climb on 160 heading to intercept Quonset Pt. VOR 038 radial. Takeoff Rnwy 16—Maintain rnwy heading to intercept Quonset Pt. VOR 038 radial. Takeoff Rnrwy 23L/R—Turn left to 090 heading as soon as practicable after leaving 500'. Climb on 090 heading to intercept Quonset Pt. VOR 038 radial. Radar vector to Providence VOR 132 radial to Quonset Pt. VOR 038 radial to Quonset Pt. VOR thence via Quonset Pt. VOR 218 radial to V-46. Cross Quonset Pt. VOR at 5000' or below. Cross Norwich VORTAC 124 radial at 7000'. Cross Hampton VORTAC 062 radial (as assigned by ATC) then via (assigned route).

STERLING TWO DEPARTURE

Takeoff Runway 34-5L/R—turn left to 250 heading as soon as practicable after leaving 500 feet. Climb on 250 heading to intercept Providence VOR 284 radial. Takeoff Runway 23L/R-16—turn right to 340 heading as soon as practicable after leaving 500 feet. Climb on 340 heading to intercept Providence VOR 284 radial. Radar vector to Providence VOR 284 radial thence via Providence VOR 284 radial to Sterling VHF intersection. Cross Sterling VHF intersection at / as assigned by ATC/then via/transition/or/assigned/route. Riverhead Transition via V16, V879.

ADDITIONAL SIDs

In addition to the above, the following areas have SID's published separately in graphic form in the C & GS low altitude chart package.

Arizona

Sky Harbor Airport, Phoenix
Tucson Int'l. Airport ,Tucson

California

Pennsylvania

Philadelphia Int'l. Airport, Philadelphia

Utah

Salt Lake City Mun. No. 1 Airport, Salt Lake City

Wyoming

Casper Air Terminal, Casper
Cheyenne Mun. Airport, Cheyenne

SUBSTITUTE ROUTE STRUCTURE
SHUT DOWN OF ENROUTE NAVIGATION AIDS

An extensive Airways Modernization Program is currently being effected, which requires the scheduled temporary shutdown of selected enroute navigation aids. This action will affect associated airways/routes, MEA's, etc., and will obsolete related information shown on the Enroute Low-Altitude, and High-Altitude U.S. charts. These facilities may be shutdown and/or returned to operation during the period between publication dates of the Enroute U.S. Charts. During this shutdown period the following Substitute Route Structure is operational. NOTAMS are published to cover any change in status of these facilities and pilots are advised to check NOTAMS thoroughly prior to each operation. Pilots are further advised to contact FAA Flight Service Stations regarding any doubtful status of enroute navigation aids or airways.

CALIFORNIA

WILLIAMS "ILA" VORTAC SHUTDOWN

VISUAL NAVIGATION CHART BULLETIN

The purpose of this Bulletin is to provide a tabulation of the major changes in aeronautical information that have occurred since the last publication date of each Sectional Aeronautical Chart. The general policy is to include only those changes to controlled airspace and special use airspace that present a hazardous condition or impose a restriction on the pilot; major changes to airports and radio navigational facilities, thereby providing the VFR pilot with the essential data necessary to update and maintain his chart current. When the Sectional Aeronautical Chart is republished, the corrective tabulation will be removed from this Bulletin.

ABERDEEN

38th Edition, August 20, 1964

Delete Madison arpt 44°01'N, 97°03'W. Delete Nicholas arpt 45°37'N, 101°30'W. Add obstn 2029' MSL 43°56'59''N, 96°54'36''. Add obstn 2040' MSL 44°23'-02''N, 97°00'37''W. In northern border change Bismarck VOR freq 115.7 to 116.5.

ALBANY

53rd Edition, July 23, 1964

Delete Dades arpt 43°28'N, 75°12'W. Delete East Greenbush arpt 42°34'N, 73°43'W. Add V196 airway Utica to Plattsburgh via Utica 016°T & Plattsburgh 236°T. Add obstn 1344' MSL 43°33'41''N, 72°17'14''W. Add obstn 2161' MSL 43°12'29''N, 72°09'40''W. Correct Schenectady Co ctl twr freq 321 to 321.1. Change Chester VOR freq from 108.6 to 117.3. Change Utica VOR freq from 112.0 to 113.9. Change Watertown VOR freq from 110.6 to 109.8. Change Binghamton VORTAC freq from 114.1 ch 88 to 114.3 ch 90. Change Griffis (AF) VOR freq 111.4 to 112.5. In southern border change Clermont VOR freq 114.3 to 117.6. Change De Lancey VOR freq. 109.6 to 112.1. Add circular restricted area R–5207 with a radius of 1,350' centered at 42°46'59''N, 76°53'06''W. Add obstn 994' MSL 43°33'41'' N, 72°17'14''W. Add Becksgrove RBn freq 329, ident BKG class MHW 43°13'20''N, 75°28'58''W. In northern border change Massen VOR freq 112.1 to 114.1.

ALBUQUERQUE

53rd Edition, August 20, 1964

Add obstn 4100' MSL 34°31'00''N, 102°17'00''W. Add obstn 5012' MSL 35°08'03''N, 103°41'52''W. Delete Bacaville VOR 34°35'N, 106°50'W. Delete Dalhart RBn 36°01'N, 102°03'W. In eastern border correct Borger VOR ident BDG to BGD.

AROOSTOOK

41st Edition, April 30, 1964

Delete Green arpt 46°02'N, 68°16'W. Realign Red 9 airway direct from Montmorency RBn to Bagotville RBn. Add obstn 740' MSL 46°09'00''N, 70°12'17''W. Add obstn 525' MSL 46°10'45''N, 71°20'00''W. Add obstn 625' MSL 46°52'50''N, 71°19'35''W. Add obstn 349 MSL 47°00'00''N, 70°31'00''W. Add obstn 433' MSL 47°16'40''N, 70°12'00''W. Add obstn 593' MSL 46°-36'05''N, 65°55'50''W. Add Burtts RBn freq 350, ident LI, class MHW 46°03'52''N, 66°52'13''W. Add Charlo (Pvt) RBn freq 203, ident CL, class HW 47°59'N 66°20'W. Extend Loring AFB Military Climb Corridor R–3902 1 mi S & 6 mi N. Realign Fredericton LFR W leg from 103°M to 096°M. Delete Presque Isle LFR 46°44'N, 68°04'W. Add Quebec M.V. 19°W VOR freq 112.8, ident QB class BVOR 46°42'20''N, 71°37'36''W Realign airway V 318 direct from Houlton to Quebec

AUSTIN

58th Edition, November 12, 1964

Delete Allison Ranch arpt 30°44'N, 102°02'W.

BEAUMONT

52nd Edition, September 17, 1964

Delete Saltzman arpt 29°57'N, 92°27'W. Add obstn 385' MSL 30°08'19''N, 94°38'26''W. Add obstn 351 MSL 30°26'18''N, 93°47'16''W. Add obstn 329' MSL 30°35'47''N, 91°31'47'W. Add obstn 598' MSL 30°39'-57''N, 92°08'14''W. Add obstn 347' MSL 31°03'33''N 92°08'38''W. Add obstn 525' MSL 31°33'17''N, 92°-34'04''W. PALACIOS RDO: TACAN unusable 265–330° ac roughness.

WACO RDO: TACAN unusable beyond 15 nmi belo 5000′ MSL 175–195°.

WINK RDO: TACAN unusable beyond 17 nmi below 70 MSL 030–080°.

UTAH

CEDAR CITY RDO: VOR unusable beyond 40 nmi b low 17,500′ MSL 065–090°; below 22,000′ MSL 0 100°; below 24,000′ MSL 100–140°; below 20,0 MSL 140–150°; below 17,000′ MSL 150–170° accou reduced coverage.

DELTA RDO: VOR unusable beyond 40 nmi belo 16,000′ MSL 040–080° acct reduced coverage.

HANKSVILLE RDO: VORTAC coverage restricted fro 160 thru S to 190° 26nmi at 14,000′ MSL.

LUCIN RDO: VOR unusable beyond 40 nmi belo 15,000′ MSL 180–220°; below 12,000′ MSL 280–310 below 11,000′ MSL 310–330° account reduced coverag

MILFORD: Jet Route 107 from Milford, Utah VO to Rock Springs, Wyo. VOR continuous navigati signal coverage does not exist over the entire rou segment below 28,000′. VOR moderate to hvy roug ness over mountain ridges on 072 rad 10 mi out. TACAN momentary crs excursion and roughness excess of 3° exists on TACAN rads.

OGDEN RDO: VORTAC unusable beyond 40 nmi l low 21,000′ MSL 360–055°; below 16,500′ MSL 0 thru 075°; below 22,000′ MSL 075 thru 130° accou reduced coverage.

PROVO RDO: VORTAC unusable beyond 40 nmi bel 15,000′ MSL 010–035°; below 16,000′ MSL 035–05 below 15,000 MSL 275–285°; below 14,000′ MSL 28 295° acct reduced coverage. VOR roughness exists o mountain ridges N thru E btn 15 and 20 nmi.

SALT LAKE CITY RDO: VORTAC unusable beyo 40 nmi below 19,000′ MSL 010–020°; below 20,0 MSL 020–030°; below 23,000′ MSL 030–060°; bel 24,000′ MSL 060–080°; below 19,000′ MSL 080–09 below 17,000′ MSL 095–125°; below 16,000′ MSL 12 140°; below 16,000′ MSL 195–210°; below 10,0 MSL 280–290°; below 16,000′ MSL 350–010° acct duced coverage.

VERMONT

BURLINGTON RDO: VOR unusable beyond 35 n from 080° clockwise to 105°; 25 nmi 115–135°; 30 n 135–155° at MOCA.

MONTPELIER RDO: VOR unusable beyond 30 n 205–220°; beyond 25 nmi 220–235°; beyond 30 n 234–280° at MOCA.

VIRGINIA

BROOKE RDO: TACAN distance unusable beyond 30 nmi 230° clockwise to 270° MOCA.

HERNDON RDO: VOR portion of VORTAC unusable below 2500′ MSL. Beyond 30 nmi from 050–075°; beyond 20 nmi from 075–095°; beyond 35 nmi from 105°–120°; beyond 20 nmi from 165°–215° acct of crs roughness. V39 E 209° usable 5000′ and above beyond 20 nmi.

LAWRENCEVILLE RDO: VOR unusable below 1800′ MSL beyond 8 nmi 215–250°; 14,500′ MSL to 18,000′ MSL 215–270° account roughness. MEA V–155 3000′ MSL btn LVL VOR and Franklinton, N.C. Int. MEA V–454, 5000′ MSL btn LVL VOR and LIB VOR. Changeover point 82 nmi from LIB VOR.

LINDEN RDO: DME unusable below 3500′ beyond 25 nmi 140–180°; below 5000′ 180–225° acct reduced coverage.

MONTEBELLO RDO: VOR unusable 110–220° beyond 35 nmi at MOCA. 058 rad unusable above 14,500′.

PULASKI RDO: VORTAC unusable beyond 35 nmi from 045° clockwise to 060° at MOCA.

QUANTICO MCAS RDO: Use LFR as H facil only.

ROANOKE RDO: Woodrum VOR unusable beyond 30 nmi from 360 to 285°, 20 nmi 286–360° at MOCA. H facil unusable beyond 40 nmi from 240 to 010° below 6000′ due excessive needle oscillation.

WASHINGTON

BELLINGHAM RDO: Intermittent roughness may be observed on V–23 below 6000′ MSL from 49 nmi thru 40 nmi S of VOR.

DEAH BAY RDO: H facil unusable 100–130° below 8500′ MSL acct terrain.

OLYMPIA RDO: VORTAC unusable below 7500′ MSL at 40 nmi 210–260°. TACAN unusable below 15,000′ MSL 260–270° at 40 nmi; below 9500′ MSL at 35 nmi 270–280° account reduced coverage. VOR 348° rad unusable below 4500′ MSL beyond 24 nmi.

PASCO RDO: VOR unusable below 6500′ MSL beyond 40 nmi 150–210°; below 5500′ MSL 210–270° acct reduced coverage. Coverage within R–6715 from 270–320° not flt checked.

PORT ANGELES RDO: VOR coverage 40 nmi; 220–110° at 7000′; 110–140° at 14,500′; 140–150° at 20,500′; 150–170 °at 29,000′; 170–190° at 20,500; 190–220° at 16,000′.

SEATTLE RDO: LFR NW crs has splits and multiples beyond 20 nmi. VOR unusable beyond 10 nmi 158° clockwise 165°. 309° rad unusable below 14,000 within 40 nmi.

WALLA WALLA RDO: VOR coverage at 40 nmi restricted below 6000′, 355–020° and 148–176°; below 7500′ from 130–150°; below 10,500′ from 020–060° and 110–130°; below 12,700′ from 065–110°.

WENATCHEE RDO: VOR unusable beyond 20 nmi below 20,000′ MSL 000–020° beyond 30 nmi below 20,000′ MSL 020–075° beyond 40 nmi below 14,000′ MSL 075–090° below 18,000′ MSL 090–190° below 19,000′ MSL 190–240°.

WEST VIRGINIA

BECKLEY RDO: VOR unusable beyond 20 nmi 325–350° below 5000′ acct crs roughness, excluding 335° rad at Montgomery Int. Voice reception Charleston FSS unreliable below 7500′ MSL 40 nmi radius Beckley VOR 030–180°. Reception satisfactory with acft over VOR or MEA.

WISCONSIN

LA CROSSE RDO: VOR unusable 100–150° and 230–060° below 3300′ MSL beyond 20 mi.

MILWAUKEE RDO: Timmerman VOR unusable beyond 35 mi 300–310° below 3400′ MSL acct reduced coverage. Alarm status MKE VOR indicated by transmission of unkeyed 1020 cycle ident signifying unusability for nav and indicating imminent equipment transfer shutdown.

WYOMING

BOYSEN RESERVOIR RDO: VORTAC has mementary crs excursions and roughness all radials.

DUNOIR RDO: VOR restricted to awy rad use only.

SHERIDAN RDO: VORTAC unusable below 40 nmi below 17,000′ MSL 160–175°; below 15,000′ MSL 175–200° and below 16,500′ MSL 300–230° acct reduced coverage.

VOR RECEIVER CHECK POINTS

The list of VOR airborne check points and ground check points is given on the following pages.

NOTE: The information is provided in the following order: Facility name (plus airport name, if needed) bearing in degrees magnetic from the VOR; location of the check point (distances in nautical miles); an altitude (in feet MSL, if any).

AIRBORNE

Abilene, Tex. (Municipal): 047°; 10.1 nmi silos in center of Ft. Phantom alternate for lgt acft 099° 9 nmi ctl twr and bcn.

Alexandria, La. England AFB): 329°; over water tank.

Alexandria, La. (Esler): 152°; over hangar 3.6 nmi from VOR.

Alexandria, Minn.: 223.5°; over apch end of rnwy 22.

Allendale, S.C.: 342°; over N/S rnwy on Barnwell Co. Arpt.

Anniston, Ala.: 082°; in center of segmented circle, distance 9.5 nmi; 2000′.

Appleton, Ohio: 238°; over ctl twr (Columbus, Ohio-Port Columbus Airport; 2500′.

Asheville, N.C. (Mun): 278°; over ctl twr 13.6 nmi from VOR; 3000′.

Athens, Ga.: 308°; 3 nmi over center of three rdo twrs.

Atlanta, Ga.: Lctn #1—012°; over end rnwy 09. Lctn #2—020°; over end rnwy 27.

Augusta, Ga. (Bush Field): 141°; directly over No. 17 of rnwy #17; 300′.

Augusta, Me. (State): 257°: over LFR, 1.8 nmi from AUG VOR; 1500′.

Austin, Tex. (Mueller Mun): 178°; Freeway Int aprxly 0.9 nmi N of Mueller Mun Arpt.

Bakersfield, Calif. (Meadows Fld): 127°; over apch end rnwy 30; 1200′.

Bangor, Me.: 072°; over FSS Bldg., Old Town Arpt; 1000′.

Bartlesville, Okla. (Phillips): 161°; over Phillips oil tank—white ½ mi E of arpt trml.

Baton Rouge, La. (Ryan): 064°; over tank S side of arpt.

Beatrice, Nebr.: 360°; over RR at Princeton, Nebr.; 2500′.

Beaumont, Tex. (Jefferson County): 056°; water twr aprxly 0.4 mi NE of NE end of rnwy 2.

Bellingham, Wash.: 145°; N end of rnwy 16–34; 660′.

Big Spring, Tex.: 199°; over the rdo bcn; 1000′ AGL.

Billings, Mont. (Municipal): 073°; Intersection of rnwys 4–22 and 9–27; 4600′.

Blackstone, Va.: 123°; beacon lgt Lawrenceville, Va. Arpt; 1500′.

Bloomington, Ill. (Mun): 030°; lctd 11 nmi NE of BMI VOR at railroad crossing river; 2000′.

Boise, Idaho (Air Trml): 086°; over dam outlet S en Lucky Peak Reservoir, 8.5 nmi from VOR; 5000′.

Bozeman, Mont.: 145°; over BZN rdo bcn; 5000′.

Brownsville, Tex. (Rio Grande Valley Intl): 244°; wat twr in bldg area of arpt.

Brownwood, Tex: 167°; over arpt bcn.

Brunswick, Ga. (McKinnon): 023°; at arpt rotating be con.

Burlington, Iowa: 296°; over rdo twr 3 nmi NNW Burlin ton Arpt.

Burlington, Vt. (Municipal): 030°; over arpt control tr 4.4 nmi from VOR; 2000′.

Butler, Mo.: 073°; over FSS bldg.

Butte, Mont.: 094°; intersection of rnwy 29–33; 6500′.

Carleton, Mich. (Detroit-Wayne-Major): 031°; the E and NW/SE rnwys SE of new ctl twr; 2200′.

Casper, Wyo. (Air Trml): 201°; over intersection rnw 21–25–30; 6300′.

Centralia, Ill. (Mun): 027°; at apch end of rnwy 36.

Chadron, Nebr.: 014°; railroad intersection 1.5 nmi N ar bndry.

Champaign, Ill.: 175°; over grain elevator 8 nmi S Pesotum, Ill.; 2000′.

Cleveland, Ohio (Cleveland-Hopkins): 079°; over Cle land LFR distance 13.5 nmi; 1500′.

Colorado Springs, Colo. (Peterson Fld): 320°; over mic wave twr, 6.8 nmi.

Colts Neck, N.J.: 084°; over awy bcn twr at NE corr of Red Bank, N.J. Arpt.

Concord, N.H. (Mun): 132°; over rdo twr (old LFR) nmi.

Corpus Christi, Tex. (Intl): 187°; over grain elevator 1 n E of arpt.

Cotulla, Tex.: 255°; rotating bcn on the Cotulla Intl Ar

Crescent City, Calif. (McNamara Fld): 104°; over Tar farm E side of town; 1000′.

Crestview, Fla.: 104°; over center of arpt; 900′.

Crossville, Tenn (Meml Arpt): 333°; 11 nmi over me hangar.

Cut Bank, Mont.: 312°; over center rnwy 31; 4800′.

Daggett, Calif.: 224°; over center twr LFR; 2500′.

Danville, Ill. (Vermillion Co.): 194°; int of rnwys 21 a 17; 1700′.

Daytona, Ohio (Mun): 131°; over new trml bldg, 10.76 nmi; 2500′.

Daytona Beach, Fla. (Mun): 157°; over remote ctld air/gnd facility antenna.

Decatur, Ala. (Pryor): 092°; over intersection of rnwy and taxiway 236° from HSV; 1000′.

Delta, Utah: 346°; at apch end of rnwy 34; 4900′.

Denver, Colo.: 189°; over EGW rdo bcn; 5800′.

Des Moines, Iowa: 356°; center twr of DSM LFR, 4.2 nmi from VOR.

Douglas, Ariz. (Bisbee-Douglas Intl): 119°; over intersection rnwy 12–30 and 17R–35L; 4700′.

Dublin, Ga. (Municipal): 067°; over SW end NE/SW rnwy.

Dubois, Idaho (Municipal): 335°; FAA Communications Bldg; 5200′.

Eagle Lake, Tex.: 181°; over center of football fld 0.5 nmi SW of Eagle Lake Arpt.

Dermott, Ark. (Goodwin): 228°; trml bldg E side of arpt.

Ellensburg, Wash. (Bowers): 255°; center, W end of rnwy 7-25; 2300′.

Emporia, Kans.: 046°; over schoolhouse Neosho Rapids, Kans., 8.5 nmi 2500′.

Ephrata, Wash.: 200°; centerline, SW end of rnwy 2–20; 1500′.

Evergreen, Ala.: 100.7°; arpt bcn lgt twr lctd on Evergreen (Middleton) Arpt., 15.3 nmi from VOR.

Fargo, N.Dak. (Hector): 300°; lctd apch end Hector Fld rnwy 35.

Farmington, Mo.: 195°; over center of Open Air Theater NE of the town of Fredericktown and 7.0 nmi from VOR; 2300′.

Fayetteville, Ark.: 183°; VORTAC; white circle on arpt; 2500′.

Fayetteville, N.C.: 239°; over water twr at Parktown, N.C. 8.0 nmi; 1200′.

Fresno, Calif.: 210°; at CAV rdo bcn 1800′.

Fremont, Ohio: 048°; over the Ohio Oil Company Admin Bldg at 2000′; aprxly 5 nmi from FDY VOR.

Frost, Mich. (Bishop): Pontiac VOR 332°; over apch end rnwy 9; 2200′.

Glenwood Cloud, Minn.: 349°; 4.5 nmi over smokestack at Glen Lake Sanatorium; 2000′.

Fort Leonard Wood, Mo. (Forney AAF): 351°; water twr N side E–W hvy dist 4.9 nmi from transmitter.

Fort Smith, Ark.: 232°; water tank at N edge of arpt; 1800′.

Garberville, Calif.: 358°; over intersection of rnwys Arcata Arpt; 500′.

Garberville, Calif. (Rohnerville): 128°; over apch end of rnwy 11; 1400′.

Gardena, Calif. (Air Trml): 133°; over apch end rnwy 11; 500′.

Garber, Okla.: 094°; over LFR; 3000′.

Galveston, Tex.: 110°; arpt terminal bldg.

Garden City, Kans.: 100°; Cimarron, Kans. at RR tracks and Main St.

Gardner, Mass.: 169°; hangar mrkd "WORCESTER" on roof, Worcester Arpt; 1000′.

Gila Bend, Ariz.: 193°; over apch end of rnwy 35 of Gila Bend Aux. Fld; 1500′.

Goodland, Kans. (Mun): 083°; over water twr NE edge of town of Brewster, Kans., 16 nmi; 4000′.

Gordonsville, Va.: 305°; over intersection of rnwy and center txwy Charlottesville-Abermarle Arpt., 16 nmi from GVE–VOR; 2000′.

Grand Forks, N. Dak.: 315°; over Int N/S and E/W rnwys; 1900′.

Grand Island, Nebr.: 141°; over smoke stack 5.5 nmi from VOR; 3100′.

Grand Junction, Colo. Walker Fld): 059°; int rnwys 29 and 22; 6500′.

Grants, N. Mex.: 295°; in flt over FSS adj to rnwy; 7000′.

Great Falls, Mont.: 026°; center NE end rnwy 3–21; 3900′.

Hallsville, Mo.: 225°; 14 nmi Int of E/W and N/S rnwys over Columbia Mun Arpt., Mo.; 2000′.

Harlingen, Tex.: 149°; over rot bcn on Mun Arpt.

Harrisburg, Pa. (York State): 109°; over triangle formed by rnwys: 2000′.

Hattiesburg, Miss. (Mun): 149°; over water twr and rotating lgt bcn on arpt.

Hayes Center, Neb.: 258°; 28 nmi over center of town of Enders, Neb.; 4500′.

Hibbing, Minn.: 311°; over FSS Bldg; 2400′.

Hickory, N.C.: 225°; over end rnwy 24.

Hill City, Kans.: 057°; Hill City Arpt bcn lgt 23 nmi from the VOR.

Hobart, Okla.: 352°; centerline of N/S rnwy 100′ above the elevation of the rnwy.

Hobbs, N. Mex. (Lea County): 030°; over circle on runup pad apch end rnwy 3.

Hoquaim, Wash. (Bowerman): 037°; W end and center rnwy 6; 500′.

Houghton, Mich. (County Mem'l): 241°; WHDF com. bdcst twr 3.5 nmi from VOR; 2100′.

Houlton, Me.: 042°; over Admin Bldg on E side of flt and 5.5 nmi from VOR; 1500′.

Houma, La.: 117°; over intersection of rnwys 17–35 and 11–29.

Houston, Tex. (Andrau): 276°; arpt bcn on arpt; 500′.

Houston, Tex.: 099°; over intersection of E/W txwy and parking ramp of Ellington Field.

Huron, S. Dak. ((Howes): 153°; lctd over HON/SBH; 2000′.

Hutchinson, Kans.: 032°; apch end rnwy 3 Hutchinson Mun Arpt.

Imperial, Calif.: 313°; apch end of rnwy 32; 200′.

International Falls, Minn.: 142°; RR bridge over stream of Ericsburg, Minn 5.4 nmi; 2200′.

Jackson, Miss. (Hawkins): 189°; over arpt intersection of rnwys 11–29 and 34L–16R.

Jackson, Tenn. (McKellar): 267°; over bcn twr above arpt; 1000′.

Joliet, Ill.: 102°; over centerline of NW end of NW/SE rnwy; 1500′.

Keeler, Mich.: 266°; over intersection of N/S and E/W rnwys at Ross Fld, Benton Harbor, Mich.; 1600′.

Kennebunk, Me.: 061°; over Portland Arpt control twr 18.5 nmi from Kennebunk VOR; 1500′.

Kirksville, Mo.: 138°; over water twr at La Plata, Mo. (8.2 nmi from VOR).

Kokomo, Ind.: 097°; over int NW/SE and NE/SW rnwys Marion Mun Arpt., Ind., 17.5 nmi from VOR; 1000′.

La Crosse, Wis.: 321°; 5 nmi LFR; alt 1800′.

Lafayette, Ind.: 135°; over Purdue Univ Stadium, 2100′.

Lake Charles, La. (Mun): 253°; over rotating bcn on ctl twr, 6.2 nmi.

Lamoni, Iowa ((Lamoni): 041°; over hwy "Y" 1 nmi W of Leon, Iowa.

Laredo, Tex.: 315°; over arpt bcn 9.5 DME.

Laurel, Miss. (Municipal): 025°; over water twr and rotating lgt bcn on arpt.

Lewistown, Mont.: 072°; above center of rnwy 7; 5200′.

Lexington, Ky. (Blue Grass): 305°; arpt ctl twr 7.6 nmi from LEX VOR; 2500′.

Liberal, Kans.: 056°; elevator 8.5 nmi NE Liberal, Kans. along Railroad.

Litchfield, Mich.: 051°; NE/SW rnwy Reynolds Fld, Jackson, Mich.; 2000′.

Livingston, Mont.: 199°; over ant of Livingston "H" facility; 5700′.

London, Ky.: 027°; trml bldg 3.7 nmi from LOZ VOR; 2500′.

Lufkin, Tex.: 328°; rotating bcn on Angelina Co. Arpt.

Macon, Ga. (Mun): 246°; 4.0 nmi from VOR over water tank; 2000′.

Malden, Mo.: 349°; RR crossing 0.5 nmi E of Dexter, Mo.

Manchester, N.H. (Grenier Fld-Manchester Mun): 341°; over former USAF arpt ctl twr E side 17–35 rnwy. 5.0 nmi; 1500′.

Marquette, Mich.: 120°; 5.5 nmi over NW tip of Pelesier Lake; 2000′.

Marshall, Tex.: 320°; water twr N of arpt.

Marshall, Mo. (Meml): 321° BWR; over MHL VORTAC Bldg; 2000′.

Marysville, Calif. (Yuba County): 067°; intersection of rnwys; 1500′.

Massena, N.Y. (Richards): 297°; Admin Bldg; 1500′.

McComb, Miss. (Pike County): 248°; revolving arpt bcn.

Medford, Oreg.: 212° (VOR); over rdo twr, 4.8 nmi 3000′.

Merced, Calif.: 289°; (Castle VOR); over end rnwy 30; 650′.

Midland, Tex. (Air Trml): 170°; over apch ends of rnwys 22 and 28; 1000′.

Miles City, Mont.: 30°; to apch end of rnwy 4.

Millinocket, Me. (Mun): 317°; over FSS Bldg; 1500′.

Milwaukee, Wis. (General Mitchell); 123°; over MKE LFR.

Minneapolis, Minn. (Crystal Arpt): 166°; over apch end rnwy 13L. 4.9 nmi VORTAC; 1500′ nmi.

Minot, N. Dak.: 241°; apch end rnwy 26; 1900′.

Montebello, Va. (Preston Glenn near Lynchburg, Va.): 192°; intersection all rnwys; 2500′.

Montgomery, Ala. (Dannelly): 319°; over water twr, distance 6.1 nmi from VORTAC.

Muskegon, Mich. (County): 256°; over Muskegon LFR 1500′.

Myrtle Beach, S.C. (AFB): 061°; over apch end rnwy Crescent Beach Arpt.; 500′.

Napa, Calif. (County): 045°; over rotating bcn on arpt 500′.

Naperville, Ill.: 328°; over RR underpass lctd ½ nmi N of the DuPage County Arpt; 2000′.

Nashville, Tenn.: 242°; WSM rdo twr near Brentwood Tenn., 10.2 nmi from VOR.

Neola, Iowa: 047°; over grain elevator Harlan, Iowa 2500′.

Neosho, Mo.: 343°; center triangle formed by the intersection of 3 rnwys of Joplin, Mo., Mun Arpt.

NewBern, N.C.: 259°; Int of E/W rnwys Oak Grove (navy arpt.

New Orleans, La. (Mun): 081°; over rotating bcn on bldg on New Orleans Mun Arpt.

New Orleans, La. (Lakefront Arpt): 070°; over Lakefront twr.

Newton, Iowa: 142°; lctd apch end NW/SE rnwy.

Norfolk, Nebr.: 095°; over racetrack town of Stanton Nebr.; 2600′.

North Bend, Oreg.: 254°; intersection rnwy 22–31; 750′.

North Platte, Nebr. (Lee Bird): 82.6°; over water tower Brady, Nebr.; 4000′.

Oklahoma City, Okla. (Will Rogers): 100°; rdo bcn sta 1800′.

Oklahoma City, Okla. (Wiley Post): 041°; OKC VOR on rnwys 17–35 and 12–30; 1800′.

Omaha, Nebr. (Eppley Fld): 309°; centerline of SE end of NW/SE rnwy.

O'Neill, Nebr.: 115°; at intersection of E/W road and railroad ½ nmi SE of Inman, Nebr.

Ontario, Calif. (Intl: 347°; over and parallel with twy btn rnwy 21 and 25; 2300′.

Oshkosh, Wis.: 017°; WOSH Commercial Bcst twr 5 nmi from VOR.

Ottumwa, Iowa (Mun); 303°; int of rnwys 32 and 22.

Peck, Mich.: 163°; over apch end rnwy 3 on St. Clair C Arpt; 2200′.

Philip, S.D.: 156°; over 2712′ twr 5 nmi from VOR; 33

Phoenix, Ariz.: 256°; centerline rnwy 8R–26L; 2800′.

Picayune, Miss.: 140°; over rotating lgt bcn on arpt.

Pinehurst, N.C.: 086°; over windsock on top of hangar Southern Pines, Pinehurst-Southern Pines Arpt.

Pittsburgh, Pa.: 333°; ctl twr, Greater Pittsburgh Arpt 3000′.

Plainview, Tex. (Hale Co.): 024°; intersection rnwys 4– and 12–30, 6 nmi from VOR; 4400′.

Plattsburgh, N.Y.: 229°; arpt bcn Plattsburgh Arpt; 150

Brownsville, Tex. (Rio Grande Valley Intl): 248°; ap end rnwy 13L.

Carlsbad, N. Mex.: 334°; immediately W of FSS and t bldg on ramp.

Chattanooga, Tenn. (Lovell): 332°; centerline S taxiw at point 175′ NE of centerline rnwy 32.

Cheyenne, Wyo.: 199°; on yellow line on taxi strip i mediately SE or apch end rnwy 8.

Chicago (West Chicago), Ill. (Du Page Co.): 067°; nmi on SW corner of N parking ramp at int of tx to rnwy 15 and txwy paralleling rnwy 15–33.

Childress, Tex.: 353°; intersection of edge of ramp at c ter taxi strip.

Cincinnati, Ohio: (See Covington, Ky.).

College Station, Tex.: 095°; on W edge of parking ramp Easterwood Arpt.

Columbia, S.C. (Owens Fld): 022°; compass rose on pa ing ramp.

Columbia, S.C. (Mun): 331°; circle 450′ S of ctl twr 244′.

Columbus, Ga. (Muscogee Co.): 145°; pointed circle end of main ramp area.

Columbus, Miss. (Lowndes County): 095°; at center ta way between parking ramp and rnwy.

Covington, Ky. (Greater Cincinnati): 043°; rnwy 27 E intersection rnwys 27 and 22.

Crestview, Fla.: 104°; on center of concrete circle on rn

Cross City, Fla. (Site 58, MEM–TPA): 298°; taxiw near wind indicator and rotating bcn lgt.

Dalhart, Tex.: 170°; SE corner of main ramp.

Dallas, Tex. (Addison): 159°; intersection of center a parallel taxiways.

Danville, Va. (Mun); 338°; S of trml bldg center of int section of txwy to rnwy 6 and txwy to rnwy 2.

Dickinson, N. Dak.: 182°; intersection of E/W txwy a N/S txwy.

Dodge City, Kans.: 150° center of NW end of NW/ rnwy.

Dothan, Ala. 186°; intersection of ramp and taxi st NW of trml bldg.

Dubuque, Iowa: 335°; on ramp in front of terminal bl

Duluth, Minn.: 012°; center of intersection formed by t strips leading to rnwys 31 and 2 just off SE corner ramp.

Duncan, Okla. (Halliburton Fld): 328°; trml ramp.

Dyersburg, Tenn.: 250°; intersection of ramp and cen taxi strip.

East Hartford, Conn. (Rentschler): 347°; lctd at taxi st near N side of ctl twr.

Eau Claire, Wis.: 180°; center of concrete ramp 150′ W Admin Bldg.

Elizabeth City, N.C. (CGAS): Lctn #1—028°; lctd on ta way leading from CG ramp.

Elko, Nev.: 329°; on apron just off NE end of rnwy 5–

Elmira, N.Y. (Chemung County): 066°; midpoint of sh taxistrip between rnwy 10 and 6 at W side of ar

aprxly 198' S of C/L rnwy 10 and 374' N of C/L rnwy 6.

ie, Pa. (Erie-Port Erie): 059°; txwy apchg rnwy 6.

ene, Oreg. (Mahlon-Sweet): 068°; apch to apron immediately W of the Amin Bldg.

ersville, N.C. (Grannis): 305°; on rnwy turnoff in front of ctl twr.

ence, S.C.: 235°; on taxiway W of the end of rnwy 18.

ne Leaning, Ga. (Lawson AAF): Lctn #1—021°; run up area on txwy at apch end of rnwy 20. Lctn #2—019°; run up area on txwy W ctl twr at intersection or rnwy 02-20 and 14-32. Lctn #3—055°; run up area on txwy S of ctl twr at junction with rnwy 14. Lctd #4—130°; run up area on txwy at apch end of rnwy 32.

ne Dodge, Iowa: 118°; 6.1 nmi from VOR on W edge of trml bldg.

Lauderdale, Fla (Hollywood Intl Arpt): 120°; on ramp in front of Trml Bldg.

ne Myers, Fla. (Page): 172°; N side of Trml ramp.

ne Riley, Kans. (Marshall AAF): 030°; on SE corner of tie down area and taxiway apchg rnwy 4.

ne Rucker, Ala. (Cairns AAF): Lctn #1—019°; run up area on txwy apch end rnwy 13. Lctn #2—035°; NW of Int rnwy 13 and 18. Lctn #3—040°; run up area on txwy Int rnwy 13 and 18. Lctn #4—059°; run up area on txwy N of apch end rnwy 26. Lctn #5—063°; run up area on txwy S apch end rnwy 26. Lctd #6—058°; run up area on txwy at Int rnwy 24 and 36. Lctn #7—078°; run up area on txwy W of apch end rnwy 36. Lctn #8—062°; on run up area txwy N of apch end rnwy 6.

ne Stockton, Tex.: 116°; on ramp N of terminal.

Nahore, N.C. (Seymour Johnson AFB): 028°; run up pad at apch end rnwy 8.

ne Bay, Wis. (Austin-Straubel): 141°; intersection of circular taxi strip, W of Admin Bldg., and taxi strip leading to intersection of S and SE rnwys.

nwood, Miss.: 060°; central taxiway adj to ramp.

nwood, S.C. (County): 251° on taxiway apch end of rnwy 9.

Sport, Miss.: 098°; on arpt.

nson, Ark.: 131°; Int taxiway and ramp.

ne, Mont. (City-Co.); taxiway adj to apch end rnwy 26.

bs, N. Mex. (Lea County): 060°; on runup pad apch end rnwy 3.

e Springs, Ark.: 245°; taxiway adj to rnwy 5.

nton, Tex.: 292°; NE end rnwy 12.

nnis, Mass. (Barnstable Mun): 243°; lctd on rnwy apron for rnwy 24.

ne Falls, Idaho (Fanning Fld): 007°; junction of N/S txwy and rnwy 16-34, at NE corner of arpt.

ca, N.Y. (Tompkins Co.): 202°; at bend in txwy, 375' from centerline of NW/SE rnwy.

nstown, N. Dak.: 258°; junction of taxi strip leading from hangar with SW taxi strip.

nstown, Pa. (Cambria County): 155°; taxiway to rnwy 33.

Junction, Tex. (Kimble County): 143°; N edge of parking ramp.

Key West, Fla. (Boca Chica): 091°; W just N of apch end of rnwy 7.

Key West, Fla. (Int'l): 131°; NW portion of ramp.

Kinston, N.C. (Stallings): 230°; 500' in front of Admin Bldg.

Klamath Falls, Oreg.: 294°; 154' N of txway in front of Admin Bldg., and 36' from E edge of ramp.

Lafayette, La.: Lctn #1—350°; on taxiway at N end N/S rnwy. Lctn #2—343°; on taxiway at S end N/S rnwy.

La Grange, Ga.: 106°; on compass rose at taxi strip intersection aprxly 500' due S of Admin Bldg.

Lancaster, Pa.: Intersection or ramp and txwy leading to intersection of rnwys.

Lansing, Mich. (Capital City): 053°; center of apch end rnwy 5.

Laramie, Wyo. (Brees): 100°; on loading ramp.

Laredo, Tex. (AFB): Lctn #1—137°; off end of ramp on taxiway 2, 4.8 nmi. Lctn #2—131°; off S end of ramp on taxiway 6, 4.0 nmi.

Laredo, Tex.: 315°; on ramp adj to apch bcn.

Las Vegas, Nev. (McCarran Fld): 351°; on run-up area W side rnwy 19.

Las Vegas, N. Mex.: 231°, concrete ramp N of FSS Bldg.

Lawton, Okla.: 349°; on trml apron at the point intersecting the S taxi strip.

Little Rock, Ark. (Adams): 314°; on taxi strip adj to junction rnwy 14.

Longview, Tex. (Gregg County): 125°; txwy adj to rnwy 13 to end of rnwy 13.

Louisville, Ky. (Bowman): 329°; taxiway W of rnwy 1.

Louisville, Ky. (Standiford): 301°; taxiway between ramp and rnwy 19.

Lubbock, Tex.: 111°; W edge of ramp N of trml bldg.

Lufkin, Tex.: (Angelina Co. Arpt): 328°; Intersection of ramp and taxiway in front of Trml Bldg.

Mansfield, Ohio (Mun): 133°; at intersection of NW and SW taxiways.

Marfa, Tex. (Alpine): 108°; S edge of ramp in front of FSS.

Marianna, Fla.: 310°; ESE end taxiway 6.

Marshall, Tex. (Harrison Co Arpt): 318°; Int of E and N/S taxiway in front of N ramp.

Martinsburg, W. Va.: 281°; near apch end of rnwy 35.

Mason City, Iowa: 356°; on centerline S end of N/S rnwy.

McAlester, Okla. (Mun): 350°; taxistrip at terminal ramp.

McAllen, Tex. (Miller Int'l): Lctn #1—040°; at intersection E/W txwy and N/S txwy. Lctn #2— 012°; in front airline trml on gate two loading spot,.

Melbourne, Fla. (Eau Gallie): 146°; 220' E of FSS.

Meridian, Miss. (Ky): 121°; from run up ramp for rnwy 23.

Midland, Tex. (Air Trml): Lctn #1—188°; center of warm up pad for rnwy 10. Lctn #2—178°; int txwy C and ramp in front of Trml Bldg.

Mineral Wells, Tex.: 307°; intersection of txwy and NW rnwy.

Missoula, Mont. (County): 340°; 5' from edge of ramp in front of Admin Bldg.

Mobile, Ala. (Bates) : 108° ; apch end of rnwy 9.
Monroe, La. (Selman) : 033° ; arpt ramp in front of twr structure adj to the txwy leading to intersection of rnwys 17–35 & 4–22.
Muscle Shoals, Ala.: 289° ; eastern end of E/W rnwy 11–29 equi-distance from end and both sides of rnwy.
Nantucket, Mass. (Memorial) : 241° ; taxiway apchg rnwy 24.
Needles, Calif. (Site 25B, LAX–AMA) : 253° ; on ramp in front of Admin Bldg.
New Bern, N.C.: 088° ; on compass rose at ramp.
New Orleans Intl, La. (Moisant Fld) : 235° ; center of perimeter txwy 100′ S of rnwy 10.
Norfolk, Va. (Mun) : 031° ; center of txwy "E", 250′ NW of centerline of rnwy 22.
Oakland, Calf. (Metro-Oakland Int'l) : 081° ; middle of pad between rnwys 27L and 27R.
Olympia, Wash.: 347° ; on ramp in front of Admin Bludg.
Orlando, Fla. (Herndon) : 300° ; midpoint of N/S taxiway on W bndry of arpt.
Paducah, Ky. (Barkley) : 040° ; on txwy apchg end of rnwy 22.
Palacious, Tex.: 119° ; intersection NW end NW/SE rnwy and S txwy strip.
Panama City, Fla. (Bay Co. Arpt) : 195° ; N/S txwy 1050′ N or Term bldg.
Paris, Tex. (Cox Fld) : 348° ; intersection of N/S and E/W txwys.
Parkersburg, W. Va. (Wood County) : Lctn #1—209° ; run-up area N side of rnwy 28. Lctn #2—207° ; on txwy near intersection rnwys 16 and 21.
Pasco, Wash.: 020° ; S of int ofN/S txwy and rnwy 20L.
Paso Robles, Calif.: 248° ; 150′ S of Admin Bldg on parking ramp, indicated by circle and sign.
Pecos, Tex. (Mun) : 133° ; on ramp adj to center taxiway.
Pellston, Mich. (Emmet Co.) : 239° ; intersection of centerlines of N/S rnwy and E/W txwy of arpt.
Pendleton, Oreg.: 076° ; 200′ W of Admin Bldg.
Peoria, Ill. (Greater Peoria) : 098° ; at SW corner of service ramp E side of fld.
Philadelphia, Pa. (North Philadelphia) : 215° ; on taxi strip between ramp and rnwy 10.
Phillipsburg, Pa. (Black Moshannon-State) : 252° ; rnwy intersection.
Pierre, S. Dak.: 250° ; in front of municipal hangar.
Pine Bluff, Ark. (Grider) : 179° ; center txwy at junction N/S rnwy.
Ponca City, Okla.: 101° ; taxi strip at junction to trml ramp.
Pontiac, Mich.: 114° ; center of warmup pad S of apch end rnwy 27.
Pueblo, Colo.: 244° ; painted circle with arrow on ramp W of Admin Bldg.
Quincy, Ill. (Quincy-Baldwin Fld) : 030° at intersection of NE/SW and NW/SE taxi strips N of trml bldg.
Raleigh, N.C.: 244° ; end rnwy 5.
Rapid City, S. Dak.: 320° ; in front of Admin Bldg adj to center taxi strip.
Raymond, Nebr. (Lincoln AFB/Mun) : 174° run up pad of rnwy 35R along centerline of N/S txwy.
Redding, Calif. (Mun) : 310° ; intersection txwy and rnw 12.
Redmond, Oreg.: 066° ; on ramp in front of Admin Bl 60′ W of centerline of txwy to rnwy 10–28.
Reno, Nev.: 240° ; lctd on concrete runup mat for rnwy 1
Riverton, Wyo. (Mun) : 178° ; txwy between Admin Bl and rnwy.
Roanoke, Va. (Woodrum) : 099° ; filled area rnwy 27.
Rochester, Minn.: 030° ; of taxiway that enters apch e of rnwy 31.
Rochester, N.Y. (Monroe Co.) : 149° ; on ramp in front ctl twr 415′ from centerline rnwy 1–19 and 305′ fr centerline of rnwy 7–25.
Rock Springs, Wyo.: Lctn #1—266° ; in center of tu around E end rnwy 25. Lctn #2—261° ; in cen of turn-around W end rnwy 7.
Rockford, Ill.: 112° ; apex of txwys at center of arpt.
Rocky Mount, N.C.: 263° ; right 3 rnwy 33, marker.
Rome, Ga. (Russell Fld) : Intersection of taxiways 2 S of the terminal bldg.
Saginaw, Mich. (Tri-City) : 280° ; lctd on NE parki ramp 12′ from field edge near center txwy.
St. Paul, Minn., (Downtown Arpt) : 291° ; over drain center of int parking ramp and taxiway in front trml bldg.
St. Petersburg, Fla. (Pinellas County Int'l) : 255° ; park ramp 500′ SE of ctl twr.
St. Thomas, V.I. (Charlotte Amalie, Truman) : 118° ; center point of arpt txwy on line 3 mi WNW.
Salinas, Calif. (Mun) : 257° ; rgt shoulder rnwy 21, direc in front of trml bldg.
Salisbury, Md. (Salisbury-Wicomico County) : 243° ; ra front of ctl twr.
San Angelo, Tex. (Mathis) : 236° ; E edge of ramp in fr of twr.
San Antonio, Tex. (Stinson Mun) : Lctn #1 ; 329R, run area at apch end rnwy 9. Lctn #2 : 335R, on W ramp opposite hangars 1 and 2.
San Jose, Calif. (Mun) : 095° ; on ramp in front of t bldg.
San Juan, Puerto Rico (Intl) : 081° ; lctd on taxiway trml bldg.
Santa Barbara, Calif.: 198° ; gate 2 in front of trml b over Figure 2 painted on apron.
Santa Catalina, Calif.: 346° ; SW corner apch end rnw Santa Catalina Arpt.
Santa Fe, N. Mex. (New Municipal) : 334° ; at junct main intersection txwy and ramp.
Sarasota, Fla. (Bradenton) : 172° ; on ramp 800′ N t bldg.
Scottsbluff, Nebr. (Mun : 240° ; NE edge ramp oppo trml bldg and W of txwy leading to rnwy 30 apr 3000′ from apch end.
Seattle, Wash. (Seattle-Tacoma Int'l) : 028° ; 30′ near e of ramp S and W of Admin Bldg.
Sioux City, Iowa: 314° ; painted circle directly in front new twr.
Sioux Falls, S. Dak.: 148° ; in line with E edge of txwy of ctl twr, 75′ S from N edge of parking ramp.
South Bend, Ind. (St. Joseph Co.) : 178° ; center of west N/S txwy 200′ N of N edge of trml ramp.

partanburg, S.C. (Municipal): Lctn #1—192°; at compass rose on ramp.

pringfield, Ill. (Capital): 214°; in front of twr at intersection NW/SE and NE/SW taxi strips.

pringfield, Mo.: 191°; at bend in N/S txwy 400' S of N end of taxi strip.

inson, Tex. (Mun Arpt): Lctn #1, 329°; runup area at apch end runway 09. Lctn #2, 335°; on W end of ramp opposite hangars 1 and 2.

rmal, Calif.: 328°; ramp 250' in front of hangar.

peka, Kans. (Philip Billard Arpt): 212°; N/S taxiway W of tetrahedron.

uth or Consequences, N. Mex.: 155°; on SE/NW txwy adj to wind cone.

cumcari, N. Mex.: Lctn #1—255°; over square metal plate lctd on hangar ramp paved area. Lctn #2—266°; over painted orange circle, lctd on taxi strip 100' off end of rnwy 8.

scaloosa, Ala. (Van De Graaff): 241°; point lctd on centerline of txwy midway between ramp and rnwy.

in Falls, Idaho (Joslin): 030°; on parking strip apron 300' SW of Admin Bldg.

re Beach, Fla.: 112°; on taxiway adj to wind sock adj to rnwy 11-29.

hy, Mo.: 241°; on center line of NE/SW rnwy 125' from NE end Rolla National Arpt.

Victoria, Tex. (Victoria Co.-Foster): 126°; apch end rnwy 13L.

Walla Walla, Wash. (City-County): 025°; ctr of txwy apch rnwy 20, mrkd.

Walnut Ridge, Ark.: 050°; taxi strip at parking apron adj to tetrahedron.

Watertown, N.Y. (Mun): 048°; ramp in front of Admin. Bldg.

Watertown, S. Dak.: 184°; lctd SE corner of ramp near taxiway leading to rnwy 12-30.

Wausau, Wis. (Alexander): 338°; 100' N of wind tee, 30' from S edge of concrete trnl ramp where concrete ramp terminates and blacktop ramp begins.

Wenatchee, Wash. (Pangborn Fld): 45°; front of Administration Bldg.

Westfield, Mass.:304°; from center of compass rose lctd end of rnwy 15.

Wheeling, W. Va. (Wheeling-Ohio County): 219°; txwy on E side of ramp.

Woodring, Okla.: 348°; ramp W of Term. Bldg.

Youngtown, Ohio: 182° compass rose end of rnwy 18.

Zanesville, Ohio: 010°; on arpt 270' NE of intersection of NE/SW and NW/SE taxistrips on centerline of NE/SW taxistrip.

VFR AIRPORT TRAFFIC PATTERNS

(In accordance with Agency Order AT 7100.14A)

Airports	*Runways*	*Departure Procedures*	*Traffic Pattern Alts.*
Atlanta, Ga.	9, 27	No turns until 3 mi, 2500′ for *large acft.	
	15, 21	No turns by *large acft over more populated areas until 3 mi, 2500′.	
Betts AAF, Tobyhanna Supply Depot, Pa.	14	Right hand tfc pattern.	
Burlington Mun., Vt.		Single engine.	1140′ MSL
		Multi engine.	1340′ MSL
Caldwell-Wright, Fairfield, N.J.	27	Acft shall not start crosswind leg until well past the school lctd ¼ mi to the right of the extended rnwy centerline and ¼ mi from the arpt.	
	32	Acft shall bear right as soon as practicable after take-off to avoid flying over the Fairfield township school lctd ¼ mi NW of arpt and slightly left of the extended rnwy centerline.	
Chicago–Midway, Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
Chicago–OHare I'ntl Arpt., Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
Gardner, Kans.	East	Recommend alt not above 400′ AGL until cross-wind leg northbound. Exit pattern NW to remain clear of tfc patterns of Olathe NAS, 3.5 mi NE.	
Jennings Arpt, La.	13, 17, 22	Right hand tfc pattern.	
Kansas City Fairfax Mun., Kans.		Acft under 12,500 lbs.	600′ AGL
Lake Charles, La.	15, 22	Right hand tfc pattern. 1000′ slow acft pattern; 1500′ turbine powered fixed-wing acft.	
New York, LaGuardia	13	Rgt turn and proceed over Flushing Meadow Park before turning on course.	1500′
San Antonio, Tex., Stinson Arpt	9, 14, 22	Right hand tfc pattern. 800′ AGL light or slow acft. 1500′ AGL, heavy or fast acft.	
Torrance Mun., Calif.	11L	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 45 degrees from the runway departure heading and continue climb.	
	11L	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 90 degrees to the departure runway heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the right of the cross wing leg course.	
	11R	All aircraft—Climb on departure rnwy heading to 1500′.	

* Large acft—acft weighing over 12,500 lbs maximum certificated take-off weight.

Airports	*Runways*	*Departure Procedures*	*Traffic Patterns Alts.*
	29R	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 45 degrees from the runway departure heading and continue climb.	
	29R	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 90 degrees to runway departure heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the left of the cross wind leg course.	
	29L	All aircraft—Upon reaching an altitude of of 500 feet MSL, make left turn from the departure runway heading to intercept an area approximately over the Pacific Coast Highway, then proceed in a westerly direction until reaching 1,500 feet MSL or the shoreline.	
Wilkes-Barre Scranton, Avoca, Pa.	16, 22	Right hand tfc pattern.	
Winona, Minn., Max Conrad Fld		Right tfc NW.	

FLIGHT SERVICE STATION (FSS)

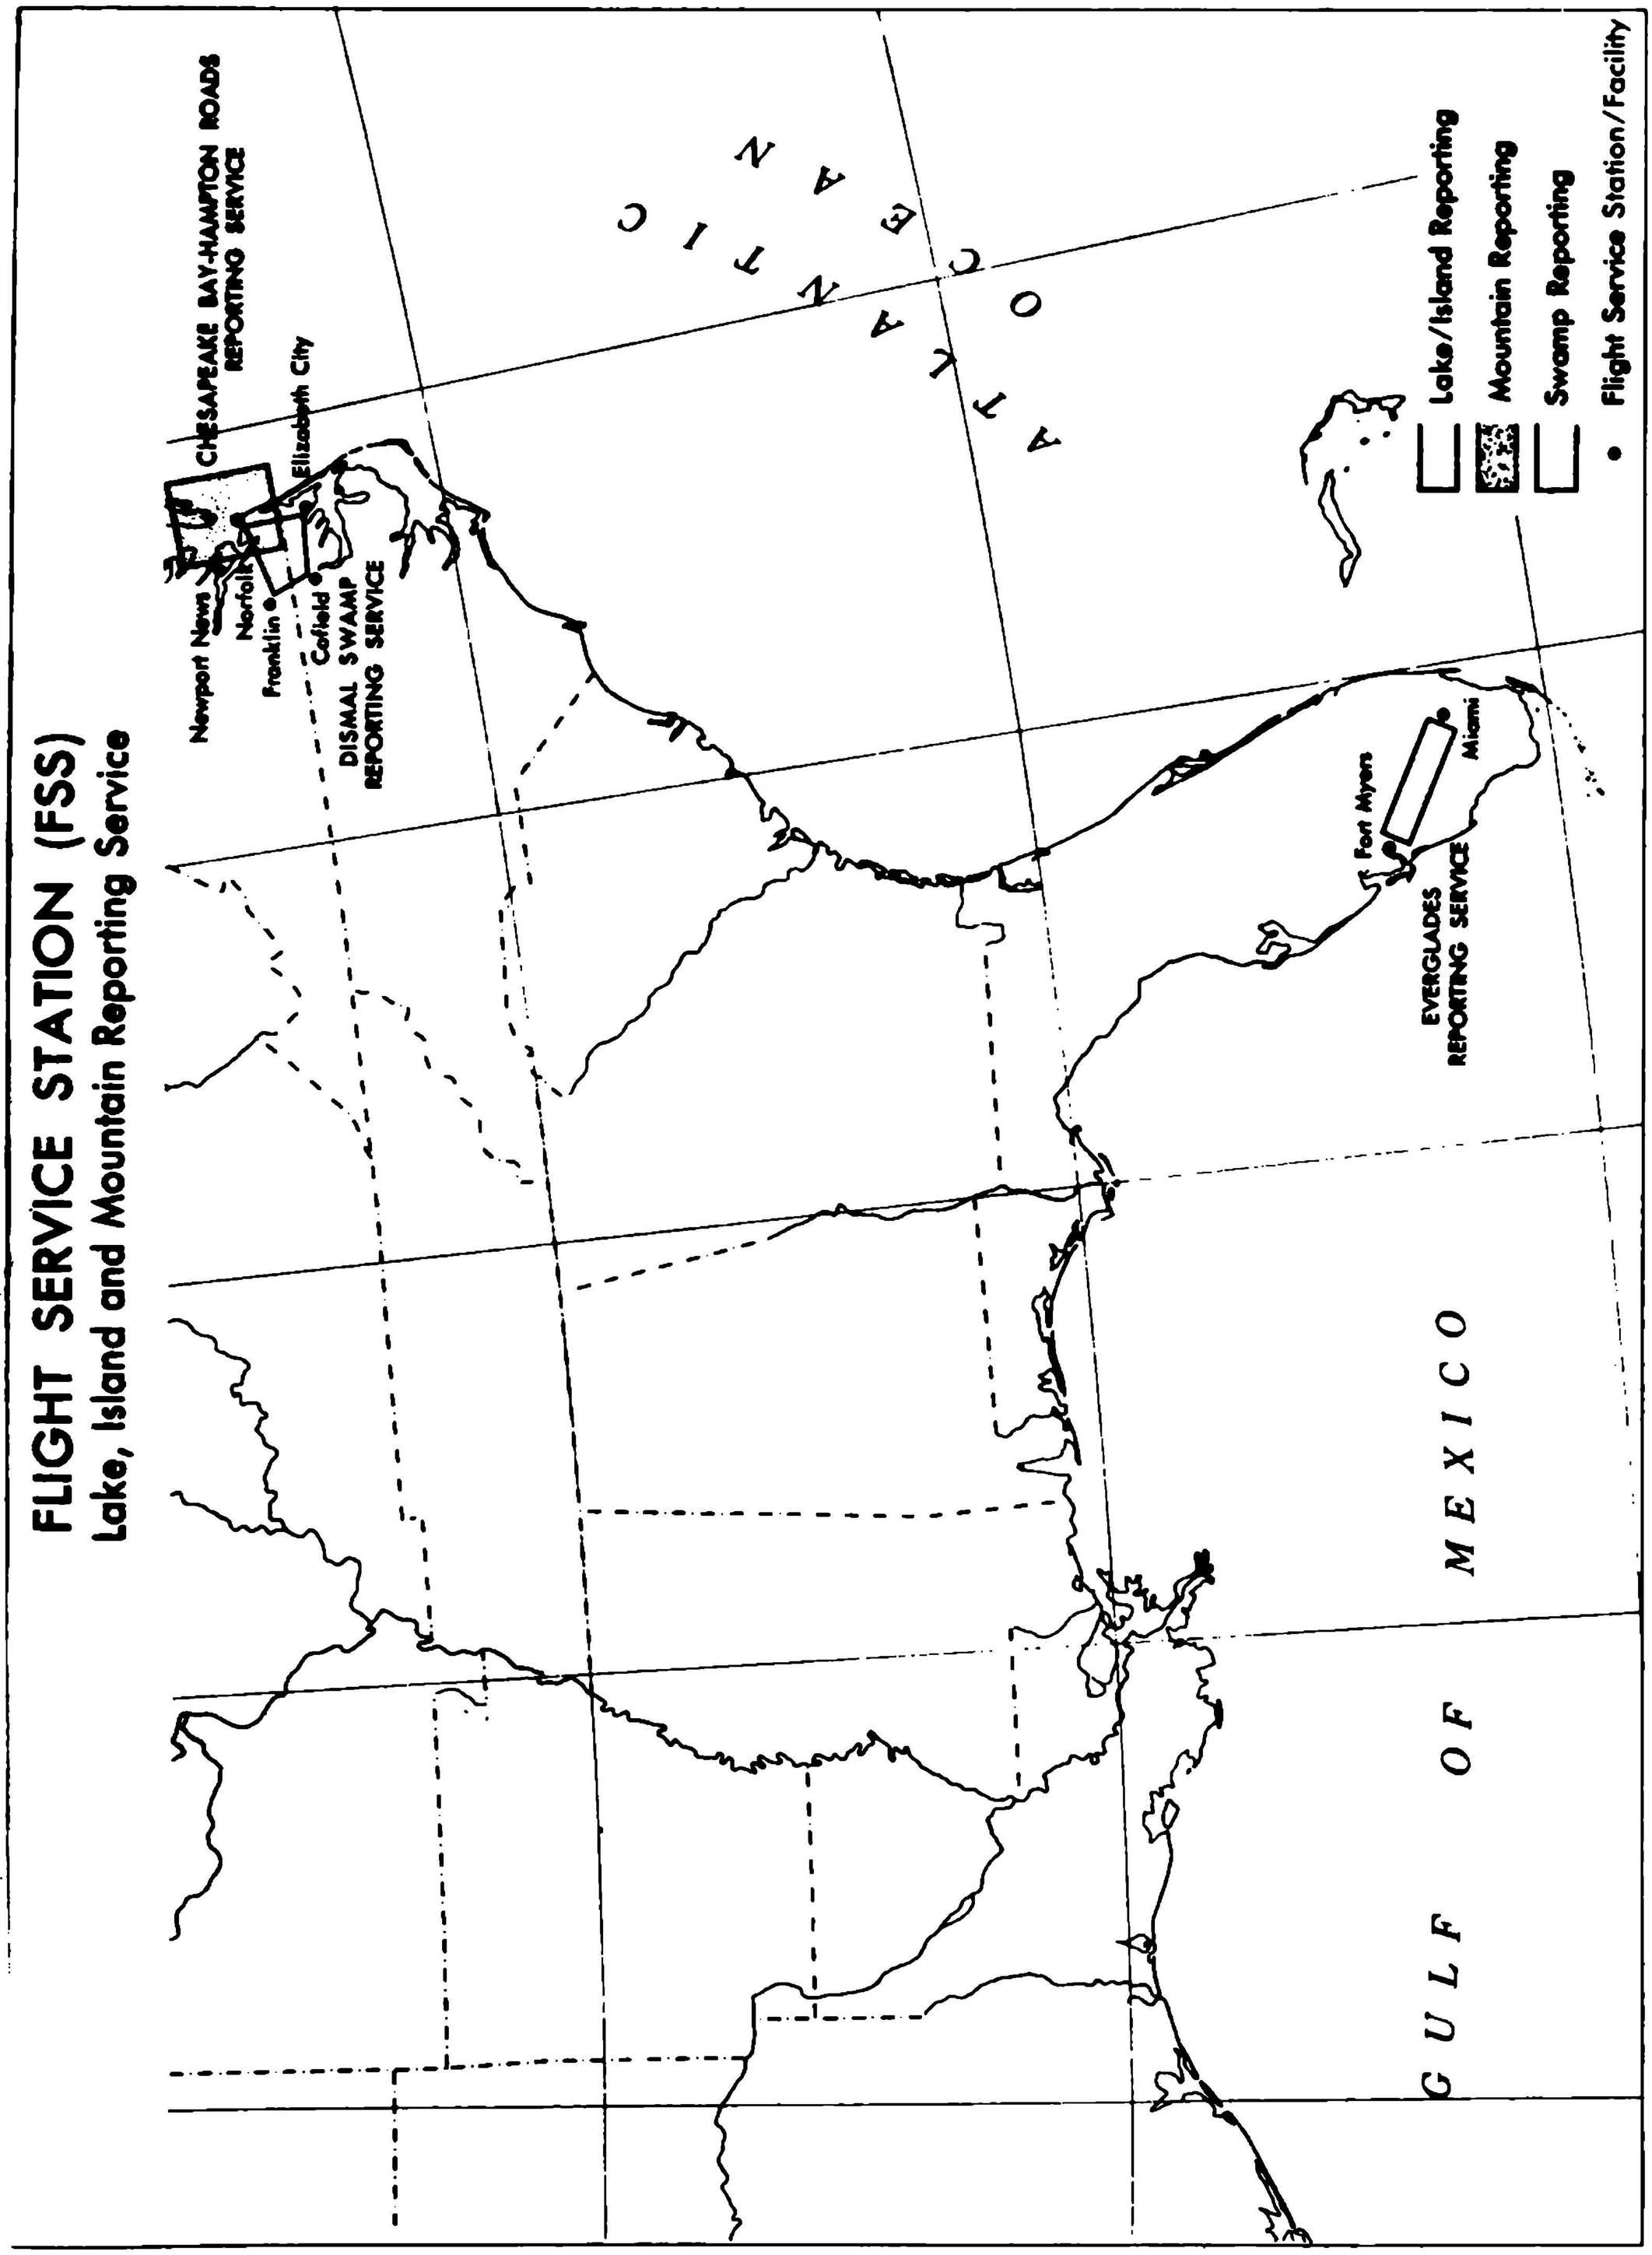
Lake, Island and Mountain Reporting Service

This service provides flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.

Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface", "Overlake", etc., are indicated on the following charts. To obtain this service, contact the FSS by telephone or radio giving present position, type aircraft, altitude, indicated airspeed, proposed route of flight, and mainland estimate.

After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.

FLIGHT SERVICE STATION (FSS)
Lake, Island and Mountain Reporting Service



ROCKY MOUNTAIN REPORTING SERVICE

This service is available to aircraft operating VFR (with or without flight plan) between Denver and Grand Junction via Corona Pass or Monarch Pass. This service can not be offered on an area or random route basis due to the unreliability of communications caused by terrain extremes. The routes via Corona Pass and Monarch Pass have been flight checked and communications found reliable at the altitudes published on the chart.

"Rocky Mountain Reporting Service" shall be available to all VFR aircraft upon request, whether or not operating on a regular flight plan.

REQUIREMENTS

1. Aircraft must be equipped with functioning 2-way radio capable of receiving VOR and transmitting 122.1mc.
2. Pilot must fly prescribed route at an altitude no less than established MRA (Minimum Reception Altitude).
3. Pilot must arrange for accurate time of departure to be received by the FAA facility through which the service was requested.
4. Pilot must radio a position report every ten minutes as follows, whether eastbound or westbound:

   CORONA ROUTE

   To Denver Radio while operating between Denver and Corona Pass (vicinity of Moffat Tunnel, west of Tolland, Colorado).

   To Eagle Radio (through Kremmling VOR) between Corona Pass and vicinity of Glenwood Springs.

   To Grand Junction Radio between vicinity of Glenwood Springs and Grand Junction.

   MONARCH ROUTE

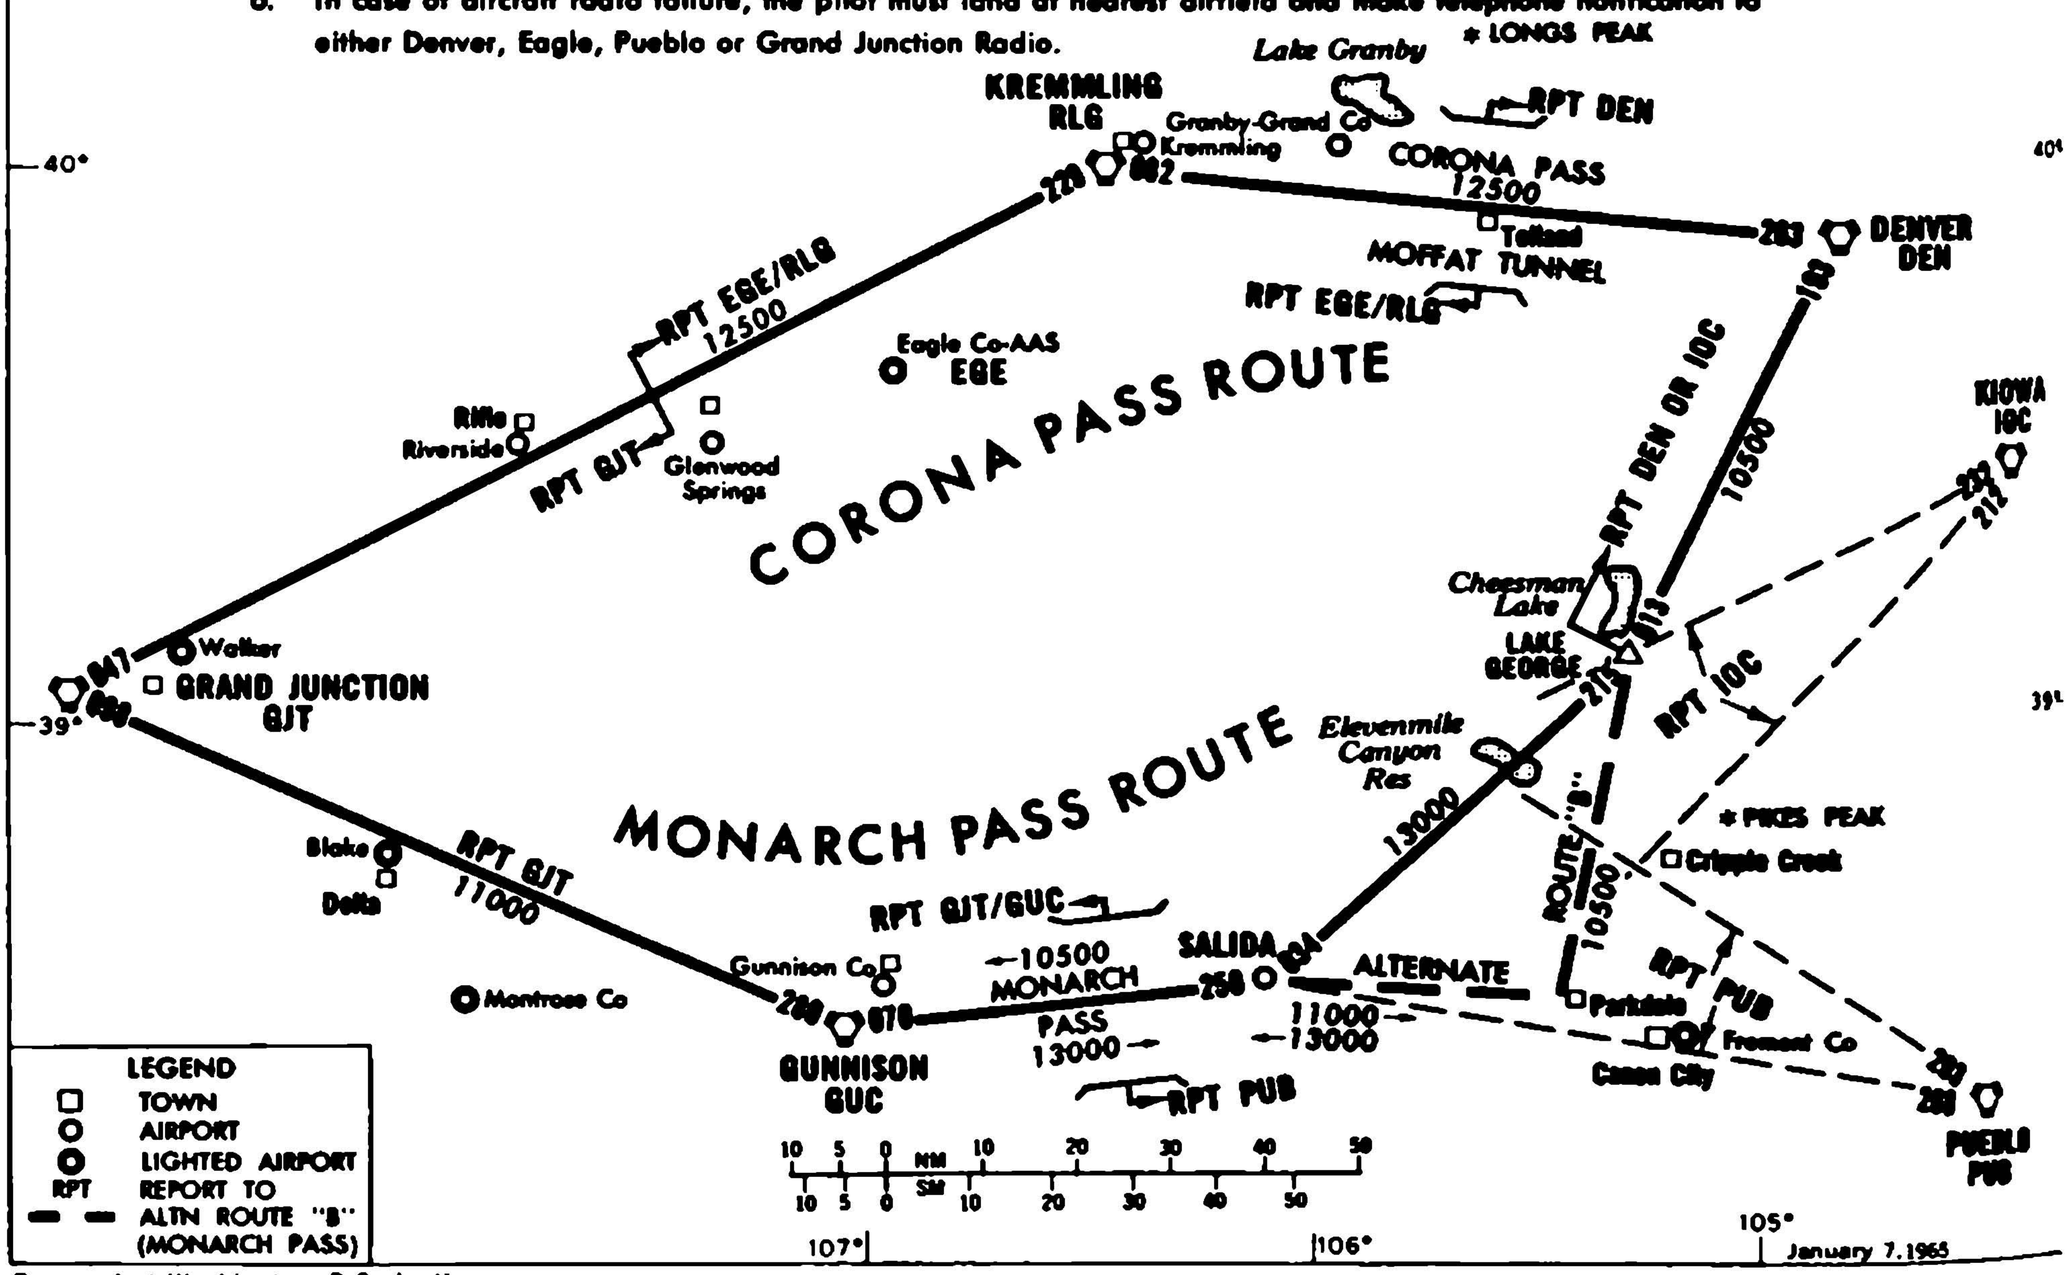
   To Denver Radio (through Denver or Kiowa VOR) between Denver and Lake George Intersection (Cheesman Reservoir). To Denver Radio (through Kiowa VOR only) between the Intersection and Elevenmile Reservoir, or west of Cripple Creek, Colorado.

   To Pueblo Radio between Elevenmile Reservoir or west of Cripple Creek and Salida, Colorado.

   To Grand Junction Radio (through Gunnison VOR) between Salida and Grand Junction.

   Pilots may file for all or any portion of either route, i.e. on a flight from Denver to Grand Junction, a pilot may request the service from Denver to Kremmling only.

   (If contact with the aircraft is lost for more than 15 minutes, Search and Rescue will be alerted.)
5. The service may be terminated at any time upon request of the pilot.
6. In case of aircraft radio failure, the pilot must land at nearest airfield and make telephone notification to either Denver, Eagle, Pueblo or Grand Junction Radio.



Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

SPECIAL NOTICES

Special Notices of a general nature or universal application, and otner than for a specific geographical location, are grouped together under General Notices. Special Notices pertinent to a specific geographic area are grouped together under Area Notices by state, then city, airport, or location within the state. The month and year the notice is initially inserted into the manual is provided at the conclusion of each Special Notice. A solid dot ● prefixes new or revised Special Notices.

GENERAL NOTICES

MILITARY CLIMB CORRIDORS

ALL FLIGHTS desiring to traverse these areas must obtain prior approval from the Appropriate Authority and maintain continuous listening watch on the appropriate frequency while traversing the corridor. The list of corridors, appropriate authority and frequencies follows:

Corridors	Appropriate Authority	Frequencies
Bangor (Dow AFB) Maine	Dow AFB Apch Ctl	126.2; 363.8; 122.5G
Charleston AFB/Mun., S.C.	Charleston Apch Ctl	119.3; 319.8; 122.5G
Columbus (Lockbourne AFB), Ohio	Columbus Apch Ctl	123.7; 122.5G; 360.6
Falmouth (Otis AFB), Mass.	Otis RAPCON	124.7; 118.2; 122.5G
Glasgow (Glasgow AFB), Mont.	Glasgow AFB Apch Ctl	126.2; 236.6; 122.5G; 363.8
Goldsboro (Seymour Johnson AFB), N.C.	Seymour Johnson Apch Ctl	119.7; 122.5G

T—Transmits G—Guards

CIVIL USE OF MILITARY FIELDS:

U.S. Air Force, Navy and Coast Guard Fields are open to civil fliers only in emergency or with prior permission; Army Air Fields are open to civil aircraft on authorization of the Air Field Commander.

For Air Force installations, prior permission should be requested at least 30 days prior to first intended landing from Headquarters USAF (AFOAPDA) via the Commanding Officer of the field concerned (who has authority to approve landing rights for certain categories of civil aircraft). For use of more than one Air Force installation, requests should be forwarded direct to Hq USAF (AFOAPDA), Washington, D.C. 20330.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned (who has the authority to approve landing rights for certain categories of civil aircraft).

For Coast Guard fields prior permission should be requested from the Commandant, U.S. Coast Guard via the Commanding Officer of the field.

However, with minor exceptions, authority to use Air Force and Navy fields is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity. Use of Coast Guard fields is limited to persons on government business only when there is no suitable civil airport in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

HEAVY TRAFFIC AROUND MILITARY FIELDS

Pilots are advised to exercise vigilance when ir close proximity to most military airports. Thes airfields have an unusually heavy concentration o jet aircraft operating within a 25 nautical mil radius and from the surface to all altitudes. Thi precautionary note also applies to the larger civi airports. BE ALERT, STAY ALIVE!

December 196

FLIGHTS ACROSS U.S. BORDERS:

All pilots contemplating flights across U.S. border should refer to complete regulations in INTERNA TIONAL FLIGHT INFORMATION MANUAL, Volum 12, April 1964. Pilots must report for inspection at tim of each entry to avoid inconveniences, additional e penses and penalties.

December 196

HELP PREVENT SMUGGLING BY AIR

All American pilots are asked to help Federal law e forcement agencies in combating the smuggling of illeg aliens and contraband into the U.S. by private aircraf If you have information of any kind that might relat to smuggling by air, please contact the nearest U.S. Im migration and Naturalization Service or U.S. Bureau c Customs office at once. The local FAA office will pass th information along for you, if you so desire. Awards fc original information are paid by Customs under certai circumstances.

December 196

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS):

The FAA is conducting a series of operational tests a Kennedy, Chicago O'Hare, San Francisco, and Van Nuy Airports to determine the feasibility of automatical broadcasting routine, noncontrol information on the voi feature of the VOR, VORTAC, VOT or a discrete VH frequency serving the airport. Routine noncontrol i formation such as ceiling, visibility, wind, altimeter, ru ways in use, and other pertinent information are aut matically broadcast and updated as necessary. Pilo participating in these evaluations should, on initial co tact with the tower or approach control, repeat th phonetic alphabet code word appended to the record broadcast. This will indicate that he has received th latest operational tests.

Tests are being conducted on the following navaids:

Kennedy (departure information) JFK VORTAC 115 mc. Arrival information: DPK VORTAC 111.2 mc COL VORTAC 108.2 mc.

Chicago O'Hare (arrival and departure information 124.2 mc; ORD VORTAC 111.6 mc.

Van Nuys (arrival and departure information) VO 109.0 mc.

December 196

SPECIAL CIVIL AIR REGULATION NO. 456

Effective immediately the provisions applicable under Special Civil Air Regulation No. 456 will apply as follows:

Air traffic clearances to aircraft of Cuban registry not engaged in scheduled International Air Service in U.S. airspace will require that flight be conducted on one of the following routes and a landing be made at Kennedy International Airport. In the event alternates are necessary due to weather, such alternates will be Logan International Airport and Dulles International Airport in that order.

Flights from Montreal to Kennedy below FL 180 will be routed via V-282, V-203, V-91, V-475, DPK. Those at FL 180 and above will be routed via St. Eustache V-91, PLB, J-75, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Montreal below FL 180 will be routed via Sound Intersection, POU, V-487. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-75, PLB, V-91, St. Eustache.

Flights from Ottawa to Kennedy below FL 180 will be routed via MSS, V-203, ALB, V-91, V-475, DPK. Those at FL 180 and above will be routed via G-1 Maxville, V-104, MSS, J-37, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Ottawa below FL 180 will be routed via Sound Intersection, POU, V-91, ALB, V-203, MSS. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-37, MSS, V-104, Maxville, PLB

Flights from Toronto to Kennedy below FL 180 will be routed via V-36S, V-252, BGM, V-270, V-34, V-475, DPK. Those at FL 180 and above will be routed via V-36S, BUF, J-95, HUO, CMK, V-34, V-475, DPK. Flights from Kennedy to Toronto below FL 180 will be routed via HUO, V-126, AVP, V-36. Those at FL 180 and above will be routed via Northport Intersection, V-10, J-95, BUF, V-36.

All flights in both directions, between Kennedy and Bermuda will be routed via the Tuna Intersection and the Gulfwater Papa Route. These are the only routes which will be authorized. Reroutings which will traverse other Bermuda airspace will not be authorized.

The procedures set forth herein will not apply at this time to overflights by aircraft of Cuban registry engaged in scheduled International Air Service. However, if circumstances subsequently warrant, a notam prescribing routes for such aircraft will be issued.

December 1964

Exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations

The Department of the Air Force has been issued an exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations to conduct certain Radar Bomb Scoring (RBS) training missions at or above Flight Level 300 within 75 nautical miles of the sites listed below. A navigation aid will be listed to define the center of the complex if such an aid is so located. If a NAVAID is not located at the center, the center will be defined by bearing/distance from a High Altitude Navigation Aid.

The NIKE/RBS Complexes used are:

Providence 280°/35NM
Windsor VORTAC
Presque Isle 087°/20NM
Kennedy VORTAC
Boston VORTAC
Rapid City 110°/33NM
Dupree VORTAC 010°/114NM
Syracuse VOR 018°/48NM

PILOT-TO-FORECASTER WEATHER SERVICE

Pilot-to-Forecaster Service (PTFS) in the general area of the Washington ARTCC is provided for the purpose of the direct pilot/forecaster exchange of meteorological information when **weather conditions are critical, changing rapidly or when the direct advice of a professional aviation meteorologist is considered necessary.** Routine requests for weather information or pilot reports should be directed to the nearest FAA Flight Service Station (FSS).

PTFS is available on the radio frequency of 122.6 megacycles (mc) within communications range of the following FAA FSS locations:

Washington, D.C.
Elkins, West Virginia
Richmond, Virginia
Roanoke, Virginia
Front Royal, Virginia
Rocky Mount, North Carolina

Air/ground calls should be made to "Washington Forecaster" for direct communications with a U.S. Weather Bureau Meteorologist who is currently familiar with weather in the area. This service is available from 1200Z to 0200Z (7:00 a.m. to 9:00 p.m., EST). Emergency weather service during other periods may be made available by contacting the flight service specialist (when VFR) or the Washington ARTCC (when IFR) and requesting that "Washington Forecaster" communicate on 122.6 mcs.

December 1964

MEA, MCA, MOCA, MRA, MAA

Effective Immediately: (1) MEA on V-138 from Mead INT, Neb. to Washington INT, Neb. raised to 3000'. Delete MOCA 2500'; (2) The MOCA on V-8, V-422 btn FDY and Antwerp INT, Ohio is raised to 2200'; (3) The MOCA on V-255, DLL to STE is 2400' vice 2300'; (4) MOCA on V-13E, 161W, Elkhart INT, Iowa to Union INT. Iowa is raised to 2400'; (5) 1200' MOCA on V-31, Golden Hill INT, Md. to OTT is deleted; (6) MEAs flwg Jet routes authorized: J-5, BFL to RNO, MEA 18,000'; J-7, RBL to REO, MEA 23,000'; J-7, BOI to DLN, MEA 18,000', COP 78 NM from BOI; J-15, GJT to SLC MEA 18,000'; J-15 BOI to OGD, MEA 20,000'; J-16, PDT to HIA, MEA

Efctv 1–28–65: The MEA on V–104 from the U.S. Canadian Border to MSS is 1500′. No MOCA authorized.

January 1965

VFR PRACTICE INSTRUMENT APPROACH PROCEDURES

VFR practice instrument approach procedures at the following locations are published for and used by USAF Air Training Command pilots:

Cotulla, Tex.	Radio Beacon	JAL–907–ADF
Draughon-Miller Arpt. Temple, Tex	VOR	JAL–809–VOR
Cotulla, Tex.	VOR	JAL–907–VOR
Howard County Arpt. Big Spring, Tex.	VOR	JAL–5019–VOR
Rock Springs, Tex.	VOR	JAL–111–VOR–3
Sequin AF Aux., Tex.	Beacon	AL–5223–ADF
Vance AFB, Woodring, Okla.	VOR	JAL–135–VOR–3

These approach charts are published by the USAF Aeronautical Chart and Information Center in a loose-leaf format. Civil aviation requests for these charts should be submitted to the Director, Coast and Geodetic Survey, 14th and Constitution Avenue, N.W., Attention: Distribution Division Washington, D.C. 20230.

December 1964

SPECIAL CIVIL AIR REGULATION NO. SR 454A

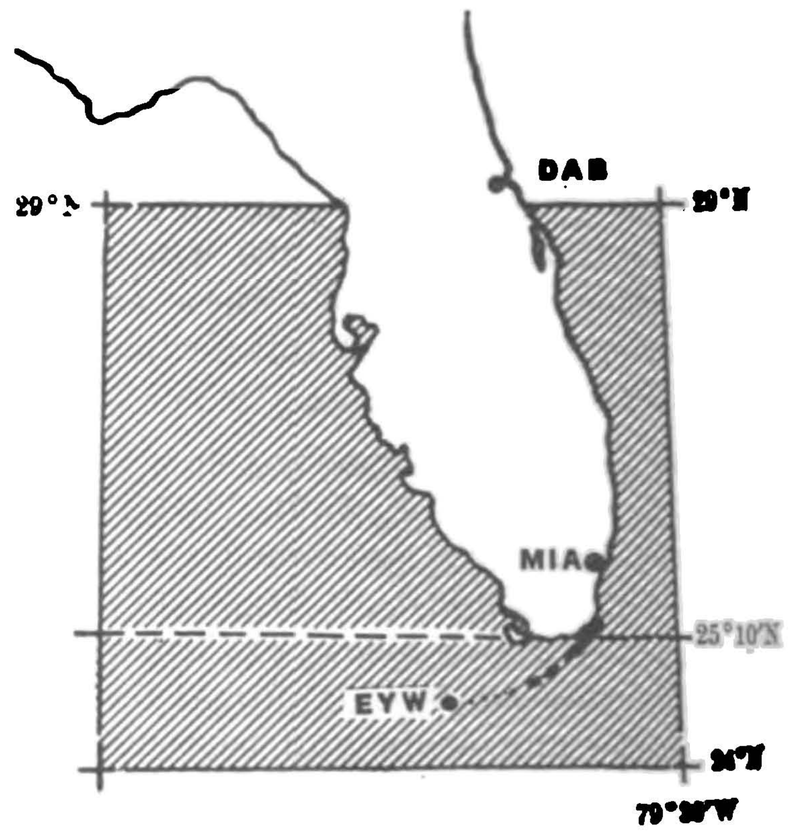
The following special rules of SR 454A are in effect. No person may operate any civil aircraft:

(1) Over water and outside the land mass of the State of Florida beginning at 29°N lat., 85°W long., thence clockwise to 29°N lat., 79°30′W long. to 24°N lat., 79°30′ W long., to 24°N lat., 85°W long., to the point of beginning or over land South of 25°10′N lat., unless:

(a) It is operated under a flight plan that has been approved by an FAA air traffic control facility; and

(b) the aircraft possesses functioning navigation and communications equipment necessary to maintain two-way radio contact with air traffic control facilities at all times during the operation, and the pilot in command monitors the radio frequencies specified by air traffic control.

SR 454A is applicable to the land mass between 25°10′ and 29°00′N whenever activated by NOTAM.



LOCATION IDENTIFIERS

The following changes affect the use of the Local Identifiers ATP–7350.1G:

AWM	West Memphis, Ar, Municipal Airport (Assignment)
BIF	Biggs AFB, El Paso, Texas (Correction)

January 1

New Flight Assistance Service Facility Tests

Two new methods of providing flight assistance services t airports will be field tested by FAA for a six-month eriod beginning about January 1, 1965.

A part-time, Flight Service Facility (FSF) will be valuated at five airport locations—one in each FAA do- estic region. During open hours, these facilities will rovide the terminal flight services now available at regu- r Flight Service Stations (FSSs).

An unmanned Airport Information Desk (AID) will be ted at 16 other locations. It will provide "do-it-yourself" ght planning services and will have current weather in- rmation available and direct communications to the arest FSS.

The five FSF test sites with control FSS shown in arenthesis are:

Watertown, New York (Massena, New York)
Myrtle Beach, South Carolina (at Cresent Beach) Florence, South Carolina)
Manhattan, Kansas (Salina, Kansas)
Junction, Texas (San Antonio, Texas)
Delta, Utah (Salt Lake City, Utah)

The AID test sites with control FSS shown in parenthe- sis are:

Jamestown, New York (Bradford, Pennsylvania)
Laconia, New Hampshire (Montpelier, Vermont)
Pittsfield, Massachusetts (Albany, New York)
Frankfort, Kentucky (Lexington CS/T)
Aiken, South Carolina (Florence, South Carolina)
Auburn, Alabama (Montgomery, Alabama)
Lakeland, Florida (Tampa, Florida)
Liberal, Kansas (Garden City, Kansas)
Marion, Indiana (Indianapolis, Indiana)
Mt. Vernon, Illinois (Cape Girardeau, Missouri)
Kerrville, Texas (San Antonio, Texas)
Ruidoso, New Mexico (Roswell, New Mexico)
Altus, Oklahoma (Wichita Falls, Texas)
Twin Falls, Idaho (Burley, Idaho)
Tacoma Industrial Airport, Washington (Seattle, Washington)
Aspen, Colorado (Denver, Colorado)

The FSF test facilities will be manned by flight service specialists and will normally operate 12 hours a day, seven days a week. The hours of operation will be tailored to the requirements of each location. Pilots may contact an FSF within 15 nautical miles of the FSF airport by calling on 121.9 mcs. and listening for reply on the same frequency. In radio calls, use the name of the FSF airport followed by the word "radio"; e.g., "Crescent Beach radio this is N1234V, over."

The FSFs will also guard the 121.5 mc. emergency frequency during open hours for the test period.

Pilots should check NOTAM information for commissioning dates of each of the facilities listed above.

Pilots are invited to use and evaluate these services.

Comments, criticism and suggestions should be forwarded to:

Director, Air Traffic Service
Federal Aviation Agency
800 Independence Avenue, S. W.
Washington, D. C. 20553

January 1965

Washington DISTRICT OF COLUMBIA

TEST EVALUATION OF VFR ARRIVAL AND DEPARTURE RADAR TRAFFIC INFORMATION SERVICE

In Washington, D.C. Terminal Area

Beginning on June 23, 1961, at 0401 GMT, and until further advised, the FAA will conduct an evaluation of VFR arrival and departure radar traffic information service in the Washington, D.C., Terminal Area. Pilot participation is urged, but is not mandatory.

VFR Radar Traffic Information Area

GENERAL PROCEDURES: The Washington VFR Radar Traffic Information Area is that airspace which extends upwards to an altitude of four thousand feet, MSL inclusive, and is encompassed by a line connecting the following points: Rockville, Laurel, Shadyside RBN, Hughesville, Indian Head, Centreville, and Herndon. (See chart on facing page.)

Pilots of aircraft without radio, as well as those unable to contact VFR Arrival or Departure Information Service on assigned frequencies, are urged to conform to routing via designated VFR arrival and departure routes.

Pilots operating VFR flights destined for Washington National Airport should follow the designated arrival and departure routes listed herein in order to maintain a safe, orderly flow of air traffic in the Washington area.

All aircraft arriving or departing Washington National Airport should proceed with caution when in the vicinity of Andrews AFB.

If destination is other than Washington National Airport, so advise.

THE RADAR SERVICE DESCRIBED HEREIN IS NOT INTENDED TO RELIEVE THE PILOT OF HIS RESPONSIBILITY FOR CONTINUAL VIGILANCE TO SEE AND AVOID OTHER AIRCRAFT. IT IS PROVIDED TO AID HIM IN HIS VISUAL SURVEILLANCE BY CALLING TO HIS ATTENTION PERTINENT TRAFFIC. PILOTS ARE REMINDED THAT THE SURVEILLANCE RADAR UTILIZED BY THE CONTROLLER DOES NOT PROVIDE ALTITUDE INFORMATION.

The following procedures should be adhered to by pilots of VFR flights desiring this service and having proper radio equipment when arriving at and departing from Washington National Airport.

ARRIVAL PROCEDURES: Arriving VFR flights desiring traffic information should contact Washington Traffic Information Service on 119.3 mcs/338.2 mcs UHF when approaching from Laurel, Shadyside RBN, and Hughesville; or on 120.1 mcs/306.3 mcs UHF when approaching from Indian Head, Centreville, Herndon, and Rockville. When practicable, pilots should follow the appropriate VFR arrival route as indicated (See Chart) and maintain listening watch on traffic information frequency until further advised. Landing information will be furnished to aircraft destined for Washington, and rad traffic information will be provided until the pilot is visesd to contact the tower.

DEPARTURE PROCEDURES: VFR flights departing fr Washington Airport desiring traffic information sho request the service on initial contact to Ground Cont The pilot should also advise his proposed direction flight; e.g., "VFR Information Service, Laurel." F lowing take-off, the tower will advise the pilot when contact Washington Information Service and the f quency to be used. Flights proceeding to Laurel, Sha side RBN, and Hughesville will use 119.3 mcs/338.2 m UHF. Flights proceeding to Indian Head, Centrevi Herndon, and Rockville will use 120.1 mcs/306.3 mcs U Pilots should depart the Washington Terminal area via designated VFR departure route most nearly aligned w their destination. They should also maintain listen watch on the appropriate information service freque until cleared to leave the frequency or beyond the per eter fix.

Washington National Airport

Arrival Routes

Northeast—Report Laurel. Proceed well right of Wa ington-Baltimore Parkway to Beltsville, then north Washington to Chain Bridge.

East—Report Shadyside RBN. Proceed via Bran wine to Fort Washington. Caution—Military conv tional and jet traffic vicinity of Andrews AFB Cont Zone.

Southeast—Report Hughesville. Proceed via Wald to Fort Washington. Caution—Andrews jet penetrat inbound on Andrews VOR 187 degree radial descend to cross Andrews LFR at 1500 feet MSL.

Southwest—Report Indian Head. Proceed on right s of Potomac River until past Mount Vernon.

West—Report Centreville. Proceed well right of U Route 29 highway to Falls Church.

Northwest—Report Herndon. Proceed well right of tomac River to Falls Church.

North—Report Rockville. Proceed well left of Potor River to Chain Bridge.

Departure Routes

Northeast—Proceed via west bank of Anacostia Ri to Riverdale and well right of Washington-Baltim Parkway until past Beltsville Airport.

East—Proceed via Fort Washington and Brandyw to Shadyside RBN.

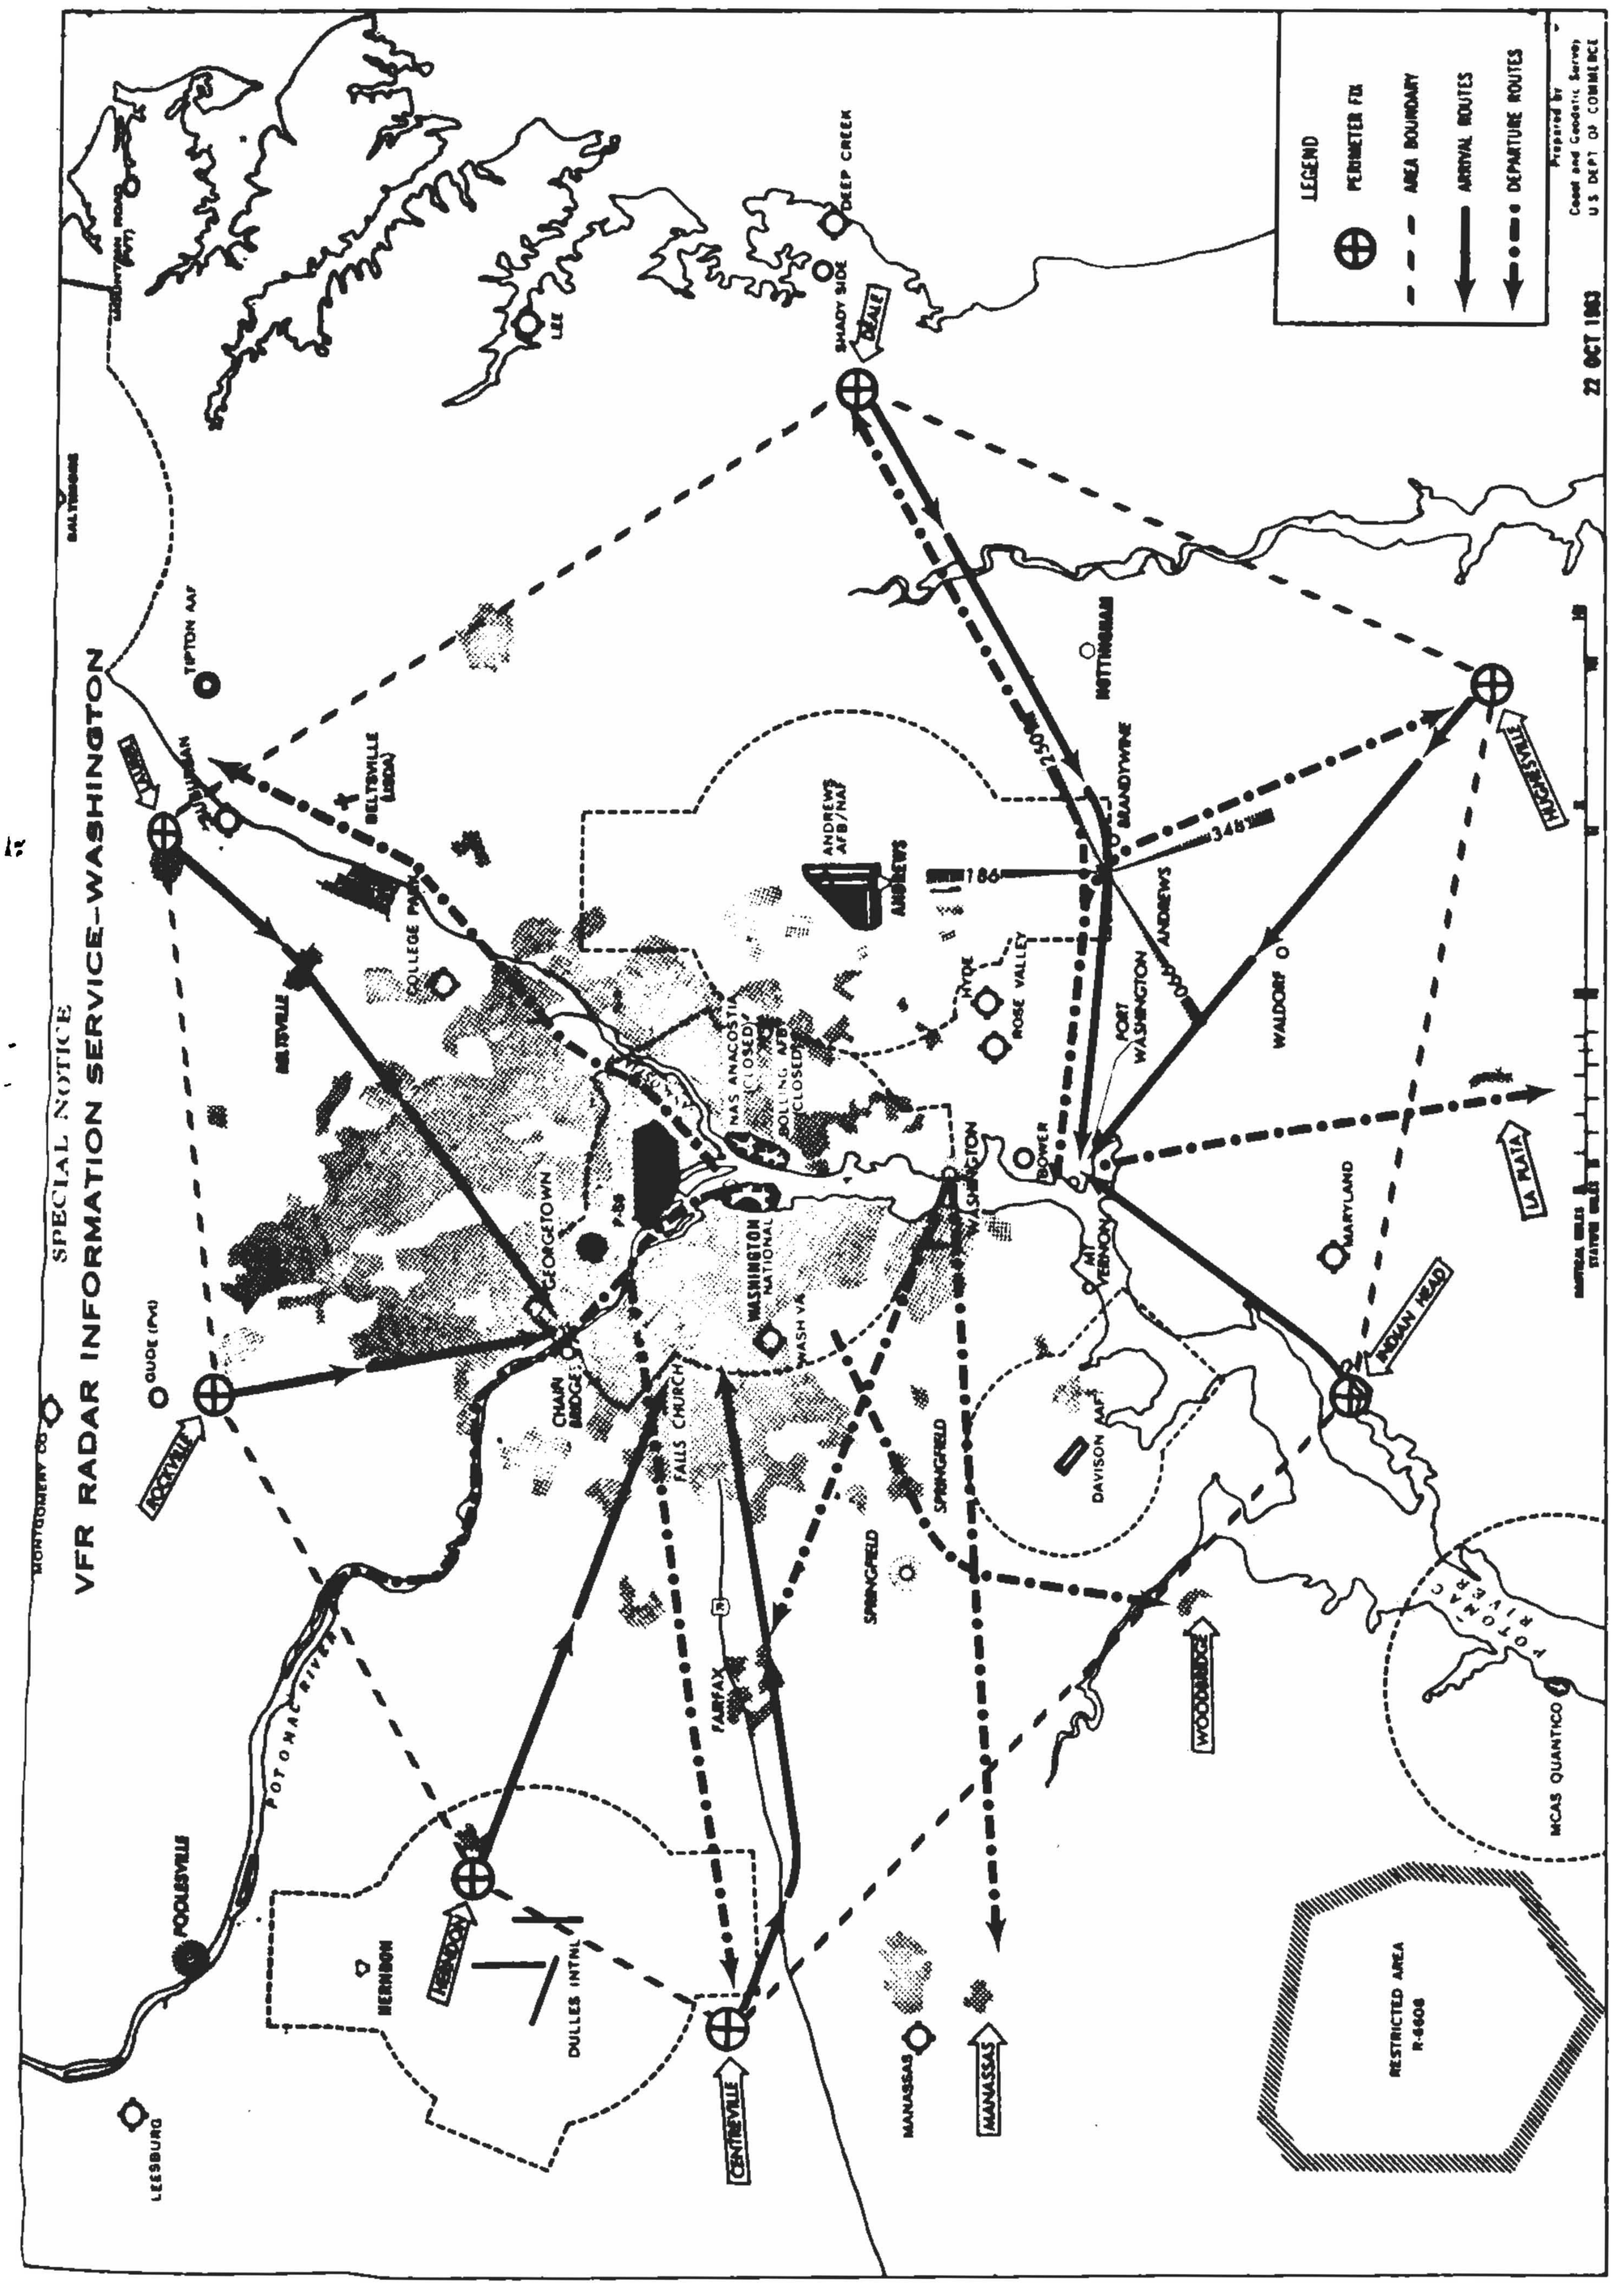
Southeast—Proceed via Fort Washington and LaPlata

Southwest—Proceed well right of Potomac River u past Woodbridge.

West—North departures proceed well right of U Route 29 highway until past Centreville. South dep tures proceed via Washington LFR to Manassas.

Northwest—North departures proceed via Potomac Ri until leaving the area. South departures proceed Washington LFR to Fairfax.

DISTRICT OF COLUMBIA



Atlanta GEORGIA

TERMINAL RADAR SERVICE AREA

(An Evaluation of Terminal Area Positive Separation)

The Air Traffic Service, FAA, has developed a program to evaluate a concept of providing a positive separation service to aircraft operating within a terminal area. The airspace area where this evaluation will be conducted will be known as a Terminal Radar Service Area (TRSA). During the evaluation period, a true positive separation environment will not be guaranteed.

This program is in consonance with the report of the Task Force on air traffic control (Project Beacon) and the subsequent Air Traffic Service analysis of the report.

A program for positive separation of aircraft operating in terminal airspace, regardless of weather conditions, must be able to satisfy the many varied requirements of both the VFR and IFR users without imposing excessive restrictions to their operations, yet it must be within the capabilities of the air traffic control system.

In consideration of these two major stipulations, the program will initially be implemented on a voluntary basis, whereby pilot participation will be encouraged rather than required. In this respect, it is obvious that considerable cooperation and effort must be expended jointly by the Federal Aviation Agency (FAA) and the airspace users, if a realistic evaluation is to be made.

Generally, the objective of this evaluation is to determine the following:

1. Airborne equipment and pilotage requirements.
2. Operating personnel, equipment, procedural and airspace requirements.
3. Impact on the over-all terminal operation.
4. Capability of the air traffic control system to provide positive separation to all aircraft operating within a terminal area.
5. Need for regulatory action.

Following a thorough and complete analysis of this evaluation, FAA in cooperation with the users, will determine the necessary requirements for implementation of a positive separation system in high activity terminal areas, wherein all aircraft would be provided separation by the ATC system, irrespective of weather conditions.

The size and shape of the TRSA will vary depending upon operational requirements. This area may be shown as a circular radius or other configuration and should be no larger than absolutely necessary to adequately perform the control functions.

Implementation

On November 15, 1962, a TRSA program was implemented at Atlanta, Georgia, as the first of selected locations to thoroughly evaluate the program.

In addition to the following details and procedures, information has been provided on appropriate charts, other aeronautical flight information publications a through representative user organizations.

The Atlanta Terminal Radar Service Area is that airspace extending upward from the surface to and including 6,000 feet MSL within the Atlanta Airport Control Zone; and, in addition, that airspace extending from 2,000 feet MSL to and including 6,000 feet MSL within a 15 statute mile radius of the Atlanta Airport, excluding Dobbins AFB Control Zone and the airspace within a 1½ mile radius of the Edwards Skyport and the Gunn Airport; EXCEPT that the base of the airspace area within the Fulton County Airport control zone is 2,500 feet MSL.

Flight Procedures

1. **IFR Flights**—Aircraft operating within the Atla TRSA shall be operated in accordance with curr IFR procedures.
2. **VFR Flights**

   a. Airports within the Atlanta TRSA:

      (1) Arriving aircraft will be expected to cont Atlanta Terminal Control on specified f quencies and in relation to geographical fi listed in d. below.

      (2) Departing aircraft will be advised by the tov when to contact departure or terminal c trol and the frequency to be used.

   b. Airports underlying the Atlanta TRSA:

      (1) Unless flight will be conducted below the fl of the TRSA, arriving aircraft will be pected to contact Atlanta Terminal Cont on specified frequencies and in relation geographical fixes listed in d. below.

      (2) Departing aircraft will be expected to cont Atlanta Terminal Control on the freque specified in d. below as soon as possible af becoming airborne if it is desired that fli be conducted within the TRSA.

   c. Transiting Aircraft—Aircraft desiring to trai the TRSA will be expected to contact Atla Terminal Control on specified frequencies and relation to geographical fixes listed in d. below

   d. Frequencies and Fixes—En route aircraft sho establish communications with Atlanta Termi Control approximately 25 miles from Atlanta A port. Aircraft entering the TRSA north of A way V-18N should use 119.8 or 381.6 MC; Aircr entering the TRSA south of Airway V-18N sho use 119.3 or 343.6 MC. Aircraft not equipped two-way communications on these frequenc should transmit on 122.7 MC and listen on appropriate frequency specified above.

      In addition to published radio fixes and ot prominent geographical fixes, the following f

ATC Procedures

1. The Atlanta TRSA is primarily a radar environment, and control will be predicated thereon. This does not preclude application of nonradar separation as required or deemed appropriate.
2. To facilitate radar identification of arriving and transiting VFR aircraft, ATC may request such aircraft to report their position in relation to fixes (prominent geographical or radio) within or outside the perimeter of the TRSA.
3. Radar headings and, if required, altitude assignments may be given to VFR flights operating within the TRSA.

NOTE.—Assignment of radar headings and/or altitudes are based on the provision that a pilot operating in accordance with VFR is expected to advise ATC if compliance with an assigned route, radar heading or altitude will cause the pilot to violate such rules.

4. Traffic information on observed but unidentified radar targets will be provided on a workload permitting basis.
5. When VFR aircraft are being held within the TRSA and control is based thereon, the ATC clearance will specify the distance (radius) and, if appropriate, the direction from the geographical fix within which holding is to be accomplished. In such cases, the pilot will be advised when to EXPECT FURTHER CLEARANCE.
6. During weather conditions equal to or better than basic VFR, 500 feet vertical separation may be employed between VFR flights and/or between VFR and IFR flights operating within the TRSA.
7. During weather conditions equal to or better than basic VFR, visual separation may be employed between VFR flights and/or between VFR and IFR flights operating within the TRSA when a pilot reports the other aircraft in sight and advises that he can maintain his own separation from such aircraft.
8. When IFR flights, operating in VFR weather conditions, are being sequenced with other traffic and the pilot reports the aircraft he is to follow is in sight the pilot may be advised to follow such traffic and may be cleared for a "visual approach."

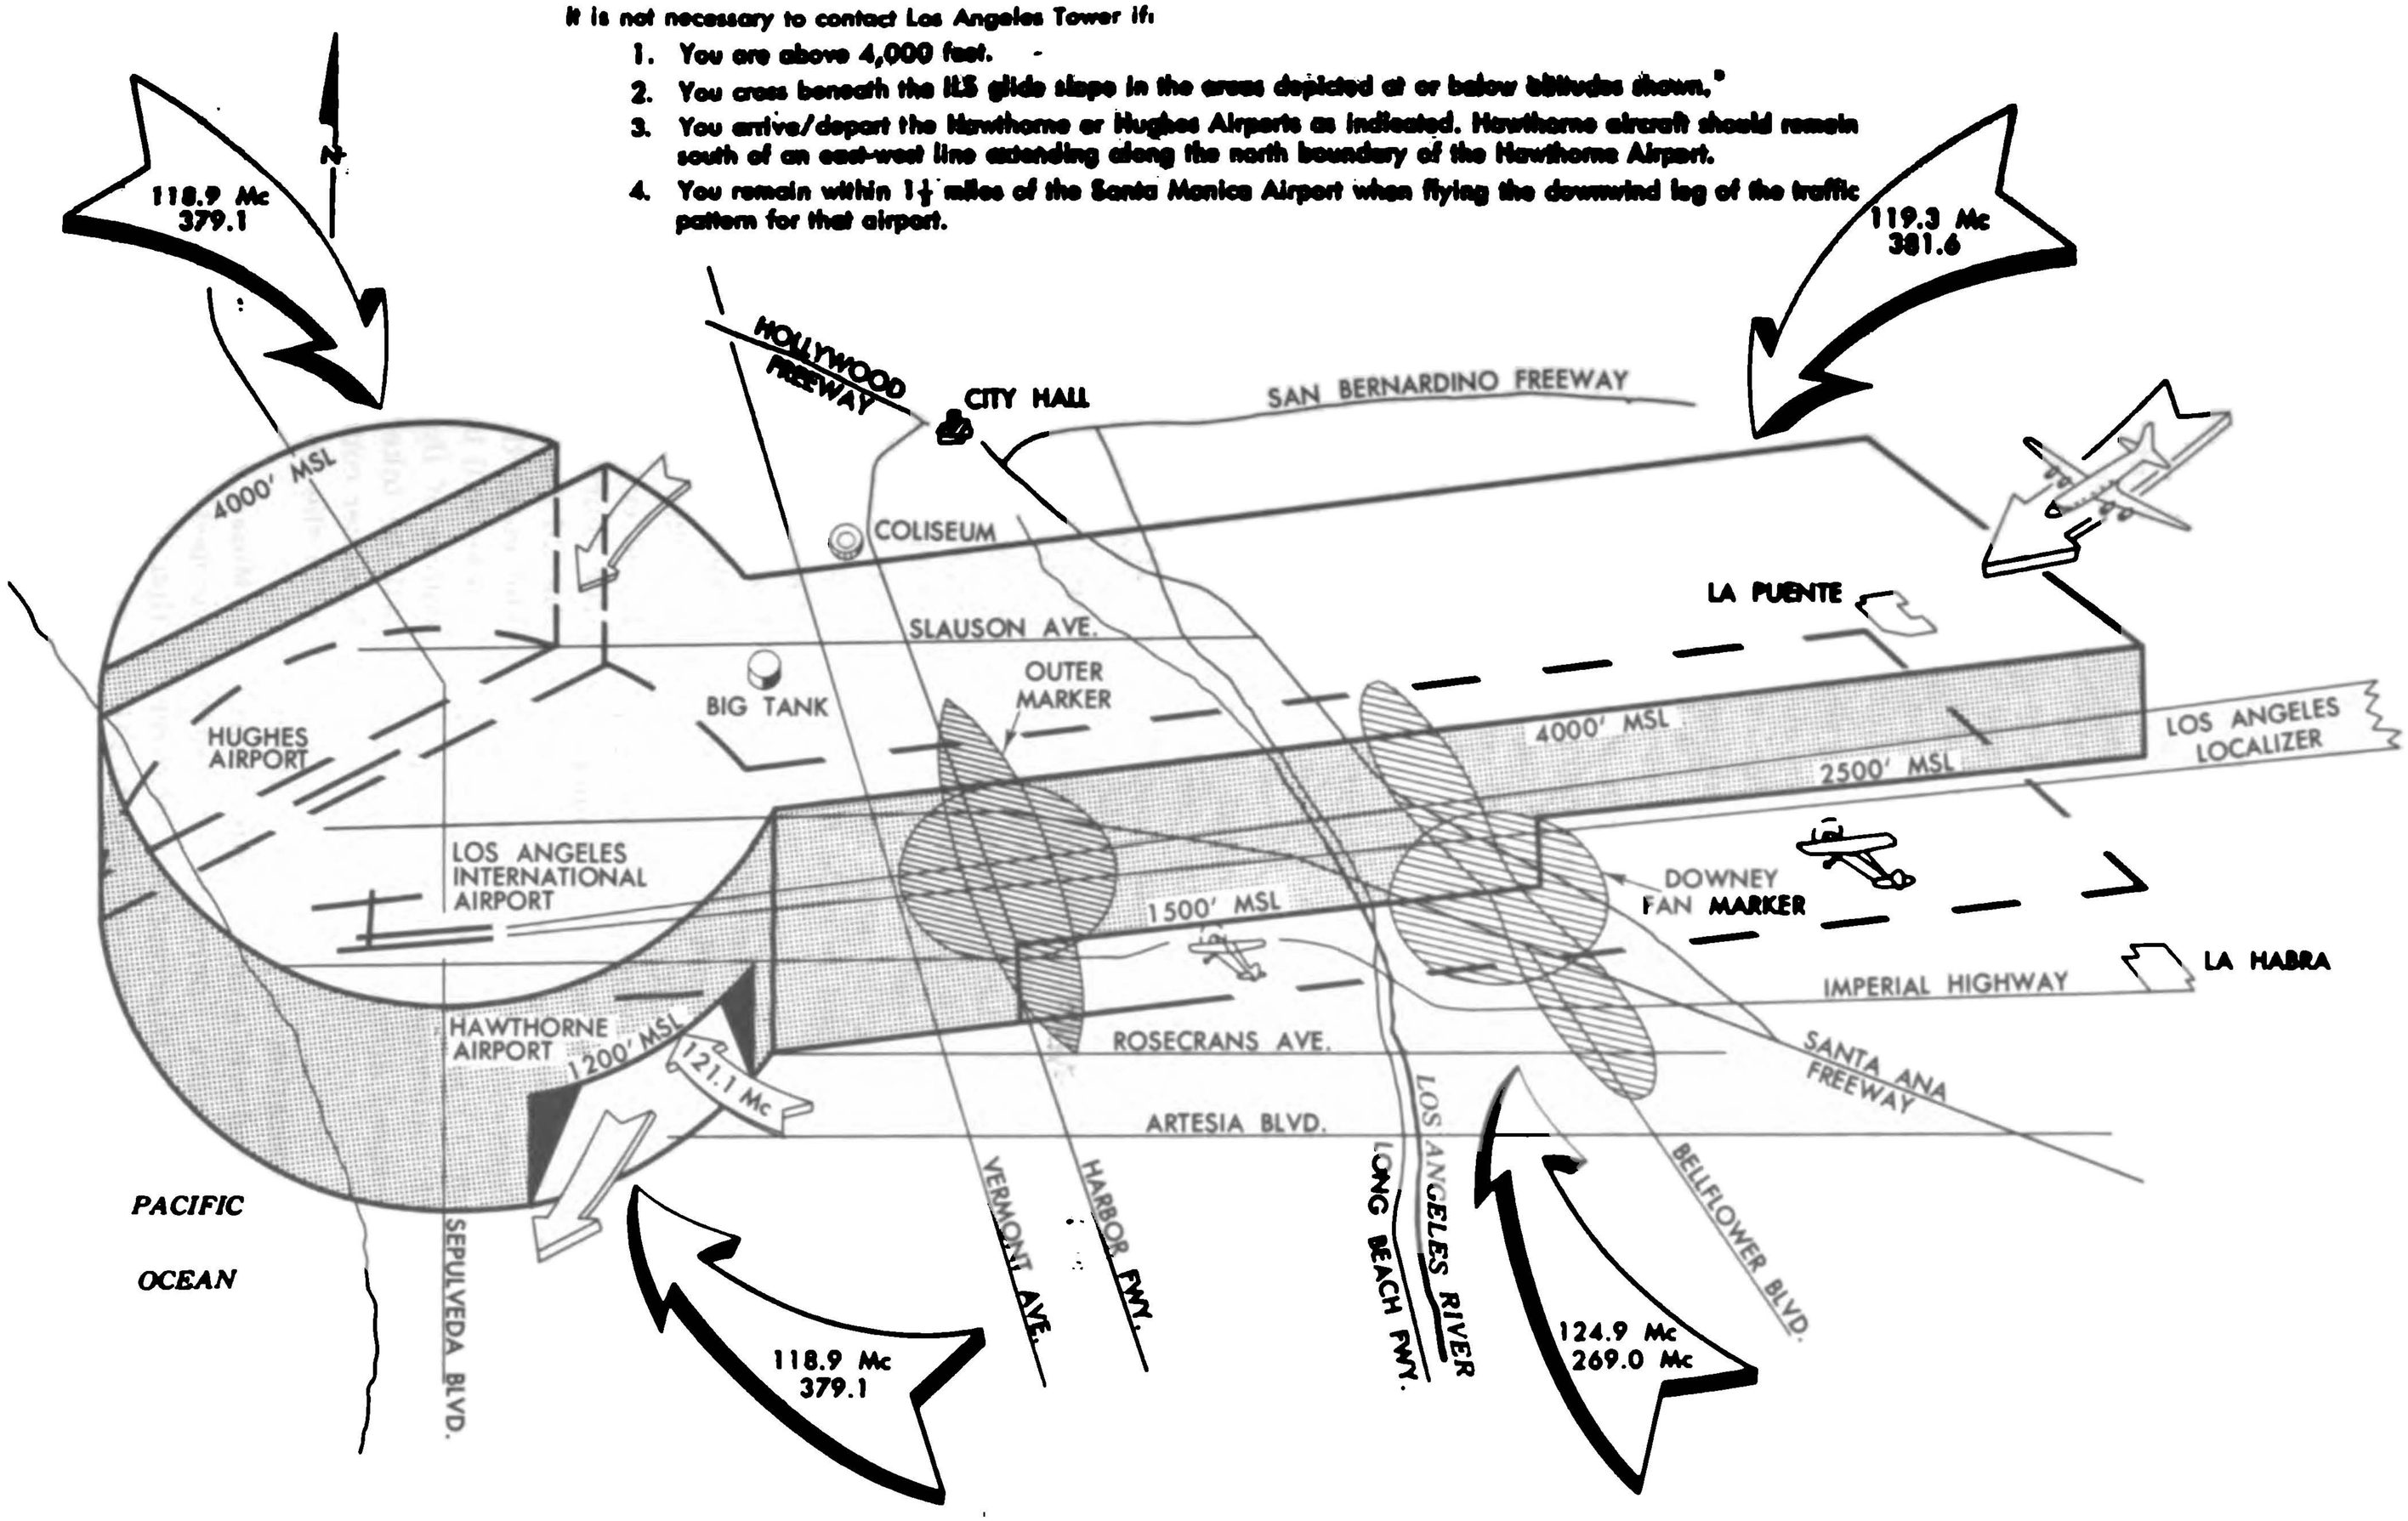
NOTE.—Basic VFR weather minima as set forth in FAR 91.105 shall apply within the Atlanta TRSA, except that special VFR weather minima set forth in FAR 91.107 shall continue to be applicable within control zones. Application of ATC procedures and separation minima within the TRSA is not to be interpreted as relieving pilots of their responsibilities to see and avoid other traffic operating in basic VFR weather conditions, to maintain appropriate terrain and obstruction clearance, or to remain in weather conditions equal to or better than the established minima. However, this does not preclude the pilot from requesting IFR handling, or while within the control zone, requesting clearance in accordance with special VFR.

LOS ANGELES TERMINAL AREA NOTICE

Prior to penetrating this area, VFR pilots are encouraged to contact Los Angeles Tower for traffic advisory service on the frequencies indicated for the direction of flight.

It is not necessary to contact Los Angeles Tower if:

1. **You are above 4,000 feet.**
2. **You cross beneath the ILS glide slope in the areas depicted at or below altitudes shown.***
3. **You arrive/depart the Hawthorne or Hughes Airports as indicated. Hawthorne aircraft should remain south of an east-west line extending along the north boundary of the Hawthorne Airport.**
4. **You remain within 1½ miles of the Santa Monica Airport when flying the downwind leg of the traffic pattern for that airport.**



*THIS DOES NOT CONSTITUTE AUTHORITY FOR A PILOT TO DEVIATE FROM FAR 91.79 OR OTHER APPLICABLE PROVISIONS OF THE FEDERAL AVIATION REGULATIONS.

Chicago ILLINOIS

PARALLEL ILS APPROACHES—CHICAGO O'HARE INTERNATIONAL AIRPORT

Effective April 11, 1964 a revised Parallel ILS 14R&L approach procedure Amendment 1 was effective for Chicago O'Hare International Airport. ILS, radar, communications, ATC procedures and flight procedures are employed as integral parts of a total system. Under the system, Chicago Approach Control may clear aircraft to conduct Parallel ILS Approaches to Runways 14L and 14R when wind conditions permit straight-in landings and when all components of the system—except airborne or ground glide slope equipment—are operating normally. Aircraft are radar vectored to the final approach course (localizer) of either runway and the pilot executes an ILS approach. The separation between localizer courses (6,510 feet) imposes certain requirements and techniques peculiar to parallel approaches.

Requirements: To conduct a Parallel ILS Approach, aircraft must be equipped with a functioning 75 mc marker (or ADF) and localizer receivers, and have the capability to simultaneously monitor both the assigned control frequency and the appropriate localizer voice frequency when advised by ATC.

ATC Concept and Procedures: Arriving IFR aircraft en route to O'Hare Airport will be cleared by Chicago Center to one of four outer fixes (Northbrook, Niles, Lakewood, or Warren) established in the O'Hare Terminal Area and changed over to Chicago Approach Control for further clearance. On initial contact, Chicago Approach Control will advise the pilot that PARALLEL ILS APPROACHES ARE IN PROGRESS. Upon receipt of this information, **pilots who do not have required equipment** or do not wish to conduct a Parallel ILS approach, or require a specific runway, or require a radar fix in lieu of Meadow Intersection for 14L, must advise Chicago Approach Control prior to departing the outer fix. This will enable the controller to plan and provide for individual handling.

Chicago Approach Control will clear aircraft to depart the outer fix on a specified heading and at a specified altitude FOR RADAR VECTOR TO RUNWAY 14 (RIGHT/LEFT) ILS FINAL APPROACH COURSE and will specify the appropriate localizer frequency (109.7 or 110.1). After departing the outer fix, aircraft will be descended to the appropriate ILS Intercept Altitude (2,200 or 3,200 feet m.s.l.) and provided a period of level flight prior to the ILS intercept in which the pilot may dissipate any excess speed accumulated during the descent.

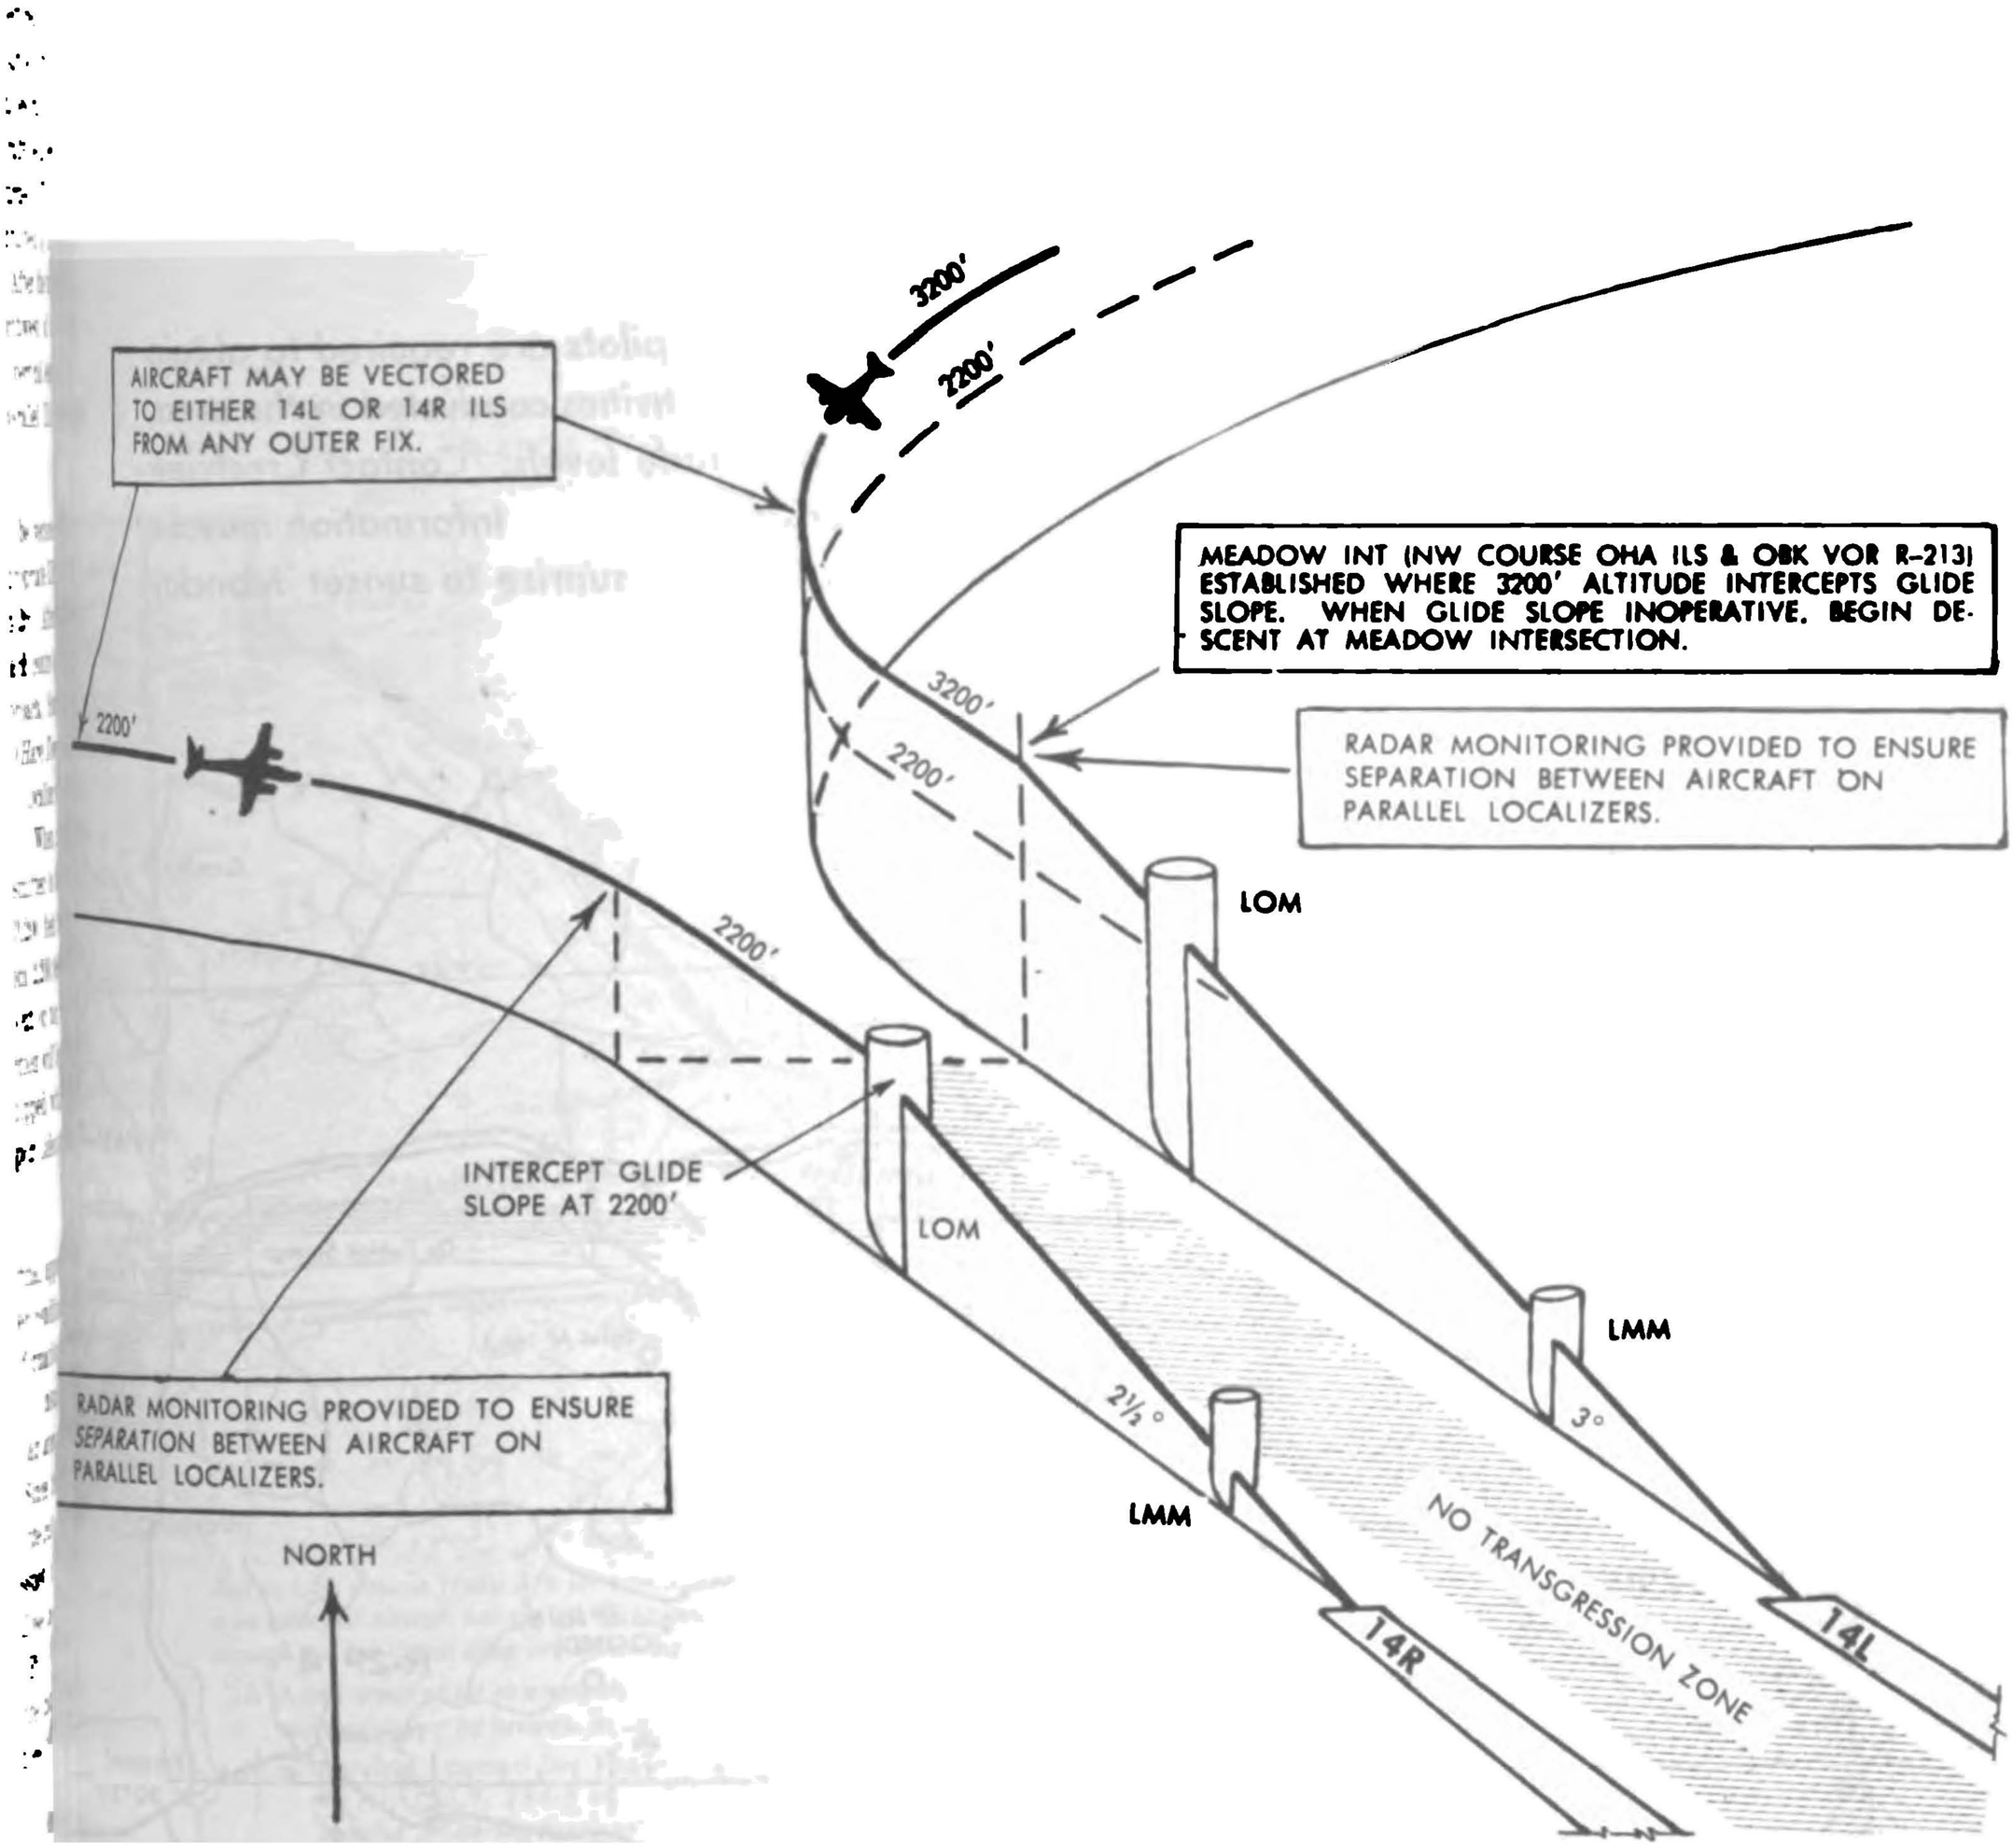
ATC Separation: Radar separation is provided between aircraft being vectored to, and while on, the same localizer course throughout the entire approach. Aircraft being vectored to Runway 14R will intercept that localizer course at 2,200 feet m.s.l. Aircraft being vectored to 14L will intercept that localizer course at 3,200 feet m.s.l., or higher. Since aircraft may be vectored to either ILS localizer course from any of the four outer fixes, a minimum of 1,000 feet vertical or 3 miles radar separation will be provided between the aircraft being vectored to opposite ILS courses during the turn-on. The appropriate ILS Intercept Altitude is maintained by the aircraft until intercepting the glide slope. After the turn-on and until aircraft are 2.3 miles northwest of the outer markers, a minimum of 1,000 feet vertical separation is provided between aircraft on parallel ILS localizer courses.

Localizer Interception: Aircraft will be vectored so as to permit the pilot to intercept the appropriate ILS localizer course at an angle not greater than 20°. After assigning this final intercept heading, approach control will clear the aircraft for a parallel ILS approach. Subsequently the pilot will be changed over to O'Hare Tower and instructed to monitor the appropriate localizer voice frequency (either 109.7 or 110.1 mc). When glide slope receiver or ground glide slope transmitter is inoperative the pilot will begin descent from 3,200 feet for 14L at Meadow Intersection or descend from 2,200 feet for 14R at the LOM. When glide slope is out or not received radar fix in lieu of Meadow Intersection will be provided upon pilots request or aircraft equipped with ILS and VOR will start descent on 14L upon identification of Meadow Intersection.

Radar Monitoring: All turn-ons and final approaches are radar monitored regardless of weather conditions. Monitor controllers will issue advisory information and control instructions as may be necessary to insure that aircraft on final approach remain within an area 1,500 feet either side of the localizer course. Since the primary responsibility for navigation rests with the pilot, advisory information and control instructions issued on the localizer voice frequency are limited to those necessary to insure separation between aircraft. Pilots need not acknowledge transmissions made by the monitor controller on localizer voice frequency unless specifically requested to do so.

A "no transgression zone" 3,510 feet wide is established equidistant between the centerlines of each localizer course and displayed on the monitor radar scope. Should an aircraft on final approach deviate from course and enter the "no transgression zone," the monitor controller will issue instructions as are necessary to alter the course of that aircraft. Concurrently, immediate action will be taken by the controller monitoring the adjacent localizer course to cause any aircraft in potential conflict with the intruding aircraft to alter its flight path.

Missed Approach: The missed approach procedure developed for either runway is designed to provide separation from the adjacent runway. The pilot may be instructed to execute the missed approach procedure at any time during the approach.



AIRCRAFT MAY BE VECTORED TO EITHER 14L OR 14R ILS FROM ANY OUTER FIX.

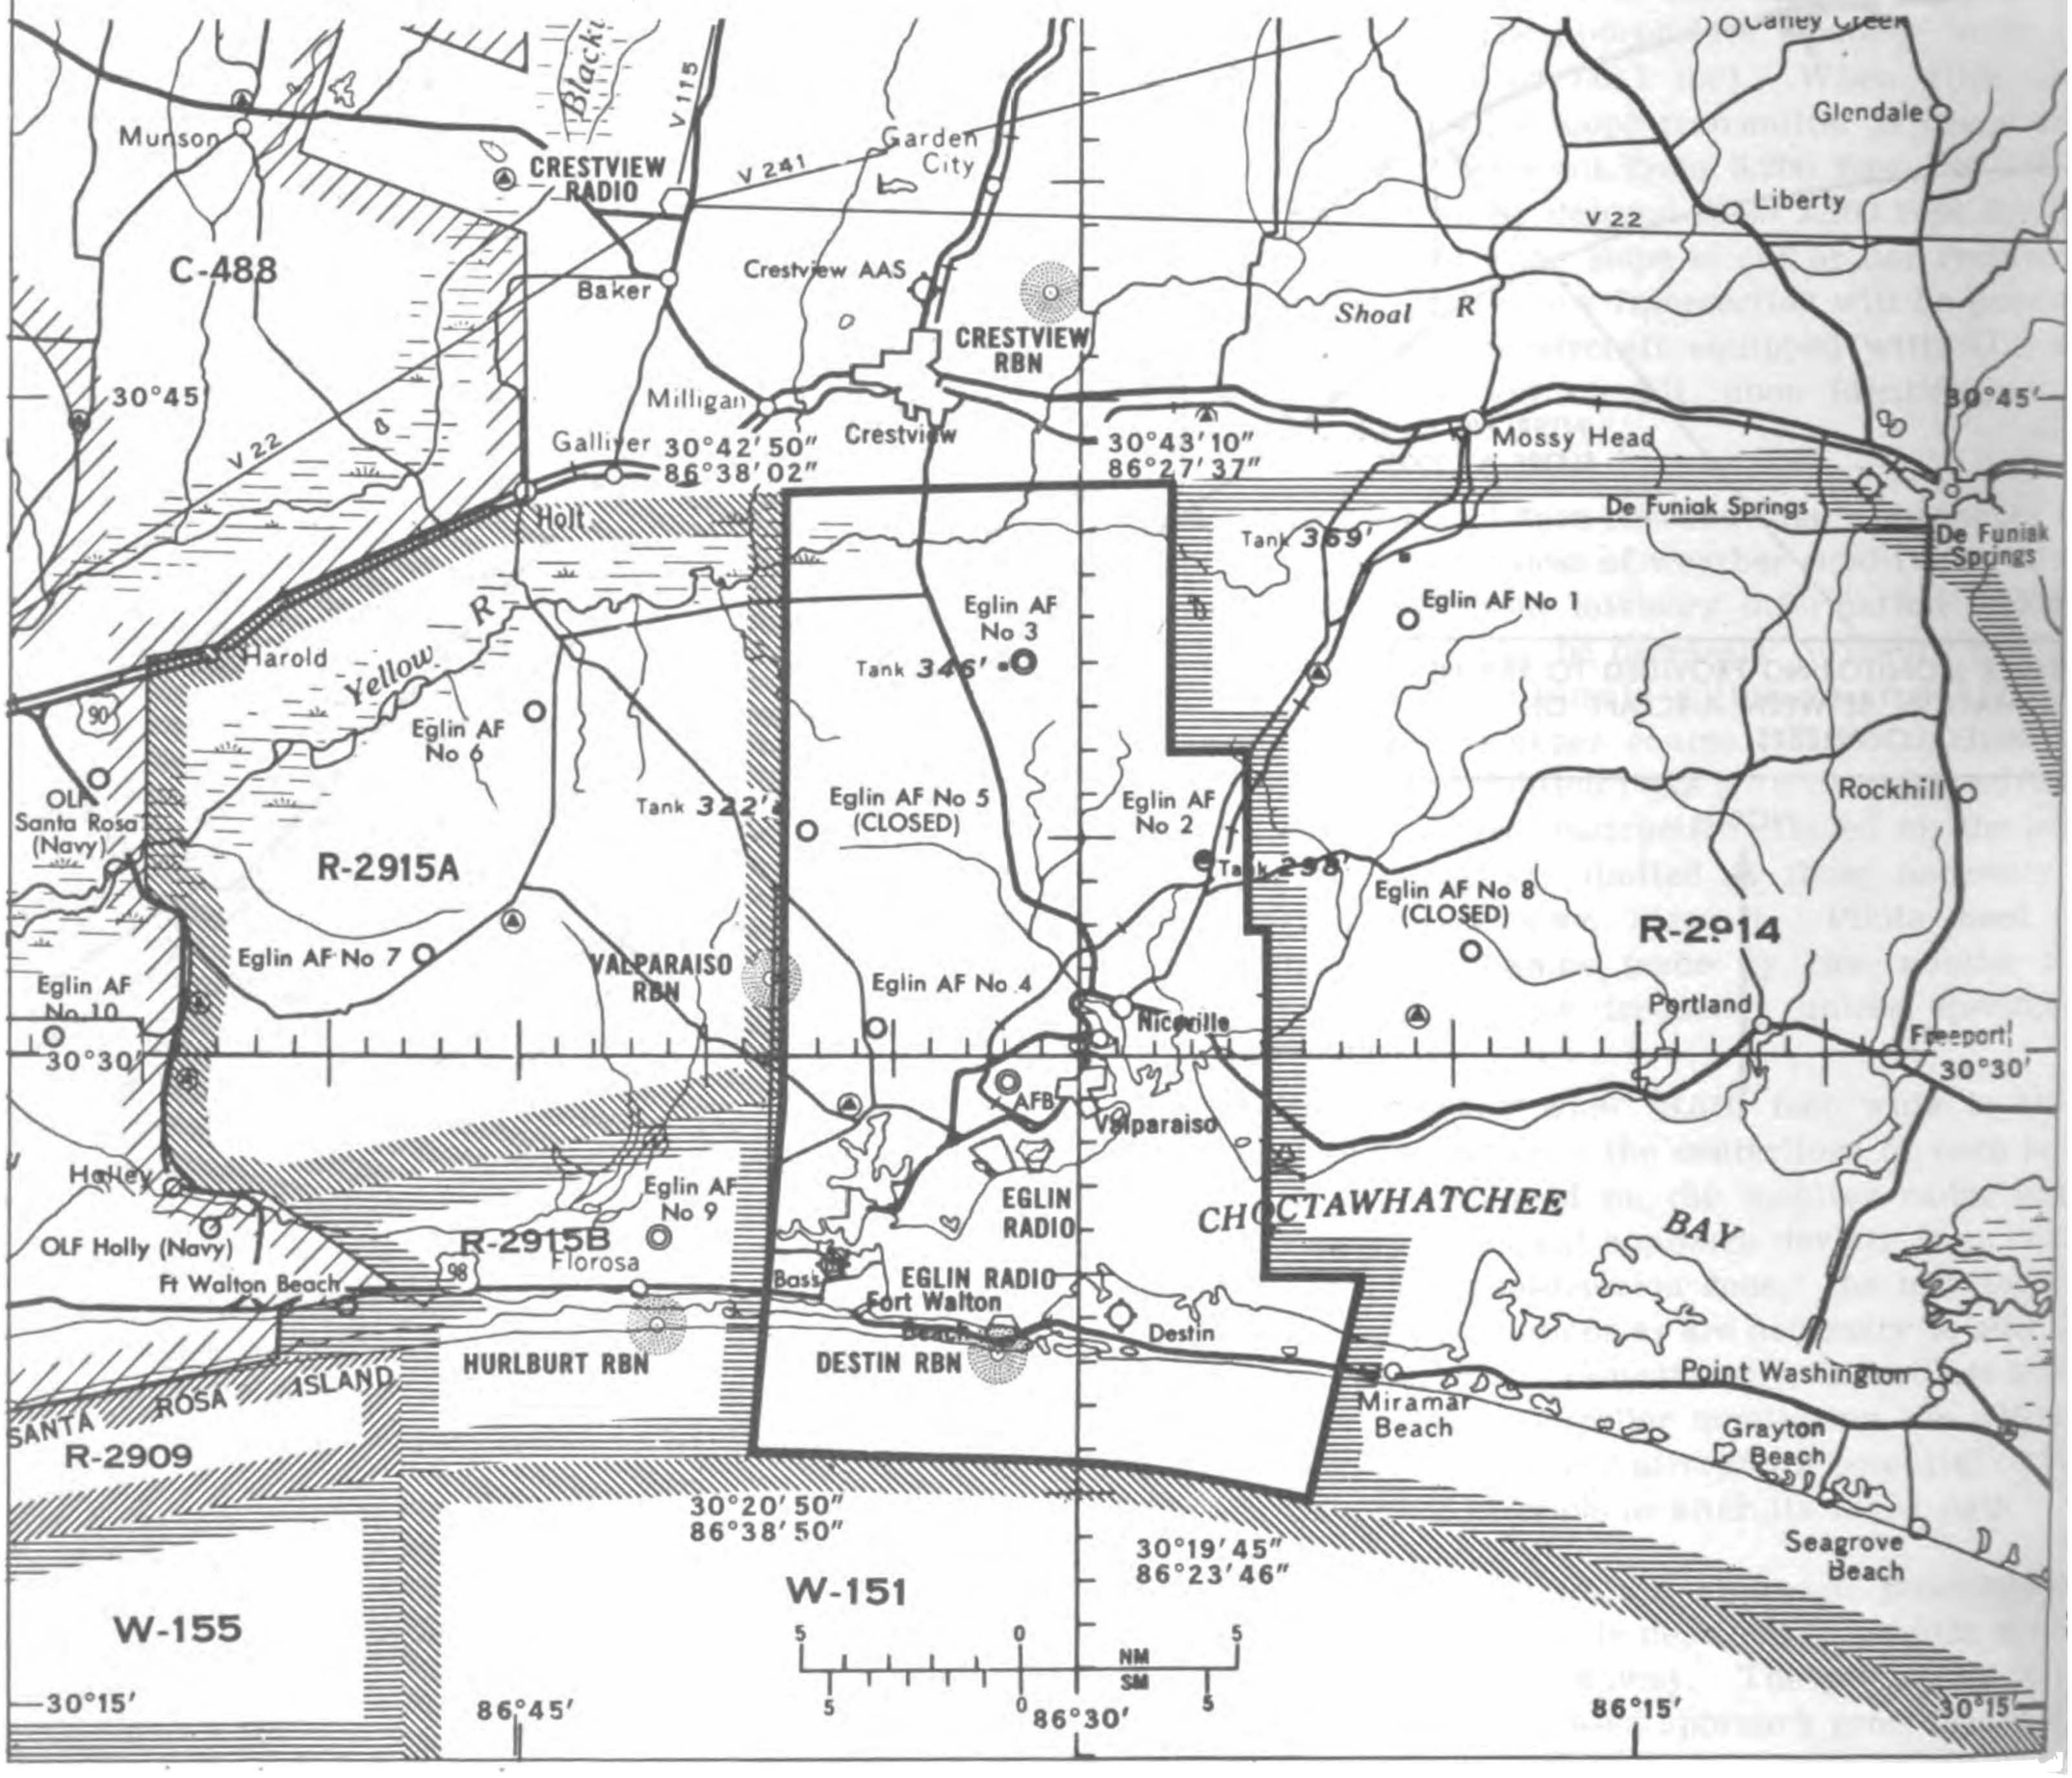
VALPARAISO, FLORIDA, TERMINAL AREA

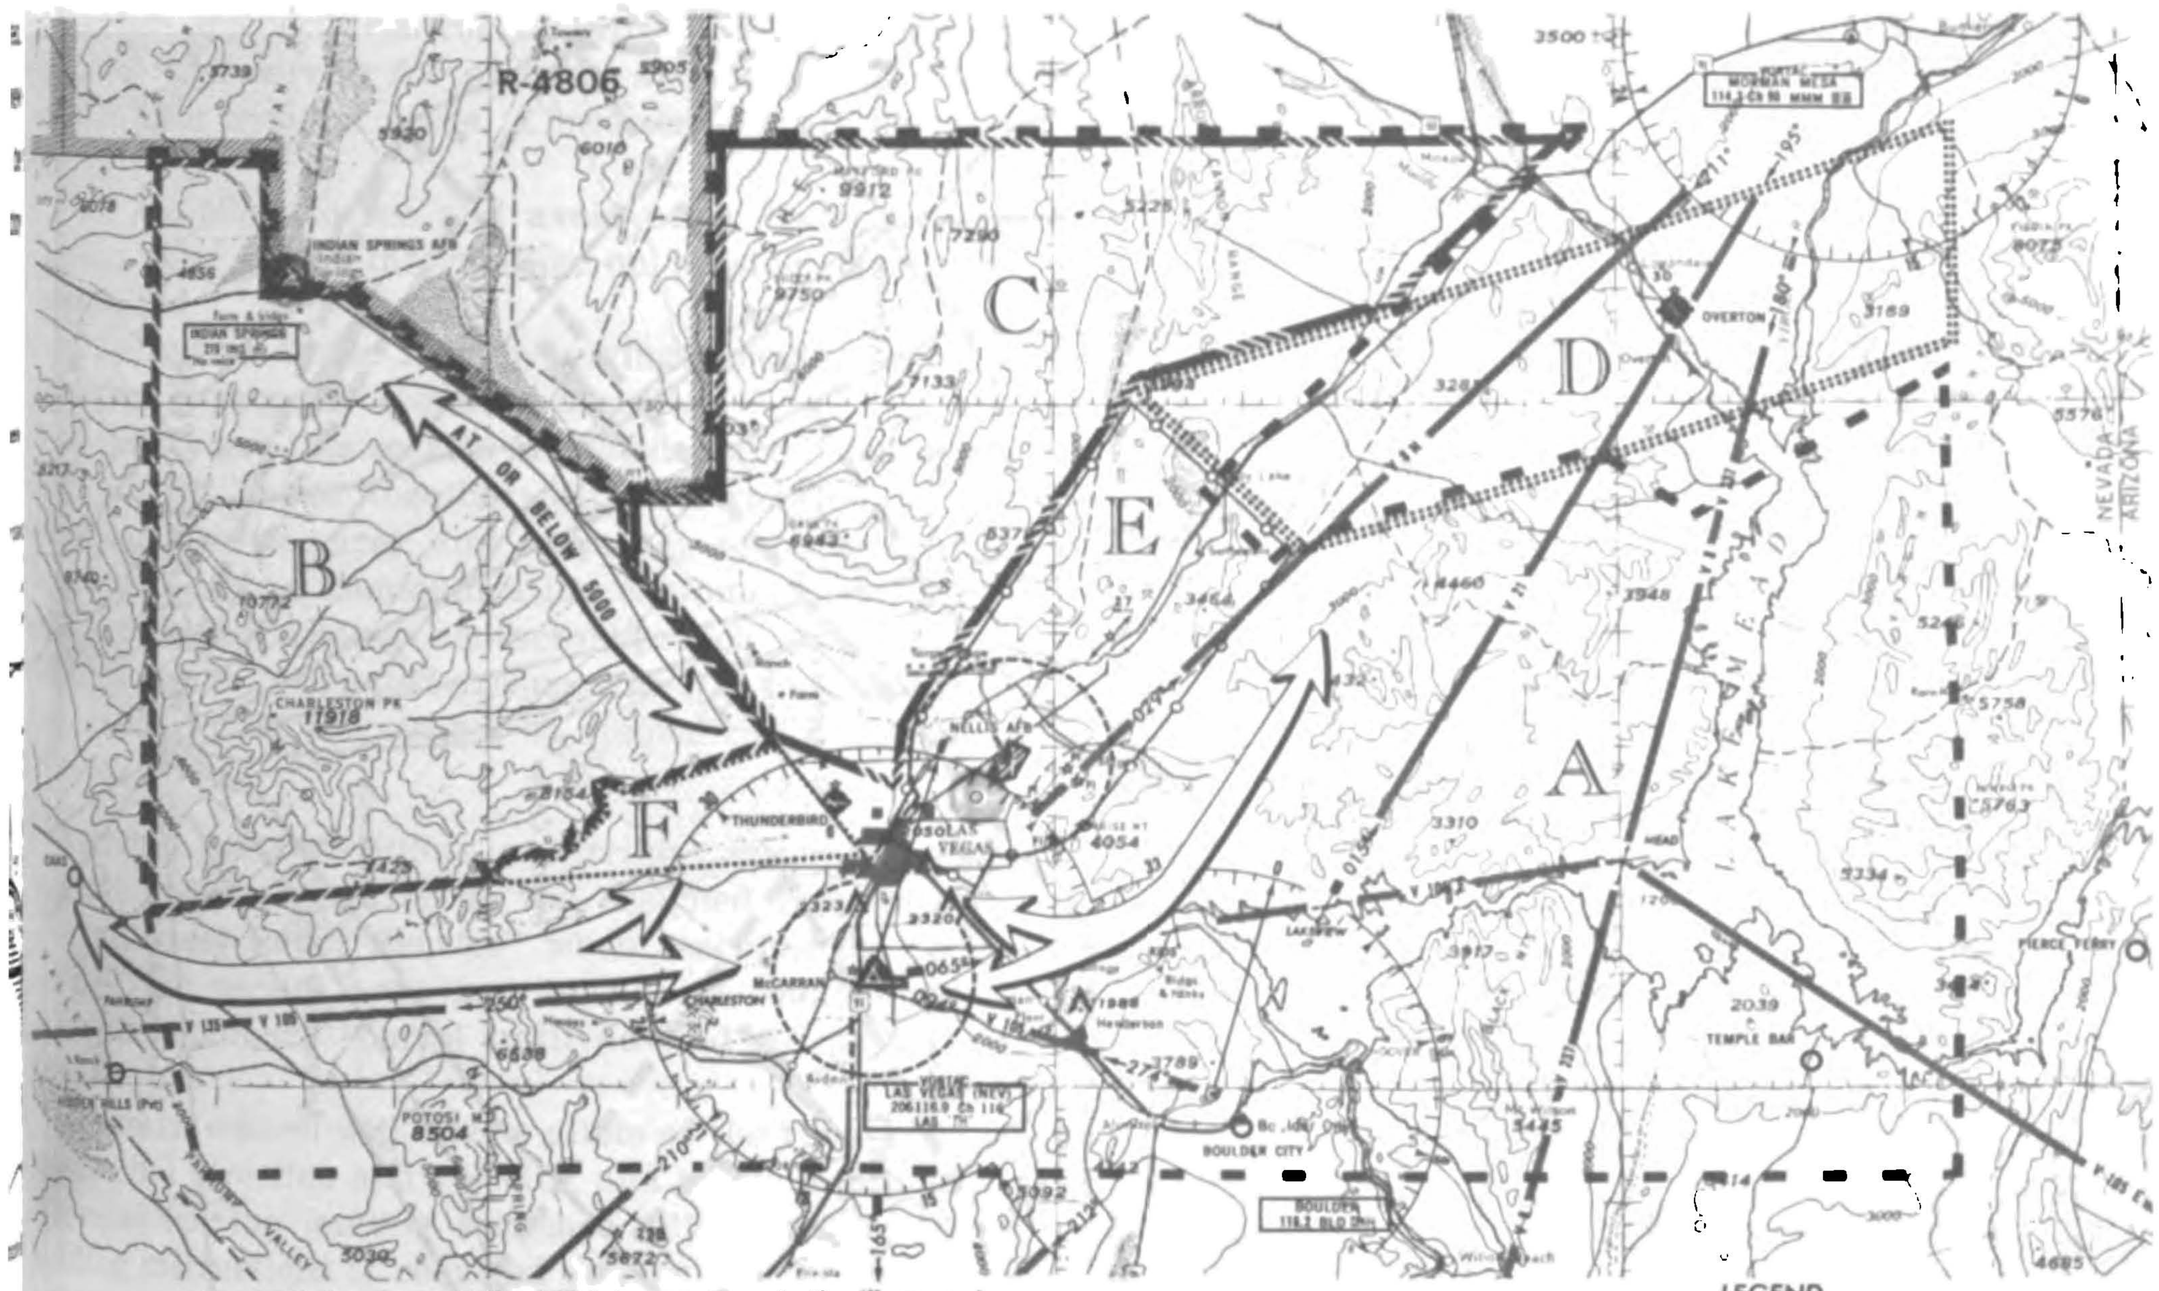
SPECIAL AIR TRAFFIC RULES (VFR OR VFR CONDITIONS)

EFFECTIVE DECEMBER 10, 1964

Prior to conducting flight operations in the area shown, pilots are required to obtain information about operating altitudes of high speed special activities conducted in the area. Normally, special activities will use not more than two altitude levels. Contact Crestview Radio, Eglin AFB RAPCON, Tallahassee Radio, or Pensacola Radio. Information may be obtained by radio or telephone. This special rule is in effect sunrise to sunset Monday through Saturday.



LAS VEGAS TERMINAL AREA NOTICE
LAS VEGAS, NEVADA



Due to high volume Nellis AFB jet operations in the illustrated area pilots of aircraft not on IFR flight plans operating into or through the Las Vegas area are encouraged to:

1. *Avoid areas of jet concentration by following suggested routings shown by arrows, at appropriate altitudes and;*
2. a. *Arriving – contact Las Vegas Approach Control on 121.1, 125.9, 284.6 or 353.6 mcs, for radar advisories when inbound prior to reaching a point approximately 30 miles from Las Vegas or if not practical, contact Las Vegas Radio for in-flight advisories.*

   b. *Departing – contact Las Vegas Departure Control on 119.4 or 335.5 mcs, for radar advisories immediately after departure from McCarran Field or Thunderbird Airport.*

Refer to ANRA Section Of Airguide
For Latest Frequency Information

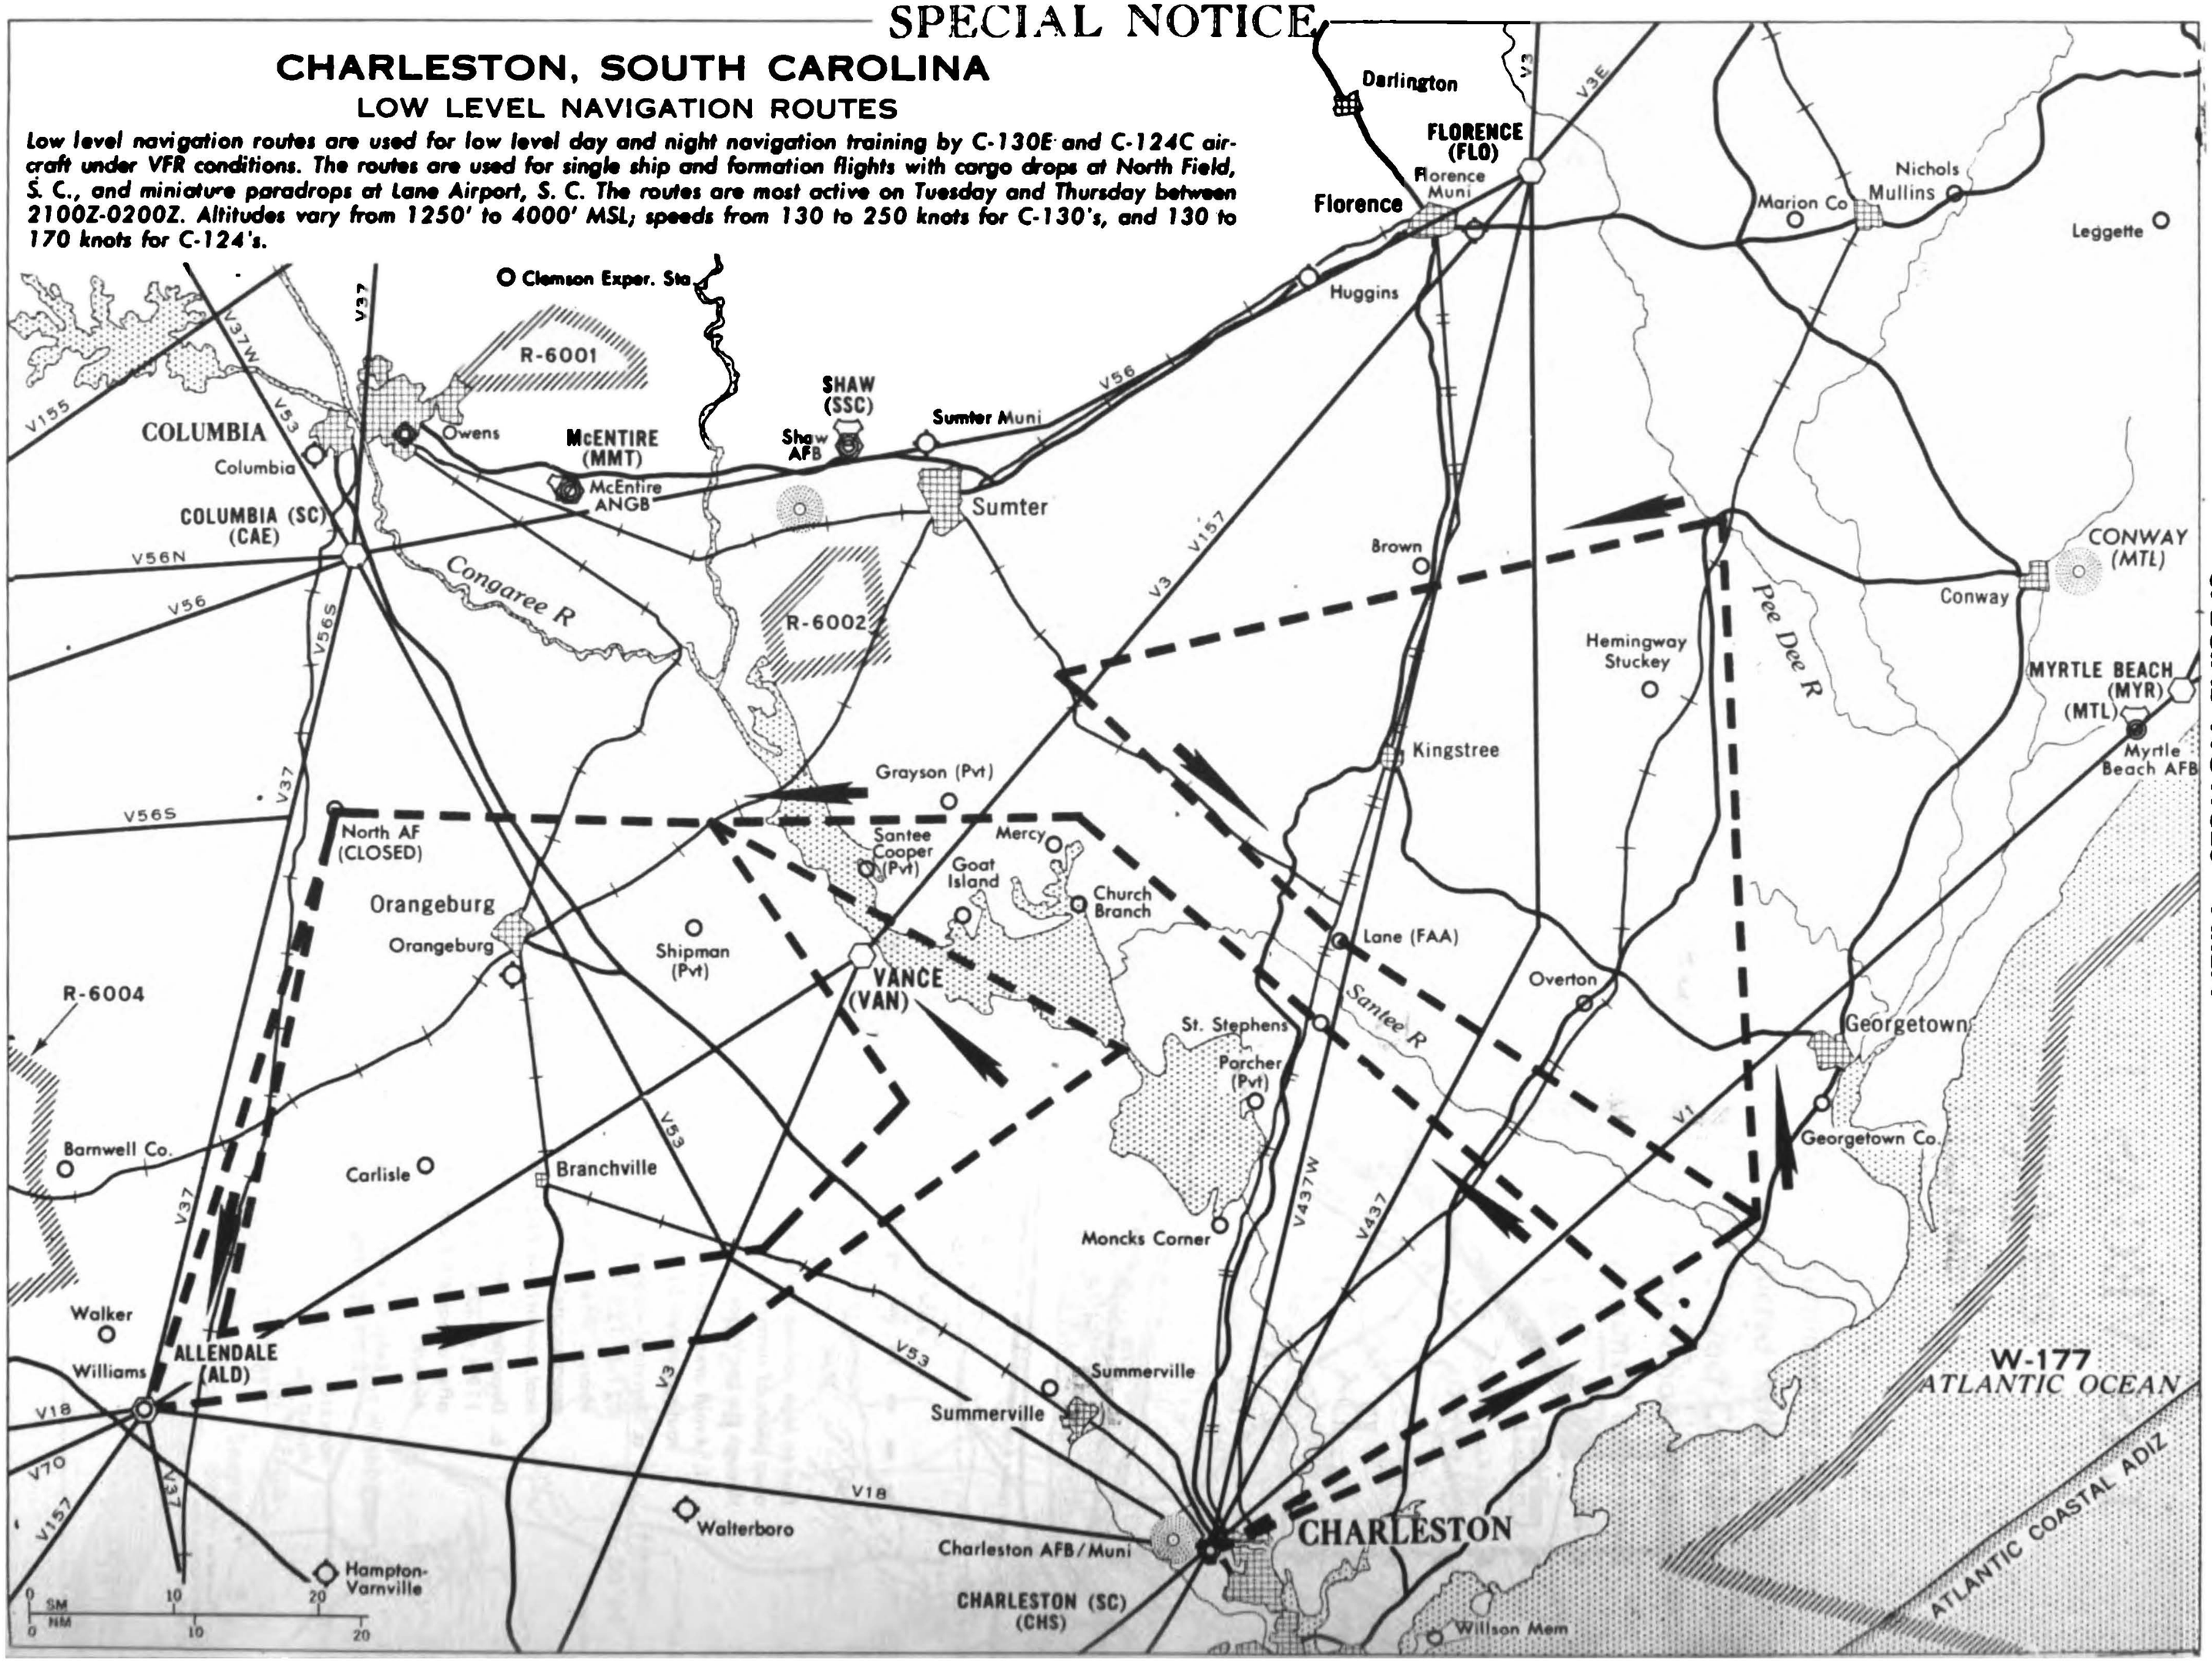
CHARLESTON, SOUTH CAROLINA

LOW LEVEL NAVIGATION ROUTES

Low level navigation routes are used for low level day and night navigation training by C-130E and C-124C aircraft under VFR conditions. The routes are used for single ship and formation flights with cargo drops at North Field, S. C., and miniature paradrops at Lane Airport, S. C. The routes are most active on Tuesday and Thursday between 2100Z-0200Z. Altitudes vary from 1250' to 4000' MSL; speeds from 130 to 250 knots for C-130's, and 130 to 170 knots for C-124's.



EXPANDED RADAR SERVICE FOR ARRIVING AND DEPARTING FLIGHTS IN TERMINAL AREAS

Certain approach control facilities are providing expanded radar service for arriving and departing flights within their terminal areas. These services are designed to:

1. Aid pilots to see and avoid other traffic by providing radar traffic information on possible conflicting traffic, and

2. Improve traffic flow by giving specific routes or headings to properly sequence arrivals.

Locations where this service is provided are listed at the end of this Notice together with information on the designated service area and frequency to be used. Aircraft with limited communication equipment who desire the service but cannot contact approach or departure control on the designated frequencies will be given service to the extent practicable on frequencies available to the pilot.

ARRIVING AIRCRAFT: Pilots of arriving aircraft should contact approach control on the assigned frequency/ies and "Request Radar Service" when reaching the perimeter of the service area and remain in communication with the approach control until advised to contact the tower.

Approach control will advise pilots of the runway to be used, wind direction and velocity, and traffic information. To establish the landing sequence, pilots will be given holding instructions if required and/or specific routes or headings to fly. When a pilot reports he has the aircraft he is to follow in sight, he will be directed to follow it. When a pilot of an IFR flight, operating in basic VFR weather conditions, is instructed to follow a preceding aircraft he will be cleared for a "visual approach." This clearance may be issued whether or not the IFR flight is operating within the control zone. With a "visual approach" clearance, the pilot operating on an IFR flight plan in VFR conditions may deviate from the prescribed instrument approach procedure and proceed to the airport with visual reference to the surface. Radar service will be terminated when aircraft are told to contact the tower and the tower will assign a landing sequence number.

DEPARTING AIRCRAFT: Departing VFR aircraft desiring traffic information should "Request Radar Service" on initial contact with ground control and advise proposed direction of flight. Following takeoff, the tower will advise when to contact departure control and the frequency to be used.

When radar contact is established, departure control will provide traffic information until radar contact is lost or the flight has reached the perimeter of the service area. The pilot will be advised when radar service is terminated.

TRAFFIC INFORMATION: Standard radar separation will be provided between aircraft operating in accordance with Instrument Flight Rules until such time as the aircraft is sequenced and the pilot sees the aircraft he is to follow. Standard radar separation between VFR or between VFR and IFR aircraft will not be provided; instead, traffic information will be issued to the appropriate aircraft prior to the time less than 3 nmi exists between one identified VFR flight and another identified flight, either VFR or IFR. Traffic information on other observed but unidentified radar targets will be issued to the extent controller workload permits. Pilots may request radar vectors to avoid reported traffic and vectors will be given to the extent possible consistent with controller workload.

Pilot participation in this program is not mandatory but is strongly urged since the success of the program is largely dependent on full pilot participation.

THESE PROCEDURES ARE NOT TO BE INTERPRETED AS RELIEVING PILOT OF THEIR RESPONSIBILITIES TO SEE AND AVOID OTHER TRAFFIC OPERATING IN BASIC VFR WEATHER CONDITIONS, TO MAINTAIN APPROPRIATE TERRAIN AND OBSTRUCTION CLEARANCE, OR TO REMAIN IN WEATHER CONDITIONS EQUAL TO OR BETTER THAN THE MINIMA REQUIRED BY FAR 91.105. WHENEVER COMPLIANCE WITH AN ASSIGNED ROUTE OR HEADING IS LIKELY TO COMPROMISE SAID PILOT RESPONSIBILITY RESPECTING TERRAIN AND OBSTRUCTION CLEARANCE AND WEATHER MINIMA, APPROACH CONTROL SHOULD BE SO ADVISED AND A REVISED CLEARANCE OR INSTRUCTION OBTAINED.

LOCATIONS AT WHICH THE ABOVE RADAR SERVICE IS PROVIDED

John F. Kennedy Intl Airport, N.Y.

EFFECTIVE DATE: 18 AUGUST 1962

Area Within Which Service is Provided: Approximately 25 nautical mile radius of John F. Kennedy Intl Airport exclusive of LaGuardia, Newark, and Floyd Bennett NAS control zones. **Arrival Frequencies:** Aircraft flying to the airport, contact approach control on 120.8 mc. Aircraft not equipped for two-way communication on 120.8 mc should transmit 122.7 mc and listen on 120.8 mc. **Departure Frequencies:** N and W bound 123.9 mc or 269.4 mc; all others 121.1 mc or 269.4 mc.

Houston International Airport, Tex.

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 nmi from the airport. **Arrival Frequencies:** Aircraft flying to the airport on headings of 189° thru 037° contact approach control on 118.3 mc or 379.1 mc. Those flying headings of 038° thru 188° use 118.1 mc or 307.1 mc. Aircraft not equipped for two-way communication on those frequencies should transmit 122.5 mc and listen on the appropriate frequency specified above or a frequency/ies assigned by the facility. **Departure Frequencies:** 123.7 mc or 290.2 mc.

El Paso International Airport, Texas and Biggs AFB, Texas

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 mi from the airports. **Arrival Frequencies:** Aircraft should use 118.7 mc or 307.0 mc. Aircraft not equipped for two-way communications on those frequencies should transmit 122.7 mc and listen on the appropriate listed frequency. **Departure Frequencies:** The tower will advise pilots of departing VFR flights who have requested the service when to contact departure control and the frequency to be used.

Castle AFB Terminal Area Merced, Calif.

EFFECTIVE DATE: 1 JUNE 1963

AREA WITHIN WHICH SERVICE IS PROVIDED: 20 mi radius of Castle AFB, 4000 feet and below. Aircraft entering this area or, departing from airports within this area should contact Castle approach on 118.9 mcs, 137.65 mcs or 294.5 mcs. Aircraft not equipped for two-way communications an 118.9 mcs should transmit on 122.5 mcs and receive on 118.9 mcs or 114.2 mcs.

Metropolitan-Oakland International Airport, Calif.

EFFECTIVE DATE: 15 OCTOBER 1964

Area Within Which Service is Provided: 15 smi radius of the Metropolitan Oakland International Airport from the surface to and including 5,000′ MSL. Aircraft flying toward the airport on headings of 090° thru 270° should use the frequencies 118.1 or 354.1 mc. Aircraft flying toward the airport on headings of 271° thru 089° should use the frequencies 124.7 or 323.2 mc. Aircraft not equipped for two-way communications on these frequencies should transmit on 122.6 mc and listen on the appropriate frequency.

Los Angeles International Airport, California

EFFECTIVE DATE: 22 SEPTEMBER 1964

Area within which service is provided: 25 nmi. **Arrival Freq:** 045–224 degrees inbound, 119.3 or 381.6 mc. 225–044 degrees inbound, 124.9 or 260.0 mc. If not so equipped, trans 122.7 mc and guard above freq or LAX VOR. **Departure Freq:** tower, 118.9 mc. then departure control on 125.2 or 385.4 mc when outbound 225–045 degrees, 124.3 or 363.2 mc, 045–225 degrees.

Weir-Cook, Indianapolis, Indiana

EFFECTIVE DATE: 14 SEPTEMBER 1964

Area within which service is provided: 20 nmi, 4000′ and below. **Arrival Freq:** 118.5 mc. **Departure freq:** ground control, 121.9 mc then Indianapolis Departure Radar Service, 121.3 mc. Enroute aircraft contact Indianapolis Terminal Radar Service, 118.5 mc.

MILITARY AERIAL REFUELING TRACKS

Military aircraft conduct refueling operations throughout the continental United States normally between 12,000 feet MSL and FL 240 on an IFR flight plan at assigned altitude(s). Refueling aircraft have right of way over other aircraft in accordance with FAR 91.67(c)

OIL BURNER ROUTES

MILITARY LOW-LEVEL OPERATION "OIL BURNER": The USAF and the U.S. Navy conduct low-level navigational/bombing training flights in jet aircraft in both VFR and IFR weather conditions along the routes shown in the following pages. Operations are contained within 10 statute miles on either side of the centerline except that on the VFR segments they will be contained within 5 statute miles of the centerline. When route widths shown on the chart are less than those indicated above, the operation will be confined to the route width shown. Aircraft will operate at the altitudes specified on the route charts. Near the end of the low-level navigation portion of the route, aircraft will conduct simulated bomb release maneuvers within a "Bomb Run Corridor" at and between the altitudes shown. "Short Look" and "Lay Down" bomb runs are generally conducted from 4,000 to 6,000 feet MSL "Long Look" bomb runs are generally conducted from 18,000 to 21,000 feet MSL. On some route segments when the weather conditions are 3,000 feet ceiling and 5 miles' visibility or better, aircraft may descend to an altitude of not less than 500 feet above terrain in daylight hours or 800 feet above terrain during hours of darkness. Flights are conducted only during the times specified for each route. The current operational status of a particular route is included in scheduled weather broadcasts or may be obtained by calling a Flight Service Station near the route. Revised information is underlined.

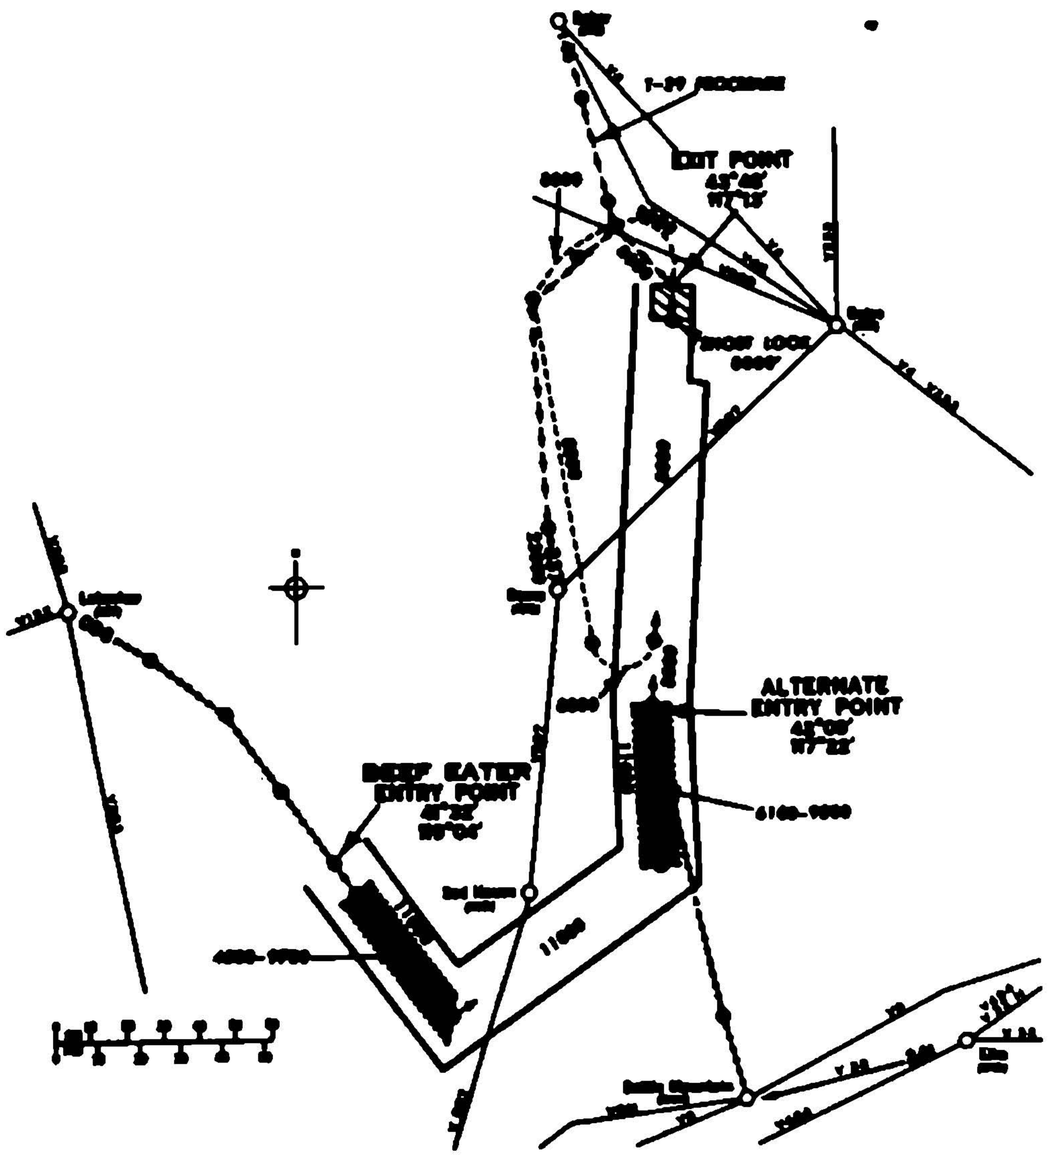
OIL BURNER ROUTES

NEVADA/OREGON

BEEF EATER

Effective May 3, 1964

Aircraft shall cross the Lakeview, Ore. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC; then maintain assigned altitude via the Lakeview 096° radial until 22 NM east of the Lakeview VORTAC (42°-20′N, 120°04′W); then descend direct to cross 42°07′N, 119°39′W at or below 23,000′ MSL; then descend direct to cross 41°49′N, 119°21′W at or above 16,000′ MSL; then descend direct to cross the entry point of the low level route at 41°32′N, 119°04′W at 11,000′ MSL, then 11,000′ MSL direct 40°55′N, 118°27′W, then 11,000′ MSL direct 41°31′N, 117°20′W, then 11,000′. MSL direct 42°09′N, 117°22′W; then descend to cross 42°26′N, 117°20′W at 8000′ MSL, then 8000′ MSL direct 43°40′N, 117°13′30″W.



Short Look—After passing 43°40′N, 117°13′30″W aircraft shall maintain 8000′ MSL thru the bomb run corridor (5 SM either side of centerline from 43°40′N, 117°13′30″W to 43°48′N, 117°13′W). After exiting the route at 43°48′N, 117°13′W aircraft shall maintain 8000′ MSL direct 44°03′N, 117°31′W; then climb direct to cross 43°55′N, 117°44′W (reporting point—Beef Eater 1) at 10,000′ MSL; then climb direct to cross 43°45′N, 117°-59′W at or above 14,000′ MSL; then climb direct to cross 42°51′N, 117°54′W at 23,000′ MSL, then maintain 23,000′ MSL via the Rome 337° radial to the Rome, Ore. VOR

Re-Entry—After exiting the route at 43°48′N, 117°13′V aircraft shall maintain 8000′ MSL direct 44°03′N, 117° 31′W, then 8000′ MSL direct 43°45′N, 117°59′W, the 8000′ MSL direct 42°24′N, 117°41′W, then 8000′ MSL t re-enter the route via direct 42°26′N, 117°20′W.

VFR and Contour—If the encountered weather condition along the route are equal to or better than ceiling 3000 visibility 5 miles, the pilot may descend VFR and operat between the VFR altitudes indicated on the chart betwee the following points: From 41°25′N, 118°57′W to 40° 55′N, 118°27′W and from 41°31′N, 117°20′W to 42°09′N 117°22′W. During daylight hours some VFR operatior will be flown 500′ above the immediate terrain. VF operations conducted during the hours of darkness wi not be flown lower than 800′ above the terrain. Th lower VFR altitude shown on the chart is the minimu altitude that will be reached on each route segment du ing daylight hours.

Alternate Entry—Aircraft shall cross the Elko VORTA 241/54 DME fix (Battle Mountain VOR) (reportin point) at 23,000′ MSL or as assigned by ARTCC, the maintain assigned altitude direct 40°55′N, 117°01′W then descend direct to enter the route at 42°09′N, 117 22′W at 11,000′ MSL.

Route Width—The route width from 43°25′N, 117°15′V to 43°48′N, 117°13′W is reduced to 5 SM on the east sid of the centerline.

T–29 Procedure—Aircraft shall cross the Elko, Nevad VORTAC 241/54 (Battle Mountain VOR) (reportin point) as assigned by the ARTCC; then proceed via th alternate entry route to 43°48′N, 117°13′W exit poin of the bomb run corridor; then maintain 8,000′ MS direct 44°03′N, 117°31′W; then climb direct to cro 44°08′N, 117°33′W at or below 10,000′ MSL; then dire via Baker, Oregon, VORTAC 146 radial to cross Bak 146/19 (44°32′N, 117°42′W) at 14,000′ MSL or as a signed by the ARTCC; then maintain assigned altitud direct Baker VORTAC (44°51′N, 117°48′W).

Hours of Operation—24 hours daily, 7 days a week.

ARKANSAS/MISSOURI

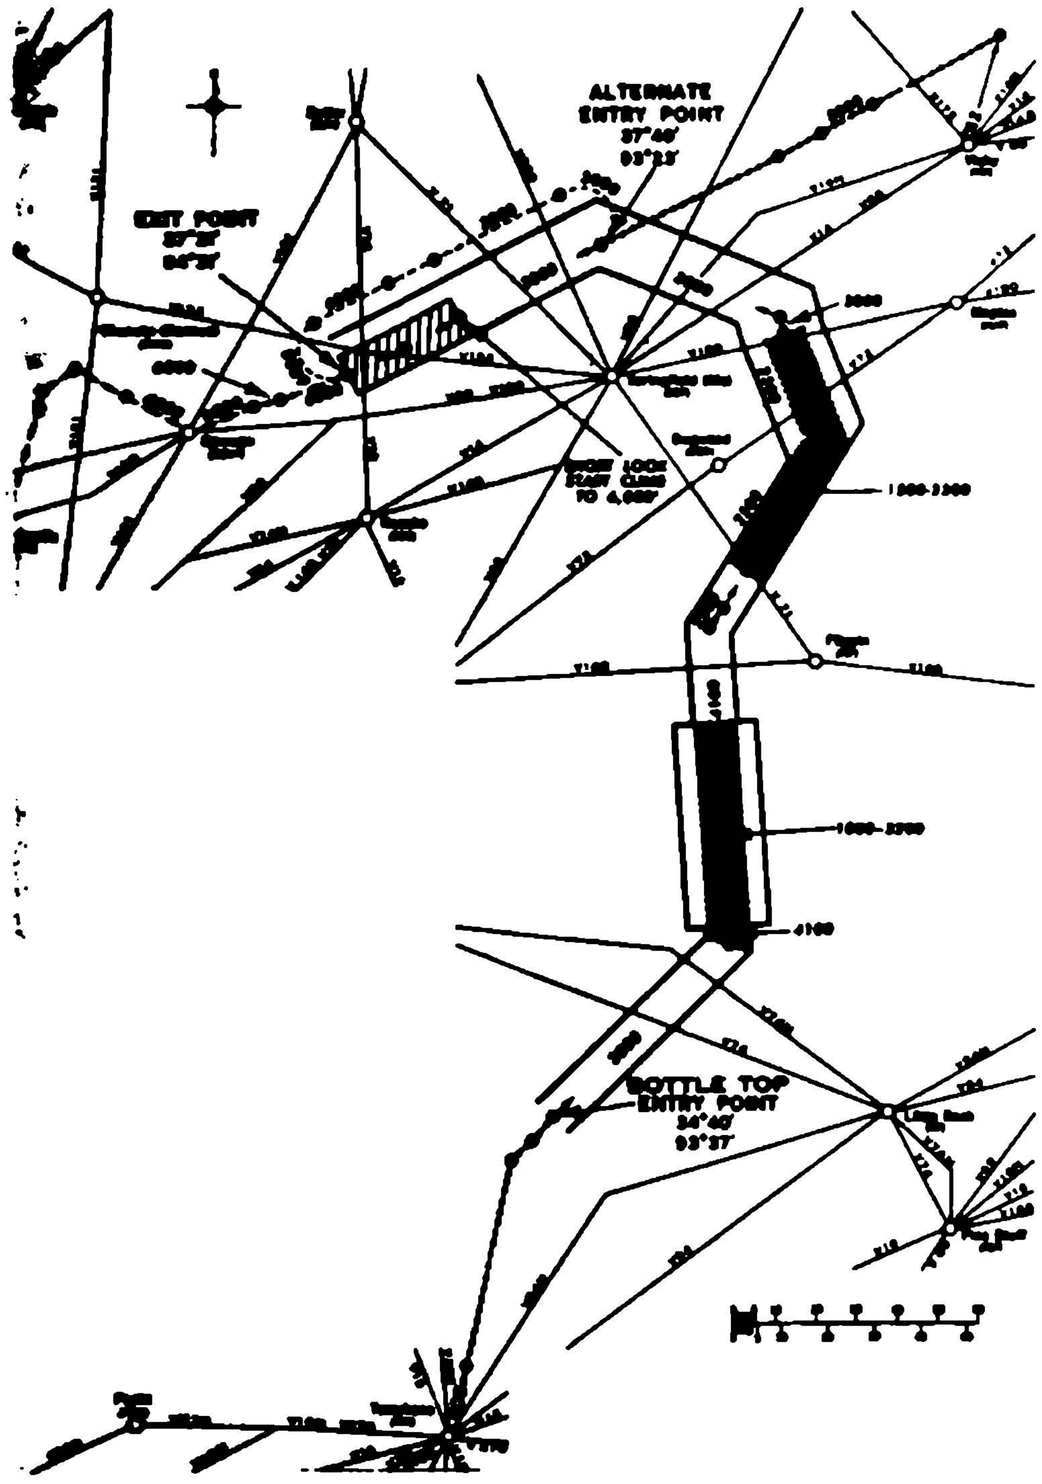
BOTTLE TOP

November 15, 1964

Aircraft shall cross the Texarkana, Ark. VORTA 005/15 at 19,000′ MSL or as assigned by ATC; then pr ceed outbound on the 005° radial descending so as cross 34°31′N, 93°48′W, at 6000′ MSL; direct descendi so as to cross 34°35′N, 93°43′W, at 4000′ MSL; th direct so as to cross the route entry point 34°40′ 93°37′W at 2800′ MSL, then 2800′ MSL direct 35°17′ 92°51′W; then climb direct so as to cross 35°21′N, 92 51′W, at 4100′ MSL, then 4100′ MSL direct to 36°26′ 92°55′W; then descend direct so as to cross 36°30′ 92°52′W, at 2500′ MSL, then 2500′ MSL direct 37°06′ 92°23′W, then 2500′ MSL direct 37°30′N, 92°34′W; th climb direct so as to cross 37°33′N, 92°35′W at 30 MSL, then 3000′ MSL direct 37°49′N, 93°23′W, then 30 MSL turn lef direct 37°33′30″N, 94°01′W.

Short Look—After passing 37°33'30''N, 94°01'W, aircraft shall climb so as to cross 37°27'N, 94°16'W, at 6000' MSL, maintain 6000' MSL thru the bomb run corridor (5 SM either side of centerline from 37°33'30''N, 94°-01'W, to 37°21'N, 94°31'W). After exiting the route at 37°21'N, 94°31'W maintain 6000' MSL direct 37°16'N, 94°49'W, then 6000' MSL direct 37°14'N, 94°56'W, then 6000' MSL direct Oswego, Kans. VOR, maintain 6000' MSL direct 37°16'N, 95°28'W; then start climb to 23,000' MSL direct 37°22'N, 95°42'W; turn left continuing climb direct 37°17'N, 95°52'W; direct cross 37°13'N, 95°53'W at 16,000' MSL; direct cross Bartlesville, Okla. at 23,000' MSL.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 37°21'N, 94°-31'W, maintain 6000' MSL, turn right to 37°32'N, 94°-41'W, then 6000' MSL direct 37°41'N, 94°20'W; then descend so as to cross 37°46'N, 94°08'W at 3000' MSL direct to 38°00'N, 93°34'W, then 3000' MSL turn right to 37°49'N, 93°23'W, thence via the published route.



VFR and Contour—If the encountered weather conditions ong the route are equal to or better than ceiling 3000', sibility 5 miles, the pilot may descend VFR and operate tween the VFR altitudes indicated on the chart be-een the following points: From 35°17'N, 92°51'W to °05'N, 92°53'W and from 36°38'N, 92°45'W to 37°30'N, °34'W. During daylight hours, some VFR operations ill be flown 500' above the immediate terrain. VFR erations conducted during the hours of darkness will t be flown lower than 800' above the terrain. The wer VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Vichy, Mo. VOR-TAC 012/25 at 15,000' MSL or as assigned by ATC. Descend direct so as to cross 38°19'N, 92°08'W at 8000' MSL; then at 8000' MSL direct to 38°13'N, 92°22'W; then descend so as to cross 38°08'N, 92°34''W at 4000' MSL; then continue descent so as to cross 37°49'N, 93°23'W at 3000' MSL. Thence via published route.

Route Width—The route width from 34°40'N, 93°37'W to 35°21'N, 92°51'W and from 36°05'N, 92°53'W to 37°-06'N, 92°23'W is reduced to 5 SM either side of centerline and 5 SM on the south side of centerline from 37°33'N, 92°35'W to 37°21'N, 94°31'W.

Hours of Operation—0100Z to 1400Z, 7 days per week.

KANSAS/MISSOURI/NEBRASKA

CLEAR VIEW

Effective September 6, 1964

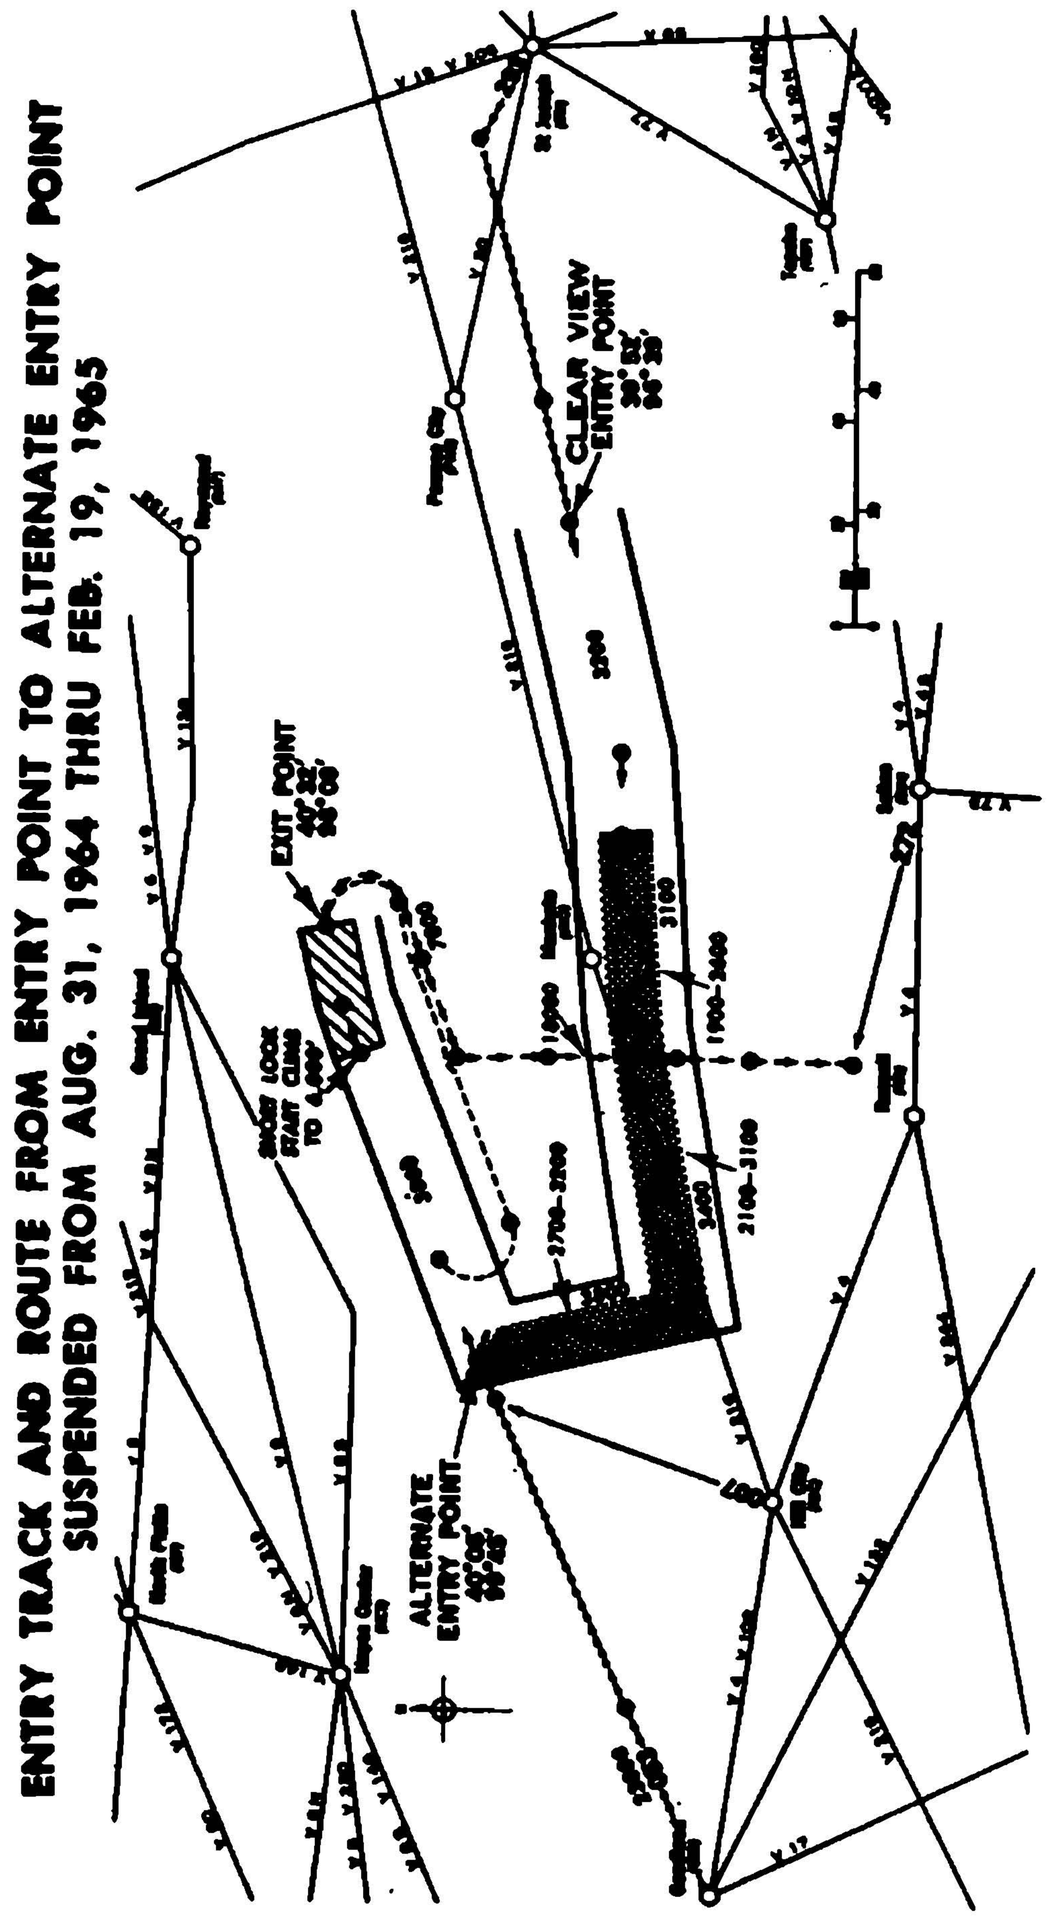
Aircraft shall cross the St. Joseph, Mo. VOR at FL 240 or above, then proceed northwest on the St. Joseph VOR 293° radial, maintain FL 240 or above until 17 NM northwest of St. Joseph VOR; turn left direct 39°56'N, 96°12'W crossing this point at 9000' MSL, descend to 3200' MSL direct to the route entry point at 39°52'N, 96°39'W, maintain 3200' MSL direct 39°43'N, 97°30'W, descend to 3100' MSL direct 39°40'N, 98°30'W, climb to 3400' MSL direct 39°31'N, 99°34'W, climb to 3800' MSL direct 40°05'N, 99°45'W; maintain 3800' MSL direct 40°26'N, 98°37'W.

Short Look—After passing 40°26'N, 98°37'W, proceed direct to 40°29'N, 98°27'W climbing so as to cross this point at 6000' MSL; maintain 6000' MSL through the bomb run corridor (5 SM either side centerline from 40°26'N, 98°37'W to 40°32'N, 98°09'W); after exiting the route at 40°32'N, 98°09'W, turn right climbing to cross 40°20'N, 98°03'W at 7000' MSL; then at 7000' MSL direct 40°16'N, 98°16'W; then start climb so as to cross 40°10'N, 98°37'W at or below 14,000' MSL; then turn left climbing so as to cross 39°54'N, 98°37'W at 18,000' MSL; then at 18,000' MSL direct 39°33'N, 98°-37'W; then climb so as to cross 39°21'N, 98°37'W at or below 23,000' MSL, then start climb so as to cross the Salina VORTAC 272/48 at FL 250.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 40°32'N, 98°-09'W, turn right climbing to 7000' MSL to 40°20'N, 98°03'W, maintain 7000' MSL direct 40°00'N, 99°14'W; turn right descending to 3800' MSL to 40°12'N, 99°22'W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 39°42'N, 97°48'W to 40°05'N, 99°45'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Goodland, Kansas VOR at 23,000' MSL; and proceed northeast on the Goodland VOR 053° radial maintaining 23,000' MSL until 35 NM nrtheast of Goodland VOR, then descend so as to reach 5500' MSL by the Hill City, Kansas VOR 007/49 NM fix; then descend to 3800' MSL direct 40°05'N, 99°45'W, thence via the published route.



Route Width—The route width from 39°31′N, 99°34′W to the route exit point is 5 SM on the west and north side of the route centerline and 10 SM on the east and south side of the route centerline.

Hours of Operation—0000Z to 2359Z Monday through Saturday.

ALABAMA/MISSISSIPPI

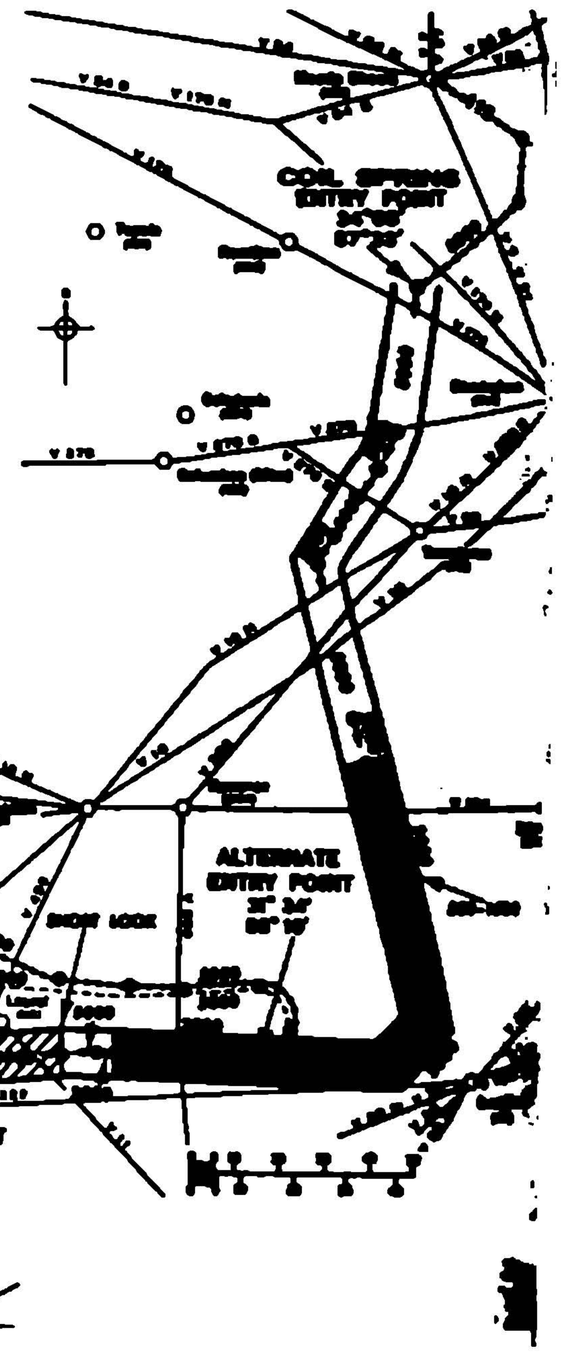
COIL SPRING

Effective October 18, 1964

Aircraft shall cross Muscle Shoals, Alabama VOR at 20,000′ MSL, or as assigned. Descend via Muscle Shoals VOR 115° radial, cross Muscle Shoals VOR 115°/24 NM at 12,000′ MSL; turn right, descend to cross 34°19′N, 87°06′W at 8000′ MSL, maintain 8000′ MSL direct to the route entry point at 34°03′N, 87°33′W, direct 33°-35′N, 87°38′W, direct 33°28′N, 87°42′W; descend direct to cross 33°15′N, 87°52′W at 5000′ MSL, maintain 500 MSL direct 33°10′N, 87°56′W, direct 32°40′N, 87°48′W descend to cross 32°31′N, 87°45′W at 2000′ MSL, main tain 2000′ MSL direct 31°41′N, 87°31′W, turn right t 31°33′N, 87°40′W, maintain 2000′ MSL direct 31°36′N 88°42′W; climb direct to cross 31°36′N, 88°46′W at 300 MSL, direct to cross 31°36′N, 88°55′W at 5000′ MSI In addition to the above, aircraft may climb to 300 MSL after 31°33′N, 87°40′W and maintain 3000′ MS to 31°36′N, 88°55′W during the hours 0600Z–1200Z.

Short Look—After passing 31°36′N, 88°55′W aircraf shall operate through the bomb run corridor at 500 MSL. In addition, aircraft may operate through th bomb run corridor at 3000′ MSL during the hours 0600Z 1200Z. (The bomb run corridor is 5 SM either sid centerline from 31°36′N, 88°55′W to 31°35′N, 89°14′W. After exiting the route at 31°35′N, 89°14′W, aircraf shall cross 31°36′N, 89°30′W at 5000′ MSL; start clim direct to cross 31°37′N, 89°56′W at 14,000′ MSL (r porting point), maintain 14,000′ MSL direct 31°33′ 90°25′W; start climb direct 31°32′N, 90°36′W, turn rigt to intercept Jackson, Miss. VORTAC 205° radial 56 N fix (31°42′N, 90°44′W) at or below 23,000′ MSL, thenc via 205° radial to cross 36 NM fix at FL 250, maintai FL 250 or as assigned to Jackson VORTAC.

Re-Entry—Aircraft scheduled to execute an addition bomb run shall, after exiting the route at 31°35′ 89°14′W, turn right, cross 31°42′N, 89°22′W at 500 MSL, maintain 5000′ MSL, turn right to 31°49′N, 89 14′W, direct 31°48′N, 88°27′W; direct 31°48′N, 88°10′W turn right, cross 31°40′N, 88°03′W at 3000′ MSL; co tinue turn, cross 31°34′N, 88°10′W at 2000′ MSL; thenc via published route.



VFR and Contour—If the encountered weather condition along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and op

ate VFR between the VFR altitudes indicated on the chart between the following points: From 32°31'N, 87°-45'W to 31°36'N, 88°42'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum that will be reached on each segment during daylight hours.

Alternate Entry—Aircraft shall cross McComb, Miss. VOR (31°18'15''N, 90°15'29''W) at 23,000' MSL, or as assigned; maintain 23,000' MSL or as assigned via the McComb VOR 028° radial to 13 NM fix; start descent, cross McComb VOR 028° radial 41 NM fix at 15,000' MSL; cross 45 NM fix at 14,000' MSL; turn right, cross 32°01'N, 89°35'W at 10,000' MSL, maintain 10,000' MSL, turn right, 32°01'N, 89°27'W, direct 31°49'N, 88°55'W; descend direct, cross 31°48'N, 88°39'W at 6000' MSL; direct, cross 31°48'N, 88°27'W at 5000' MSL, maintain 5000' MSL direct 31°48'N, 88°10'W; turn right cross 31°40'N, 88°03'W at 3000' MSL continue turn, cross 31°34'N, 88°10'W at 2000' MSL; thence via the published route.

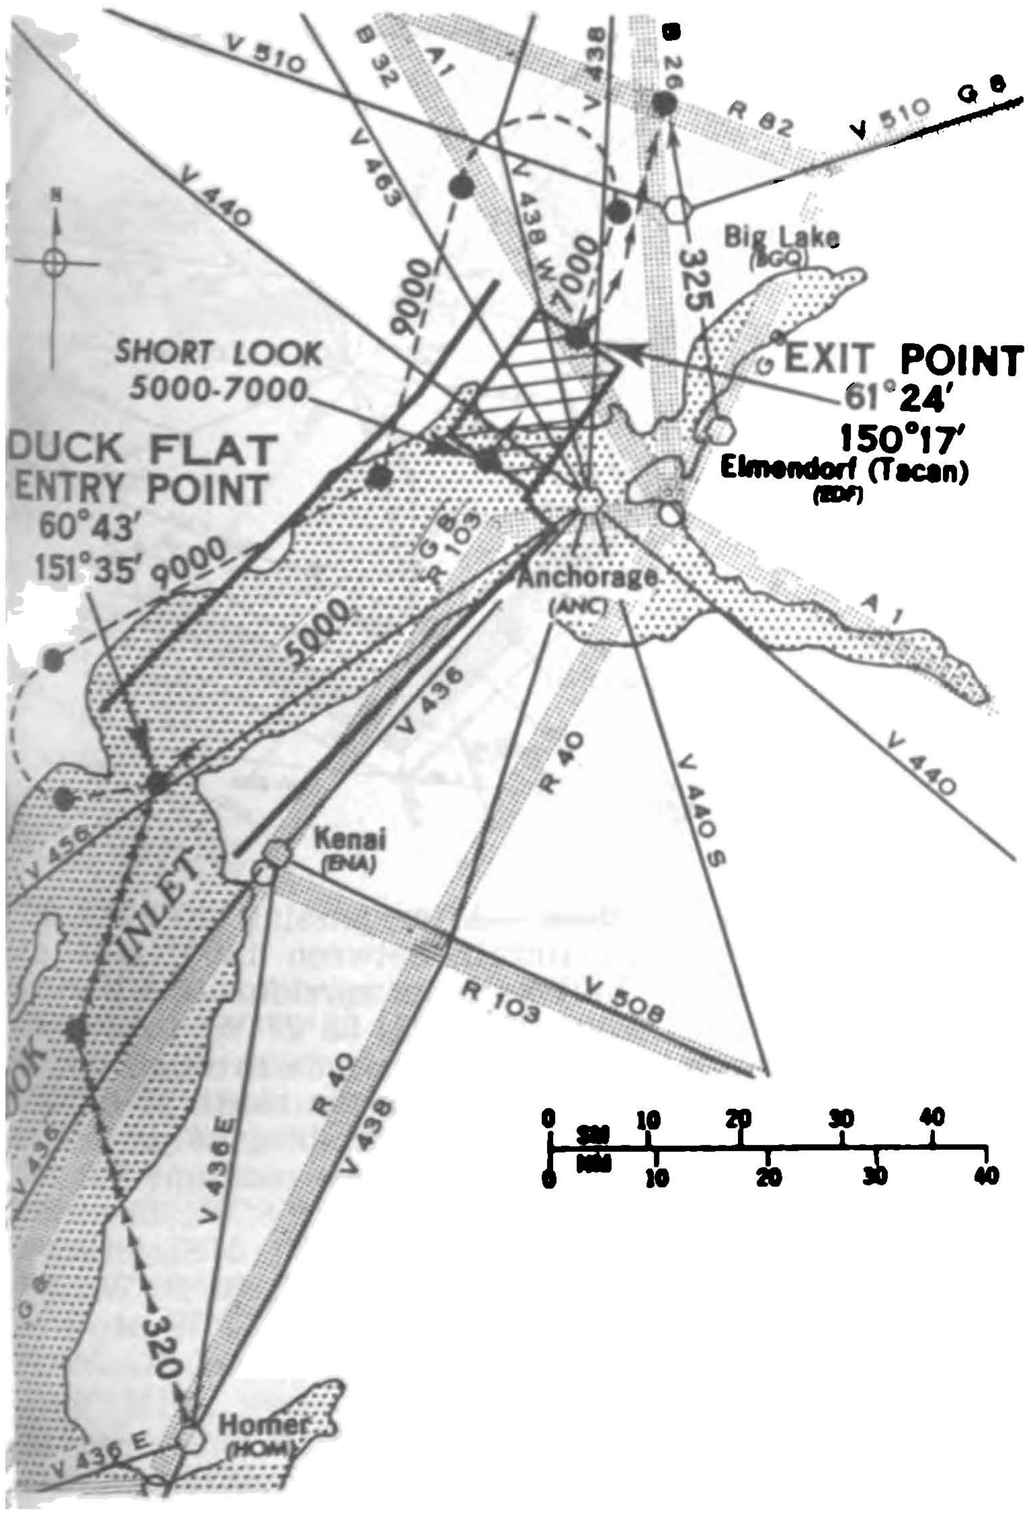
Route Width—The entire route is reduced to 5 SM either side of route centerline.

Hours of Operation—24 hours per day, 7 days a week.

DUCK FLAT

ALASKA

Effective June 16, 1963



Aircraft shall cross the Homer, Alaska VOR (reporting point) at FL 250 or as assigned by ARTCC, descend via the 320° radial of the Homer VOR to 60°20'N, 151°50'W, continue descent to cross the route entry point at 60°-43'N, 151°35'W at 5000' MSL, maintain 5000' MSL to 61°13', 150°34'W.

Short Look—After passing 61°13'N, 150°34'W aircraft shall maintain between 5000' MSL and 7000' MSL through the bomb run corridor (5 smi either side centerline from 61°13'N, 150°34'W to 61°24'N, 150°17'W). After passing 61°24'N, 150°17'W (reporting point), the route exit point, aircraft shall climb to or maintain 7000' MSL direct to the Elmendorf TACAN 325° radial 30 NM fix (Willow Intersection).

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 61°24'N, 150°17'W, maintain 7000' MSL to 61°35'N, 150°08'W, then turn left climbing to 9000' MSL direct to 61°38'N, 150°38'W, then 9000' MSL to 61°13'N, 150°54'W, then 9000' MSL direct 60°53'N, 151°57'W, then a left descending turn to cross 60°41'N, 151°54'W at 7000' MSL or above, direct to reentry the Duck Flat route at 60°43'N, 151°35'W at 5000' MSL.

Route Width—The route width is reduced to 5 smi southeast of centerline from 61°13'N, 150°34'W to 61°24'N, 150°17'W.

Hours of Operation—2000Z to 2400Z Monday through Friday.

ALABAMA/MISSISSIPPI/TENNESSEE

FAST FREEZE

Effective January 4, 1965 through March 27, 1965

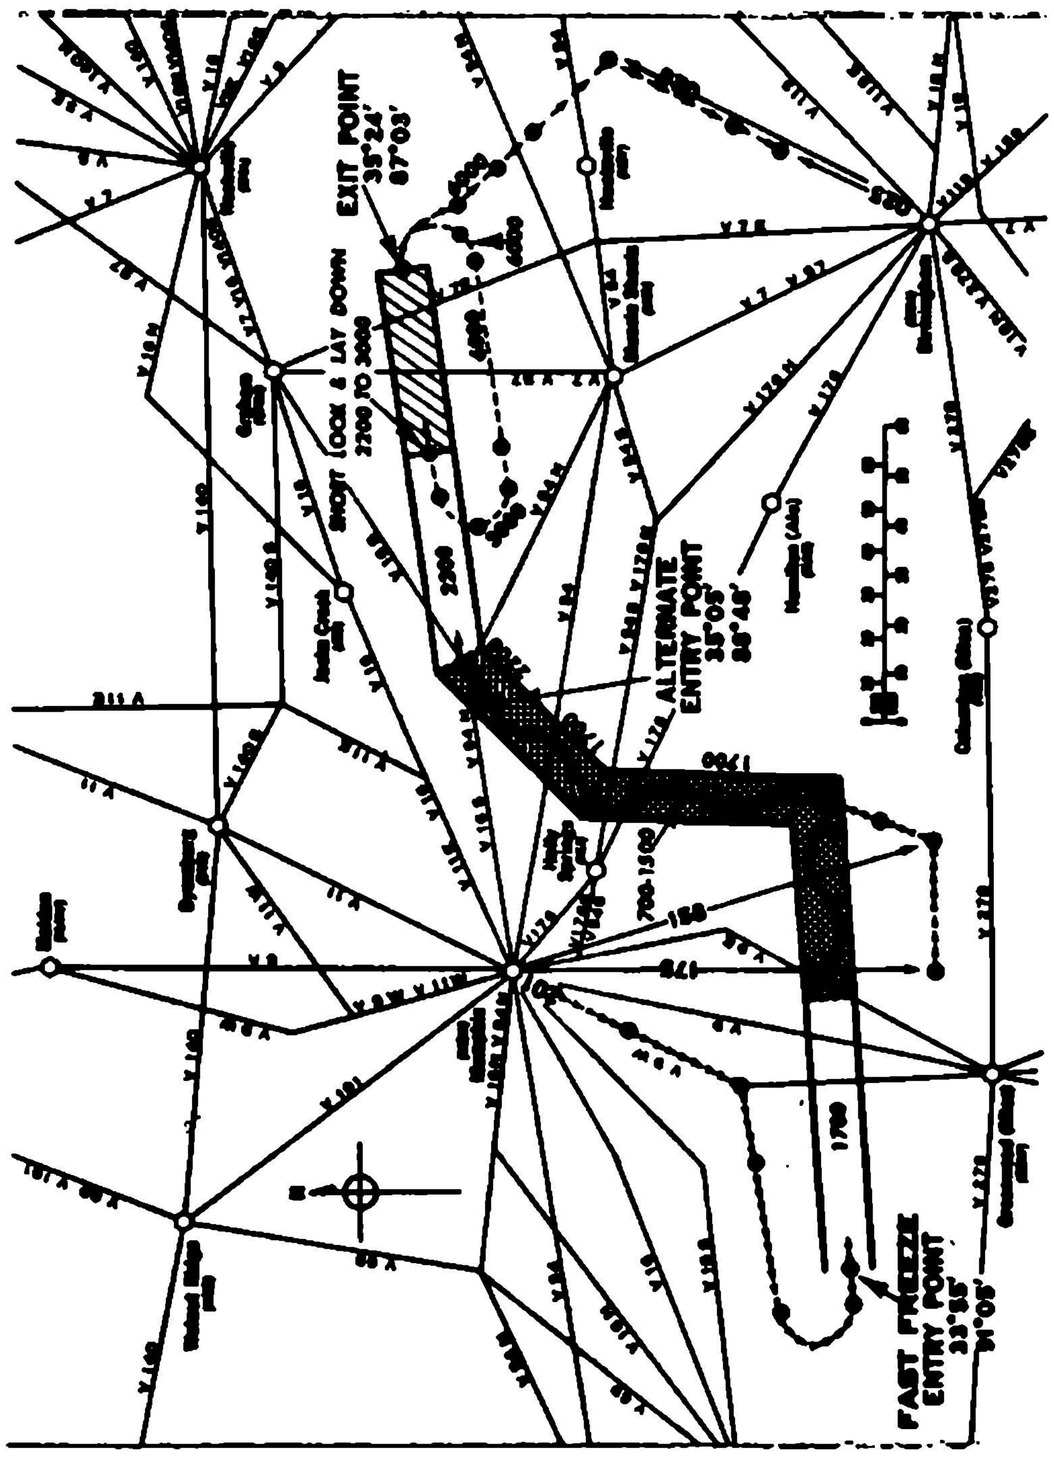
Aircraft shall cross the Memphis, Tennessee, VORTAC at FL 250 or as assigned by ARTC; then maintain FL 250 or assigned altitude via the 201° radial of the Memphis VORTAC to the 26 NM DME fix (34°39'N, 90°-08'W); then descend direct so as to cross 34°17'N, 90°21'W (201/50 NM DME fix of Memphis VORTAC) at FL 200; then descend direct so as to cross 34°14'N, 90°40'W at 16,000' MSL; then descend direct to 34°08'N, 91°16'W; then turn left descending to 33°54'N, 91°13'W; then continue descend direct so as to cross 33°55'N, 91°-05'W at 1700' MSL (low level entry point); then at 1700' MSL direct to 34°03'N, 89°12'W; then at 1700' MSL direct to 34°47'N, 89°11'W; then at 1700' MSL direct to 35°05'N, 88°48'W; then at 2200' MSL direct to 35°13'N, 88°39'W; then at 2200' MSL direct to 35°19'N, 87°47'W.

Short Look and Lay Down—After passing 35°19'N, 87°-47'W aircraft shall maintain between 2200' MSL and 3000' MSL through the bomb run corridor (5 statute miles either side of centerline from 35°19'N, 87°47'W to 35°24'N, 87°03'W). After exiting the route at 35°-24'N, 87°03'W, aircraft shall turn right climbing so as to cross 35°14'N, 86°47'W at 6000' MSL; then at 6000' MSL to 35°05'N, 86°38'W; then climb direct so as to cross 34°58'N, 86°30'W at 10,000' MSL or above; then climb direct so as to cross 34°43'N, 86°13'W at (026/71 NM DME fix of Birmingham, Alabama, VORTAC) at 15,000' MSL; then climb direct so as to cross 34°18'N, 86°30'W (025/43 NM DME fix of Birmingham, Alabama, VORTAC) at FL 220 or above; then climb direct so as to cross 34°09'N, 86°36'W (025/33 NM DME fix of Birmingham, Alabama, VORTAC) at FL 240.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after passing 35°24'N, 87°03'W, turn right

and climb so as to cross 35°13′N, 86°55′W at 6000′ MSL; then continue turn at 6000′ MSL to 35°10′N, 87°01′W; then at 6000′ MSL direct to 35°05′N, 87°46′W; then descend direct so as to cross 35°04′N, 87°56′W at 3000′ MSL; then at 3000′ MSL turn right to 35°10′N, 88°-06′W; then turn right descending so as to cross 35°17′-30′′N, 87°59′W at 2200′ MSL; then at 2200′ MSL direct to 35°19′N, 87°47′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 34°00′N, 90°00′W to 35°13′N, 88°39′W. During daylight hours, some VFR operations will be flown 500 feet above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800 feet above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.



Alternate Entry—Aircraft shall cross the 175/88 NM DME fix of the Memphis, Tennessee, VORTAC (33°39′N, 89°53′W) at FL 200 or as assiged by ARTC; then descend direct to 33°39′N, 89°22′W (158/86 NM DME fix of the Memphis VORTAC); then continue descent direct so as to cross 33°50′N, 89°18′W at 10,000′ MSL or below; then descend direct so as to cross 34°03′N, 89°12′W at 6000′ MSL; then descend direct so as to cross 34°19′N, 89°12′W at 1700′ MSL; then at 1700′ MSL direct to 34°47′N, 89°11′W; then at 1700′ MSL direct 35°05′N, 88°48′W; thence via the published route.

Route Width—The route width is reduced to 5 statu miles on either side of centerline from 33°55′N, 91°05′ to 35°24′N, 87°03′W.

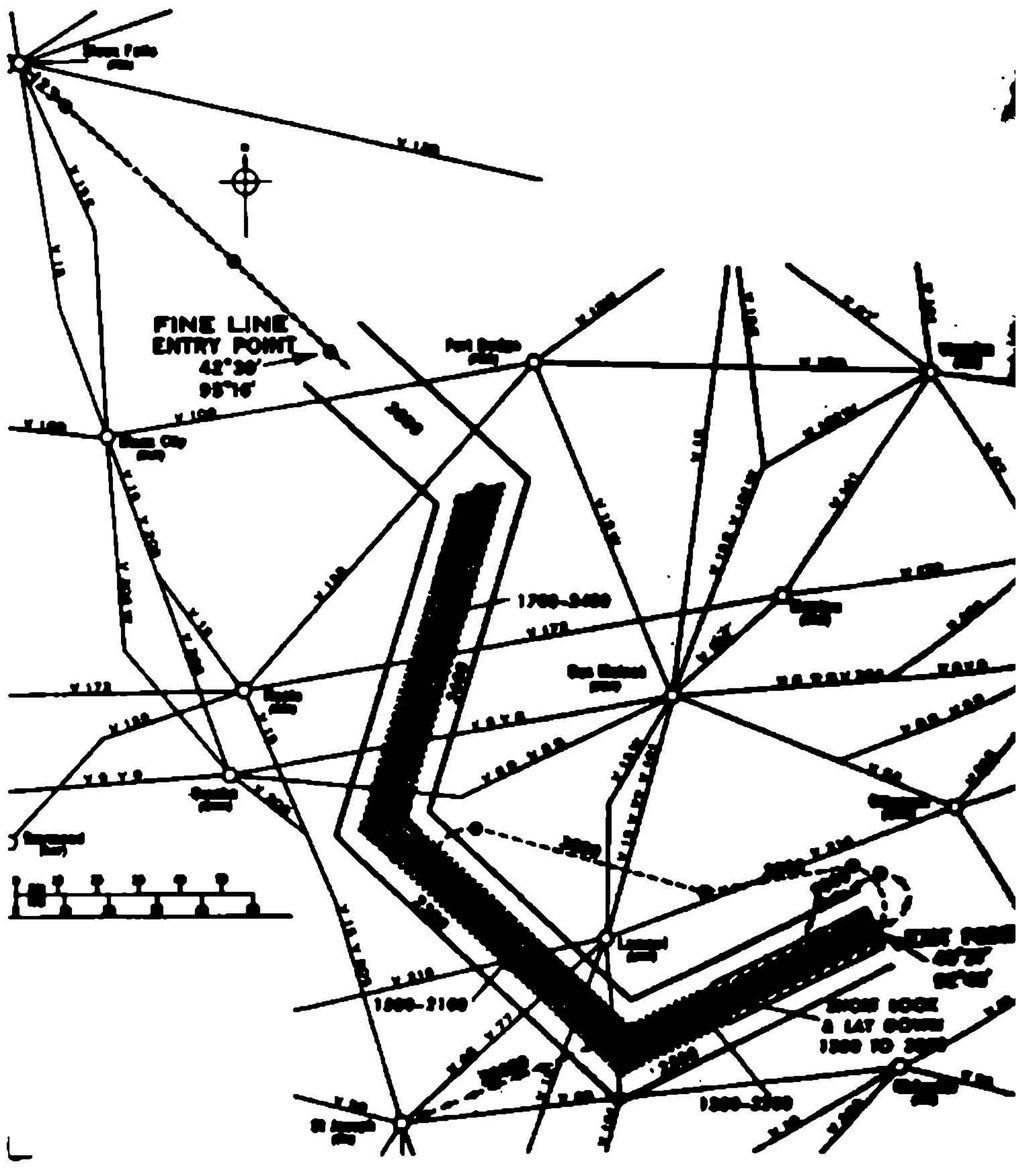
Hours of Operation—24 hours daily, 7 days per week.

IOWA/MISSOURI

FINE LINE

Effective August 31 thru February 19, 1965

Aircraft shall cross the Sioux Falls, South Dako VORTAC at 23,000′ MSL or as assigned by ARTCC a proceed via the 123° radial maintaining 23,000′ MSL assigned altitude until 13 NM southeast; then descer via the 123° radial of the Sioux Falls VORTAC so to cross 42°58′N, 95°44′W at 11,000′ MSL or below; th descend direct so as to cross the route entry point 42 39′N, 95°16′W at 2800′ MSL; then at 2800′ MSL dire to 42°10′N, 94°33′W; then at 2600′ MSL direct to 41 00′N, 95°01′W; then at 2500′ MSL direct to 40°12′ 93°53′W; then at 2500′ MSL direct to 40°22′N, 93°27′W



Short Look and Lay Down—After passing 40°22′N, 93° 27′W, aircraft shall maintain between 1300′ MSL an 3000′ MSL through the bomb run corridor (5 SM eithe side of centerline from 40°22′N, 93°27′W to 40°37′N 92°43′W). The minimum IFR altitude through the co ridor is 2500′ MSL. After exiting the route at 40°37′N 92°43′W, aircraft shall turn left climbing so as to cros 40°48′N, 92°41′W at 9000′ MSL; then continue left tur maintaining 9000′ MSL to 40°42′N, 92°58′W; then climb so as to cross 40°30′N, 93°08′W at 14,000′ MSL or below then continue climb direct to 40°28′N, 93°09′W; the climb direct so as to cross 40°19′N, 93°42′W at 23,00 MSL; then at 23,000′ MSL direct to the St. Joseph Missouri VORTAC.

Re-Entry—After completing the initial bomb run, air craft that are scheduled to execute an additional bom

run shall, after passing 40°37′N, 92°43′W, turn left and climb to or maintain 3000′ MSL to 40°50′N, 92°49′W; then at 3000′ MSL direct to 40°45′N, 93°30′W; then at 3000′ MSL direct to 40°59′N, 94°35′W; then turn left descending to intercept the Oil Burner Route at 40°48′N, 94°44′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 42°10′N, 94°33′W to 40°37′N, 92°43′W. During daylight hours, some VFR operations will be flown 500 feet above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800 feet above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

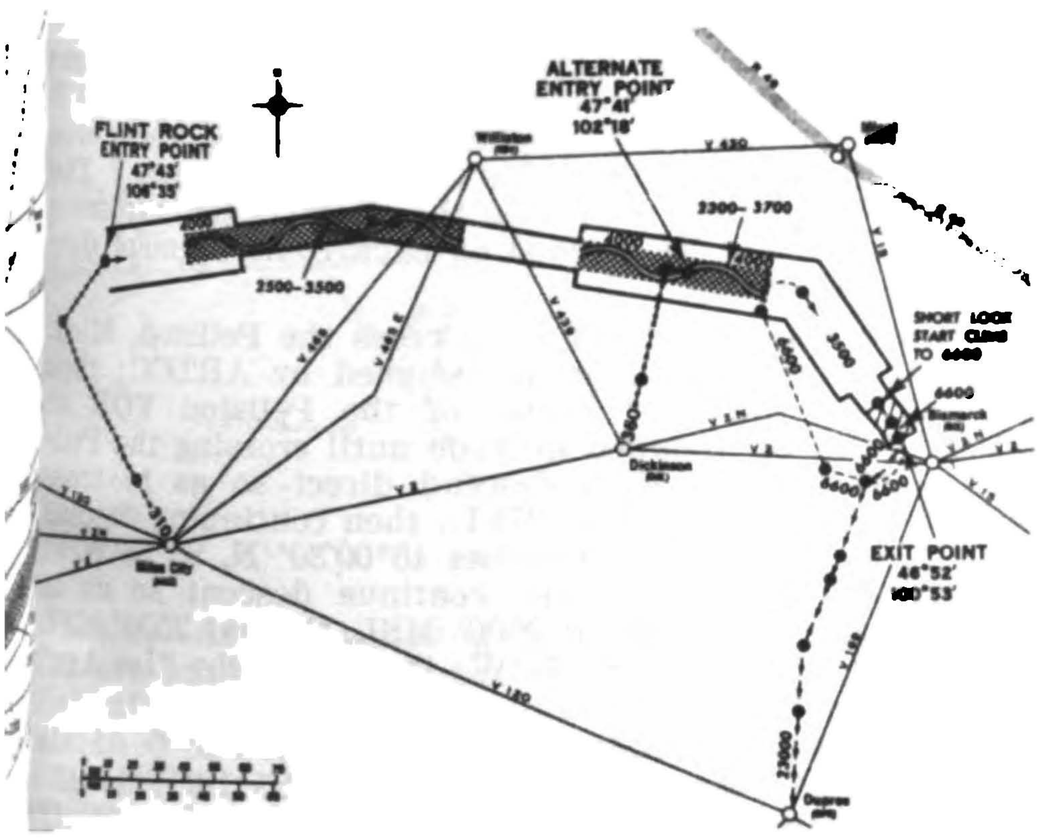
Hours of Operation—24 hours daily 7 days per week.

FLINT ROCK

MONTANA/NORTH DAKOTA

Effective June 14, 1964

Aircraft shall cross the Miles City, Mont. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC, and proceed via the 310° radial, maintaining 23,000′ or as assigned, to 46°40′N, 106°14′W; then descend to cross 47°24′N, 107°00′W at or above 6000′ MSL; then continue descent so as to cross the route entry point, 47°43′N, 106°35′W, at 4000′ MSL; then at 4000′ MSL direct 47°57′N, 104°30′W; then at 4000′ MSL direct 47°35′N, 101°31′W; then descend to 3500′ MSL direct 47°02′N, 101°02′W.



Short Look—After passing 47°02′N, 101°02′W aircraft shall climb so as to cross 46°56′N, 100°56′W at 6600′ MSL; then at 6600′ MSL direct to the exit point 46°52′N, 100°53′W (bomb run corridor 5 SM either side of centerline from 47°02′N, 101°02′W to the exit point 46°52′N, 100°53′W); then maintaining 6600′ MSL turn right direct 46°39′N, 101°07′W; then start climb to 23,000′ MSL direct to 45°53′N, 101°35′W; direct to Dupree VORTAC, climbing so as to cross 46°19′N, 101°19′W at or above 11,000′ MSL, crossing 46°13′N, 101°23′W at or below 19,000′ MSL; crossing 45°53′N, 101°35′W at 21,000′ MSL, and to reach 23,000′ MSL at a point 30 nautical miles northeast of the Dupree VORTAC.

No-Entry—After completing the initial bomb run aircraft that are scheduled to execute an aditional Short Look bomb run shall, after passing 46°52′N, 100°53′W maintain 6600′ MSL direct 46°39′N, 101°07′W; then at 6600′ MSL make a right turn direct to 46°43′N, 101°24′W; then at 6600′ MSL direct 47°30′N, 101°49′W; then a right decending turn so as to reenter the route at 47°-35′N, 101°31′W at 3500′ MSL, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°48′N, 105°53′W to 47°53′N, 103°53′W and from 47°47′N, 103°03′W to 47°37′N, 101°45′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

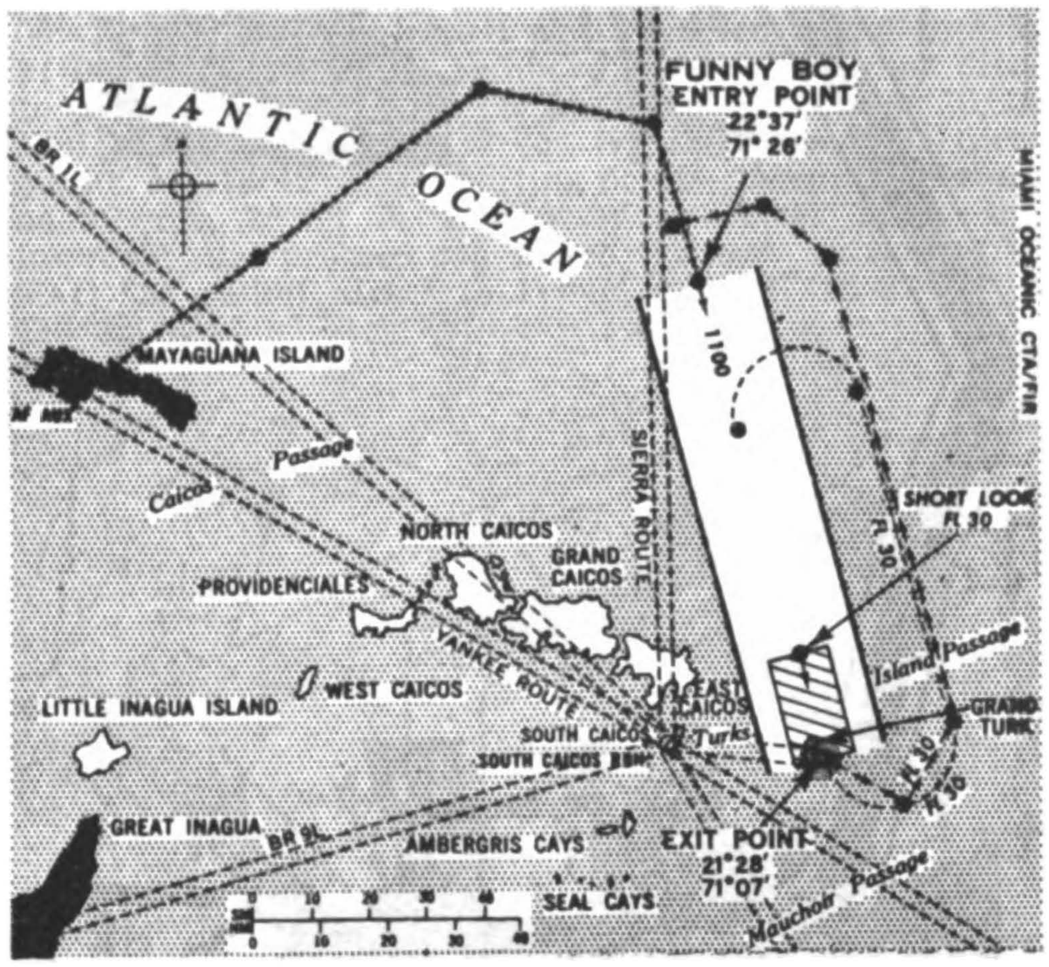
Alternate Entry—Aircraft shall cross the Dickinson, No. Dakota VORTAC (reporting point) at 15,000′ MSL, or as assigned by ARTCC; then proceed via the 360° radial of Dickinson VORTAC at 15,000′ MSL, or assigned flight level/altitude, direct to a point 20 NM north of the Dickinson VORTAC; then descend so as to cross 47°42′-30′′N, 102°27′W at 6000′ MSL; then a descending right turn so as to cross 47°41′N, 102°18′W at 4000′ MSL, thence via the published route.

Route Width—The route width is reduced to 5 SM on either side of centerline from 47°50′N, 105°30′W to 47°-47′N, 103°03′W and from 47°07′N, 101°06′W to 46°52′N, 100°53′W.

Hours of Operation—0000Z to 2400Z, 7 days weekly.

FUNNY BOY

Effective December 1, 1963



Aircraft shall cross 22°23′N, 73°02′W (Mayaguana AFB) at FL 270 or as assigned; maintain FL 270 or as assigned 22°41′N, 72°35′W (reporting point); start descent, cross 23°05′N, 72°00′W at FL 150; right turn, cross 23°00′N, 71°33′W at FL 90 or below; cross 22°37′N, 71°26′W at 1100′ MSL; the route entry point, maintain 1100′ MSL direct 21°43′N, 71°11′W.

Short Look—After passing 21°43′N, 71°11′W aircraft shall climb to FL 30 and maintain FL 30 through the bomb run corridor (5 SM either side of centerline from 21°43′N, 71°11′W to 21°28′N, 71°07′W). After exiting the low level route at 21°28′N, 71°07′W, maintain FL 30, direct 21°21′N, 70°54′W; direct 21°33′N, 70°47′W; start climb cross 22°40′N, 71°06′W at FL 250 or above; left turn to 22°48′N, 71°16′W; cross 22°45′N, 71°30′W at FL 290 or as assigned.

Re-Entry—After completing the initial bomb run, aircraft scheduled to execute an additional bomb run shall, after exiting the low level route at 21°28′N, 71°07′W; maintain FL 30; direct 21°21′N, 70°54′W; direct 21°33′N, 70°47′W; direct 22°21′N, 71°01′W; left turn descend to cross 22°16′N, 71°20′W at 1100′ MSL; thence via "Funny Boy" route.

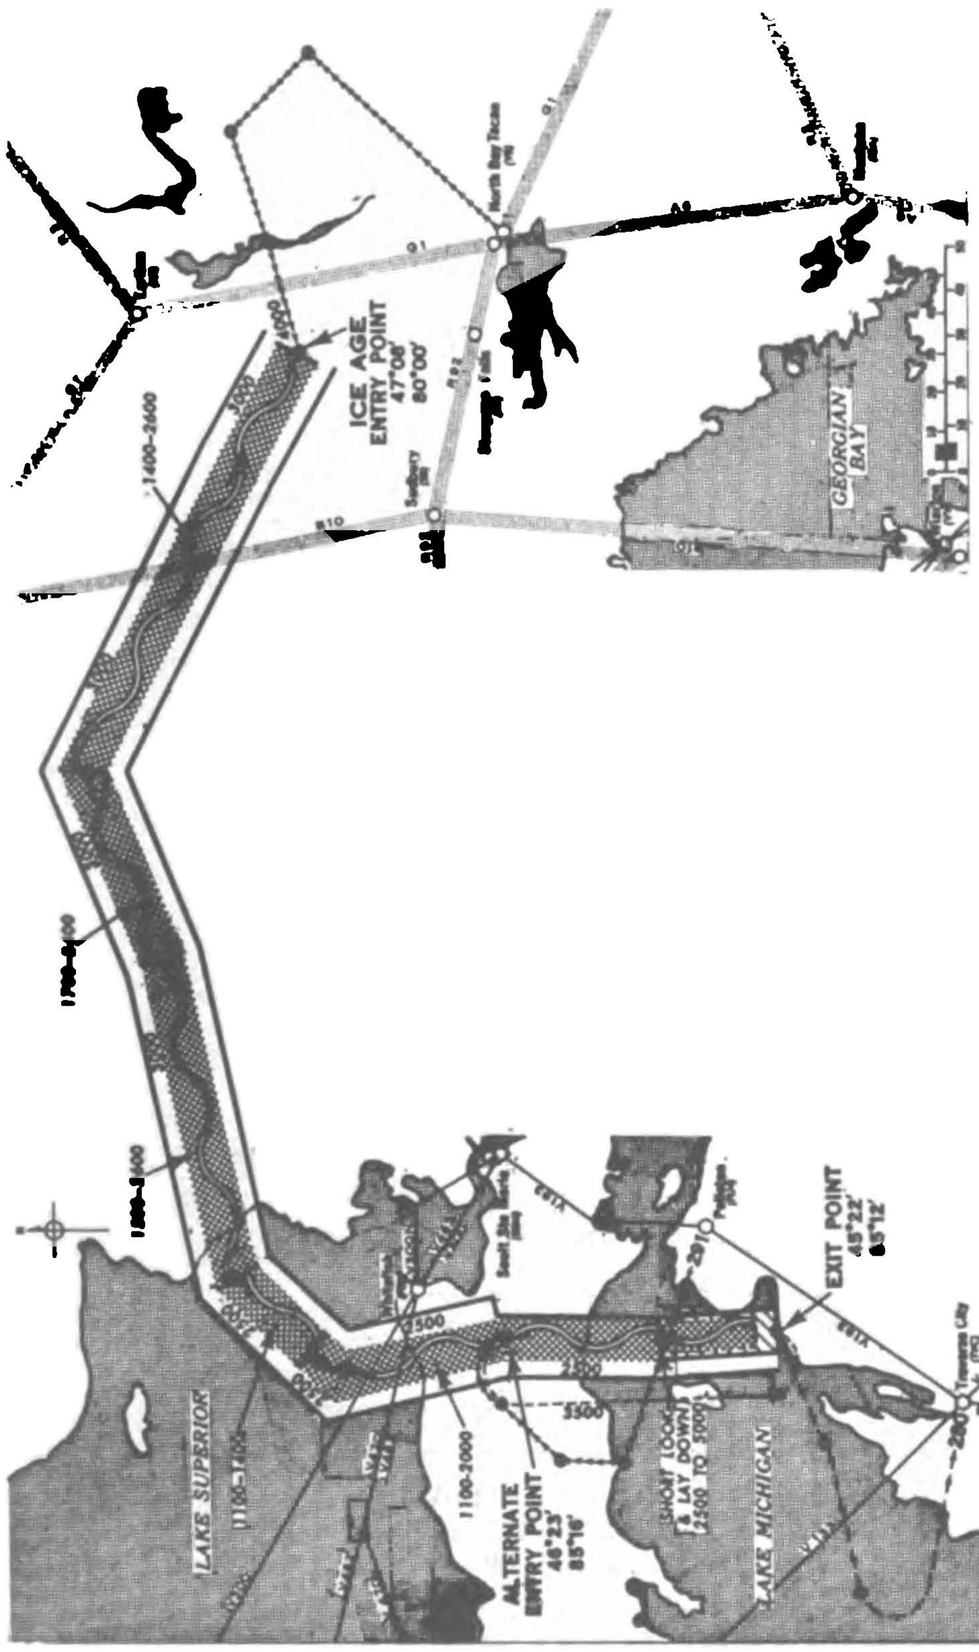
Hours of Operation—0000Z to 2359Z Monday through Saturday.

MICHIGAN/ONTARIO, CAN.

ICE AGE

Effective September 6, 1964

Start descent over North Bay Ont. TACAN from FL 250 or as otherwise assigned to 17,000′ MSL direct 47°-04′N, 78°25′W, descend to 10,000′ MSL direct to 47°22′N, 78°49′W, descend to 4000′ MSL direct to 47°15′N, 79°-25′W, maintain 4000′ MSL direct to low level entry point at 47°08′N, 80°00′W (aircraft shall maintain an altitude below 3500′ AGL on the low level route while in Canadian airspace), descend so as to cross 47°22′N, 80°35′W at 3000′ MSL, then maintain 3000′ MSL direct 47°58′N, 82°15′W, then at 3000′ MSL direct to 47°40′N, 83°16′W, then at 3000′ MSL direct 47°23′N, 85°00′W, then descend direct 47°06′N, 85°22′W at 2500′ MSL (termination of Canadian portion of route). Aircraft shall enter the U.S.A. at 47°06′N, 85°22′W at 2500′ MSL, direct 47°00′N, 85°30′W at 2500′ MSL, direct 46°23′N, 85°16′W at 2500′ MSL, direct 45°48′N, 85°15′W at 2500′ MSL.



Short Look and Lay Down—After passing 45°48′N, 85°-15′W aircraft shall maintain between 2500′ MSL and 5000′ MSL through the bomb run corridor (5 SM either side of centerline from 45°48′N, 85°15′W to 45°22′N, 85°12′W. The minimum IFR altitude through the bomb run corridor is 2500′ MSL); after passing 45°22′N, 85°-12′W then turn right climbing so as to cross 45°10′N, 85°47′W at 10,000′ MSL; then climb direct so as to cross 45°01′N, 86°33′W at 12,000′ MSL. Turn left to intercept 280° radial of the Traverse City VOR climbing so as to cross Traverse City VOR 280/25 at 21,000′ MSL. Continue climbing via the Traverse City VOR 280° radial so as to cross the Traverse City VOR at FL 250.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 45°22′N, 85°12′W turn right climbing so as to cross 45°21′N, 85°32′W at 3,500′ MSL, then at 3,500′ MSL direct to 46°23′N, 85°-37′W; then turn right descending so as to cross 46°23′N, 85°16′W at 2500′ MSL; thence via the "Ice Age" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°08′N, 80°00′W to 45°27′N, 85°13′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mich. VOR at 20,000′ MSL, or as assigned by ARTCC; then proceed via the 291° radial of the Pellston VOR at 20,000′ MSL or assigned altitude until crossing the Pellston VOR 291/15; then descend direct so as to cross 45°55′N, 85°55′W at 8000′ MSL; then continuing descent turn right direct so as to cross 46°09′30″N, 85°55′W at or below 4000′ MSL; then continue descent so as to cross 46°23′N, 85°37′W at 2500′ MSL, then at 2500′ MSL turn right to 46°23′N, 85°16′W; thence via the "Ice Age" route.

Route Width—The route width is reduced to 5 statute miles east of centerline from 46°23′N, 85°16′W to 45°-22′N, 85°12′W.

Hours of Operation—0000Z to 2400Z, 7 days a week.

NEVADA

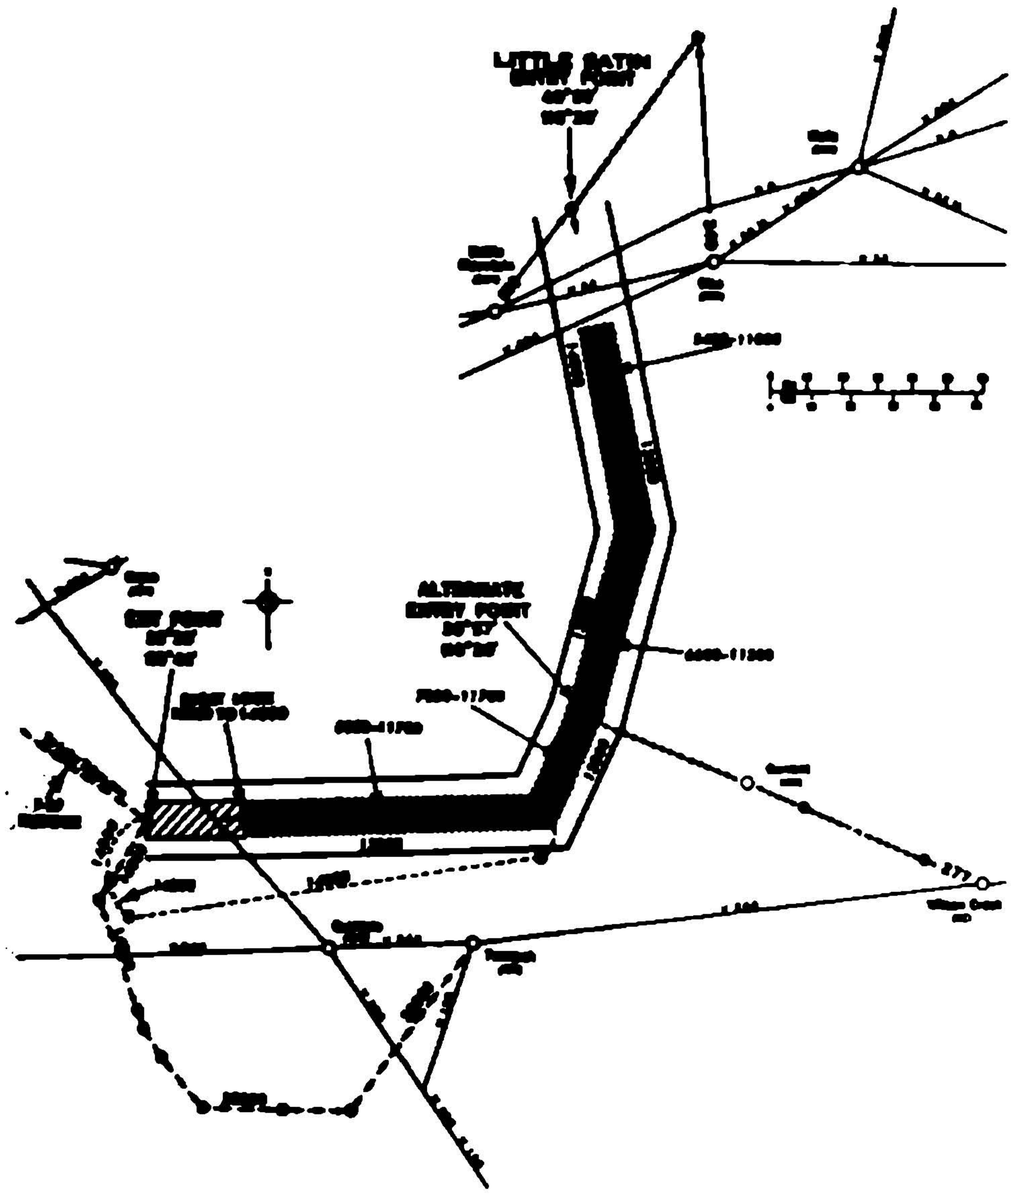
LITTLE SATIN

Effective May 3, 1964

Aircraft shall cross 41°40′N, 115°49′W (Elko VOR-TAC 340°/55 NM DME fix) (reporting point) at 23,000′ MSL or as assigned by ARTCC; then descend direct to cross the route entry point, 40°59′N, 116°30′W (Battle Mountain VOR 019°/31) at 14,000′ MSL, then 14,000′ MSL direct 40°10′N, 116°17′W; then descend to 13,000′ MSL direct 39°42′N, 116°10′W, then 13,000′ MSL direct

38°57'N, 116°26'W, then 13,000' MSL direct 38°34'N, 116°40'W, then 13,000' MSL direct 38°31'N, 118°12'W.

Short Look—After passing 38°31'N, 118°12'W aircraft shall operate between a maximum altitude of 14,000' MSL and a minimum of 13,000' MSL thru the bomb run corridor (5 SM either side of centerline from 38°31'N, 118°12' W to 38°30' N, 118°44' W). After exiting the route at 38°30'N, 118°44'W aircraft shall maintain 14,000' MSL direct 38°10'N, 119°00'W, then 14,000' MSL direct 37°43'N, 118°46'W (reporting point "Little Satin 2"); then climb direct to cross 37°40'N, 118°43'W at or above 14,300' MSL and 37°33'N, 118°37'W at or above 15,000' MSL; then climb to 20,000' MSL direct 37°21'N, 118°25'W, then 20,000' MSL direct to 37°21'N, 118°-0'W (reporting point "Little Satin 3"); then climb direct to cross 37°21'N, 117°40'W at 23,000' MSL, then 23,000' MSL direct to Tonopah, Nev. VOR.



Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°30'N, 118°44'W, maintain 14,000' MSL direct 38°15'N, 118°57'W, then 14,000' direct 38°06'N, 118°50'W (reporting point "Little Satin 1"), then 14,000' MSL direct 38°23'N, 116°40'W; then descend to 13,000' MSL direct to re-enter the route at 38°34'N, 116°40'W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000' visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 40°30'N, 116°22'W to 38°31'N, 118°12'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Wilson Creek, Nev. VOR (reporting point) at 23,000' MSL or as assigned by ARTCC, then maintain assigned flight level via the Wilson Creek VOR 277° radial until 15 NM northwest of the Wilson Creek VOR (38°21'N, 114°41'W); then descend direct to cross 38°34'N, 115°18'W at or below 15,000' MSL; then descend direct via the Currant, Nev. VOR to cross 38°57'N, 116°26'W at 13,000' MSL, thence via the published route.

I-29 Procedure—Aircraft shall cross Wilson Creek, Nevada, VOR (38°15'N, 114°23'W) (reporting point) as assigned by the ARTCC; then proceed via alternate entry route to 38°30'N, 118°44'W exit point of the bomb run corridor; then climb to 14,000' MSL or as assigned by the ARTCC direct Lake Tahoe, California, VOR (39°11' N, 120°16'W).

Hours of Operation—24 hours daily, 7 days a week.

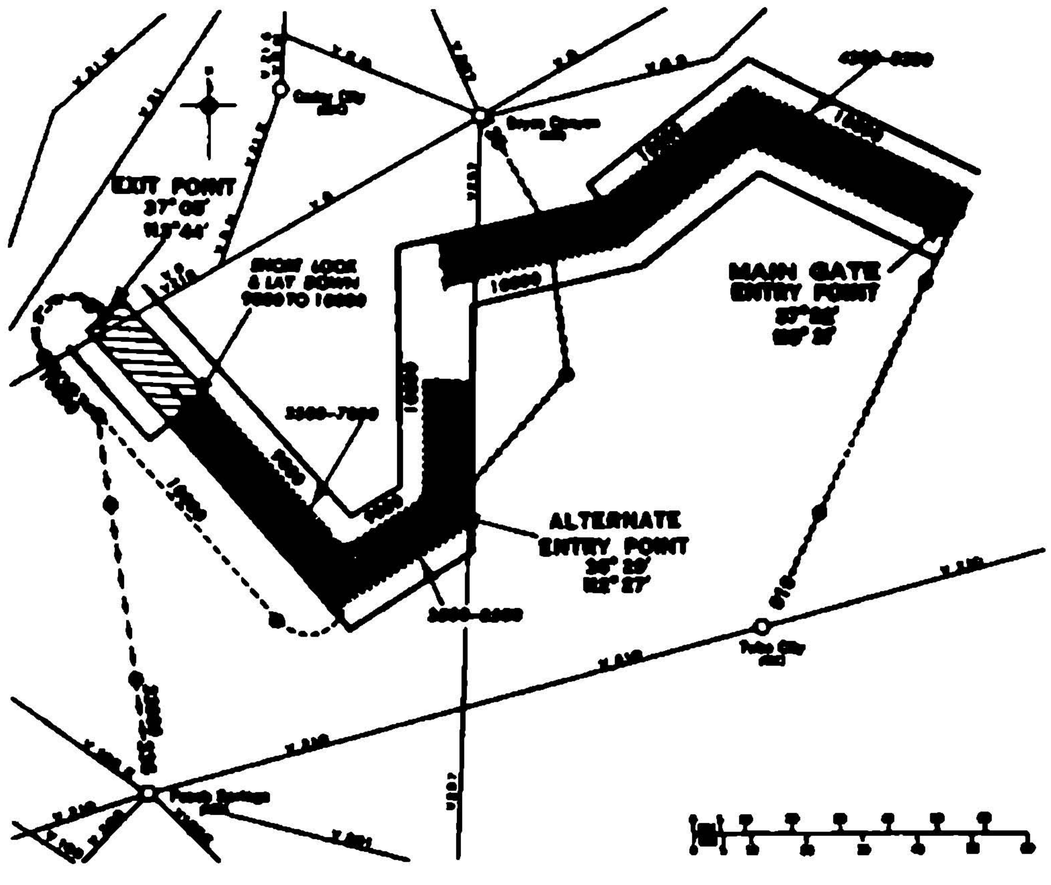
ARIZONA/UTAH

MAIN GATE

Effective May 17, 1964

Aircraft shall cross the Tuba City, Arizona VOR (36°-07'30" N, 111°16' W) (reporting point) at 23,000' MSL or as assigned by ARTCC; then maintain assigned altitude via Tuba City 010 radial until 23 nautical miles north (36°28' N, 111°04' W); then descend direct to cross 37°10' N, 110°39' W at or above 12,000' MSL, then direct to cross 37°22' N, 110°31' W at 10,000' MSL (entry point of the low level route) then 10,000' MSL direct 37°41'N, 111°17'; then 10,000' MSL direct 37°-22' N, 111°48' W; then 10,000' MSL direct 37°15' N, 112°27' W; then 10,000' MSL direct 36°29' N, 112°27' W; then descend direct to cross 36°17' N, 112°51' W at 9,000' MSL; then 9,000' MSL direct 36°48' N, 113°25' 9000' MSL; then 9000' MSL direct 36°48'N, 113°25'W.

Short Look and Lay Down—After passing 36°48' N, 113°-25'W, aircraft shall operate between 9,000' MSL and 10,000' MSL through the bomb run corridor (5 SM either side of centerline from 36°48' N, 113°25' W to 37°05' N, 113°44' W). After exiting the route at 37° 05' N, 113°44' W, aircraft shall proceed direct to cross 37°06' N, 113°47' W at or above 9,200' MSL; then direct to cross 36°57' N, 113°57' W at 10,000' MSL; then 10,000' MSL direct 36°46' N, 113°45' W; then climb via direct 36°30' N, 113°42' W (reporting point—"Main Gate 1") so as to cross 35°58' N, 113°36' W at 23,000' MSL; then intercept and proceed via Peach Springs, Arizona VOR-TAC 336 radial direct to Peach Springs (35°37'30" N, 113°32' W).



Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall after exiting the route at 37°05′N, 113°44′W proceed direct to cross 37°06′N, 113°47′W at or above 9200′ MSL; then direct to cross 36°57′N, 113°57′W at 10,000′ MSL; then 10,000′ MSL direct 36°09′N, 113°05′W; then descend direct to cross 36°17′N, 112°51′W at 9000′ MSL; then via published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visbility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 37°22′N, 110°31′W to 37°15′N, 112°27′W and from 36°52′N, 112°27′W to 36°48′N, 113°25′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft cross the Bryce Canyon, Utah VOR (37°41′30″N, 112°18′W) (reporting point) at 23,000′ MSL or as assigned by ARTCC; then proceed direct via Bryce Canyon 135 radial until 25 NM southeast (37°19′N, 112°02′W); then descend direct to cross 36°54′N, 112°-00′W at 14,000′ MSL; then direct to cross 36°29′N, 112°-27′W at 10,000′ MSL; thence via published route.

Hours of Operation—Twenty-four hours per day, seven days a week.

Route Width—The route width is reduced to 5 statute miles on the north side of course from 37°22′N, 111°48′W to 37°15′N, 112°27′W; 5 statute miles east side of course from 37°15′N, 112°27′W to 36°29′N, 112°27′W and 5 statute miles southwest of course from 36°17′N, 112°51′W to 36°48′N, 113°25′W.

KENTUCKY/TENNESSEE

ORANGE TREE

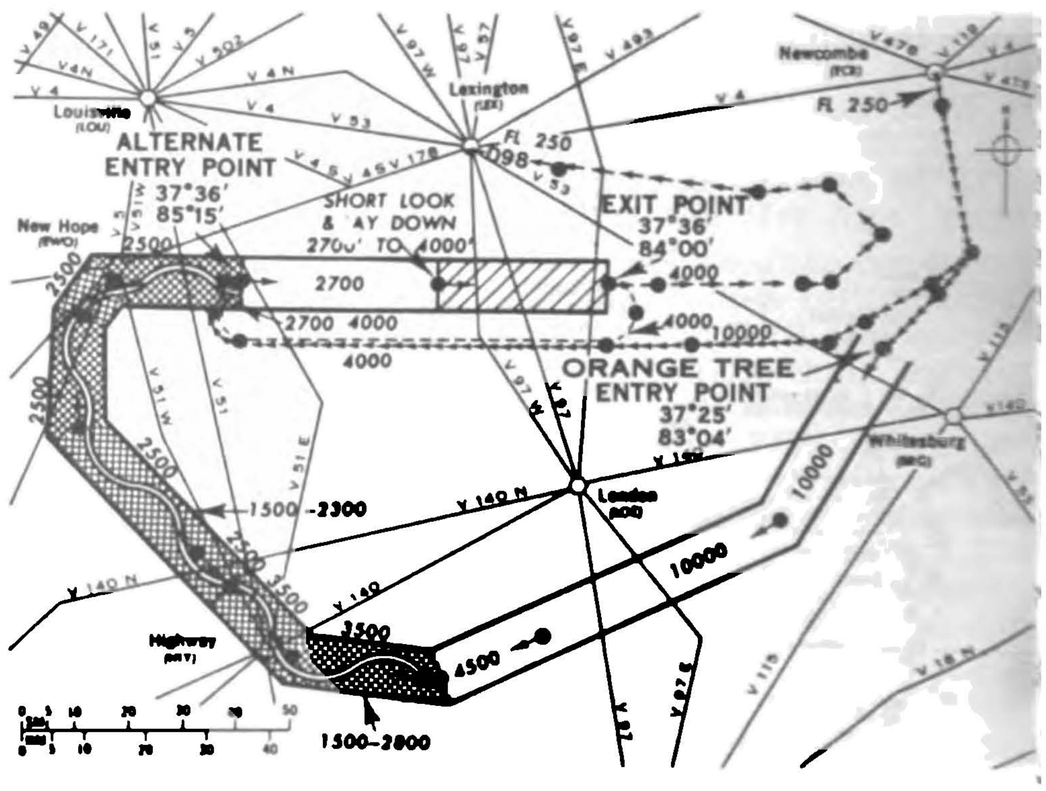
Effective November 1, 1964

Aircraft shall cross the Newcomb, Kentucky VOR at FL 250; maintain FL 250 direct 38°05′N, 82°53′W; then start descend so as to cross 37°41′N, 82°48′W at 17,000′ MSL; cross 37°34′N, 82°55′W at 14,000′ MSL; then continue descent so as to cross the route entry point at 37°25′N, 83°04′W at 10,000′ MSL, then at 10,000′ MSL direct 36°57′N, 83°25′W, then at 10,000′ MSL direct 36°38′N, 84°13′W; then start descent so as to cross 36°-31′N, 84°33′W at 4500′ MSL; then descend so as to cross 36°31′N, 84°36′W at 3500′ MSL, then at 3500′ MSL direct 36°34′N, 85°03′W, then at 3500′ MSL direct 36°46′N, 85°16′W; then descend so as to cross 36°51′N, 85°22′W at 2500′ MSL, then at 2500′ MSL direct 37°11′N, 85°-47′W, then at 2500′ MSL direct 37°30′N, 85°46′W, then at 2500′ MSL turn right to 37°35′N, 85°42′W, then at 2500′ MSL direct 37°36′N, 85°17′W; then climb so as to cross 37°36′N, 85°15′W at 2700′ MSL, then at 2700′ MSL direct to 37°36′N, 84°35′W.

Short Look and Lay Down—After passing 37°36′N, 84°-35′W aircraft shall maintain between 2700′ MSL and 4000′ MSL through the bomb run corridor (5 SM either side of centerline from 37°36′N, 84°35′W to 37°36′N, 84°00′W; the minimum IFR altitude thru the bomb run corridor is 2700′ MSL). After exiting the route at 37°-36′N, 84°00′W aircraft shall cross 37°36′N, 83°50′W at 4000′ MSL; then at 4000′ MSL direct 37°36′N, 83°20′W; then start climb direct 37°36′N, 83°15′W; cross 37°44′N, 83°05′W at or below 9000′ MSL; continue climb direct 37°52′N, 83°15′W; then climbing direct so as to cross 37°51′N, 83°30′W at or below 17,000′ MSL; then via the Lexington VORTAC 098° radial climbing so as to cross 37°56′N, 84°11′W (Lexington VORTAC 098/14) at FL 250, then at FL 250 direct to Lexington VORTAC.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 37°36′N, 84°00′W, turn right so as to cross 37°31′N, 83°55′W at 4000′ MSL, then at 4000′ MSL continue right turn to 37°26′N, 84°-00′W, then at 4000′ MSL direct 37°26′N, 85°15′W; then turn right descending so as to cross 37°31′N, 85°20′W at 2700′ MSL, then at 2700′ MSL continue right turn to 37°36′N, 85°15′W, thence via the "ORANGE TREE" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 36°31′N, 84°33′W to 37°36′N, 85°15′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.



Alternate Entry—Aircraft shall cross the Newcomb, Ky VOR at FL 250, then at FL 250 direct 38°05′N, 82°53′W; then start descent so as to cross 37°41′N, 82°48′W at 17,000′ MSL; cross 37°35′N, 82°56′W at 14,000′ MSL; cross 37°29′N, 83°08′W at 10,000′ MSL; then at 10,000′ MSL direct 37°26′N, 83°15′W; direct 37°26′N, 83°42′W; then start descent so as to cross 37°26′N, 84°00′W at 4000′ MSL; then at 4000′ MSL direct to 37°26′N, 85°-15′W; then turn right descending so as to cross 37°31′N 85°20′W at 2700′ MSL; then at 2700′ MSL direct to 37°36′N, 85°15′W; thence via the established route.

Route Width—The route width is reduced to 5 statute miles on either side of centerline throughout the entire route.

Hours of Operation—0000Z to 2400Z, 7 days weekly.

COLORADO/NEBRASKA/WYOMING

POOL SHARK

Effective January 4, 1965 through June 26, 1965

Aircraft shall cross 42°14′N, 107°07′W (Casper, Wyoming, VORTAC 201/63) at FL 220; then direct

42°14'N, 106°35'W; then descend direct to cross 42°14'N, 106°26'W at FL 200; then maintain FL 200 direct 42°-14'N, 105°59'W; then descend direct to cross 42°14'N, 105°46'W at 17,000' MSL; then maintain 17,000' MSL direct 42°13'N, 105°20'W, then maintain 17,000' MSL direct to the route entry point at 42°09'N, 104°53'W, then descend direct to cross 42°07'N, 104°42'W at 16,000' MSL; then descend direct to cross 41°47'N, 104°22'W at 8000' MSL; then descend direct to cross 41°33'N, 104°-08'W at 7300' MSL; then direct 41°07'N, 103°39'W; then descend direct to cross 41°03'N, 103°35'W at 6100' MSL; then 6100' MSL direct to 40°27'N, 102°57'W then descend direct so as to cross 40°25'N, 102°55'W at 5800' MSL then at 5800' MSL direct to 40°20'N, 102°49'W; then 5800' MSL direct 39°47'N, 102°49'W; then 5800' MSL direct 39°05'N, 102°33'W.

Short Look and Lay Down—After passing 39°05'N, 102°-33'W, aircraft shall maintain between 5800' MSL and 7000' MSL through the bomb run corridor (5 SM either side of centerline from 39°05'N, 102°33'W to 38°32'N, 102°21'W). After exiting the route at 38°32'N, 102°-21'W; aircraft shall climb direct to cross 38°24'N, 102°-20'W at 9000' MSL; then maintain 9000' MSL direct 37°59'N, 102°18'W; then 9000' MSL direct 37°45'N, 102°27'W; then climb direct to cross 37°40'N, 102°31'W at 12,000' MSL; then 12,000' MSL direct 37°20'N, 102°-39'W; then climb direct to cross 37°09'N, 102°44'W at or above 16,000' MSL; then climb direct to cross 36°-49'N, 102°40'W at FL 210; then maintain FL 210 direct to Dalhart, Texas, VORTAC.

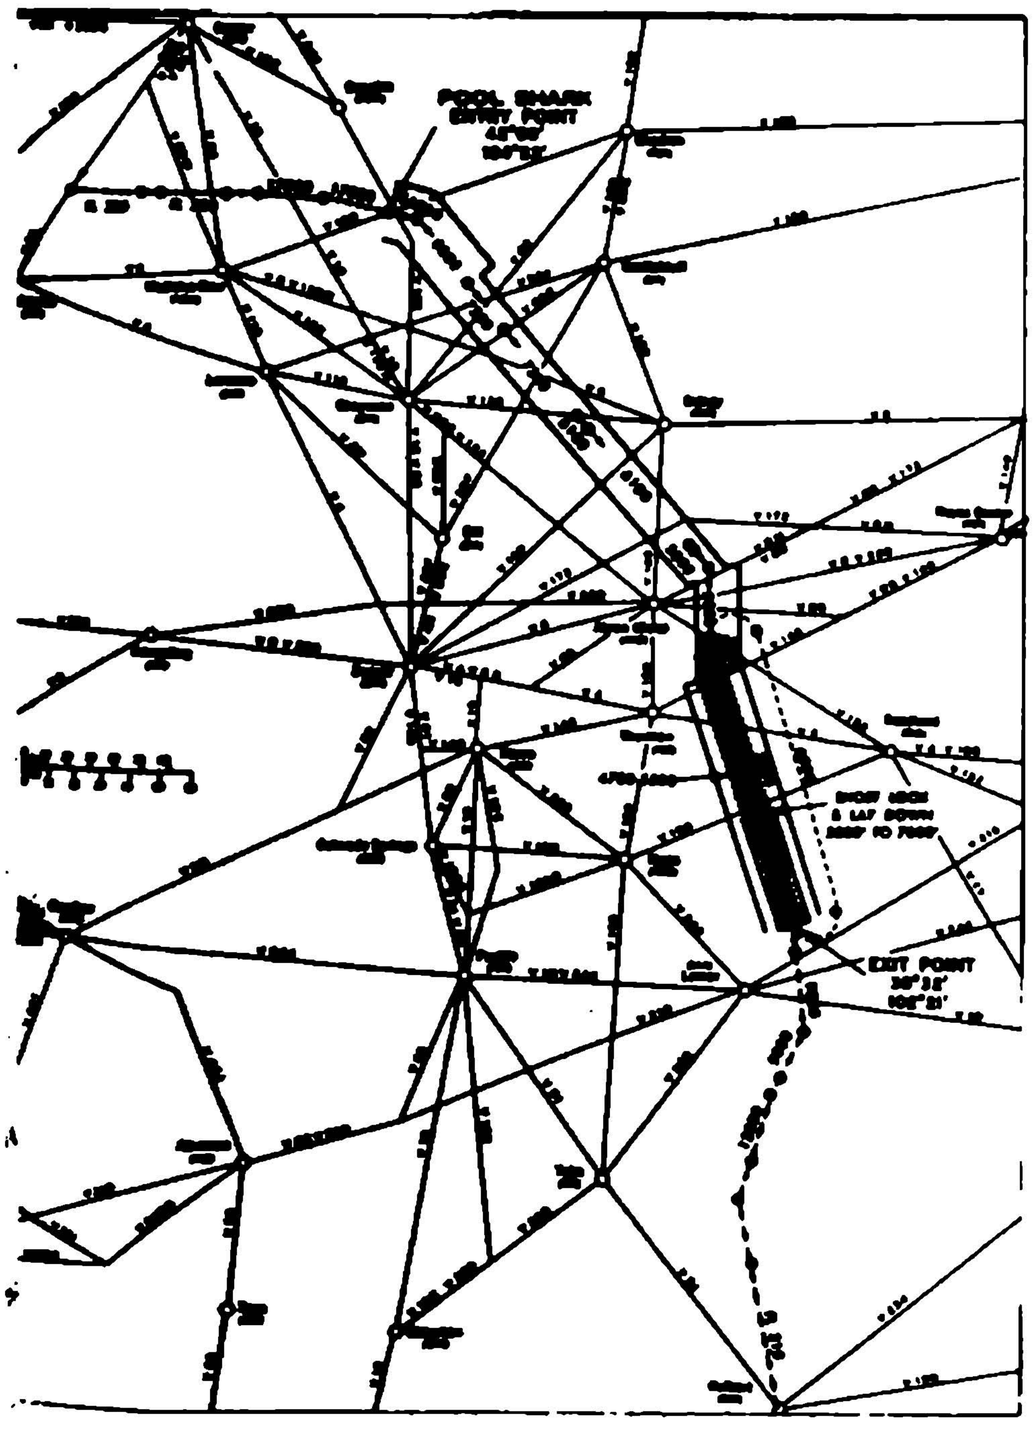
Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°32'N, 102°21'W, turn left to cross 38°35'N, 102°04'W at 6000' MSL; then 6000' MSL direct to 40°00'N, 102°31'W; then turn left to cross 40°00'N, 102°49'W at 5800' MSL, thence via the published route.

Alternate Entry—None.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart bewteen the following points 40°00'N, 102°49'W to 38°-32'N, 102°21'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Route Width—The route width is reduced to 5 SM on the NE side of the centerline from 41°47'N, 104°22'W to 40°20'N, 102°49'W, and to 5 SM on the west side of centerline from 40°20'N, 102°49'W to 39°47'N, 102°49'W.

Hours of Operation—24 hours daily, 7 days per week.



ARIZONA/NEW MEXICO

PRIMA DONNA

Effective October 5 thru December 23, 1964

Aircraft shall cross the Truth or Co[illegible]equences, N. Mex. VORTAC 201° radial, 38 NM fix (32°[illegible]107°42'W) at FL 250 or as assigned by Albuque[illegible]TC Center; descend southwestbound via the T[illegible]onsequences, N. Mex. 201° radial to 32°35'N, 1[illegible] turn right to 32°31'N, 107°57'W direct to cros[illegible], 108°16'W at 14,000' MSL; maintain 14,000'[illegible]ct to 32°54'N, 108°35'W, (Route entry point)[illegible]n 14,000' MSL direct to 34°22'N, 109°49'W;[illegible]ent to cross 34°-26'N, 109°49'W at or above 1[illegible]L; direct to cross 34°38'N, 109°50'30''W at 9[illegible]; maintain 9000' MSL direct to 35°02'30''N,[illegible] turn right at 9000' MSL to 35°09'30''N, 109°37'[illegible] direct to cross 35°-10'N, 109°18'W at 9800' M[illegible]ain 9800' MSL direct to 35°17'N, 108°38'W.

Short Look and Lay Dow[illegible] passing 35°17'N, 108°-38'W, aircraft shall m[illegible]etween 9800' MSL and 10,000' MSL through th[illegible]un corridor (5 SM either side of centerline fro[illegible]N, 108°38'W to 35°25'N, 107°52'W). After ex[illegible]route at 35°25'N, 107°52'W aircraft shall climb[illegible]o cross 35°28'N, 107°37'W at 11,000' MSL;[illegible]climbing to intercept the Crownpoint, N. M[illegible]101° radial, then climb via the Crownpoint V[illegible]radial so as to cross 35°39'N, 107°40'W at 15,0[illegible]then climb direct so as to cross 35°42'N, 107°46'[illegible]000' MSL; then at 17,000' MSL direct to the C[illegible]. VOR.

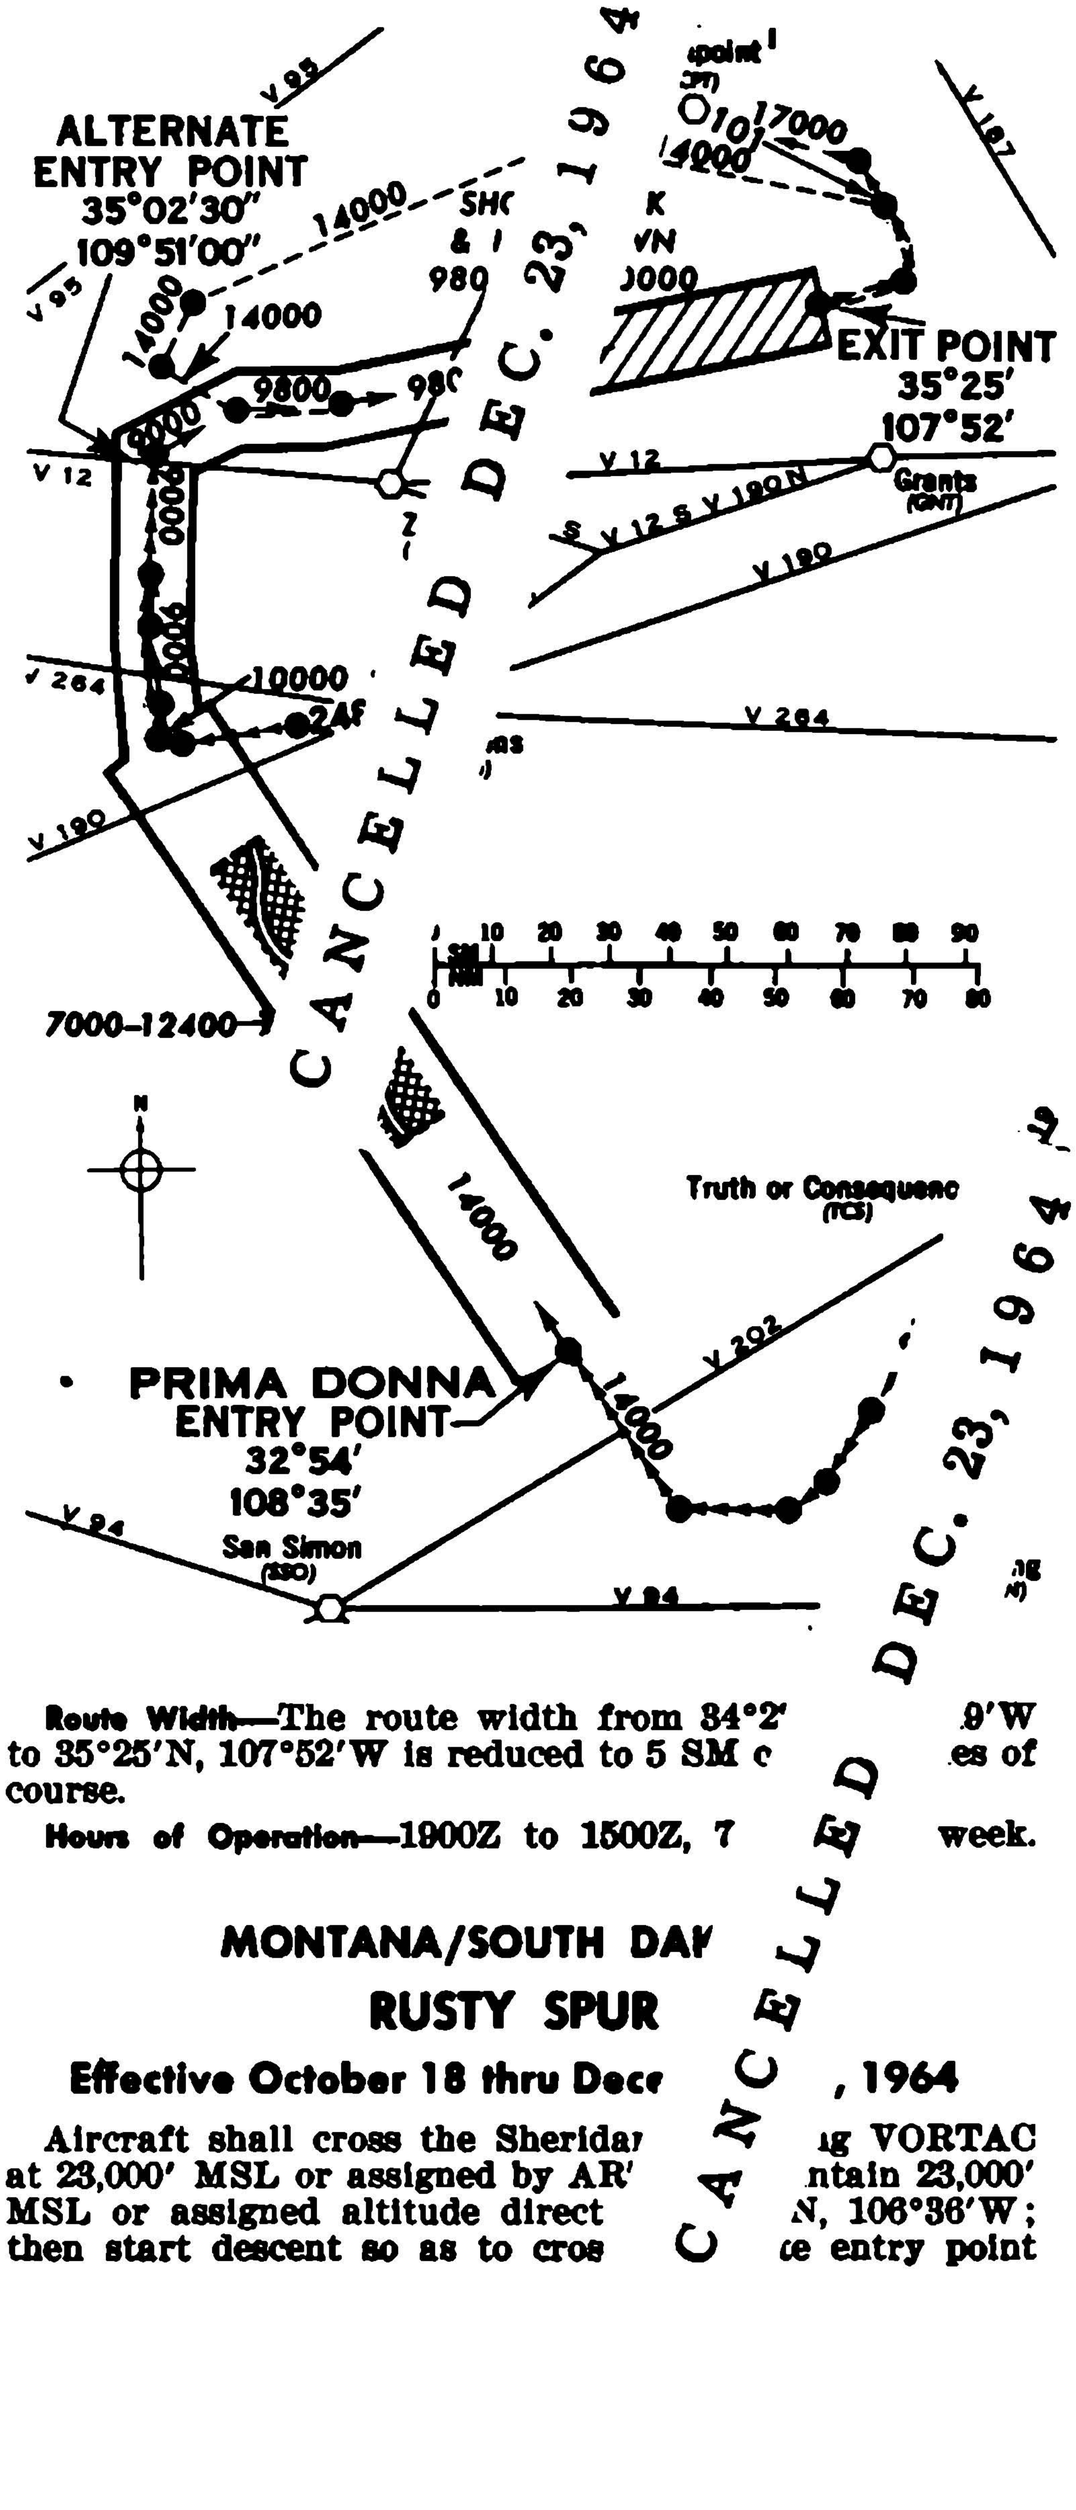
Re-Entry—Af[illegible]eting the initial short look bomb run aircraft[illegible]scheduled to execute an additional bomb run sh[illegible]exiting the route at 35°25'N, 107°-52'W, climb[illegible]0' MSL direct to 35°28'N, 107°37'W, turn left[illegible]cross 35°39'N, 107°40'W, at 14,000' MSL, ma[illegible]000' MSL direct to 35°48'N, 108°38'W, 14,000'[illegible]ct to 35°24'N, 109°45'W, turn left at 14,000' MS[illegible]35°15'N, 109°50'W, turn left at 14,000' MSL to 35°0[illegible]0'N, 109°37'W; descend direct to cross 35°10'N, 109°18'W at 9800' MSL thence via published route.

VFR and Contour—If the encountered weather conditions along the route are equal or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 33°26'N, 109°01'W to 34°05'N, 109°34'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the

CANCELLED DEC. 23, 1964

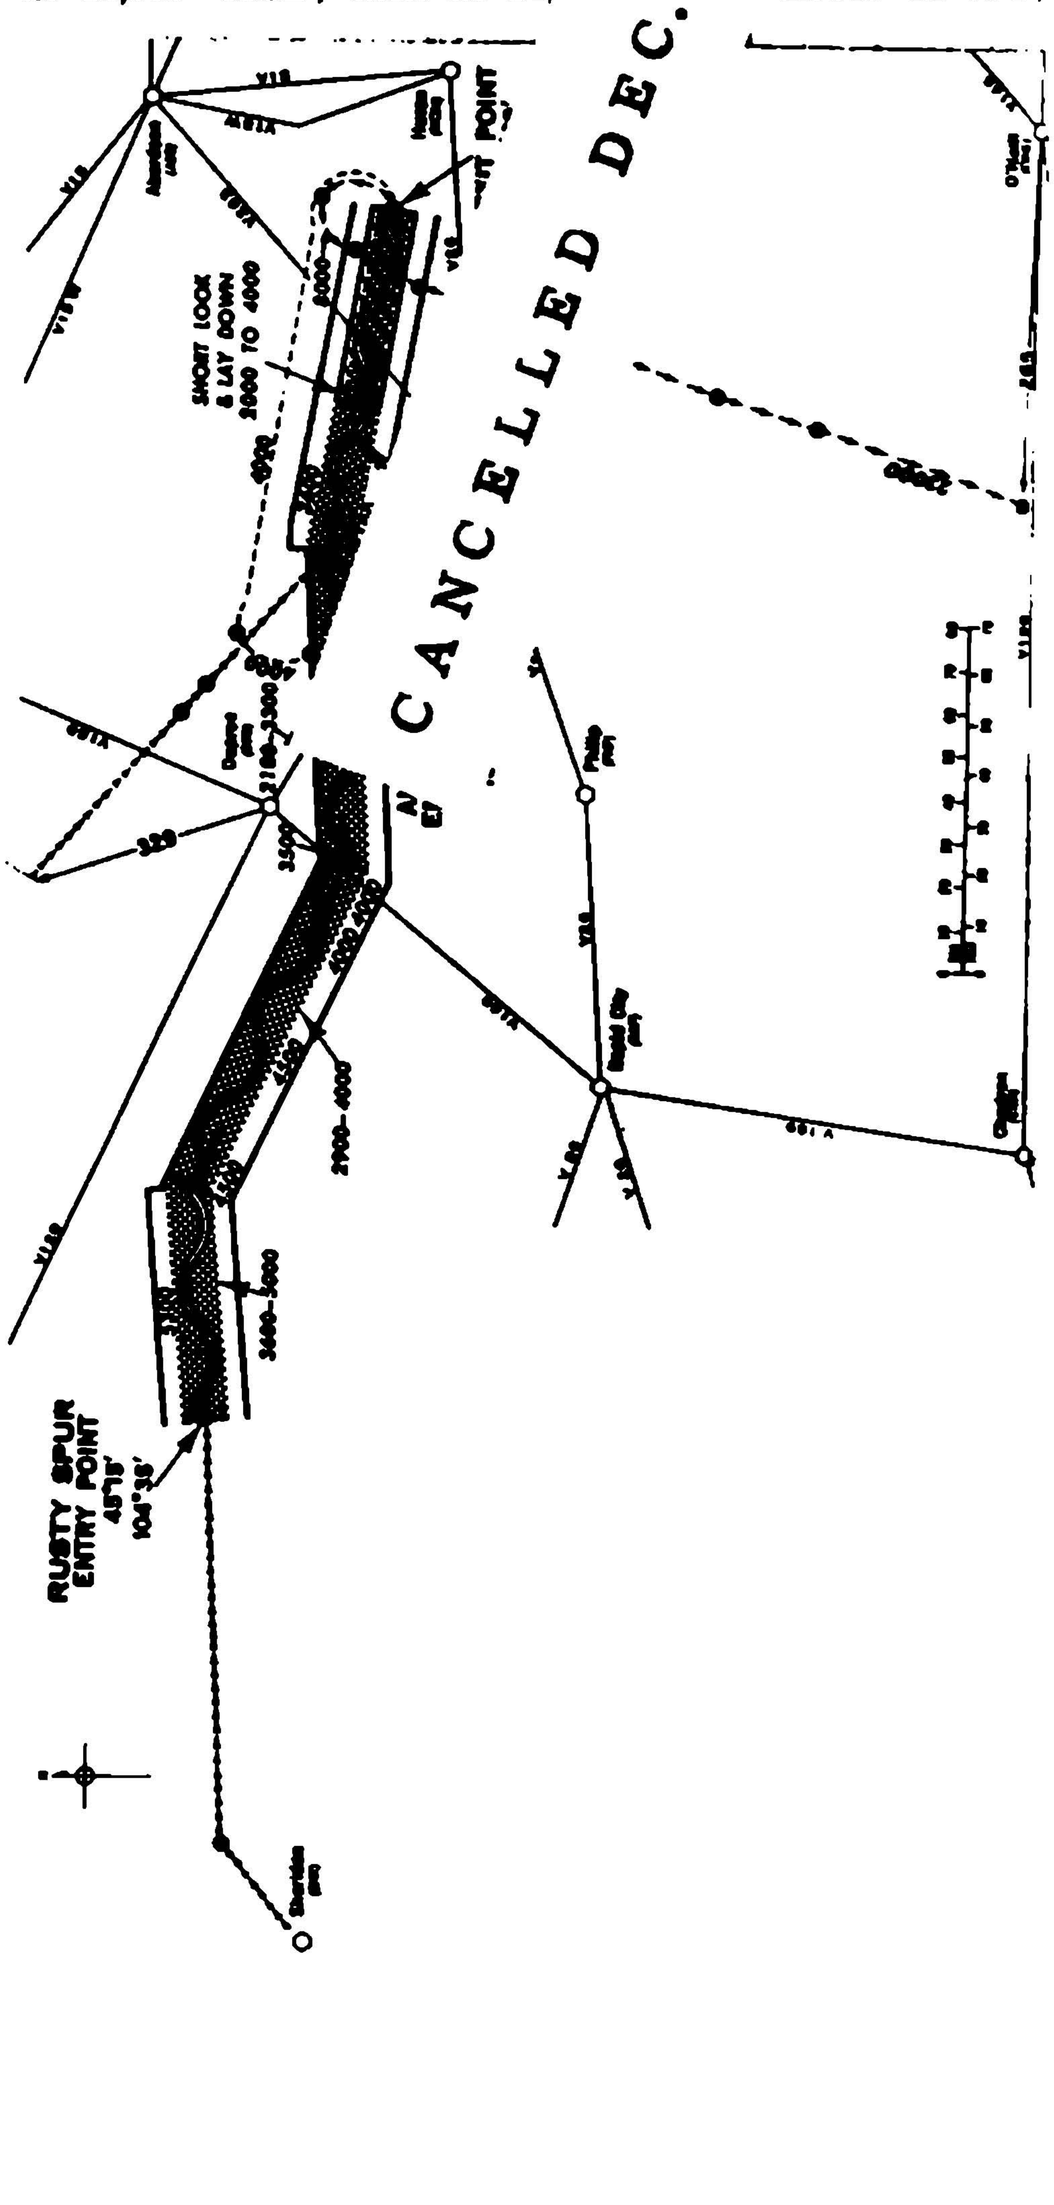
terrain. The lower VFR altitude sho ~n on the chart is the minimum that will be reached on egment during daylight hours.

Alternate Entry—Aircraft shall cross :. Johns, Arizona VORTAC at 15,000′ MSL or ;ned by Albuquerque ARTC Center, maintain l altitude via the St. Johns VORTAC 248° radia e 13 NM DME fix; then descend via the St. John radial to cross 34°21′30″N, 109°44′30″W at 10,00 ; then at 10,000′ MSL turn right to 34°38′N, 109° N; then descend direct so as to cross 34°44′N, 1 at 9000′ MSL; then at 9000′ MSL direct to 30″N, 109°51′W; thence via the published route.



at 45°15′N, 104°35′W at 5300′ MSL; then at 5300′ MSL direct to 45°20′N, 103°30′W; then descend so as to cross 45°18′N, 103°23′W at 4500′ MSL; then at 4500′ MSL direct 44°57′N, 102°20′W; then descend direct so as to cross 44°55′N, 102°14′W at 4000′ MSL; then at 4000′ MSL direct to 44°50′N, 102°00′W; then descend direct so as to cross 44°50′N, 101°55′W at 3500′ MSL; then at 3500′ MSL direct to 44°53′N, 100°30′W; then climb so as to cross 44°53′N, 100°23′W at 3600′ MSL; then at 3600′ MSL direct to the entry point of the bomb run corridor at 44°47′N, 99°49′W.

Short Look and Lay Down—After p ing 44°47′N, 99°-49′W, aircraft shall maintain betv ′ MSL and 4000′ MSL through the bomb run SM either side of centerline from 44°47′N, o 44°39′N, 98°55′W), the minimum IFR alti h the bomb run corridor is 3600′ MSL. Af the route at 44°39′N, 98°55′W, aircraft sha climbing so as to cross 44°52′N, 98°51′W SL; then at 8000′ MSL continue left turn 7′N, 99°06′W; then start climb direct so as '35′N, 99°17′W at 14,000′ MSL; then at 14, direct 44°05′N,



Route Width—The route width from 34°2′ 9′W to 35°25′N, 107°52′W is reduced to 5 SM c es of course.

Hours of Operation—1900Z to 1500Z, 7 week.

MONTANA/SOUTH DAK

RUSTY SPUR

Effective October 18 thru Dece , 1964

Aircraft shall cross the Sheridan ig VORTAC at 23,000′ MSL or assigned by ART ntain 23,000′ MSL or assigned altitude direct N, 106°36′W; then start descent so as to cros e entry point

99°33'W then start climb direct O'Neil. ska VOR-TAC 265/74 (42°35'N, 100°21'W); 43°36'N, 99°49'W at or above 20,000' MSL; 43°16'N, 100°00'W at 23,000' MSL; then ma ,000' MSL to O'Neil 265/74.

Re-Entry—After completing the nb run, aircraft that are scheduled to exec ditional bomb run shall after passing 44°39'N turn left and climb to or maintain 4000' MS 52'N, 98°51'W; then at 4000' MSL direct to 4' 0°55'W; then at 4000' MSL turn left to 44°57' 'W; then at 4000' MSL direct 44°53'N, 100°30'' e via the published route.

VFR and Contour—If the d weather conditions along the route are equa' ter than ceiling 3000', visibility 5 miles, the pil scend VFR and operate between the VFR alti' icated on the chart between the following p om 45°15'N, 104°35'W to 44°39'N, 98°55'W. aylight hours, some VFR operations will be flo above the immediate terrain. VFR operations co during the hours of darkness will not be flowr han 800' above the terrain. The lower VFR nown on the chart is the minimum altitude th e reached during daylight hours.

Alternate Entr ft shall cross the Dupree, South Dakota VOR 53 (45°55'N, 102°06'W) at 20,000' MSL or bel ssigned by ARTCC; then descend direct so ar 45°23'N, 101°16'W at 16,000' MSL; then desce o cross 45°18'N, 101°08'W at or above 14,000' M descend direct so as to cross 44°53'N, 100°30'W ' MSL; thence via the published route.

Route Width—The route width is reduced to 5 SM on the north side of centerline from 45°20'N, 103°30'W to 44°53'N, 100°30'W.

Hours of Operation—24 hours daily, 7 days per week.

CANCELLED DEC. 23, 1964

TEXAS

SEA HORSE

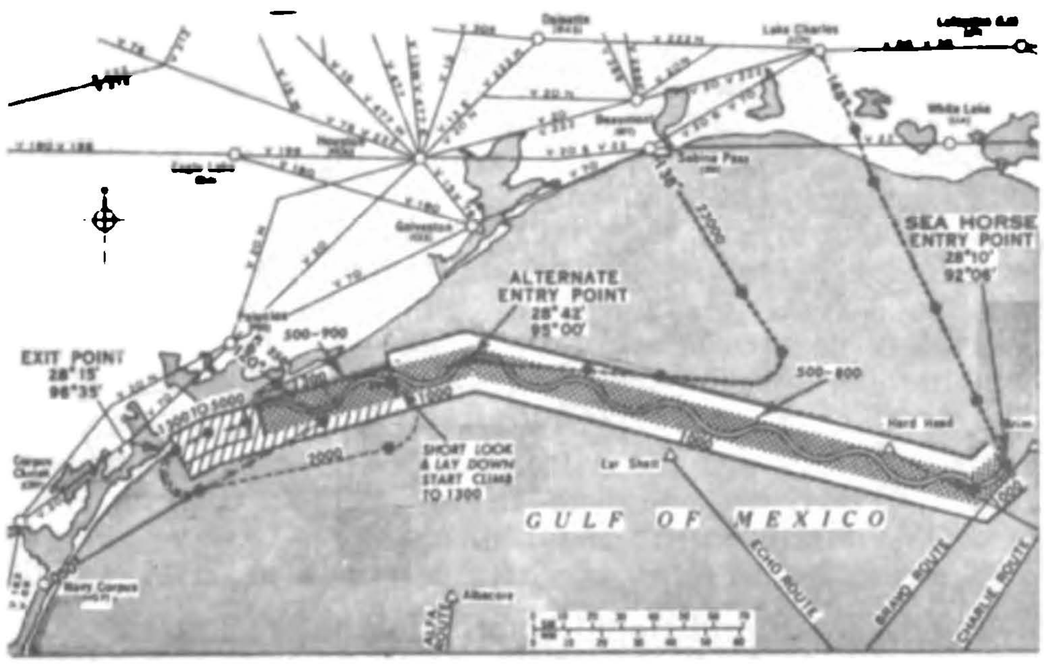
Effective July 12, 1964

Aircraft shall cross the Lake Charles, La., VOR at 23,000' MSL, or as assigned; maintain 23,000' MSL or as assigned via the Lake Charles VOR 148° radial to to 25 NM fix; start descent, cross 29°31'N, 92°47'W at 19,000' MSL, descend direct to cross 28°55'N, 92°28'W at 15,000' MSL, descend direct to cross 28°28'N, 92°15'W at 8000' MSL or below, descend direct to cross 28°10'N, 92°06'W at 1000' MSL (Low level entry point). Maintain 1000' MSL, turn right to 28°03'N, 92°16'W, direct to 28°42'N, 95°00'W, direct to 28°35'N, 95°25'W.

Short Look and Lay Down—After passing 28°35'N, 95°-25'W climb to 1300' MSL direct 28°23'N, 96°12'W. After passing 28°23'N, 96°12'W aircraft shall maintain between 1300' and 5000' MSL through the bomb run corridor (5 SM either side of centerline from 28°23'N, 96°12'W direct 28°20'N, 96°25'W direct 28°15'N, 96°35'W). (The minimum IFR altitude through the bomb run corridor is 1300' MSL) to 28°15'N, 96°35'W, the route exit point, turn left to intercept the Navy Corpus VOR 050 radial (reporting point); then climb via the Navy Corpus VOR 050 radial to intercept the Palacios, Texas VOR 120 radial at 18,000' MSL or above. Climb via the Palacois VOR 120 radial so as to reach FL 250 at a point 18 NM southeast of the Palacios VOR, cross the Palacios VOR at FL 250.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 28°15'N, 96°-35'W turn left to intercept the Navy Corpus VOR 050° radial at 2000' MSL, maintain 2000' MSL direct 28°-22'N, 95°26'W; turn left descending so as to cross 28°-35'N, 95°25'W at 1300' MSL, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 28°10'N, 92°06'W to 28°24'N, 96°09'W. During daylight hours, some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached during daylight hours.



Alternate Entry—Aircraft shall cross the Sabine Pass VOR at 23,000' MSL or as assigned, then via Sabine Pass VOR 138° radial maintaining 23,000' MSL until the 47 NM fix (29°02'N, 93°33'W). Start descent direct to cross 28°44'N, 93°19'W at 16,000' MSL turn right, descend to cross 28°37'N, 93°58'W at 4000' MSL; descend direct to cross 28°39'N, 94°21'W at 1000' MSL direct 28°42'N, 95°00'W thence via published route.

Route Width—The route width is reduced to 5 SM north of the centerline from 28°35'N, 95°25'W to 28°15'N, 96°35'W.

Hours of Operation—24 hours daily, seven days per week.

NEW YORK/VERMONT

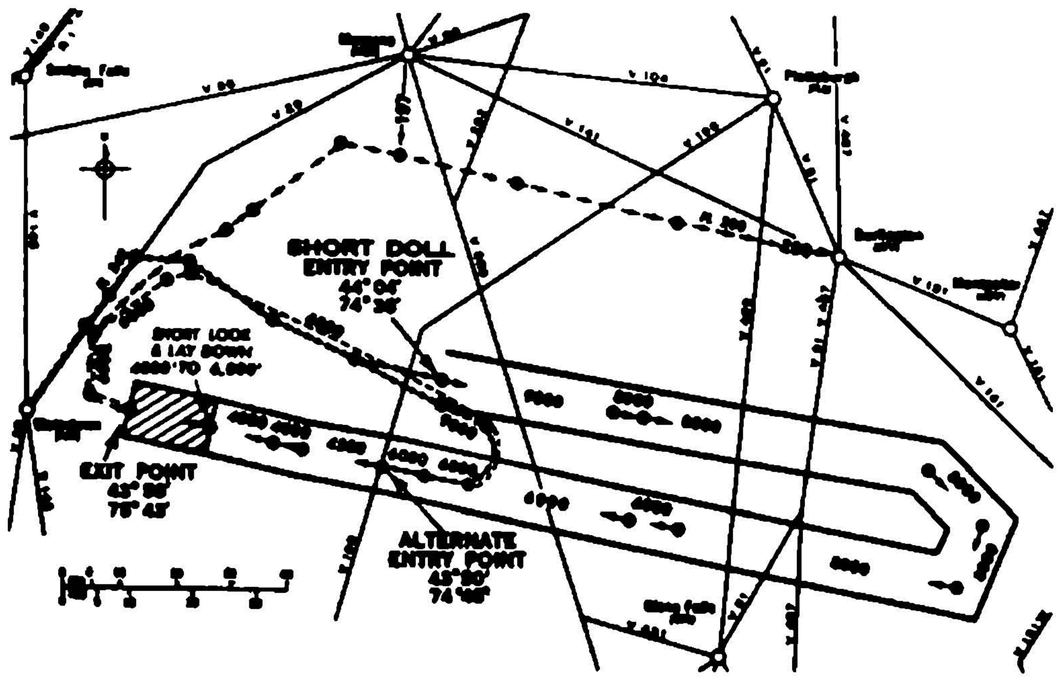
SHORT DOLL

Effective September 6, 1964

Aircraft shall cross 43°57'N, 76°04'W (Watertown, New York VOR) at FL 290; descend, cross 44°11'N, 75°52'W at FL 250 or above ; cross 44°16'N, 75°47'W at FL 240; direct 44°22'N, 75°42'W; cross 44°22'N, 75°-30'W at 19,000'; cross 44°13'N, 75°12'W at 14,000'; cross 44°07'N, 74°54'W below 12,000'; cross 44°04'N, 74°35'W, the entry point to the low level route, at 9000'; maintain 9000' direct 43°59'N, 73°58'W; descend, cross 43°58'N, 73°52'W at 8000'; maintain 8000' direct 43°-50'N, 72°52'W; direct 43°41'N, 72°40'W; direct 43°31'N, 72°46'W; direct 43°40'N, 73°45'W; descend, cross 43°-42'N, 73°56'W at 6000' MSL; direct 43°50'N, 74°48'W; descend, cross 43°52'N, 75°05'W at 4500' MSL; descend, cross 43°53'N, 75°11'W at 4000' MSL, maintain 4000' MSL direct to the entry point of the bomb run corridor at 43°55'N, 75°25'W.

Short Look and Lay Down—After passing 43°55'N, 75°-25'W aircraft shall operate through the bomb run corridor between 4000' and 6000' MSL (the bomb run corridor is 5 SM either side of centerline from 43°55'N,

75°25′W to 43°58′N, 75°43′W). After exiting the low level route at 43°58′N, 75°43′W aircraft shall cross 44°-00′N, 75°51′W at 6000′ MSL, maintain 6000′ MSL direct 44°10′N, 75°51′W; direct 44°27′N, 75°22′W; climb, cross 44°30′N, 75°17′W at 13,000′ or below; cross 44°41′N, 74°58′W at 15.000′ or above (Burlington, Vt. VOR 298 radial); direct (via Burlington VOR 298 radial) cross 44°39′N, 74°45′W at 19,000′ (Massena, N.Y. VOR 197 radial); continue climb, cross 44°35′N, 74°19′W at 23,000′; cross 44°29′N, 73°45′W at FL 280, maintain FL 280, direct 44°24′N, 73°11′W (Burlington, Vt. VOR).



Re-Entry—After completing the bomb run, aircraft scheduled for an additional bomb run shall, after exiting the route at 43°58′N, 75°43′W; cross 44°00′N, 75°51′W at 6000′; maintain 6000′ direct 44°10′N, 75°51′W; direct 44°19′N, 75°35′W; direct 44°20′N, 75°30′W; direct 43°-57′N, 74°26′W; right turn to 43°47′N, 74°30′W; thence via the "Short Doll" route.

Alternate Entry—Aircraft shall cross 43°57′N, 76°04′W (Watertown, N.Y. VOR) at FL 290; descend, cross 44°-11′N, 75°52′W at FL 250 or above; cross 44°16′N, 75°-47′W at FL 240, direct 44°22′N, 75°42′W; cross 44°22′N, 75°30′W at 19,000′; cross 44°13′N, 75°12′W at 14,000′; cross 44°07′N, 74°54′W below 12,000′; cross 44°00N, 74°35′W at 9000′; maintain 9000°, direct 43°57′N, 74°-26′W; right turn to 43°47′N, 74°30′W; descend, cross 43°48′N, 74°39′W at 7000′ or below; cross 43°50′N, 74°-48′W at 6000′; thence via the "Short Doll" route.

Route Width—The entire low level route is reduced to 5 SM either side of centerline.

Hours of Operation—0000Z to 2359Z, Monday thru Sunday.

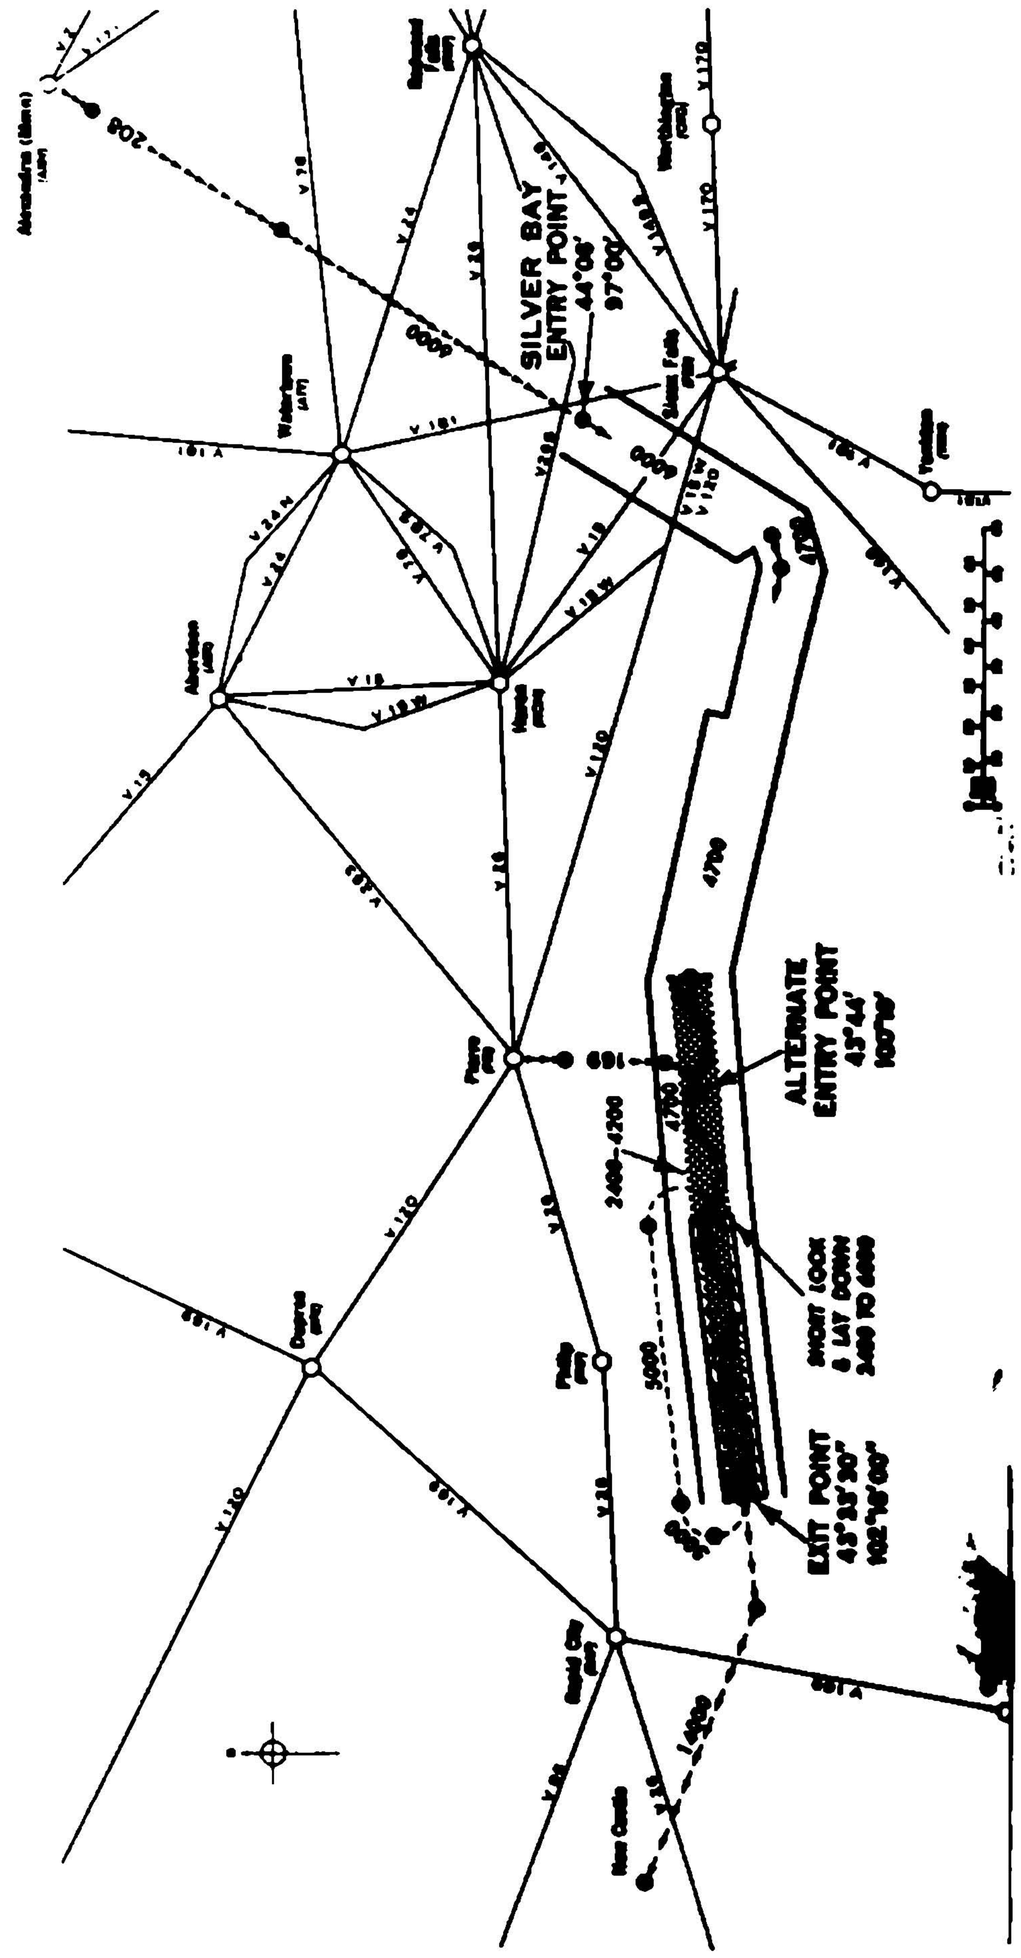
SOUTH DAKOTA

SILVER BAY

Effective October 18, 1964

Aircraft shall cross the Alexandria, Minn. VOR at 20,000′ MSL or as assigned by ARTCC and proceed via the Alexandria VOR 208° radial maintaining 20,000′ MSL or assigned altitude until 10 NM SW; then descend direct so as to cross 45°10′N, 96°00′W at 6000′ MSL; then at 6000′ MSL direct 44°08′N, 97°00′W (low level entry point); then at 6000′ MSL direct 43°29′N, 97°35′W; then turn right descending so as to cross 43°27′N, 97°45′W at 4700′ MSL; then at 4700′ MSL direct 43°47′N, 99°45′W; then at 4700′ MSL direct to 43°42′N, 100°56′W.

Short Look and Lay Down—After passing 43°42′N, 100°-56′W, aircraft shall maintain between 2400′ MSL and 6000′ MSL through the bomb run corridor (5 SM either side of centerline from 43°42′N, 100°56′W to 43°33′-30″N, 102°18′W). The minimum IFR altitude through the corridor is 4700′ MSL. After exiting the route at 43°33′30″N, 102°18′W aircraft shall climb so as to cross 43°30′N, 102°50′W at 14,000′ MSL; then at 14,000′ MSL direct to 43°51′N, 104°13′W. (New Castle, Wyoming)



Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall after exiting the route at 43°33′30″N, 102°18′W turn right and climb or descend so as to cross 43°40′N, 102°29′W, at 5000′ MSL; then at 5000′ MSL continue turn to 43°47′N, 102°20′W; then at 5000′ MSL direct 43°55′N, 100°58′W; then turn right descending so as to intercept the Silver Bay route at 43°42′N, 100°56′W at 4700′ MSL; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 43°47′N, 99°45′W to 43°33′30″N, 102°18′W. During daylight hours some VFR

operations will be flown 500' above the immediate terrain. VFR operation conducted during the hours of darkness will not be flonw lower than 800' above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pierre, South Dakota VOR (reporting point) at 15,000' MSL or below as assigned by ARTCC; then proceed via the Pierre VOR 169° radial maintaining 15,000' MSL or assigned altitude until 10 NM south (44°13'N, 100°10'W); then descend direct to 43°52'N, 100°10'W; then turn right descending so as to cross 43°44'N, 100°19'W at 4700' MSL; thence via the published route.

Route Width—The route width is reduced to 5 SM north of centerline between 43°29'N, 97°35'W to 43°35'N, 98°-30'W.

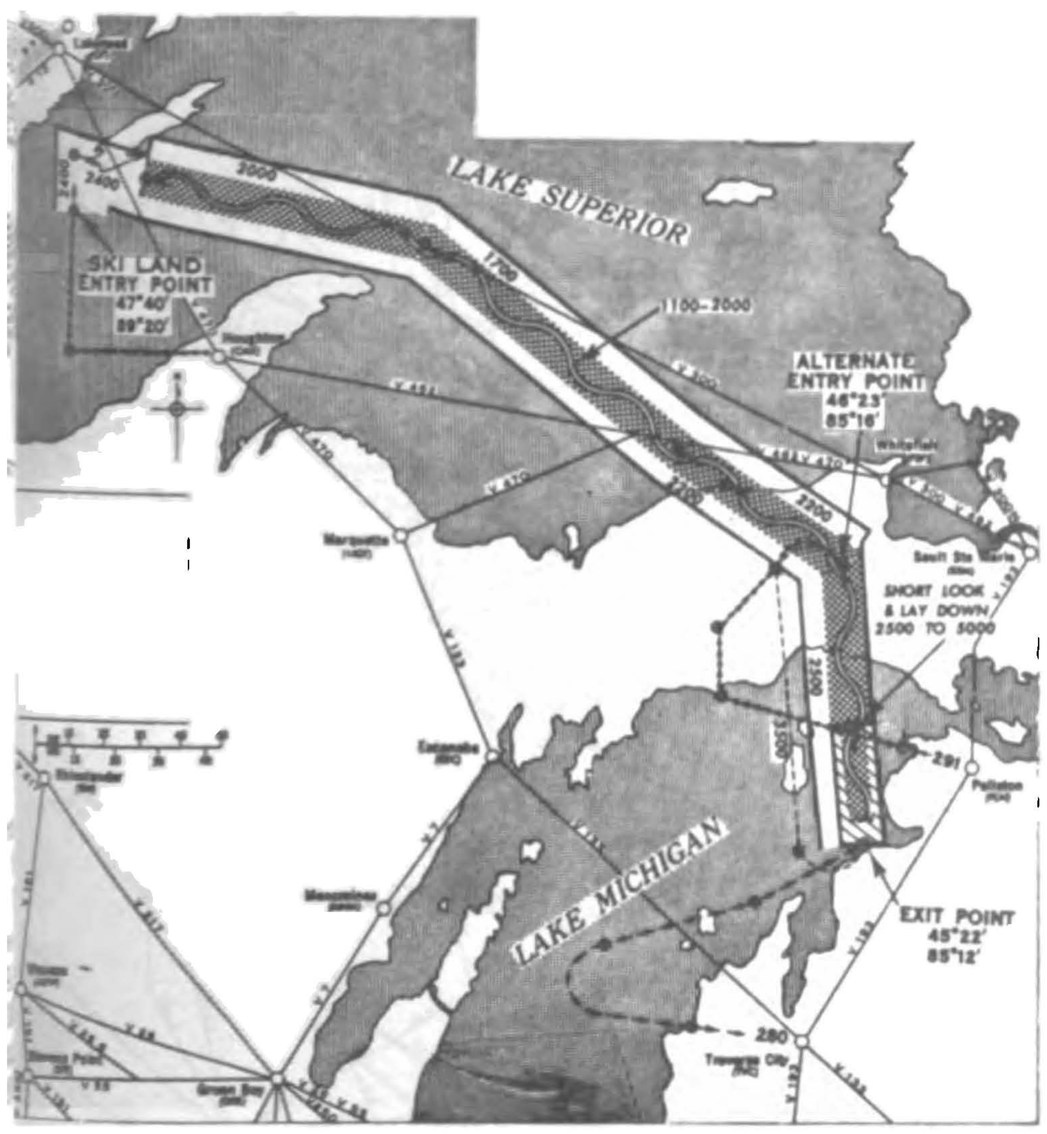
Hours of Operation—24 hours daily seven days per week.

MICHIGAN

SKI LAND

Effective September 6, 1964

Aircraft shall cross the Houghton, Michigan VOR at 20,000' MSL or as assigned by ARTCC; then descend direct so as to cross 47°10'N, 89°20'W at 11,000' MSL; then turn right continuing descent so as to cross the route entry point at 47°40'N, 89°20'W at 2400' MSL, then at 2400' MSL direct 47°52''N, 89°20'W, then at 2400' MSL direct 47°48'N, 88°55'W; then descend to 2000' MSL direct 47°35'N, 87°25'W; then descend to 1700' MSL direct 46°49'N, 86°06'W; then climb so as to cross 46°42'N, 85°52'W at 2200'MSL, then at 2200' MSL direct 46°23'N, 85°16'W; then climb to 2500' MSL direct 45°-18'N, 85°15'W.



Short Look and Lay Down—After passing 45°48'N, 85°15'W aircraft shall maintain between 2500' MSL and 5000' MSL through the bomb run corridor (5 SM either side of centerline from 45°48'N, 85°15'W to 45°22'N, 85°-12'W. The minimum IFR altitude through the bomb run corridor is 2500' MSL); after passing 45°22'N, 85°12'W then turn right climbing so as to cross 45°10'N, 85°47'W at 10,000' MSL; then climb direct so as to cross 45°01'N, 86°33'W at 12,000' MSL. Turn left to intercept 280° radial of the Traverse City VOR climbing so as to cross Traverse City VOR 280/25 at 21,000' MSL. Continue climbing via the Traverse City VOR 280° radial so as to cross the Traverse City VOR at FL 250.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 45°22'N, 85°12'W, turn right climbing so as to cross 45°21'N, 85°32'W at 3500' MSL, then at 3500' MSL direct to 46°23'N, 85°37'W; then turn right descending so as to cross 46°23'N, 85°-16'W at 2500' MSL; thence via the "Ski Land" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°48'N, 88°55'W to 45°27'N, 85°13'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mich. VOR at 20,000' MSL, or as assigned by ARTCC; then proceed via the 291° radial of the Pellston VOR at 20,000' MSL or assigned altitude until crossing the Pellston VOR 291/15; then descend direct so as to cross 45°55'N, 85°55'W at 8000' MSL; then continuing descent turn right direct so as to cross 46°09'30''N, 85°55'W at or below 4000' MSL; then continue descent so as to cross 46°23'N, 85°37'W at 2500' MSL, then at 2500' MSL turn right to 46°23'N, 85°16'W; thence via the "Ski Land" route.

Route Width—The route width is reduced to 5 statute miles west and north of centerline from 47°40'N, 89°-20'W to 47°48'N, 88°55'W, and east of centerline from 46°23'N, 85°16'W to 45°22'N, 85°12'W.

Hours of Operation—0000Z to 2400Z, 7 days a week.

OREGON

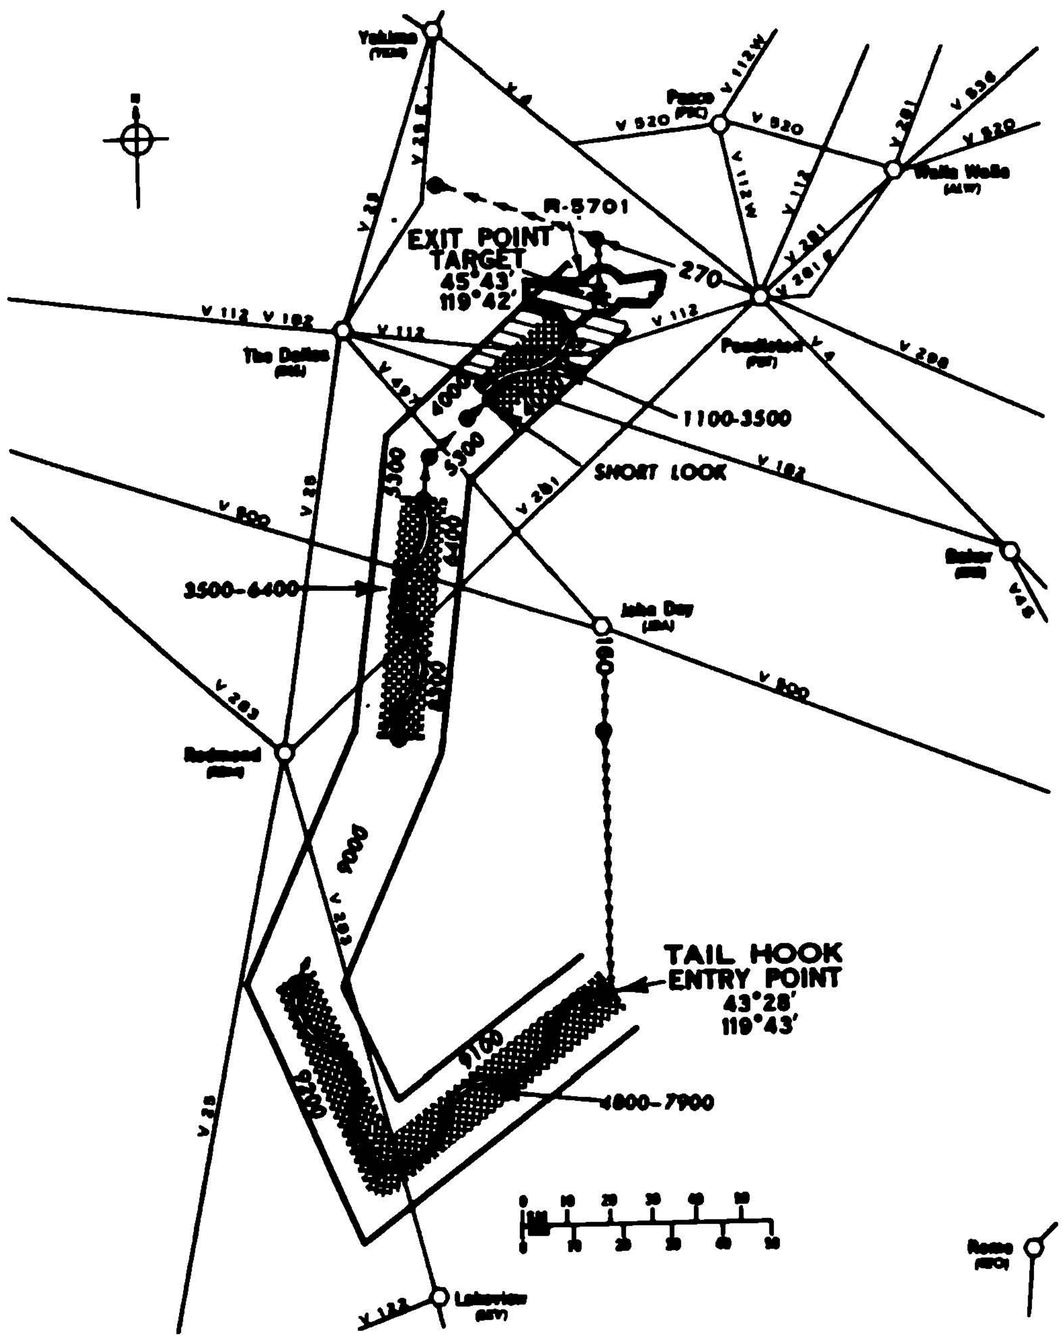
TAIL HOOK

Effective February 12, 1963

Aircraft shall cross the John Day, Oregon VOR (reporting point) at 23,000' MSL, or as assigned by Seattle ARTCC; then proceed via the John Day VOR 160° radial, maintaining assigned altitude until 20 nautical miles south of the John Day VOR (44°19'N, 119°43'W); then descend to 9100' MSL to the entry point of the low level route at 43°28'N, 119°43'W; then 9100' MSL direct to 42°54'N, 120°45'W; then climb to 9200' MSL direct to 43°31'N, 121°08'W; then descend to 9000' MSL direct to 44°18'N, 120°39'W; then descend to 8300' MSL direct to 44°40'N, 120°36'W; then descend to 6400' MSL direct to 45°05'N, 120°31'W; then descend to 5300' MSL direct to 45°13'N, 120°30'W; then 5300' MSL direct to 45°20'N, 120°19'W; then descend so as to cross 45°23'N, 120°13'W at 4000' MSL.

Short Look—After passing 45°23'N, 120°13'W, aircraft shall maintain 4000' MSL until within Restricted Area R-5701; after crossing RBS target located at 45°43'N, 119°42'W, the route exit point, aircraft shall make a climbing left turn so as to intercept the Pendleton, Oregon VORTAC 270° radial 34 nautical mile fix (reporting point) at or above 11,000' MSL; then climb westbound

on the Pendleton VORTAC 270° radial so as to cross the Pendleton VORTAC 270° radial 68 nautical mile fix at 23,000′ MSL.



VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′ visibility five miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 43°28′N, 119°43′W to 43°31′N, 121°08′W, from 44°18′N, 120°39′W to 45°05′N, 120°31′W, and from 45°23′N, 120°13′W to restricted area R–5701. During daylight hours, VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness shall not be flown lower than 800′ above terrain. The lower VFR altitude shown on the chart is the minimum altitude that shall be reached on each route segment during daylight hours.

Hours of Operation—1600Z to 2400Z Monday thru Friday and 0000Z to 0800Z Tuesday thru Saturday.

GEORGIA/NORTH CAROLINA/SOUTH CAROLINA

WALNUT GROVE

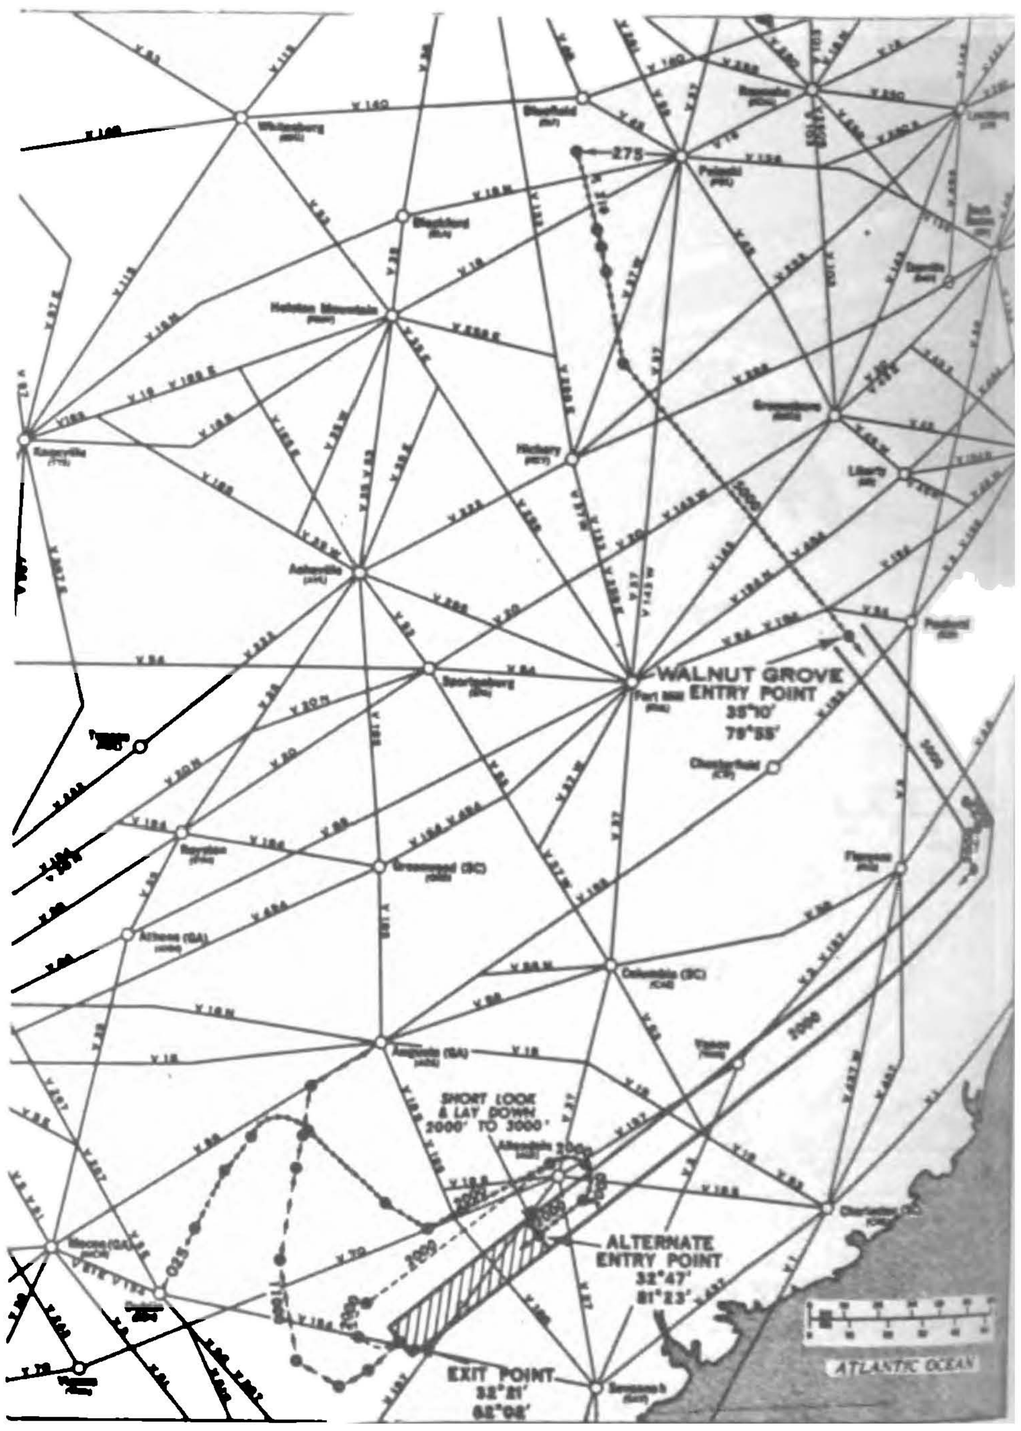
Effective January 4, 1965

Aircraft shall cross the Pulaski, Virginia VORTAC 275/25 DME fix (37°06′N, 81°14′W) at FL 210 or as assigned by ARTC; then maintain and cross 36°47′N, 81°08′W at FL 210; then descend direct so as to cross 36°43′N, 81°07′W at FL 180 or above; then descend direct so as to cross 36°37′N, 81°06′W at or below 14,000′ MSL; then descend direct so as to cross 36°15′N, 81°00′W at 5000′ MSL; then at 5000′ MSL direct to 35°10′N, 79°55′W (low level entry point); then at 5000′ MSL direct to 34°29′N, 79°16′W; then descend direct so as to cross 34°23′N, 79°11′W at 2000′ MSL; then at 2000′ MSL turn right to 34°13′N, 79°13′W; then at 2000′ MSL direct to 32°47′N, 81°23′W.

Short Look and Lay Down—After passing 32°47′N, 81°23′W aircraft shall maintain between 2000′ MSL and 3000′ MSL through the bomb run corridor (5 SM either side of center line from 32°47′N, 81°23′W to 32°21′N, 82°02′W). After exiting the route at 32°21′N, 82°02′W, aircraft shall climb to or maintain 3000′ MSL to 32°14′N, 82°10′W; then climb direct so as to cross 32°10′N, 82°18′W at 6000′ MSL; then climb direct so as to cross 32°16′N, 82°30′W at 11,000′ MSL; maintain 11,000′ direct 32°40′N, 82°35′W; then climb direct so as to cross 33°02′N, 82°31′W at FL 180; cross 33°10′N, 82°29′W at FL 200; cross 33°22′N, 82°27′W at FL 230 or as assigned; then at FL 230 or as assigned direct to the Augusta, Georgia VOR.

Re-Entry—Aircraft that are scheduled to execute an additional bomb run shall, after exiting the low level route at 32°21′N, 82°02′W, turn right and descend or maintain 2000′ MSL to 32°22′N, 82°13′W; then at 2000′ MSL continue turn to 32°30′N, 82°11′W; then at 2000′ MSL direct to 33°04′N, 81°20′W; then at 2000′ MSL turn right to 33°04′N, 81°10′W; continue turn to 32°55′N, 81°11′W; then at 2000′ MSL direct to 32°47′N 81°23′W; thence via the published route.

Alternate Entry—Aircraft shall cross the Dublin, Georgia VOR (32°31′N, 83°08′W) at FL 260 or as assigned then descend direct via the Dublin VOR 025° radial so as to cross 32°47′N, 82°59′W at FL 230; cross 33°01′N 82°51′W at 17,000′ MSL; cross 33°09′N, 82°44′W at 15,000′ MSL; turn right to cross 33°11′N, 82°28′W at 13,000′ MSL; cross 32°54′N, 82°06′W at 3000′ MSL; then descend direct so as to cross 32°48′N, 81°54′W at 2000′ MSL; then at 2000′ MSL direct to 33°04′N, 81°20′W



then at 2000' MSL turn right to 33°04', 81°10'W; continue turn to 32°55'N, 81°11'W; then at 2000' MSL direct to intercept the Walnut Grove route at 32°47'N, 81°23'W.

Route Width—The entire route width is reduced to 5 SM either side of centerline.

Hours of Operation—Primary entry 1900Z to 2300Z and from 0100Z to 1400Z, 7 days per week; alternate entry 24 hours per day, 7 days per week.

COLORADO/KANSAS/NEW MEXICO OKLAHOMA/TEXAS

ZERO HOUR

Effective November 1, 1964

Aircraft shall cross 34°22'N, 105°40'30"W (Corona, New Mexico VOR) (reporting point) at FL 250 or as assigned by ATC, then descend direct to cross 34°33'N, 105°33'W at or below 23,000' MSL; then descend direct to cross 34°40'N, 105°28'W at 22,000' MSL; then descend direct to cross 34°45'N, 105°12'W at or below 18,000' MSL; then descend direct to cross 34°53'N, 104°48'W at 10,000' MSL; then descend direct to cross the route entry point at 34°47'N, 104°29'W at 7000' MSL, maintain 7000' MSL direct to 35°24'N, 104°08W, then 7000' MSL direct to 36°37'N, 102°50'W; then descend direct to cross 36°49'N, 102°35'W at 6000' MSL, maintain 6000' MSL direct to 37°03'N, 102°17'W, then 6000' MSL direct to 37°52'N, 103°10'W.

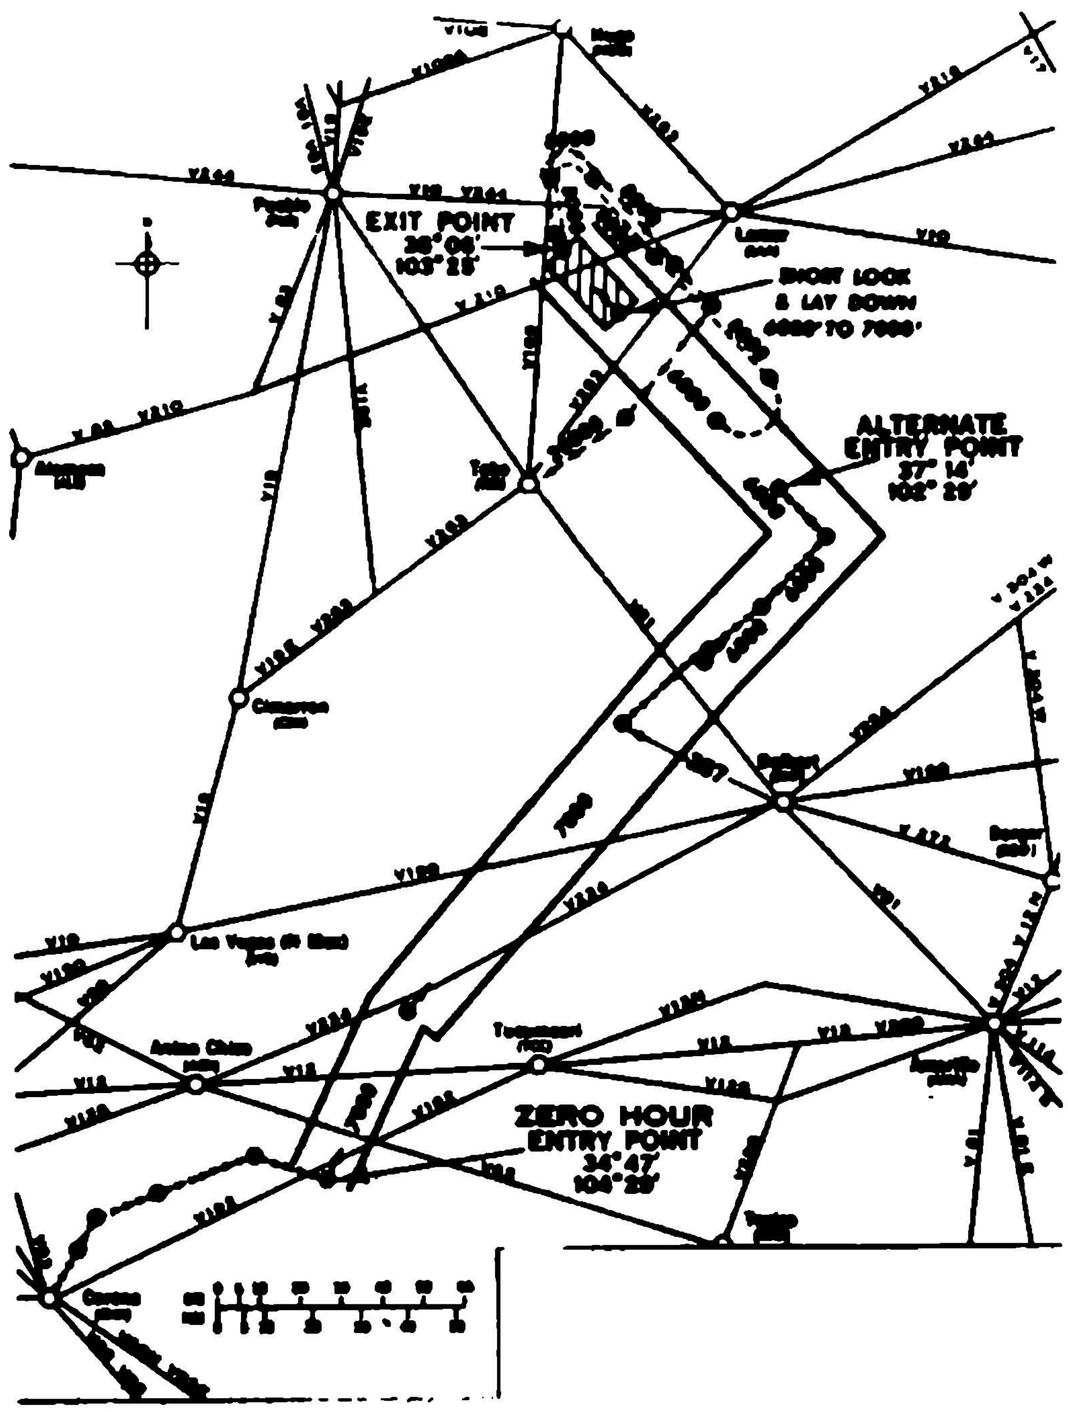
Short Look and Lay Down—After passing 37°52'N, 103°-10'W aircraft shall maintain between 6000' and 7000' MSL thru the bomb run corridor (5 SM either side of centerline from 37°52'N, 103°10'W to 38°06'N, 103°25'W). After exiting the route at 38°06'N, 103°25'W climb direct to cross 38°09'N, 103°26'W at 8000' MSL, maintain 8000' MSL direct to 38°22'N, 103°27'W, then 8000' MSL direct to 38°21'N, 103°17'W; then 8000' MSL direct 38°02'N, 102°55'W; then direct to cross 37°53'N, 102°45'W at 9000' MSL; then climb direct to cross 37°30'N, 103°08'W at FL 200; then maintain FL 200 direct to Tobe VOR-TAC.

Re-Entry—After completing the initial Short Look bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°06'N, 103°-25'W, climb direct to cross 38°09'N, 103°26'W at 8000' MSL, maintain 8000' MSL direct to 38°22'N, 103°27'W, then 8000 MSL direct to 38°21'N, 103°17'W, then 8000' MSL direct to 38°04'N, 103°00'W, then 8000' MSL direct to 37°38'N, 102°31'W; then turn right descending to cross 37°29'N, 102°45'W at 6000' MSL, thence via the published route.

Alternate Entry—Aircraft shall cross 36°23'N, 103°13'W (Dalhart VORTAC 287/37) (reporting point) at 15,000' MSL, maintain 15,000' MSL direct to 36°39'N, 102°49'-30"W; then descend direct to cross 36°49'N, 102°35'W at 11,000' MSL, maintain 11,000' MSL direct to 37°03'N, 102°17'W; then descend direct to cross 37°14'N, 102°-29'W at 6000' MSL, thence via the published route.

Route Width—The route width from 34°47'N, 104°29'W to 35°24'N, 104°08'W is reduced to 5 SM on the east side of centerline.

Hours of Operation—24 hours daily, 7 days per week.



STANDARD INSTRUMENT APPROACH PROCEDURES ACTIONS

The following Standard Instrument Approach Procedures will be revised, established, or cancelled effective Jan. 9, 1965:

Location	Procedure	Action
AUTOMATIC DIRECTION FINDING		
Albany, N.Y.—Albany Co	No. 1, Amdt. 6	Revised
Augusta, Ga.—Bush Fld	No. 2, Amdt. 1	Revised
Augusta, Ga.—Bush Fld	No. 3, Amdt. 1, efctv 23 May 64	Cancelled
Independence, Kan.—Independence Mun	No. 1, Orig.	Revised

AIRMAN'S INFORMATION MANUAL

FLIGHT DATA AND SPECIAL OPERATIONS

SECTION III

EFFECTIVE 0501Z 4 FEBRUARY 1965

To 0501Z 4 MARCH 1965

FEDERAL AVIATION AGENCY

AIRMAN'S INFORMATION MANUAL

INTRODUCTION

This Airman's Information Manual (AIM) has been developed by the Federal Aviation Agency as a pilot's operational manual replacing the Airman's Guide, Directory of Airports and Seaplane Bases, and the Flight Information Manual within the conterminous United States. The existing Alaska Airman's Guide and Chart Supplement and the Pacific Airman's Guide and Chart Supplement will continue to be published every 28 days.

The new AIM presents, in a single document, all information necessary for the planning and conduct of a flight in the National Airspace System. The content and format reflect user identified requirements and provide a "one package" approach.

The manual is divided into six sections, each composed of a specific category or family of information, fashioned into a format consistent with the operational needs of aviation. In contradistinction to previous flight information publications issued by FAA, the design concept of the AIM has provided for consolidation of similar information, segregation of air traffic control procedural information and its sequencing according to operational use, and the elimination of administrative and non-essential data.

The AIM is designed to be carried in the cockpit and may be used collectively or independently by sections. The manual is published as loose-leaf pages, and is three-hole punched to fit a standard three-ring binder.

New or amended textual or tabulated information except in the Airport/Facility Directory, is indicated by a solid dot ● prefixing the heading, paragraph, or line.

Each section of the AIM will be published at varying intervals during the year, depending on the stability or frequency or change of the information.

The various sections and the revision cycle of each are:

Section I	Basic Flight Manual	Semi-annually
Section II	ATC Operations and Procedures	Quarterly
Section III	Flight Data and Special Operations	Every 28 days
Section III–A	Notices to Airmen	Every 14 days
Section IV	Airport Directory	Semi-annually
Section IV–A	Airport/Facility Directory	Every 28 days

The above schedule provides a completely new manual every 6 months.

The revision cycle of Sections III and IV–A is every 28 days, the same as the IFR Enroute charts. Since the charts contains basically enroute information, the AIM serves as a supplementary publication, providing information for planning and terminal operations. Therefore, radio navigation aids are on the charts and unlike the Airman's Guide, are not tabulated in the AIM. Every effort has been made to minimize and eliminate duplication of information within publicatons and between publications and charts.

A brief description of the contents of each section in the AIM follows.

Section I—Basic Flight Manual

This section contains information of an instructional, educational, and training nature, assembled and presented in a systematic format, categorized by subject matter. The novice pilot, as well as the more experienced pilot will find here the basic fundamentals of knowledge for operating in the National Airspace System, information on adverse factors affecting safety of flight and health, and a list af available publications of general operational interest.

Section II—ATC Operations and Procedures

Section II is designed to serve as an official means of disseminating pertinent ATC information of interest to all pilots. The information governing flight operations, air traffic services, and procedures is presented in layman's language and avoids ambiguities which often result from individual interpretations of rules. Data is seqeunced in accordance with typical flight operations: Preflight, departure, enroute, arrival and landing procedures. In addition, supporting general procedures and information such as ADIZ, and SCATER procedures is included. Emergency procedures are combined and published at the end of the section.

Section III—Flight Data and Special Operations

Operational data most subject to change and which is not appropriate for inclusion within other sections of the AIM is carried in Section III. Because it contains critical flight data most subject to change, this section should be kept close at hand in the event of a divergence in enroute flight. Some of the most significant material contained in Section III is described below.

A glossary or explanation of aeronautical term or phrases used in the AIM, and a list of commonly used abbreviations.

Special Notices of pertinent current information of operational value for both preflight planning and enroute operations. These Special Notices are divided into three categories: General Notices—those of a general nature with universal application; Area Notices—those pertinent to a specific geographical area; and Regulatory Notices—these are condensations of changes to or new rules, parts, Advisory Circulars, Special Procedures and other regulatory matters of operational interest.

A Visual Navigation Chart Bulletin, as a means of updating the Sectional Charts, providing a cumulative tabulation of the major changes in aeronautical information occurring since the last chart publication date.

Detailed description tabulations and charts of Special Operations such as Oil Burner Routes and military refueling tracks.

Section III—A—Notices to Airmen

This section serves as a supplement, issued every fourteen days, to the AIM and provides operationally required data pertinent to the continuous NOTAMs carried in the daily teletypewriter NOTAM Summary (NOSUM), revisions to Oil Burner routes, and those airman advisories deemed essential to the safe conduct of flight.

Sections IV and IV–A—Airport Directory

Within Sections IV and IV–A there are provided an Airport Directory, a tabulation of ARTCC communications, frequencies, and a tabulation of Flight Service Stations.

Section IV contains the Airport Directory which is a listing of all known airports, heliports, and seaplane bases available for transient civil use within the conterminous United States, and indicates those airport services and facilities available at each. The seaplane tabulation and the heliport tabulation follow the airport tabulation. Military airports and privately owned and operated airports closed to civil aviation are not listed.

Section IV–A contains an Airport/Facility Directory providing an integrated tabulation of major airports, heliports and seaplane bases which have terminal navaids and communications facilities available at the airport. This tabulation combines all facilities and services available at each airport (heliport or seaplane base) or terminal area into a single listing.

In both Sections IV and IV–A, airports are listed alphabetically by geographical location (city or town) within each state. Airports tabulated in IV–A are cross-referenced in Section IV.

In Section IV–A, the Airport/Facility Directory is followed by the tabulation of all ARTC Center VHF communications frequencies. This, in turn, is followed by the tabulation of FSS's, which shows their telephone numbers, the number of the associated Weather Bureau Office, and other pertinent data.

• The Master Alphabetical Index of the entire Manual is provided in this Section. This complete and comprehensive index lists all items of information, cross referenced

under all headings to which reference might reasonably be made, giving section and page number. Within the index, any reference involving emergency actions or procedures is printed in bold-face type.

Errors, Omissions, or Suggested Changes

Errors, omissions, or suggested changes should be forwarded to the Federal Aviation Agency, Air Traffic Service, Attention AT-600, Washington, D.C. 20553. Airport managers, operators and owners are urged to review data for their airport and report any errors or omissions to FAA at the address given above.

Procurement

The Airman's Information Manual is available on annual subscription for $15.00, plus $4.00 additional for foreign mailing. Requests should be directed to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Orders should be accompanied by check or money order made payable to the Superintendent of Documents.

• INTRODUCTION

Section III—FLIGHT DATA AND SPECIAL OPERATIONS

Section III is published every 28 days and contains operational flight data most subject to continuous change that is not appropriate for inclusion within other sections of the Manual. Because it contains such critical flight data, this section should be kept close at hand in the event of a divergence in en route flight.

The information in Section III is presented in various tabulations or grouping arrangements appropriate to the specific items. Typical examples are: Preferred Routes, VOR Receiver Check Points, Parachute Jumping Areas, and Substitute Route Structures.

As a means of updating the Sectional Charts produced by the Coast and Geodetic Survey, Department of Commerce, a Visual Navigation Chart Bulletin is included in Section III. This bulletin provides a cumulative tabulation of the major changes in aeronautical information that have occurred since the last publication date (normally every 6 months) of each sectional chart. Only those changes to controlled airspace and special use airspace, airports, and radio navigation facilities that present a hazardous condition or impose a restriction on the pilot are listed, thereby continually providing the VFR pilot with the essential data for keeping his sectional charts current until they are reissued.

At the end of Section III are grouped detailed tabulations and charts of special operations and areas such as Oil Burner Routes, and military low altitude refueling tracks. This arrangement provides a consolidated presentation of areas and special operations that are not designated through rule-making procedures.

TABLE OF CONTENTS

Section III
FLIGHT DATA AND SPECIAL OPERATIONS

VOR Receiver Check Points ---------- III- 56

GLOSSARY OF AERONAUTICAL TERMS

E DEFENSE IDENTIFICATION ZONE (ADIZ)—The area of air- ace over land or water within which the ready identi- ation, the location, and the control of aircraft are re- ired in the interest of national security. For operat- g details see ADIZ procedures.

IRPORT ADVISORY AREA—The area within five statute iles of an uncontrolled airport on which is located a light Service Station so depicted on the appropriate rtional Aeronautical Chart.

IRPORT ADVISORY SERVICE—A service provided by a Flight rvice Station to enhance the safety of terminal oper- ions of airports where a station is operating but where ere is no control tower.

IRPORT SURFACE DETECTION EQUIPMENT (ASDE)—Radar uipment specifically designed to detect all principal atures on the surface of an airport, including vehicular affic, and to present the entire picture on a radar indi- tor console in the control tower. ASDE has a maxi- um range of four miles, though its 16 inch diameter ope usually displays an area of only one mile radius out the control tower.

IRPORT SURVEILLANCE RADAR (ASR)—Radar providing posi- on of aircraft by azimuth and range data without ele- ation data. It is designed for a range of 50 miles.

IRPORT TRAFFIC AREA—The airspace within a circular mit defined by a five statute mile horizontal radius om the geographical center of an airport at which an erative airport traffic control tower is located and ex- ending upwards from the surface to, but not including, 000 feet above the surface.

R ROUTE SURVEILLANCE RADAR (ARSR)—Long range radar hich increases the capability of ATC for handling heavy l route traffic. An ARSR site is usually located at some istance from the ARTCC it serves.

R ROUTE TRAFFIC CONTROL CENTER (ARTCC)—A facility stablished to provide traffic control service to Instru- ent Flight Rules (IFR) flights operating within con- olled airspace and principally during the en route hase of flight.

LTITUDE RESERVATION (ALTRV)—Airspace utilization under rescribed conditions, normally employed for the mass ovement of aircraft or other special user requirements hich cannot otherwise be accomplished. ALTRV's are pproved by the appropriate FAA facility.

PPROACH CONTROL SERVICE—Air traffic control service, rovided by a terminal area traffic control facility, for rriving and or departing IFR flights and, on occasion, FR flights.

●AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)—The continuous broadcast of recorded noncontrol information in selected high activity terminal areas. Its purpose is to improve controller effectiveness and to relieve frequency congestion by automating the repetitive transmission of essential but routine information.

CARDINAL ALTITUDES OR FLIGHT LEVELS—"Odd" or "even" thousand-foot altitudes or flight levels. Examples: 5000, 6000, 7000, FL 250, FL 260, FL 270.

CEILING—The height above the ground or water of the lowest layer of clouds or obscuration phenomena that is reported as "broken," "overcast," or "obscuration" and not classified as "thin" or "partial."

CENTRAL ALTITUDE RESERVATION FACILITY (CARF)—An Air Traffic Service facility established to conduct the volume of coordination, planning and approval of special user requirements under the altitude reservation concept.

CONSOLAN—A low frequency, long-distance navaid used principally for transoceanic navigation.

CONTERMINOUS U.S.—Forty-eight states and the District of Columbia.

CONTINENTAL CONTROL AREA—The area, which includes that airspace within the contermious United States at and above 14,500 feet MSL, excluding airspace less than 1,500 feet above terrain, and prohibited and restricted areas (except certain specified restricted areas).

CONTINENTAL U.S.—Forty-nine states. The original 48 states and Alaska.

CONTROL AREA—Controlled airspace extending upwards from a specified height above the surface of the earth. Unless otherwise provided in appropriate cases, control areas extend upward from 700 feet above the surface until designated from 1,200 feet above the surface or from at least 500 feet below the MEA, whichever is higher, to the base of the continental control area.

CONTROL ZONE—Controlled airspace extending upwards from the surface of the earth. Control zones may include one or more airports and are normally circular areas 5 statute miles in radius with extension where necessary to include instrument approach and departure paths.

CRUISE—The term "cruise" used instead of "maintain" in an ATC clearance indicates that descent from cruising altitude may be commenced at pilot's discretion without further clearance from ATC. "Cruise" is normally used only on relatively short flights in uncongested areas, and is authorization for the flight to proceed to, and make an approach at, destination.

DISCRETE FREQUENCY—A frequency assigned a particular function.

EXPECTED APPROACH CLEARANCE TIME (EAC)—The time at which it is expected that an arriving aircraft will be cleared to commence approach for a landing.

FINAL APPROACH—IFR—The flight path of an aircraft which is inbound to the airport on an approved final instrument approach course, commencing at the point of interception of said course and extending to the airport or the point where circling for landing or missed approach is executed.

FINAL APPROACH—VFR—A flight path of a landing aircraft in the direction of landing along the extended runway center line from the base leg to the runway.

FIX—A geographical position determined visually, by reference to one or more radio navigational aids, by celestial plotting, or by another navigational device.

FLIGHT ADVISORY SERVICE—Advice and information provided by a facility to assist pilots in the safe conduct of flight.

FLIP—Flight Information Publication.

FLIGHT LEVEL (FL)—A level of constant atmospheric pressure related to a reference datum 29.92" HG. For example: Flight Level 250 is equivalent to an altimeter indication of 25,000 feet, and Flight Level 265 to 26,500 feet.

FLIGHT SERVICE STATION (FSS)—A facility operated by the FAA to provide flight assistance service.

IFR CONDITIONS—Weather conditions below the minimum prescribed for flights under VFR.

INITIAL APPROACH—Initial approaches to a facility are normally made over specified routes to the primary navigation facility. When the approach fix is not the primary navigation facility, the transition routes are specified and shown on the particular AL chart. The minimum en route altitude for the route along which the pilot has been flying is normally used as the initial approach altitude. The high level initial approach altitude is usually termed "Initial Penetration Altitude" and is considered as the altitude at which the aircraft begins a penetration. This altitude is established for each particular procedure and is indicated on the associated AL chart.

INTERROGATOR—The ground-based surveillance radar beacon transmitter-receiver which scans in synchronism with a primary radar, transmitting discrete radio signals which repetitiously request all transponders, on the mode being used, to reply. The replies received are then mixed with the primary radar video to be displayed on the same plan position indicators.

JET ROUTES—A high altitude route system, at and above 18,000 feet MSL, predicated on a network of designated high altitude VHF/UHF facilities. (For operating procedures applicable to this system see ENROUTE).

JOINT USE RESTRICTED AREA—An area wherein an aircr may operate if prior permission has been granted either the restricted area "using agency" or the "c trolling agency." (1) The using agency organization, military command whose activity within a restric area necessitated the area being so designated; exc that, in the case of those Restricted Area/Military Cli Corridors which do not have a designated controll agency, the using agency is a military air traffic cont facility which may be contacted for transit through climb corridor. The using agency notifies the controll agency whenever permission may be granted by controlling agency for transit of, or flight within a stricted area. (2) The controlling agency is a designa FAA facility which may authorize transit of a restric area.

MAINTAIN—The altitude/flight level instructions in ATC clearance normally require that a pilot "mainta the altitude/flight level at which the flight will oper when in controlled airspace. Altitude/flight le changes while en route should be requested prior to t time the change is desired.

MAXIMUM AUTHORIZED ALTITUDE (MAA)—The highest a tude on a Federal airway, jet route, or other direct rou for which a MEA is designated in F.A.R. Part 95 which adequate reception of navigation aid signals assured.

MINIMUM CROSSING ALTITUDES (MCA)—The lowest altitud at certain radio fixes at which an aircraft must cro when proceeding in the direction of a higher minimu en route IFR altitude.

MINIMUM EN ROUTE IFR ALTITUDE (MEA)—The altitude effect between radio fixes which assures acceptable na gational signal coverage and meets obstruction clearan requirements between those fixes.

MINIMUM OBSTRUCTION CLEARANCE ALTITUDE (MOCA)—T specified altitude in effect between radio fixes on VO airways, off-airway routes on route segments, whi meets obstruction clearance requirements for the enti route segment and which assures acceptable navigation signal coverage only within 22 nautical miles of a VO

MINIMUM RECEPTION ALTITUDE (MRA)—The lowest altitu required to receive adequate signals to determine specif VOR/VORTAC/TACAN fixes.

MODE—The number or letter referring to the specif pulse spacing of the signal transmitted by an interrog tor.

RADAR BEACON (SECONDARY RADAR)—A radar system i which the object to be detected is fitted with cooperativ equipment in the form of a radio receiver/transmitte (transponder). Radio pulses transmitted from th searching transmitter/receiver (interrogator) site ar received in the cooperative equipment and used to trig ger a distinctive transmission from the transponde This latter transmission, rather than a reflected signa is then received back at the transmitter/receiver site.

ADAR ADVISORY SERVICE—The provision of advice or information based on radar observation.

ADIAL—A radial is a magnetic bearing extending from VOR, VORTAC, or TACAN.

IMARY RADAR—A radar system in which a minute portion of a radio pulse transmitted from a site is reflected from an object and then received back at that site.

OHIBITED AREA—Designated airspace within which the ght of aircraft is prohibited.

ARGET—The indication displayed on a radar scope resulting from a primary radar return or a radar beacon reply.

ANSITION AREA—An area extending upward from 1,200 et or higher above the surface when designated to mplement control zones; from 700 feet above the surce when designated in conjunction with an airport with control zone but for which an instrument approach ocedure has been prescribed; or from 1,200 feet or gher above the surface when designated in conjuncn with airway route structures or segments. Unless herwise limited, transition areas terminate at the base the overlying control area or Continental Control Area.

ANSPONDER—The airborne radar beacon receiver-transitter which automatically receives radio signals from l interrogators on the ground, and selectively replies th a specific reply pulse or pulse group only to those nterrogations" being received on the mode to which it set to respond.

CTOR—A heading issued to the pilot for the purpose of oviding navigational guidance by means of radar.

SIBILITY, PREVAILING—The horizontal distance at which rgets of known distance are visible over at least half the horizon. It is normally determined by an observer or close to the ground viewing buildings or other milar objects during the day and ordinary city lights night. Under low visibility conditions the observaons are usually made at the control tower. Visibility REPORTED IN MILES AND FRACTIONS OF ILES in the Aviation Weather Report. If a single value does not adequately describe the visibility, additional information is reported in the "Remarks" section of the report.

VISIBILITY, RUNWAY—The horizontal distance at which a stationary observer near the end of the runway can see an ordinary light (about 25 candlepower) at night or a dark object against the horizon sky in the daytime. In practice the human observer is used very little for this observation. Instead runway visibility is normally determined by a transmissometer (a photoelectric device calibrated in terms of a human observer). It is REPORTED IN MILES AND FRACTIONS OF MILES in the "Remarks" section of the Aviation Weather Report. A meter in the control tower gives the FAA traffic controller a continuous indication of the runway visibility at transmissometer locations. Runway visibility, where available, is used in place of prevailing visibility for the determination of minimums on a transmissometer runway. This program is gradually being replaced by Runway Visual Range at transmissometer locations.

VISIBILITY, RUNWAY VISUAL RANGE (RVR)—An instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end; it is based on the sighting of either high intensity runway lights or on the visual contrast of other targets—whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal, AND NOT SLANT, visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is REPORTED IN HUNDREDS OF FEET. At the present time, RVR observations are automatically furnished to FAA tower controllers at approximately 25 locations from readout equipment connected to the remote transmissometer installation. RVR provides an additional operating minimum at fields equipped with specified navigational aids. For example, at the present time the RVR minimum at Newark is 2000 ft. (in combination with a minimum descent altitude of 218' MSL) for both takeoffs and landings regardless of the reported ceiling and visibility.

VOT—VHF facility transmitting a test signal to determine the operational status of VOR receivers.

ABBREVIATIONS

Note: "s" may be added for plural, or as appropriate.

acft..... aircraft
adjt..... adjacent
admin.... administration
AGL..... above ground level
Airgi..... Airguide
•AL..... Approach and Landing Chart
alt..... altitude
amdt..... amendment
ANRA.... air navigation radio aids
ant..... antenna
apch..... approach
apchg..... approaching
aprxly.... approximately
arpt..... airport
arr..... arrival/arrive
ARTCC... Air Route Traffic Control Center
ASDE..... airport surface detection equipment
ATC..... air traffic control
•ATIS..... Automatic Terminal Information Service
auto..... automatic
aux..... auxiliary
avbl..... available
awy..... airway

BC..... back course
bcn..... beacon
bcst..... broadcast
bldg..... building
bndry..... boundary
brg..... bearing
btn..... between

clsd..... closed
clrnc..... clearance
cntr..... center
Co..... county
comm.... communication
comsnd... commissioned
comsng... commissioning
config..... configuration
constr.... construction
constrd... constructed
cont..... continuous/continuously
crs..... course
CS/T..... combined station/tower
ctc..... contact
ctl..... control
ctld..... controlled

dalgt..... daylight
demsnd... decommissioned
demol.... demolition
DF..... direction finder
discntd... discontinued
DME..... UHF standard (TACAN compatible) distance measuring equipment
dptg..... departing
dptr..... departure

efctv..... effective
elev..... elevation
emgcy.... emergency
eng..... engine
eqpmt.... equipment
excp..... except
extsn..... extension
extsv..... extensive

facil..... facility
flashg.... flashing
fld..... field
flt..... flight
flwg..... following
FM..... fan marker
fone..... telephone
freq..... frequency
FSS..... Flight Service Station

GCA..... groundcontrolled approach
gnd..... ground
GWT..... gross weight

•H..... Non-directional radio beacon (homing), power 50 watts to less than 2000 watts
•HH..... Non-directional radio beacon (homing), power 2000 watts or more
hi-..... high-
hr..... hour
hvy..... heavy
hwy..... highway

ident..... identification
•IFF..... Identification Friend from Foe
IFR..... Instrument Flihgt Rules
IFSS..... International Flight Service Station
ILS..... instrument landing system
imdtly.... immediately
inbnd..... inbound
indef..... indefinitely
info..... information
inop..... inoperative
inst..... instrument
int..... intersection
intl..... international
intsv..... intensive

J-bar..... jet runway barrier

kc..... kilocycles

lat..... latitude
lcl..... local
lclzr..... localizer
lctd..... located
lctn..... location
LFR..... Low/Medium frequency radio range
lgt..... light
lgtd..... lighted
lgtg..... lighting
LMM..... compass locator at middle marker ILS
lnd..... land
lndg..... landing
LOM..... compass locator at outer marker ILS
long..... longitude

M..... magnetic (after a bearing)
MAA..... maximum authorized altitude
mag..... magnetic
maj..... major
max..... maximum
mc..... megacycles
MCA..... minimum crossing altitude
MEA..... minimum enroute IFR altitude
memi..... memorial
•MH..... Non-directional radio beacon (homing), power less than 50 watts
mi..... mile
min..... minimum or minute
MM..... middle marker ILS
MOCA.... minimum obstruction clearance altitude
mod..... modernization/modification
MRA..... minimum reception altitude
mrkd..... marked
mrkg..... marking
MSL..... mean sea level
mun..... municipal
natl..... national
navaid.... navigational aid
ngt..... night
nmi..... nautical mile/s
No..... number

obstn..... obstruction
oct..... octane
OM..... outer marker ILS
operg..... operating
opern..... operation
outbnd.... outbound

patn..... pattern
permly.... permanently
p-line..... pole line
pwr..... power

quad..... quadrant

rad..... radial
RAE..... Royal Aircraft Establishme visual glide slope indica
RAPCON.. radar approach control
RATCC... radar air traffi control cent
rbn..... radio beacon
rcv..... receive
rcvg..... receiving
rcvr..... receiver
rdo..... radio
reconstr... reconstruction
REIL..... runway end ide tification ligi
relctd..... relocated
rgt..... right
rng..... range
rnwy..... runway
ruf..... rough
RVR..... runway visual range
RVV..... runway visibili values

•SIF..... Selective Identification Feature (of th basic Mark radar beacc system)
sked..... schedule
smi..... statute mile s
SR..... sunrise
SS..... sunset
stn..... station
sys..... system

'..... true (after a bearing)
ACAN... UHF navigational facility—omni-directional course and distance information
t..... tetrahedron
c..... traffic
of..... take-off
nprly.... temporarily
tmpry.... temporary
trans..... transcribed
trml..... terminal
trng..... training
tsmt..... transmit
tsmtg..... transmitting
tsmtr..... transmitter
TV..... television
twr..... tower
txwy..... taxiway
UFN..... until further notice
unavbl.... unavailable
uncltd.... uncontrolled
unlgtd.... unlighted
unmrkd... unmarked
VASI..... visual approach slope indicator
vcnty..... vicinity
VFR..... visual flight rules
VOR..... VHF navigational facility—omni-directional, course only
VOR-DME.. collocated VOR navigational facility and UHF standard navigational facility and UHF standard distance measuring equipment
VORTAC.. collocated VOR and TACAN navigational facilities
VOT..... a VOR Receiver Testing Facility
vsby..... visibility
wea..... weather
WIP..... work in progress
wt..... weight

THE NOTAM CODE

INTRODUCTION

The NOTAM Code provides for coding NOTAM information to reduce telecommunications transmission time and reduce translation difficulties in the International Service.

A NOTAM Code group contains 5 letters. The first letter is always the letter Q to indicate a code abbreviation for use in the composition of NOTAMs. The letter Q has been chosen to avoid conflict with any assigned radio call sign.

NOTAM code significations shall be amplified or completed where necessary by adding appropriate words, contractions, frequencies, location identifiers, place names, or figures. Approved abbreviations shall be used in preference to plain language whenever possible. The information necessary to complete a NOTAM code group, as indicated by a blank space, shall be given except when (1) the blank spaces are enclosed within parentheses or brackets to indicate their completion is optional; e.g., LHX QIEIK 15 MIN. Meaning: the LaJunta Colorado airport beacon is available on request at 15 minutes' notice; or (2) an alternative meaning shown in parentheses is selected and the blank space in this alternative meaning is complete; e.g., QAPOK 116.9. Meaning: the radio range on 116.9 Mc. resumed normal operation.

Expressions or words in parentheses which do not include blank spaces have the following significances:

(1) When following a blank space, signifies the explanation of information to be used in filling the preceding blank.

(2) When following a word or expression, signifies an alternative to the word or expression.

CODE GROUP FORMATION

5-letter NOTAM code groups are formed in the following manner:

(1) First Letter.—The letter Q.

(2) Second and Third Letters.—The appropriate combination of 2 letters, selected from the "2nd and 3rd letters" section of the code, identify the facility, service or danger to aircraft in flight being reported. The *second* letter has been restricted to A, E, I, O, or U. These letters also serve to classify the aid, facility, or service described: i.e., the letters A and E signify radio aids. The letter I signifies lighting facilities. The letters O and U signify airports, search and rescue, and dangers to aircraft in flight.

(3) Fourth and Fifth Letters.—The appropriate cominbation of 2 letters, selected from the "4th and 5th Letters" section, denote the operating status of the facility, service, or danger to aircraft being reported. The *fourth* letter has been restricted to A, E, I, O, or U.

DECODE

SECOND AND THIRD LETTERS

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	RADIO AIDS		
AA	. . . [*specify TWR, APP, ACC or FIC*] air traffic services receiver . . . kc/s. (*or* . . . Mc/s.).	AY	200 Mc/s. Distance Measuring Equipment.
AB	Inner marker, Instrument Landing System.	AZ	Station location marker VHF.
AC	. . . [*specify TWR, APP, ACC or FIC*] air traffic services transmitter . . . kc/s. (*or* . . . Mc/s.).	EA	En-route Surveillance Radar.
AD	Middle marker, Instrument Landing System.	EB	Broadcasting station (public).
AE	Outer marker, Instrument Landing System.	EC	CONSOL or CONSOLAN station.
AF	Fan-type marker.	ED	DECCA or DECTRA.
AG	Glide path, Instrument Landing System.	EE	Ground Controlled Approach System (GCA).
AH	Non-directional Beacon (NDB).	EF	Terminal Area Surveillance Radar.
AI	Instrument Landing System (ILS).	EG	Gee.
AJ	Radio range (other than VOR) and associated voice communications.	EH	Elevation element of the Precision Approach Radar (PAR).
AK	Radio receiving facilities.	EI	Monitoring device associated with . . . (*specify*) radio aid.
AL	Localizer, Instrument Landing System.	EJ	All air-ground facilities (except . . .).
AM	Locator, inner, Instrument Landing System.	EK	Precision Approach Radar (PAR).
AN	TACAN.	EL	LORAN.
AO	Locator, outers, Instrument Landing System.	EM	Azimuth element of the Precision Approach Radar (PAR).
AP	VOR (VHF Omnidirectional Radio Range) and associated voice communications.	EN	DME (1000 Mc/s. Distance Measuring Equipment).
AQ	VOR (VHF Omnidirectional Radio Range).	EO	Beam Approach Beacon System (BABS).
AR	Radio range (other than VOR).	EP	Radar responder beacon.
AS	Radio range leg.	EQ	Surveillance Radar Element (SRE) of GCA.
AT	Attentional signal.	ER	Radio transmitting facilities.
AU	Meteorological communications . . . kc/s. (*or* . . . Mc/s.).	ES	All radio-navigation facilities (except . . .).
AV	Voice communications . . . kc/s. (*or* . . . Mc/s.).	ET	Teletypewriter transmitting facility (ies).
AW	Unassigned.	EU	Radio direction-finding station . . . (*frequency or type*).
AX	Non-directional Beacon (NDB) and voice facility.	EV	VORTAC (the combination of VOR and TACAN).
		EW	Ground interrogator, SSR system.
		EX	Unassigned.
		EY	Ground movement radar.
		EZ	Unassigned.
	LIGHTING FACILITIES		
IA	Boundary lights.	ID	Channel lights.
IB	Aerodrome beacon.	IE	Light beacon.
IC	Unassigned.	IF	Floodlights.

DECODE

SECOND AND THIRD LETTERS (Contd.)

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	LIGHTING FACILITIES (Contd.)		
IG	Angle-of-approach lights.	IP	Approach light system [type . . . {*specify LSA (low intensity) or LSB (high intensity*}] (for runway number . . .).
IH	Taxiway lights.		
II	Hazard beacon.		
IJ	Threshold lights (for runway number . . .).	IQ	Runway alignment beacon.
		IR	Runway lights [type . . . {*specify LSA (low intensity) or LSB (high intensity)*}] (for runway number . . .).
IK	Flares.		
IL	All landing area lighting facilities.		
IM	Identification beacon.	IS	Strip lights [for strip . . . (*number or magnetic direction*)].
IN	Unassigned.	IT–IY	Unassigned.
IO	Obstruction lights.	IZ	Airway course lights.
	AERODROMES — SEARCH AND RESCUE — DANGERS TO AIRCRAFT IN FLIGHT		
OA	Land aerodrome.	UB	Mooring buoys.
OB	Beaching facilities.	UC	Unassigned.
OC	Water aerodrome.	UD	Prohibited, restricted or danger area designated as . . . (*name or reference identification*).
OD	Meteorological forecast service.		
OE	Meteorological observation service.		
OF	Meteorological watch service.	UE	Aircraft.
OG	Runway arresting gear.	UF	Fixed balloons.
OH	Helicopter landing area.	UG	Bombing or aerial depth charge dropping.
OI–OL	Unassigned.		
OM	All runways [except number(s) . . .].	UH	Air exercises (*or* flying displays).
ON	Stopway for runway number.	UI	Gun or missile firing.
OO	Taxiway(s).	UJ	Glider flying.
OP	Rescue vessel.	UK	Demolition of explosives.
OQ	Ocean Station Vessel.	UL	Landing direction indicator.
OR	Refueling [. . . type fuel(s) *or* . . . octane].	UM	Mooring and docking facilities.
		UN	Parachute jumping exercises.
OS	Search and rescue aircraft [*specify VLR, LRG, MRG, SRG or HEL*].	UO–UP	Unassigned.
		UQ	Apron.
OT	Crash and fire fighting facilities.	UR	Runway(s) and number(s).
OU	Unassigned	US	Strip . . . (*number or magnetic direction*).
OV	. . . [*specify TWR, APP, ACC or FIC*] air traffic service.	UT	Grass landing area.
		UU	Unassigned.
		UV	Fog dispersal equipment.
OW–OY	Unassigned.	UW–UY	Unassigned.
OZ	Warship.	UZ	Runway threshold (number . . .).
UA	Alighting area.		

DECODE
FOURTH AND FIFTH LETTERS

4th & 5th Letters	SIGNIFICATION	4th & 5th Letters	SIGNIFICATION
	HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES		
AA	Unassigned.	EC	Characteristics *or* identification *or* radio call sign changed to . . .
AB	Usable for length of . . . and width of . . .	ED	Operating frequency(ies) will be changed to . . . kc/s. (*or* . . . Mc/s.) effective . . . (*date/time*).
AC	Covered by snow to a depth of . . . NOTE.—*This snow is not compacted.*	EE–EG	Unassigned.
AD	Cleared of soft snow, full length and width.	EH	Not heard.
AE	Totally free of snow and ice.	EI–EL	Unassigned.

PREFERRED ROUTES

A system of preferred routes has been established to guide pilots in ming their route of flight, to minimize route changes during the operal phase of flight, and to aid in the efficient orderly management of the traffic using federal airways. The preferred routings which follow are igned to serve the needs of airspace users and to provide for a system- flow of air traffic in the major terminal and en route flight environ- ts. Cooperation by all pilots in filing preferred routes will result in r traffic delays and will better provide for efficient departure, en route l arrival air traffic control service.

The following list will hereafter appear in EACH issue of the AIRGI. his list contains preferred routes for the low altitude stratum (below 000 feet MSL).

ow Altitude Structure—A distinctive numbering system (800 Series) has n introduced to indicate some of the preferred routes in this stratum ll thereby eliminate the present lengthy route descriptions. Many of preferred routes, however, retain the common basic airway numbers ate the two systems of numbering in combination. Additional designa s of "800 Series Airways" will be made where simplicity and con- ience to both pilots and controllers dictate such assignments.

Preferred Route Starting and Terminating Fixes—Preferred routes gen- erally commence and terminate at fixes on or near the perimeter of the terminal area.

Depicted on the Area Charts, produced by Coast and Geodetic Survey, are the normal routes between the airport and the preferred route starting/ terminating fixes. Whenever a fix is shown in **bold-face** type, pilots should refer to the appropriate Area Chart for the routing he may expect prior to or after that fix as appropriate.

Preferred routes beginning/ending with an airway number indicate tha the airway essentially overlies the airport and flights are normally cleared directly on the airway. All preferred routes are listed alphabetically under the name of the departure airport. Major airports in close proximity are listed under the principal airport and categorized as a metropolitan area; e.g., Chicago Metro Area. Official location identifiers are used in the route description for VOR/VORTAC navaids. L/MF navaids are identified by the identifier and type: e.g., MIV/LFR, DOV/Rbn. Intersection names are spelled out. Where two navaids or an intersection and a navaid follow in succession, the route is direct.

(L20, 23)=Enroute chart numbers.

STANDARD INSTRUMENT DEPARTURES (SIDs)

(Explantory information is provided in Section II–8)

CALIFORNIA

Fresno Air Terminal

In narrative form only

PINEDALE ONE DEPARTURE

Via direct Fresno VORTAC, then via (transition) or (assigned route). Castle Transition—Via Fresno 273 and Castle 150 radials to Castle VOR.

BOWLES ONE DEPARTURE

Via direct Fresno radio Beacon: then a 135 magnetic bearing from the Fresno radio beacon to intercept the Los Banos 084 radial at or above 3,000 feet; then via Los Banos 084 radial to the Fresno 141 radial. Pixley Transition—Turn right via Fresno 141 and Bakersfield 322 radials to Bakersfield. Exeter Transition—Continue via Los Banos 084 radial to intercept and proceed via Fresno 123 and Portersville 323 radials to Porterville.

Ontario Intl Airport

Effective February 4, 1965

Colton One Departure—Change name to read: Colton Three Departure. College One Departure—Change name to read: College Three Departure.

CONNECTICUT

•Bradley Field, Windsor Locks

Narrative form only

AVON TWO DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via Poughkeepsie VOR 089 radial to Poughkeepsie VOR. Maintain at or below 3,000 feet for 3 minutes after departure; Cross Madison VOR 348 radial at or below 6,000 feet. Cross Bridgeport VOR 357 radial at and maintain (as assigned by ATC), then via (assigned route).

STAFFORD THREE DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via direct to V146, thence via V146 to Putnam VORTAC; thence via Putnam VORTAC 100° radial to V16, V16 to Millis Intersection. Maintain at or below 3,000 feet for 3 minutes after departure: Cross Putnam VORTAC at (as assigned by ATC). Thence via (assigned route).

MADISON THREE DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via 360° radial Hartford VOR to Hartford VOR; thence direct Madison VOR; thence V475 to Deer Park VOR. Maintain at or below 3,000 f for 3 minutes after departure; Cross Madison VOR (as assigned by ATC), thence via (assigned route).

HARTFORD THREE DEPARTURES

Via direct Hartford VOR. Hartford VOR 258 rad to Yale Intersection. Cross Madison VOR 360 radial or below 4,000 feet. Cross Yale Intersection at (as signed by ATC), then via (assigned route).

Concurrently cancel Avon One. Stafford Two, Madi Two, Hartford Two Departures.

NEW YORK

Hancock Airport, Syracuse

In narrative form only

KIRKVILLE ONE DEPARTURE

Via front course Syracuse ILS and Georgetown V 352 radial to Georgetown VOR; cross Syracuse ILS LC at 2,000 feet; cross Utica VOR 277 radial at 5,000 fe Then via (assigned route). Take-off Runway 14—Tu left after departure direct to Syracuse ILS LOM.

MONROE ONE DEPARTURE

Via front course Syracuse ILS, Georgetown VOR 3 radial to West Monroe Intersection, cross Syracuse I LOM at 2,000 feet. Then via (transition) or (assig route). Florence Transition—Via Syracuse VORTAC radial and V145 to Utica VOR. Syracuse Transition—V Syracuse VORTAC 050 radial to Syracuse VORT Pulaski Transition—Via Georgetown VOR 352 radial a V29 to Pulaski Intersection. Take-off Runway 14—Tu left after departure direct to Syracuse ILS LOM.

OHIO

Youngstown Mun Arpt.

In narrative form only

SALEM THREE DEPARTURE

Via Youngstown VOR 197 radial to Ellwood C VORTAC 302 radial. Cross Akron VORTAC 084 rad at 3000 or above. Then via Ellwood City VORTAC radial to the Ellwood City VORTAC. Cross Ellw City VORTAC (as assigned by ATC), then via assig route.

Departing aircraft shall be established on the Youn town VOR 197 radial within 10 miles of the Youngsto VOR.

RHODE ISLAND

T. F. Green Arpt., Providence

In narrative form only

WARWICK ONE DEPARTURE

Takeoff Rnwy 5L/R-34—turn right to 160 heading as n as practicable after leaving 500'. Climb on 160 head- ; to intercept Quonset Pt. VOR 038 radial. Takeoff wy 16—Maintain rnwy heading to intercept Quonset . VOR 038 radial. Takeoff Rnrwy 23L/R—Turn left 90 heading as soon as practicable after leaving 500'. mb on 090 heading to intercept Quonset Pt. VOR 038 lial. Radar vector to Providence VOR 132 radial to onset Pt. VOR 038 radial to Quonset Pt. VOR thence Quonset Pt. VOR 218 radial to V-46. Cross Quonset . VOR at 5000' or below. Cross Norwich VORTAC 124 lial at 7000'. Cross Hampton VORTAC 082 radial (as signed by ATC) then via (assigned route).

STERLING TWO DEPARTURE

Takeoff Runway 34-5L/R—turn left to 250 heading as n as practicable after leaving 500 feet. Climb on 250 ading to intercept Providence VOR 284 radial. Takeoff nway 23L/R-16—turn right to 340 heading as soon as cticable after leaving 500 feet. Climb on 340 heading intercept Providence VOR 284 radial. Radar vector Providence VOR 284 radial thence via Providence VOR 4 radial to Sterling VHF intersection. Cross Sterling IF intersection at / as assigned by ATC/then via/tran- ion/or/assigned/route. Riverhead Transition via V16/ 79.

ADDITIONAL SIDs

In addition to the above, the following areas have D's published separately in graphic form in the C & low altitude chart package.

Pennsylvania

Philadelphia Int'l. Airport, Philadelphia

Utah

Salt Lake City Mun. No. 1 Airport, Salt Lake City

Wyoming

Casper Air Terminal, Casper
Cheyenne Mun. Airport, Cheyenne

SUBSTITUTE ROUTE STRUCTURE
SHUT DOWN OF ENROUTE NAVIGATION AIDS

An extensive Airways Modernization Program is currently being effected, which requires the scheduled temporary shutdown of selected enroute navigation aids. This action will affect associated airways/routes, MEA's, etc., and will obsolete related information shown on the Enroute Low-Altitude, and High-Altitude U.S. charts. These facilities may be shutdown and/or returned to operation during the period between publication dates of the Enroute U.S. Charts. During this shutdown period the following Substitute Route Structure is operational. NOTAMS are published to cover any change in status of these facilities and pilots are advised to check NOTAMS thoroughly prior to each operation. Pilots are further advised to contact FAA Flight Service Stations regarding any doubtful status of enroute navigation aids or airways.

CALIFORNIA

OCEANSIDE "OCN" VORTAC SHUTDOWN

March 1, VORTAC will be shutdown until aprxly March 5, 1965 for rehabilitation. For substitute route structure during shutdown use the following:

VISUAL NAVIGATION CHART BULLETIN

The purpose of this Bulletin is to provide a tabulation of the major changes in aeronautical information that have occurred since the last publication date of each Sectional Aeronautical Chart. The general policy is to include only those changes to controlled airspace and special use airspace that present a hazardous condition or impose a restriction on the pilot; major changes to airports and radio navigational facilities, thereby providing the VFR pilot with the essential data necessary to update and maintain his chart current. When the Sectional Aeronautical Chart is republished, the corrective tabulation will be removed from this Bulletin.

ABERDEEN

38th Edition, August 20, 1964

Delete Madison arpt 44°01′N, 97°03′W. Delete Nicholas arpt 45°37′N, 101°30′W. Add obstn 2029′ MSL 43°56′59″N, 96°54′36″. Add obstn 2040′ MSL 44°23′-02″N, 97°00′37″W. In northern border change Bismarck VOR freq 115.7 to 116.5.

Add obstn 700 MSL 32°09′56″N, °40′33″W. Add obstn 750′ MSL 32°32′42″N, 82°- °54″W. Add obstn 830′ MSL 33°14′29″N, 82°41′46″W. dd obstn 835′ MSL 32°50′52″, 83°20′22″W. Add obstn 50′ MSL 34°03′00″N, 78°04′56″W. Delete Columbia l twr freq 335. In northern border change Florence ORTAC freq 115.5 to 115.2 ch 99. Delete Montezuma pt 32°18′N, 84°01′W. Relocate AUGUSTA RBn °28′N, 81°59′W. Delete CHARLESTON AFB/MUN ltw r freq 278. Add obstn 1333′ MSL 33°52′54″N, °17′02″W.

●SEATTLE

56th Edition, December 10, 1964

Add obstn 526′ MSL 47°05′53″N, 122°35′41″W. Add stn 421′ MSL 47°12′19″N, 122°16′11″W. Delete Ever- REEN arpt 47°18′N, 122°19′W. Delete airway beacon te #61B, code ● — — 46°11′N 122°54′W.

●SHREVEPORT

48th Edition, January 7, 1965

Delete MARSHALL VOR 32°27′N, 94°15′W. Delete HARRISON CO arpt beacon 32°31′18″N, 94°18′30″W. Add obstn 932′ MSL 33°08′03″N, 96°07′35″W. Add PARIS TEX ctl zone 5 mi radius of COX FIELD arpt 33°38′17″N, 95°26′54″W with S xtsn.

●SIOUX CITY

40th Edition, November 12, 1964

Delete Madison arpt 44°01′N, 97°03′W. Add obstn 1902′ MSL 42°05′24″N, 97°01′00″W. Add obstn 2288′ MSL 42°02′39″N, 98°02′01″W. Delete SIOUX CITY RBn 42°22′N, 96°21′W.

SPOKANE

50th Edition, December 10, 1964

No hazardous changes.

●TRINIDAD

40th Edition, Sepetember 17, 1964

Add V211 airway via 270°M from Durango. Add V421 airway Farmington to Durango to Gunnison. Delete Hermit Lakes arpt 37°49′N, 107°13′W. Add obstn 4290′ MSL 37°55′27″N, 107°13′W. Delete Clayton VOR 36°23′N, 103°13′W. Add Durango, Colo ctl zone 5 mi radius of arpt. Revise DALHART ctl zone to include airspace 5 mi radius of DALHART arpt 36°01′10″N, 102°33′10″W.

●TULSA

54th Edition, October 15, 1964

Delete Sky Haven arpt 36°46′N, 91°53′W. Delete Waynesville Mem arpt 37°49′N, 92°11′W. Add obstn 663′ MSL 36°03′40″N, 90°57′15″W. Add obstn 1350′ MSL 37°50′59″N, 94°22′22″W. Delete Golf Ranch arpt 36°38″N 93°11′W. Add obstn 799′ MSL 36°19′49″N, 90°- 17′04″W. Add obstn 25°49′ MSL 35°58′08″N, 95°36′55″ W. Add obstn 1465′ MSL 38°02′26″N, 91°30′53″W. Add INDEPENDENCE (Pvt) RBn freq 400 ident IDP class MHW 37°09′36″N, 95°46′30″W. Add PARSONS TEX transition area 6 smi radius of TRI-CITY arpt 37°30′00″ N, 95°30′30″W with 13 mi wide extsn to 12 mis N of arpt.

TWIN CITIES

49th Edition, November 12, 1964

Add obstn 1531′ MSL 45°01′32″N, 93°02′38″W. Add obstn 1363′ MSL 45°02′46″N–93°11′47″W.

●WASHINGTON

60th Edition, October 15, 1964

Change Kenton VORTAC freq 114.8 Ch 95 to 116.8 Ch 115. Change Sea Isle VORTAC freq 115.2 Ch 99 to 114.8 Ch 95. Delete Point Lookout RBn & FM 38°- 02′24″N, 76°19′16″W. Delete Sunset arpt 39°59′N, 77°38′ W. In southern border change Flat Rock VORTAC freq transition area 6 smi radius of TRI-CITY arpt 37°20′00″ 112.1 ch 58 to 113.3 ch 80. Correct Woodstown ident ODD to OOD. Change Millville VOR freq 115.8 to 115.2. ALF WEBSTER (NAVY) ctl twr decmsnd. Correct

NEW CASTLE VORTAC code ●—●—● to ●—●—● Add obstn 345′ MSL 39°22′42″N, 74°26′53″W. Delete DELAWARE VALLEY arpt 39°51′N, 75°00′W. In southern border change HOPEWELL VORTAC freq 117.3 Ch 120 to 112.0 Ch 57.

●WICHITA

53rd Edition, January 7, 1965

Delete #4 arpt symbol 37°03′N, 101°05′W. Add LIBERAL KAN ctl zone 5 mi radius of LIBERAL MUN arpt 37°02′30″N, 100°57′30″W with extsns NW N SE & SW. Add LIBERAL KAN transition area 15 smi radius of LIBERAL MUN arpt 37°02′30″N, 100°57′30″W.

WILLISTON

38th Edition, July 23, 1964

Delete Petes Port arpt 48°01′N, 101°59′W. Add obstn 2125′ MSL 49°43′15″N, 104°01′00″W. Add obstn 2690′ MSL 49°42′10″N, 106°03′05″W. Add obstn 2735′ MSL 49°38′40″N, 105°59′30″W. Add obstn 2930′ MSL 49°-26′45″N, 107°00′45″W. Add obstn 3150′ MSL 50 00′30″N, 107°45′00″W. Add Moose Jaw term ctl ar within a 50 SM radius of Moose Jaw arpt 50°20′ 105°33′W.

●WINSTON-SALEM

54th Edition, October 15, 1964

Change Bluefield VOR freq 113.3 to 115.4. Add H Springs (Pvt) RBn freq 224, ident HSP, class H 37°57′00″N, 79°49′30″W. In northern border chan Charleston W.Va. VORTAC freq 115.4 Ch 101 to 117.4 (121. Change Flat Rock VORTAC freq 112.1 ch 58 to 11 ch 80. Delete Clarksville–Finchley arpt 36°40′N, 78°29′ In western border change Lexington VORTAC freq 11 ch 106 to 117.0 ch 117. Delete London RBn 37°05′25″ 84°04′30″W. Add obstn 707′ MSL 38°02′54″N, 78°28′1 W.

●YELLOWSTONE PARK

40th Edition, September 17, 1964

Delete West Yellowstone arpt 44°40′N, 111°07′W. southern border change Boysen Reservoir VORTAC fr 114.9 Ch 96 to 117.8 Ch 125. Add V465 airway dire from DUNOIR to BILLINGS.

RESTRICTIONS TO ENROUTE NAVIGATION AIDS

Radio Facility Restrictions are cited until cancelled by the Associated Station.

ALABAMA

'BILE, BROOKLEY AFB RDO: VOR unusable be- w 2000' MSL beyond 30 nmi due reduced coverage.

LUCIN RDO: VOR unusable beyond 40 nmi be 15,000′ MSL 180-220°; below 12,000′ MSL 280-31 below 11,000′ MSL 310-330° account reduced cover

MILFORD: Jet Route 107 from Milford, Utah V to Rock Springs, Wyo. VOR continuous navigat signal coverage does not exist over the entire rc segment below 28,000′. VOR moderate to hvy rou ness over mountain ridges on 072 rad 10 mi out. TACAN momentary crs excursion and roughness excess of 3° exists on TACAN rads.

OGDEN RDO: VORTAC unusable beyond 40 nmi low 21,000′ MSL 360-055°; below 16,500′ MSL thru 075°; below 22,000′ MSL 075 thru 130° acco reduced coverage.

PROVO RDO: VORTAC unusable beyond 40 nmi be 15,000′ MSL 010-035°; below 16,000′ MSL 035-05 below 15,000 MSL 275-285°; below 14,000′ MSL 2 295° acct reduced coverage. VOR roughness exists o mountain ridges N thru E btn 15 and 20 nmi.

SALT LAKE CITY RDO: VORTAC unusable beyo 40 nmi below 19,000′ MSL 010-020°; below 20,(MSL 020-030°; below 23,000′ MSL 030-060°; bel 24,000′ MSL 060-080°; below 19,000′ MSL 080-0 below 17,000′ MSL 095-125°; below 16,000′ MSL 1 140°; below 16,000′ MSL 195-210°: below 10,(MSL 280-290°; below 16,000′ MSL 350-010° acct duced coverage.

VERMONT

'RLINGTON RDO: VOR unusable beyond 35 nmi from 080° clockwise to 105°; 25 nmi 115–135°; 30 nmi 135-155° at MOCA.

)NTPELIER RDO: VOR unusable beyond 30 nmi 205-220°; beyond 25 nmi 220–235°; beyond 30 nmi 234-280° at MOCA.

VIRGINIA

)OKE RDO: TACAN distance unusable beyond 30 nmi 230° clockwise to 270° MOCA.

:RNDON RDO: VOR portion of VORTAC unusable below 2500' MSL. Beyond 30 nmi from 050–075°; beyond 20 nmi from 075–095°; beyond 35 nmi from 095-120°; beyond 20 nmi from 165°–215° acct of rs roughness. V39 E 200° usable 5000' and above beyond 20 nmi.

WRENCEVILLE RDO: VOR unusable below 1800' MSL beyond 8 nmi 215–250°; 14,500' MSL to 18,000' MSL 215-270° account roughness. MEA V-155 3000' MSL btn LVL VOR and Franklinton, N.C. Int. MEA V-454, 5000' MSL btn LVL VOR and LIB VOR. Changeover point 82 nmi from LIB VOR.

N)EN RDO: DME unusable below 3500' beyond 25 nmi 140-180°; below 5000' 180–225° acct reduced coverage.

)NTEBELLO RDO: VOR unusable 110–220° beyond 5 nmi at MOCA. 058 rad unusable above 14,500'.

'LASKI RDO: VORTAC unusable beyond 35 nmi from 045° clockwise to 060° at MOCA.

'ANTICO MCAS RDO: Use LFR as H facil only.

)ANOKE RDO: Woodrum VOR unusable beyond 30 nmi from 360 to 285°, 20 nmi 286–360° at MOCA. H facil unusable beyond 40 nmi from 240 to 010° below 6000' due excessive needle oscillation.

WASHINGTON

:LLINGHAM RDO: Intermittent roughness may be observed on V-23 below 6000' MSL from 49 nmi thru 40 nmi S of VOR.

:AH BAY RDO: H facil unusable 100–130° below 5500' MSL acct terrain.

.YMPIA RDO: VORTAC unusable below 7500' MSL at 40 nmi 210–260°. TACAN unusable below 15,000' MSL 260-270° at 40 nmi; below 9500' MSL at 35 nmi 270-280° account reduced coverage. VOR 348° rad unusable below 4500' MSL beyond 24 nmi.

PASCO RDO: VOR unusable below 6500' MSL beyond 40 nmi 150-210°; below 5500' MSL 210 270° acct reduced coverage. Coverage within R 6715 from 270–320° not flt checked.

PORT ANGELES RDO: VOR coverage 40 nmi: 220–110° at 7000'; 110-140° at 14,500'; 140–150° at 20,500'; 150–170 °at 20,000'; 170-190° at 20,500; 190–220° at 16,000'.

SEATTLE RDO: LFR NW crs has splits and multiples beyond 20 nmi. VOR unusable beyond 10 nmi 158° clockwise 165°. 309° rad unusable below 14,000 within 40 nmi.

WALLA WALLA RDO: VOR coverage at 40 nmi restricted below 6000', 355-020° and 148-176°; below 7500' from 130–150°; below 10,500' from 020–060° and 110-130°; below 12,700' from 065-110°.

WENATCHEE RDO: VOR unusable beyond 20 nmi below 20,000' MSL 000–020° beyond 30 nmi below 20,000' MSL 020-075° beyond 40 nmi below 14,000' MSL 075-090° below 18,000' MSL 090–190° below 19,000' MSL 190–240°.

WEST VIRGIN'A

BECKLEY RDO: VOR unusable beyond 20 nmi 325–350° below 5000' acct crs roughness, excluding 335° rad at Montgomery Int. Voice reception Charleston FSS unreliable below 7500' MSL 40 nmi radius Beckley VOR 030–180°. Reception satisfactory with acft over VOR or MEA.

WISCONSIN

LA CROSSE RDO: VOR unusable 100–150° and 230–090° below 3300' MSL beyond 20 mi.

MILWAUKEE RDO: Timmerman VOR unusable beyond 35 mi 300–310° below 3400' MSL acct reduced coverage. Alarm status MKE VOR indicated by transmission of unkeyed 1020 cycle ident signifying unusability for nav and indicating imminent equipment transfer shutdown.

WYOMING

BOYSEN RESERVOIR RDO: VORTAC has momentary crs excursions and roughness all radials.

DUNOIR RDO: VOR restricted to awy rad use only.

SHERIDAN RDO: VORTAC unusable below 40 nmi below 17,000' MSL 160–175°; below 15,000' MSL 175–200° and below 16,500' MSL 300–230° acct reduced coverage.

VOR RECEIVER CHECK POINTS

The list of VOR airborne check points and ground check points is given on the following pages.

NOTE: The information is provided in the following order: Facility name (plus airport name, if needed bearing in degrees magnetic from the VOR; location of the check point (distances in nautical miles); a altitude (in feet MSL, if any).

AIRBORNE

Abilene, Tex. (Municipal): 047°; 10.1 nmi silos in center of Ft. Phantom alternate for lgt acft 099° 9 nmi ctl twr and bcn.

Alexandria, La. England AFB): 329°; over water tank.

Alexandria, La. (Esler): 152°; over hangar 3.6 nmi from VOR.

Alexandria, Minn.: 223.5°; over apch end of rnwy 22.

Allendale, S.C.: 342°; over N/S rnwy on Barnwell Co. Arpt.

Anniston, Ala.: 082°; in center of segmented circle, distance 9.5 nmi; 2000′.

Appleton, Ohio: 238°; over ctl twr Columbus, Ohio-Port Columbus Airport; 2500′.

Asheville, N.C. (Mun): 278°; over ctl twr 13.6 nmi from VOR; 3000′.

Athens, Ga.: 308°; 3 nmi over center of three rdo twrs.

Atlanta, Ga.: Lctn #1—012°; over end rnwy 09. Lctn #2—020°; over end rnwy 27.

Augusta, Ga. (Bush Field): 141°; directly over No. 17 of rnwy #17; 300′.

Augusta, Me. (State): 257°; over LFR, 1.8 nmi from AUG VOR; 1500′.

Austin, Tex. (Mueller Mun): 178°; Freeway Int aprxly 0.9 nmi N of Mueller Mun Arpt.

Bakersfield, Calif. (Meadows Fld): 127°; over apch end rnwy 30; 1200′.

Bangor, Me.: 072°; over FSS Bldg., Old Town Arpt; 1000′.

Bartlesville, Okla. (Phillips): 161°; over Phillips oil tank—white ½ mi E of arpt trml.

Baton Rouge, La. (Ryan): 064°; over tank S side of arpt.

Beatrice, Nebr.: 360°; over RR at Princeton, Nebr.; 2500′.

Beaumont, Tex. (Jefferson County): 056°; water twr aprxly 0.4 mi NE of NE end of rnwy 2.

Bellingham, Wash.: 145°; N end of rnwy 16–34; 660′.

Big Spring, Tex.: 199°; over the rdo bcn; 1000′ AGL.

Billings, Mont. (Municipal): 073°; Intersection of rnwys 4–22 and 9–27; 4600′.

Blackstone, Va.: 123°; beacon lgt Lawrenceville, Va. Arpt; 1500′.

Bloomington, Ill. (Mun): 030°; lctd 11 nmi NE of BMI VOR at railroad crossing river; 2000′.

Boise, Idaho (Air Trml): 086°; over dam outlet S e Lucky Peak Reservoir, 8.5 nmi from VOR; 5000′.

Bozeman, Mont.: 145°; over BZN rdo bcn; 5000′.

Brownsville, Tex. (Rio Grande Valley Intl): 244°; wa twr in bldg area of arpt.

Brownwood, Tex: 167°; over arpt bcn.

Brunswick, Ga. (McKinnon): 023°; at arpt rotating b con.

Burlington, Iowa: 296°; over rdo twr 3 nmi NNW Burli ton Arpt.

Burlington, Vt. (Municipal): 030°; over arpt control t 4.4 nmi from VOR; 2000′.

Butler, Mo.: 073°; over FSS bldg.

Butte, Mont.: 094°; intersection of rnwy 29–33; 6500′.

Carleton, Mich. (Detroit-Wayne-Major): 031°; the E and NW/SE rnwys SE of new ctl twr; 2200′.

Casper, Wyo. (Air Trml): 201°; over intersection rnw 21–25–30; 6300′.

Centralia, Ill. (Mun): 027°; at apch end of rnwy 36.

Chadron, Nebr.: 014°; railroad intersection 1.5 nmi N a bndry.

Champaign, Ill.: 175°; over grain elevator 8 nmi S Pesotum, Ill.; 2000′.

Cleveland, Ohio (Cleveland-Hopkins): 079°; over Cle land LFR distance 13.5 nmi; 1500′.

Colorado Springs, Colo. (Peterson Fld): 320°; over mic wave twr, 6.8 nmi.

Colts Neck, N.J.: 084°; over awy bcn twr at NE corn of Red Bank, N.J. Arpt.

Concord, N.H. (Mun): 132°; over rdo twr (old LFR) nmi.

Corpus Christi, Tex. (Intl): 187°; over grain elevator 1 m E of arpt.

Cotulla, Tex.: 255°; rotating bcn on the Cotulla Intl Ar

Crescent City, Calif. (McNamara Fld): 104°; over Tan farm E side of town; 1000′.

Crestview, Fla.: 104°; over center of arpt; 900′.

Crossville, Tenn (Meml Arpt): 333°; 11 nmi over met hangar.

Cut Bank, Mont.: 312°; over center rnwy 31; 4800′.

Daggett, Calif.: 224°; over center twr LFR; 2500′.

Danville, Ill. (Vermillion Co.): 194°; int of rnwys 21 a 17; 1700′.

ayton, Ohio (Mun): 131°; over new trml bldg, 10.76 nmi; 2500′.

aytona Beach, Fla. (Mun): 157°; over remote ctld air/gnd facility antenna.

ecatur, Ala. (Pryor): 092°; over intersection of rnwy and taxiway 236° from HSV; 1000′.

elta, Utah: 346°; at apch end of rnwy 34; 4900′.

enver, Colo.: 189°; over EGW rdo bcn; 5800′.

es Moines, Iowa: 356°; center twr of DSM LFR, 4.2 nmi from VOR.

ouglas, Ariz. (Bisbee-Douglas Intl): 119°; over intersection rnwy 12–30 and 17R–35L; 4700′.

ublin, Ga. (Municipal): 067°; over SW end NE/SW rnwy.

ubois, Idaho (Municipal): 335°; FAA Communications Bldg; 5200′.

agle Lake, Tex.: 181°; over center of football fld 0.5 nmi SW of Eagle Lake Arpt.

Dorado, Ark. (Goodwin): 228°; trml bldg E side of arpt.

lensburg, Wash. (Bowers): 255°; center, W end of rnwy 7–25; 2300′.

mporia, Kans.: 046°; over schoolhouse Neosho Rapids, Kans., 8.5 nmi 2500′.

nrata, Wash.: 200°; centerline, SW end of rnwy 2–20; 1500′.

vergreen, Ala.: 100.7°; arpt bcn lgt twr lctd on Evergreen (Middleton) Arpt., 15.3 nmi from VOR.

rgo, N.Dak. (Hector): 360°; lctd apch end Hector Fld rnwy 35.

rmington, Mo.: 195°; over center of Open Air Theater NE of the town of Fredericktown and 7.0 nmi from VOR; 2300′.

yetteville, Ark.: 183°; VORTAC; white circle on arpt; 2500′.

yetteville, N.C.: 239°; over water twr at Parktown, N.C. 8.0 nmi; 1200′.

lmore, Calif.: 210°; at CAV rdo bcn 1800′.

ndlay, Ohio: 048°; over the Ohio Oil Company Admin Bldg at 2000′; aprxly 5 nmi from FDY VOR.

int, Mich. (Bishop): Pontiac VOR 332°; over apch end rnwy 9; 2200′.

ying Cloud, Minn.: 349°; 4.5 nmi over smokestack at Glen Lake Sanatorium; 2000′.

rt Leonard Wood, Mo. (Forney AAF): 351°; water twr N side E–W hvy dist 4.9 nmi from transmitter.

rt Smith, Ark.: 232°; water tank at N edge of arpt; 1300′.

rtuna, Calif.: 358°; over intersection of rnwys Arcata Arpt; 500′.

rtuna, Calif. (Rohnerville): 128°; over apch end of rnwy 11; 1400′.

sno, Calif. (Air Trml): 133°; over apch end rnwy 11; 500′.

sge, Okla.: 094°; over LFR; 3000′.

olveston, Tex.: 110°; arpt terminal bldg.

rden City, Kans.: 100°; Cimarron, Kans. at RR tracks and Main St.

Gardner, Mass.: 169°; hangar mrkd "WORCESTER" on roof, Worcester Arpt; 1000′.

Gila Bend, Ariz.: 193°; over apch end of rnwy 35 of Gila Bend Aux. Fld; 1500′.

Goodland, Kans. (Mun): 083°; over water twr NE edge of town of Brewster, Kans., 16 nmi; 4000′.

Gordonsville, Va.: 305°; over intersection of rnwy and center txwy Charlottesville-Abermarle Arpt., 16 nmi from GVE–VOR; 2000′.

Grand Forks, N. Dak.: 315°; over Int N/S and E/W rnwys; 1900′.

Grand Island, Nebr.: 141°; over smoke stack 5.5 nmi from VOR; 3100′.

Grand Junction, Colo. Walker Fld): 059°; int rnwys 29 and 22; 6500′.

Grants, N. Mex.: 295°; in flt over FSS adj to rnwy; 7000′.

Great Falls, Mont.: 026°; center NE end rnwy 3–21; 3900′.

Hallsville, Mo.: 225°; 14 nmi Int of E/W and N/S rnwys over Columbia Mun Arpt., Mo.; 2000′.

Harlingen, Tex.: 140°; over rot bcn on Mun Arpt.

Harrisburg, Pa. (York State): 109°; over triangle formed by rnwys: 2000′.

Hattiesburg, Miss. (Mun): 149°; over water twr and rotating lgt bcn on arpt.

Hayes Center, Neb.: 258°; 28 nmi over center of town of Enders, Neb.; 4500′.

Hibbing, Minn.: 311°; over FSS Bldg; 2400′.

Hickory, N.C.: 225°; over end rnwy 24.

Hill City, Kans.: 057°; Hill City Arpt bcn lgt 23 nmi from the VOR.

Hobart, Okla.: 352°; centerline of N/S rnwy 100′ above the elevation of the rnwy.

Hobbs, N. Mex. (Lea County): 030°; over circle on runup pad apch end rnwy 3.

Hoquaim, Wash. (Bowerman): 037°; W end and center rnwy 6; 500′.

Houghton, Mich. (County Mem'l): 241°; WHDF com. bdcst twr 3.5 nmi from VOR; 2100′.

Houlton, Me.: 042°; over Admin Bldg on E side of flt and 5.5 nmi from VOR; 1500′.

Houma, La.: 117°; over intersection of rnwys 17–35 and 11–29.

Houston, Tex. (Andrau): 276°; arpt bcn on arpt; 500′.

Houston, Tex.: 099°; over intersection of E/W txwy and parking ramp of Ellington Field.

Huron, S. Dak. ((Howes): 153°; lctd over HON/SBH; 2000′.

Hutchinson, Kans.: 032°; apch end rnwy 3 Hutchinson Mun Arpt.

Imperial, Calif.: 313°; apch end of rnwy 32; 200′.

International Falls, Minn.: 142°; RR bridge over stream of Ericsburg, Minn 5.4 nmi; 2200′.

Jackson, Miss. (Hawkins): 189°; over arpt intersection of rnwys 11–29 and 34L–16R.

Jackson, Tenn. (McKellar): 267°; over bcn twr above arpt; 1000′.

Joliet, Ill.: 102°; over centerline of NW end of NW/SE rnwy; 1500′.

Keeler, Mich.: 266°; over intersection of N/S and E/W rnwys at Ross Fld, Benton Harbor, Mich.; 1600′.

Kennebunk, Me.: 061°; over Portland Arpt control twr 18.5 nmi from Kennebunk VOR; 1500′.

Kirksville, Mo.: 138°; over water twr at La Plata, Mo. (8.2 nmi from VOR).

Kokomo, Ind.: 097°; over int NW/SE and NE/SW rnwys Marion Mun Arpt., Ind., 17.5 nmi from VOR; 1000′.

La Crosse, Wis.: 321°; 5 nmi LFR; alt 1800′.

Lafayette, Ind.: 135°; over Purdue Univ Stadium, 2100′.

Lake Charles, La. (Mun): 253°; over rotating bcn on ctl twr, 6.2 nmi.

Lamoni, Iowa ((Lamoni): 041°; over hwy "Y" 1 nmi W of Leon, Iowa.

Laredo, Tex.: 315°; over arpt bcn 9.5 DME.

Laurel, Miss. (Municipal): 025°; over water twr and rotating lgt bcn on arpt.

Lewistown, Mont.: 072°; above center of rnwy 7; 5200′.

Lexington, Ky. (Blue Grass): 305°; arpt ctl twr 7.6 nmi from LEX VOR; 2500′.

Liberal, Kans.: 056°; elevator 8.5 nmi NE Liberal, Kans. along Railroad.

Litchfield, Mich.: 051°; NE/SW rnwy Reynolds Fld, Jackson, Mich.; 2000′.

Livingston, Mont.: 199°; over ant of Livingston "H" facility; 5700′.

London, Ky.: 027°; trml bldg 3.7 nmi from LOZ VOR; 2500′.

Lufkin, Tex.: 328°; rotating bcn on Angelina Co. Arpt.

Macon, Ga. (Mun): 246°; 4.0 nmi from VOR over water tank; 2000′.

Malden, Mo.: 349°; RR crossing 0.5 nmi E of Dexter, Mo.

Manchester, N.H. (Grenier Fld-Manchester Mun): 341°; over former USAF arpt ctl twr E side 17–35 rnwy. 5.0 nmi; 1500′.

Marquette, Mich.: 120°; 5.5 nmi over NW tip of Pelesier Lake; 2000′.

Marshall, Tex.: 320°; water twr N of arpt.

Marshall, Mo. (Meml): 321° BWR; over MHL VORTAC Bldg; 2000′.

Marysville, Calif. (Yuba County): 067°; intersection of rnwys; 1500′.

Massena, N.Y. (Richards): 297°; Admin Bldg; 1500′.

McComb, Miss. (Pike County): 248°; revolving arpt bcn.

Medford, Oreg.: 212° (VOR); over rdo twr, 4.8 nmi 3000′.

Merced, Calif.: 289°; (Castle VOR); over end rnwy 30; 650′.

Midland, Tex. (Air Trml): 170°; over apch ends of rnwys 22 and 28; 1000′.

Miles City, Mont.: 30°; to apch end of rnwy 4.

Millinocket, Me. (Mun): 317°; over FSS Bldg; 1500′.

Milwaukee, Wis. (General Mitchell); 123°; over MKE LFR.

Minneapolis, Minn. (Crystal Arpt): 166°; over apch end rnwy 13L. 4.9 nmi VORTAC; 1500′ nmi.

Minot, N. Dak.: 241°; apch end rnwy 26; 1900′.

Montebello, Va. (Preston Glenn near Lynchburg, Va.): 192°; intersection all rnwys; 2500′.

Montgomery, Ala. (Dannelly): 319°; over water twr, d tance 6.1 nmi from VORTAC.

Muskegon, Mich. (County): 256°; over Muskegon LF 1500′.

Myrtle Beach, S.C. (AFB): 061°; over apch end rnwy Crescent Beach Arpt.; 500′.

Napa, Calif. (County): 045°; over rotating bcn on ar 500′.

Naperville, Ill.: 328°; over RR underpass lctd ½ nmi I of the DuPage County Arpt; 2000′.

Nashville, Tenn.: 242°; WSM rdo twr near Brentwo Tenn., 10.2 nmi from VOR.

Neola, Iowa: 047°; over grain elevator Harlan, Iow 2500′.

Neosho, Mo.: 343°; center triangle formed by the int section of 3 rnwys of Joplin, Mo., Mun Arpt.

Newbern, N.C.: 259°; Int of E/W rnwys Oak Grove (nav arpt.

New Orleans, La. (Mun): 081°; over rotating bcn t bldg on New Orleans Mun Arpt.

New Orleans, La. (Lakefront Arpt): 070°; over Lakefr twr.

Newton, Iowa: 142°; lctd apch end NW/SE rnwy.

Norfolk, Nebr.: 095°; over racetrack town of Stant Nebr.; 2600′.

North Bend, Oreg.: 254°; intersection rnwy 22–31; 750′.

North Platte, Nebr. (Lee Bird): 82.6°; over water t Brady, Nebr.; 4000′.

Oklahoma City, Okla. (Will Rogers): 100°; rdo bcn st 1800′.

Oklahoma City, Okla. (Wiley Post): 041°; OKC VOR rnwys 17–35 and 12–30; 1800′.

Omaha, Nebr. (Eppley Fld): 309°; centerline of SE e of NW/SE rnwy.

O'Neil, Nebr.: 115°; at intersection of E/W road and railroad ½ nmi SE of Inman, Nebr.

Ontario, Calif. (Intl: 347°; over and parallel with tx btn rnwy 21 and 25; 2300′.

Oshkosh, Wis.: 017°; WOSH Commercial Bcst twr nmi from VOR.

Ottumwa, Iowa (Mun); 303°; int of rnwys 32 and 22.

Peck, Mich.: 163°; over apch end rnwy 3 on St. Clair Arpt; 2200′.

Philip, S.D.: 156°; over 2712′ twr 5 nmi from VOR; 330

Phoenix, Ariz.: 256°; centerline rnwy 8R–26L; 2800′.

Picayune, Miss.: 140°; over rotating lgt bcn on arpt.

Pinehurst, N.C.: 086°; over windsock on top of hangar Southern Pines, Pinehurst-Southern Pines Arpt.

Pittsburgh, Pa.: 333°; ctl twr, Greater Pittsburgh Arp 3000′.

Plainview, Tex. (Hale Co.): 024°; intersection rnwys 4– and 12–30, 6 nmi from VOR; 4400′.

Plattsburgh, N.Y.: 229°; arpt bcn Plattsburgh Arpt: 150

Pocatello, Idaho: Lctn #1—031°; over apch end of rn #3; 5450′. Lctn #2—029°; over intersection or ru ways 21 and 25; 5450′.

Pontiac, Mich. (Municipal): 113°; over circle of stones SE corner of arpt; 2000′.

Portland, Oreg.: (Intl): 162°; intersection 2 and disco tinued 29; 1000′.

oughkeepsie, N.Y.: 249°; arpt twr site at Dutchess County Arpt: 1500′.

rescott, Ariz.: 124°; rnwy 3–21 and 12–30 intersection; 5500′.

ribque Isle, Me. (AFB): 184°; Sprague ville LFR site; 200′.

rincenes, Maine: 163°; over int of rnwys, 9.63 nmi from VOR; 1000′.

ueblo Colo. (Pueblo Mem'l): 294°; over KOAA TV twr, 5.4 nmi NW of arpt (twr lgt 6322′ MSL).

uloski, Va.: 066°; bldg on S side of E/W rnwy at VPI Arpt., Blackburg, Va.; 4000′.

uitman, Tex.: 241°; water tank, town of Alba, Tex.

urlins, Wyo.: 065°; (Cherokee VOR), 17 nmi; 7300′.

ymond, Nebr.: 082°; over grain elevator at Waverly, Nebr., 9.8 nmi; 2500′.

d Bluff, Calif. (Mun): 329°; over centerline rnwy 33; 700′.

hinelander, Wisc. (Drott Arpt): 210°; over rnwy Int; 2500′

verhead, N.Y. (Brookhaven Arpt): 170° VORTAC; 4.5 nmi over apch end of rnwy 15; 1500′.

oswell, N. Mex.: 027°; over apch end rnwy 3; 400′.

yston, Ga.: 067°; over intersection rnwys 5–23 and 17–35 at Anderson, S.C. Mun Arpt; 1250′.

nsell, Kans.: 091°; over water twr in center of town of Wilson, Kans.

cramento, Calif.: 015°; apch end rnwy 02; 100′.

. Joseph, Mo. (Rosecrans Mem'l): 167°; centerline of the extreme N end of the N/S rnwy.

lina, Kans.: 115.5°; over town of Kipp, Kans., 12 nmi from VOR and 6 nmi SE of Mun Arpt.

lt Flat, Tex. (8A, ELP–FTW): 335°; over the LFR.

lt Lake City, Utah: 158°; centerline rnwy 34L/16R entire length #1 Arpt; 4400′.

nsville, Ill.:064°; over int at rnwys 4–22 and 13–31 at Mt. Carmel Mun Arpt., Ill.; 1500′.

ult Ste. Marie, Mich. (Mun): 336°; int E–W and NW/SE rnwys; 2100′.

yre, Okla. (Mun): 175°; over rot bcn twr; 3000′.

eridan, Wyo. (County): 122°; over center of apch end rnwy 13, distance 4.9 nmi; 4500′ MSL.

reveport, La. (Downtown): 011.2°; over water tank N of arpt, distance 1.3 nmi.

reveport, La. (Greater Shreveport): 175°; over the Admin Bldg.

nton, Tex.: 318°; over bcn on fld 9.5 nmi CRP VORTAC.

nithwick, S. Dak.: 300°; on Hot Springs, S. Dak. Arpt at intersection E/W taxiway and N/S rnwy.

uth Boston, Va.: 254°; over trml bldg Danville Mun Airport; 1500′.

Meridian, Miss. (Ky) : 121° ; from run up ramp for rnwy 23.
Midland, Tex. (Air Trml) : Lctn #1—188° ; center of warm up pad for rnwy 10. Lctn #2—178° ; int txwy C and ramp in front of Trml Bldg.
Mineral Wells, Tex.: 307° ; intersection of txwy and NW rnwy.
Missoula, Mont. (County) : 340° ; 5′ from edge of ramp in front of Admin Bldg.
●**Mobile, Ala.** (Bates) : 107° ; Int of N/S and E/W txwys E of rnwy 18–36. 109.5° ; Int of W ramp and W txwy.

Monroe, La. (Selman): 033°; arpt ramp in front of twr structure adj to the txwy leading to intersection of rnwys 17–35 & 4–22.

Muscle Shoals, Ala.: 289°; eastern end of E/W rnwy 11–29 equi-distance from end and both sides of rnwy.

Nantucket, Mass. (Memorial): 241°; taxiway apchg rnwy 24.

Needles, Calif. (Site 25B, LAX–AMA): 253°; on ramp in front of Admin Bldg.

New Bern, N.C.: 088°; on compass rose at ramp.

New Orleans Intl, La. (Moisant Fld): 235°; center of perimeter txwy 100′ S of rnwy 10.

Norfolk, Va. (Mun): 031°; center of txwy "E", 250′ NW of centerline of rnwy 22.

Oakland, Calif. (Metro-Oakland Int'l): 081°; middle of pad between rnwys 27L and 27R.

Olympia, Wash.: 347°; on ramp in front of Admin Bludg.

Orlando, Fla. (Herndon): 300°; midpoint of N/S taxiway on W bndry of arpt.

Paducah, Ky. (Barkley): 040°; on txwy apchg end of rnwy 22.

Palacious, Tex.: 119°; intersection NW end NW/SE rnwy and S txwy strip.

Panama City, Fla. (Bay Co. Arpt): 195°; N/S txwy 1050′ N or Term bldg.

Paris, Tex. (Cox Fld): 348°; intersection of N/S and E/W txwys.

Parkersburg, W. Va. (Wood County): Lctn #1—209°; run-up area N side of rnwy 28. Lctn #2—207°; on txwy near intersection rnwys 16 and 21.

Pasco, Wash.: 020°; S of int ofN/S txwy and rnwy 20L.

Paso Robles, Calif.: 248°; 150′ S of Admin Bldg on parking ramp, indicated by circle and sign.

Pecos, Tex. (Mun): 133°; on ramp adj to center taxiway.

Pellston, Mich. (Emmet Co.): 239°; intersection of centerlines of N/S rnwy and E/W txwy of arpt.

Pendleton, Oreg.: 076°; 200′ W of Admin Bldg.

Peoria, Ill. (Greater Peoria): 098°; at SW corner of service ramp E side of fld.

Philadelphia, Pa. (North Philadelphia): 215°; on taxi strip between ramp and rnwy 10.

Philipsburg, Pa. (Black Moshannon-State): 252°; rnwy intersection.

Pierre, S. Dak.: 250°; in front of municipal hangar.

Pine Bluff, Ark. (Grider): 179°; center txwy at junction N/S rnwy.

Ponca City, Okla.: 101°; taxi strip at junction to trml ramp.

Pontiac, Mich.: 114°; center of warmup pad S of apch end rnwy 27.

Pueblo, Colo.: 244°; painted circle with arrow on ramp W of Admin Bldg.

Quincy, Ill. (Quincy-Baldwin Fld): 030° at intersection of NE/SW and NW/SE taxi strips N of trml bldg.

Raleigh, N.C.: 244°; end rnwy 5.

Rapid City, S. Dak.: 320°; in front of Admin Bldg adj to center taxi strip.

Raymond, Nebr. (Lincoln AFB/Mun): 174° run up pad of rnwy 35R along centerline of N/S txwy.

Redding, Calif. (Mun): 310°; intersection txwy and rnw 12.

Redmond, Oreg.: 066°; on ramp in front of Admin Bl 60′ W of centerline of txwy to rnwy 10–28.

Reno, Nev.: 240°; lctd on concrete runup mat for rnwy

Riverton, Wyo. (Mun): 178°; txwy between Admin Bl and rnwy.

Roanoke, Va. (Woodrum): 099°; filled area rnwy 27.

Rochester, Minn.: 030°; of taxiway that enters apch e of rnwy 31.

Rochester, N.Y. (Monroe Co.): 149°; on ramp in front ctl twr 415′ from centerline rnwy 1–19 and 305′ fr centerline of rnwy 7–25.

Rock Springs, Wyo.: Lctn #1—266°; in center of tu around E end rnwy 25. Lctn #2—261°; in cen of turn-around W end rnwy 7.

Rockford, Ill.: 112°; apex of txwys at center of arpt.

Rocky Mount, N.C.: 263°; right 3 rnwy 33, marker.

● **Rome, Ga.** (Russeell Fld): 348°; Intersection of taxiwa 200′ S of the terminal bldg.

Saginaw, Mich. (Tri-City): 280°; lctd on NE parki ramp 12′ from field edge near center txwy.

St. Paul, Minn., (Downtown Arpt): 291°; over drain center of int parking ramp and taxiway in front trml bldg.

St. Petersburg, Fla. (Pinellas County Int'l): 255°; parki ramp 500′ SE of ctl twr.

St. Thomas, V.I. (Charlotte Amalie, Truman): 118°: center point of arpt txwy on line 3 mi WNW.

Salinas, Calif. (Mun): 257°; rgt shoulder rnwy 21, direct in front of trml bldg.

Salisbury, Md. (Salisbury-Wicomico County): 243°; ra front of ctl twr.

San Angelo, Tex. (Mathis): 236°; E edge of ramp in fro of twr.

San Antonio, Tex. (Stinson Mun): Lctn #1: 329R, run area at apch end rnwy 9. Lctn #2: 335R, on W e ramp opposite hangars 1 and 2.

San Juan, Puerto Rico (Intl): 081°; lctd on taxiway trml bldg.

Santa Barbara, Calif.: 198°; gate 2 in front of trml bl over Figure 2 painted on apron.

Santa Catalina, Calif.: 346°; SW corner apch end rnwy Santa Catalina Arpt.

Santa Fe, N. Mex. (New Municipal): 334°; at junctio main intersection txwy and ramp.

Sarasota, Fla. (Bradenton): 172°; on ramp 800′ N tr bldg.

Scottsbluff, Nebr. (Mun: 240°; NE edge ramp opposi trml bldg and W of txwy leading to rnwy 30 aprx 3000′ from apch end.

Seattle, Wash. (Seattle-Tacoma Int'l): 028°; 30′ near ed of ramp S and W of Admin Bldg.

Sioux City, Iowa: 314°; painted circle directly in front new twr.

Sioux Falls, S. Dak.: 148°; in line with E edge of txwy of ctl twr, 75′ S from N edge of parking ramp.

South Bend, Ind. (St. Joseph Co.): 178°; center of weste N/S txwy 200′ N of N edge of trml ramp.

Spartanburg, S.C. (Municipal): Lctn #1—192°; at co pass rose on ramp.

ringfield, Ill. (Capital): 214°; in front of twr at intersection NW/SE and NE/SW taxi strips.
ringfield, Mo.: 191°; at bend in N/S txwy 400' S of N end of taxi strip.
nson, Tex. (Mun Arpt): Lctn #1, 329°; runup area at apch end runway 09. Lctn #2, 335°; on W end of ramp opposite hangars 1 and 2.
rmal, Calif.: 328°; ramp 250' in front of hangar.
seka, Kans. (Philip Billard Arpt): 212°; N/S taxiway W of tetrahedron.
th or Consequences, N. Mex.: 155°; on SE/NW txwy adj to wind cone.
umcari, N. Mex.: Lctn #1—255°; over square metal plate lctd on hangar ramp paved area. Lctn #2—256°; over painted orange circle, lctd on taxi strip 100' off end of rnwy 8.
sa, Okla. (Int'l): Lctn #1—260°; W end rnwy 8. Lctn #2—266°; on txwy SW corner AAL ramp. Lctn #3—265°; in runup position for rnwy 17R.
scaloosa, Ala. (Van De Graaff): 241°; point lctd on centerline of txwy midway between ramp and rnwy.
in Falls, Idaho (Joslin): 030°; on parking strip apron 30' SW of Admin Bldg.
re Beach, Fla.: 112°; on taxiway adj to wind sock adj to rnwy 11–29.
hy, Mo.: 241°; on center line of NE/SW rnwy 125' from NE end Rolla National Arpt.
Victoria, Tex. (Victoria Co.-Foster): 126°; apch end rnwy 13L.
●Waco, Tex., (Muni): 132°; ramp N of terminal.
Walla Walla, Wash. (City-County): 025°; ctr of txwy apch rnwy 20, mrkd.
Walnut Ridge, Ark.: 050°; taxi strip at parking apron adj to tetrahedron.
Watertown, N.Y. (Mun): 048°; ramp in front of Admin. Bldg.
Watertown, S. Dak.: 184°; lctd SE corner of ramp near taxiway leading to rnwy 12–30.
Wausau, Wis. (Alexander): 338°; 100' N of wind tee, 30' from S edge of concrete trml ramp where concrete ramp terminates and blacktop ramp begins.
Wenatchee, Wash. (Pangborn Fld): 45°; front of Administration Bldg.
Westfield, Mass.:304°; from center of compass rose lctd end of rnwy 15.
Wheeling, W. Va. (Wheeling-Ohio County): 219°; txwy on E side of ramp.
●Williamsport, Pa., (Williamsport-Lycoming Co.): 237°; Int of txwy to rnwy 9 and center txwy.
Woodring, Okla.: 348°; ramp W of Term. Bldg.
Youngtown, Ohio: 182° compass rose end of rnwy 18.
Zanesville, Ohio: 010°; on arpt 270' NE of intersection of NE/SW and NW/SE taxistrips on centerline of NE/SW taxistrip.

VFR AIRPORT TRAFFIC PATTERNS

(In accordance with FAR PART 91.89(c)(3))

Airports	*Runways*	*Departure Procedures*	*Traffic Patten Alts.*
•Atlanta, Ga.	9R, 9L	No turns until 3 miles, 2500′ for *large acft.	
	27R, 27L	No turns until 3 miles, 2500′ for *large acft.	
	15	No turns by *large acft. over more populated areas until 3 mi., 2500′.	
	21	Turn south when speed & altitude permit, or as directed by ATC.	
Betts AAF, Tobyhanna Supply Depot, Pa.	14	Right hand tfc pattern.	
Burlington Mun., Vt.		Single engine.	1140′ MSL
		Multi engine.	1340′ MSL
Caldwell-Wright, Fairfield, N.J.	27	Acft shall not start crosswind leg until well past the school lctd ¼ mi to the right of the extended rnwy centerline and ¼ mi from the arpt.	
	32	Acft shall bear right as soon as practicable after take-off to avoid flying over the Fairfield township school lctd ¼ mi NW of arpt and slightly left of the extended rnwy centerline.	
Chicago–Midway, Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
Chicago–OHare I'ntl Arpt., Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
Gardner, Kans.	East	Recommend alt not above 400′ AGL until cross-wind leg northbound. Exit pattern NW to remain clear of tfc patterns of Olathe NAS, 3.5 mi NE.	
Jennings Arpt, La.	13, 17, 22	Right hand tfc pattern.	
Kansas City Fairfax Mun., Kans.		Acft under 12,500 lbs.	600′ AGL
Lake Charles, La.	15, 22	Right hand tfc pattern. 1000′ slow acft pattern; 1500′ turbine powered fixed-wing acft.	
New York, LaGuardia	13	Rgt turn and proceed over Flushing Meadow Park before turning on course.	1500′
•Oklahoma City, Wiley Post Post Arpt., Okla.	12	Acft shall proceed on rnwy heading until reaching 500′ or until passing the arpt bndry before beginning a turn to the right.	lgt acft 800′ AGL hvy acft 1200′ AGL
	17	Acft shall proceed on rnwy heading until reaching 500′ or until pasing the arpt bndry before beginning a turn to the right.	

* Large acft—acft weighing over 12,500 lbs maximum certificated take-off weight.

Airports	Runways	Departure Procedures	Traffic Patterns Alts.
	21	Acft shall proceed on rnwy heading until reaching 500' or until passing the arpt bndry before beginning a turn to the right.	
San Antonio, Tex., Stinson Arpt	9, 14, 22	Right hand tfc pattern. 800' AGL light or slow acft. 1500' AGL, heavy or fast acft.	
Sherman Mun., Texas	16	Left turn after takeoff.	800' AGL
	34	Right turn after takeoff.	
Torrance Mun., Calif.	11L	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 45 degrees from the runway departure heading and continue climb.	
	11L	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 90 degrees to the departure runway heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the right of the cross wing leg course.	
	11R	All aircraft—Climb on departure rnwy heading to 1500'.	
	29R	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 45 degrees from the runway departure heading and continue climb.	
	29R	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 90 degrees to runway departure heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the left of the cross wind leg course.	
	29L	All aircraft—Upon reaching an altitude of of 500 feet MSL, make left turn from the departure runway heading to intercept an area approximately over the Pacific Coast Highway, then proceed in a westerly direction until reaching 1,500 feet MSL or the shoreline.	
Wilkes-Barre Scranton, Avoca, Pa.	16, 22	Right hand tfc pattern.	
Winona, Minn., Max Conrad Fld		Right tfc NW.	

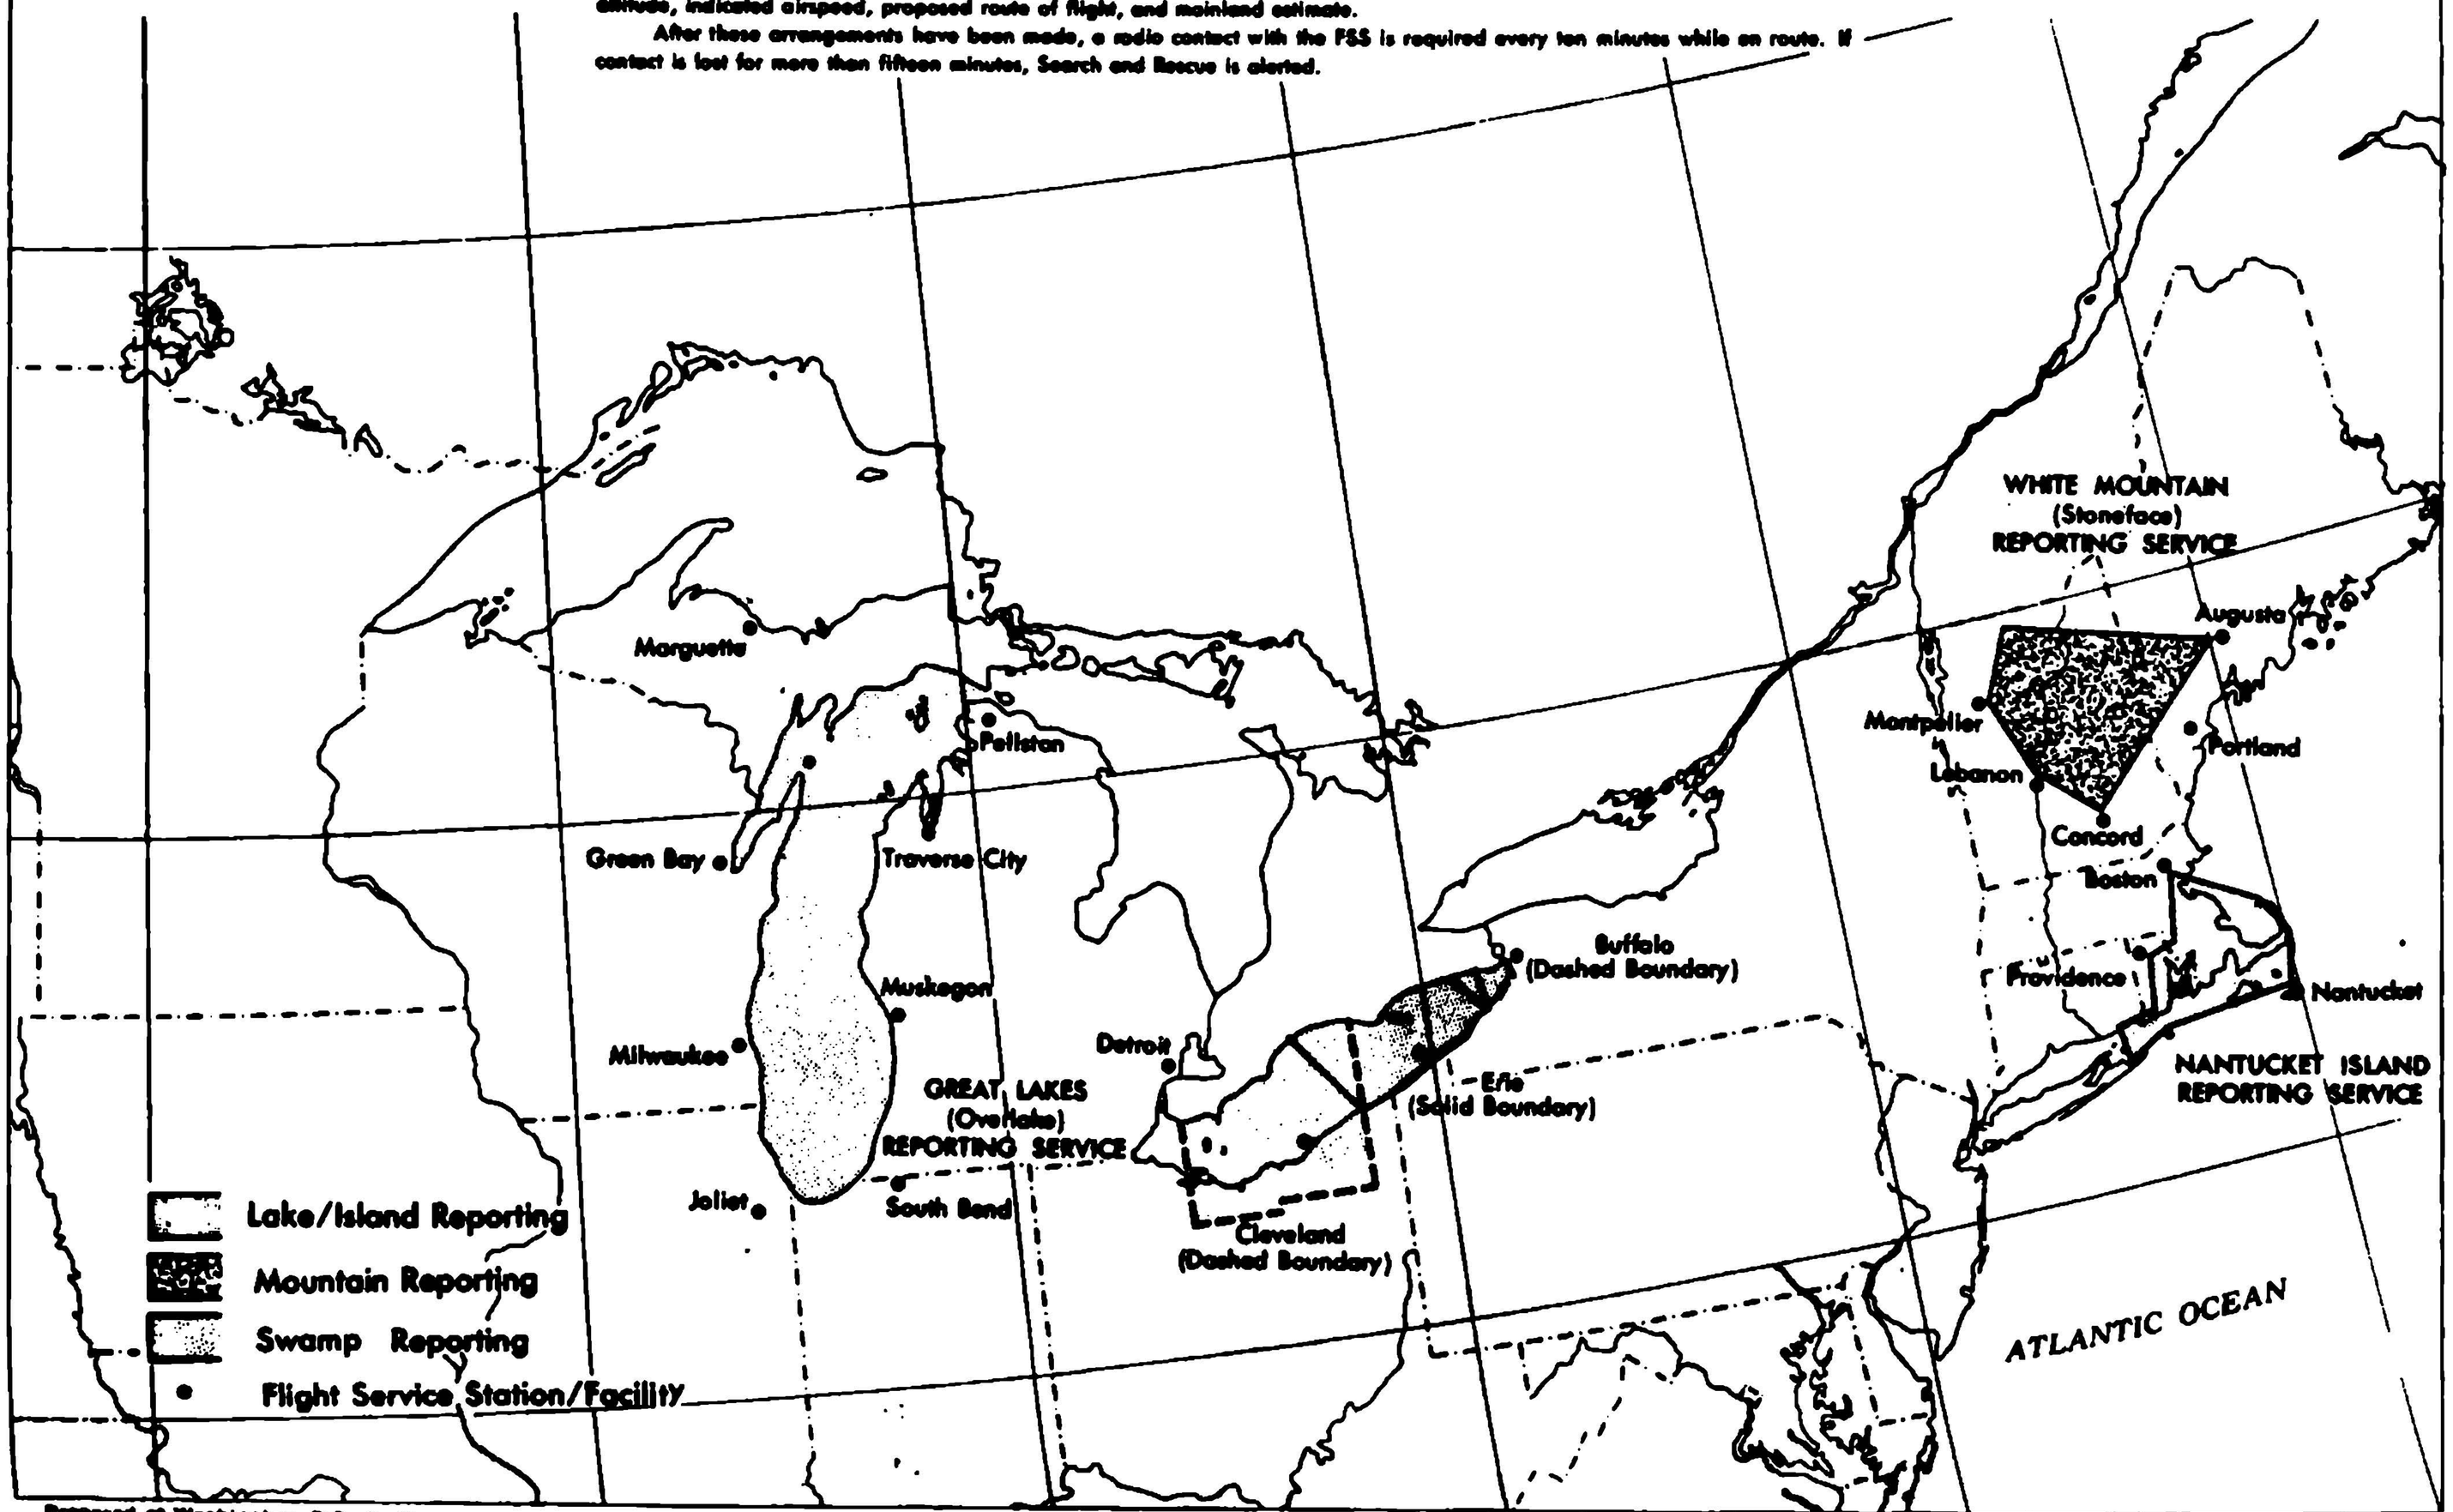
LAKE, ISLAND AND MOUNTAIN REPORTING SERVICE

Flight Service Station (FSS)

This service provides flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.

Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface", "Overlake", etc., are indicated on the following charts. To obtain this service, contact the FSS by telephone or radio giving present position, type aircraft, altitude, indicated airspeed, proposed route of flight, and mainland estimate.

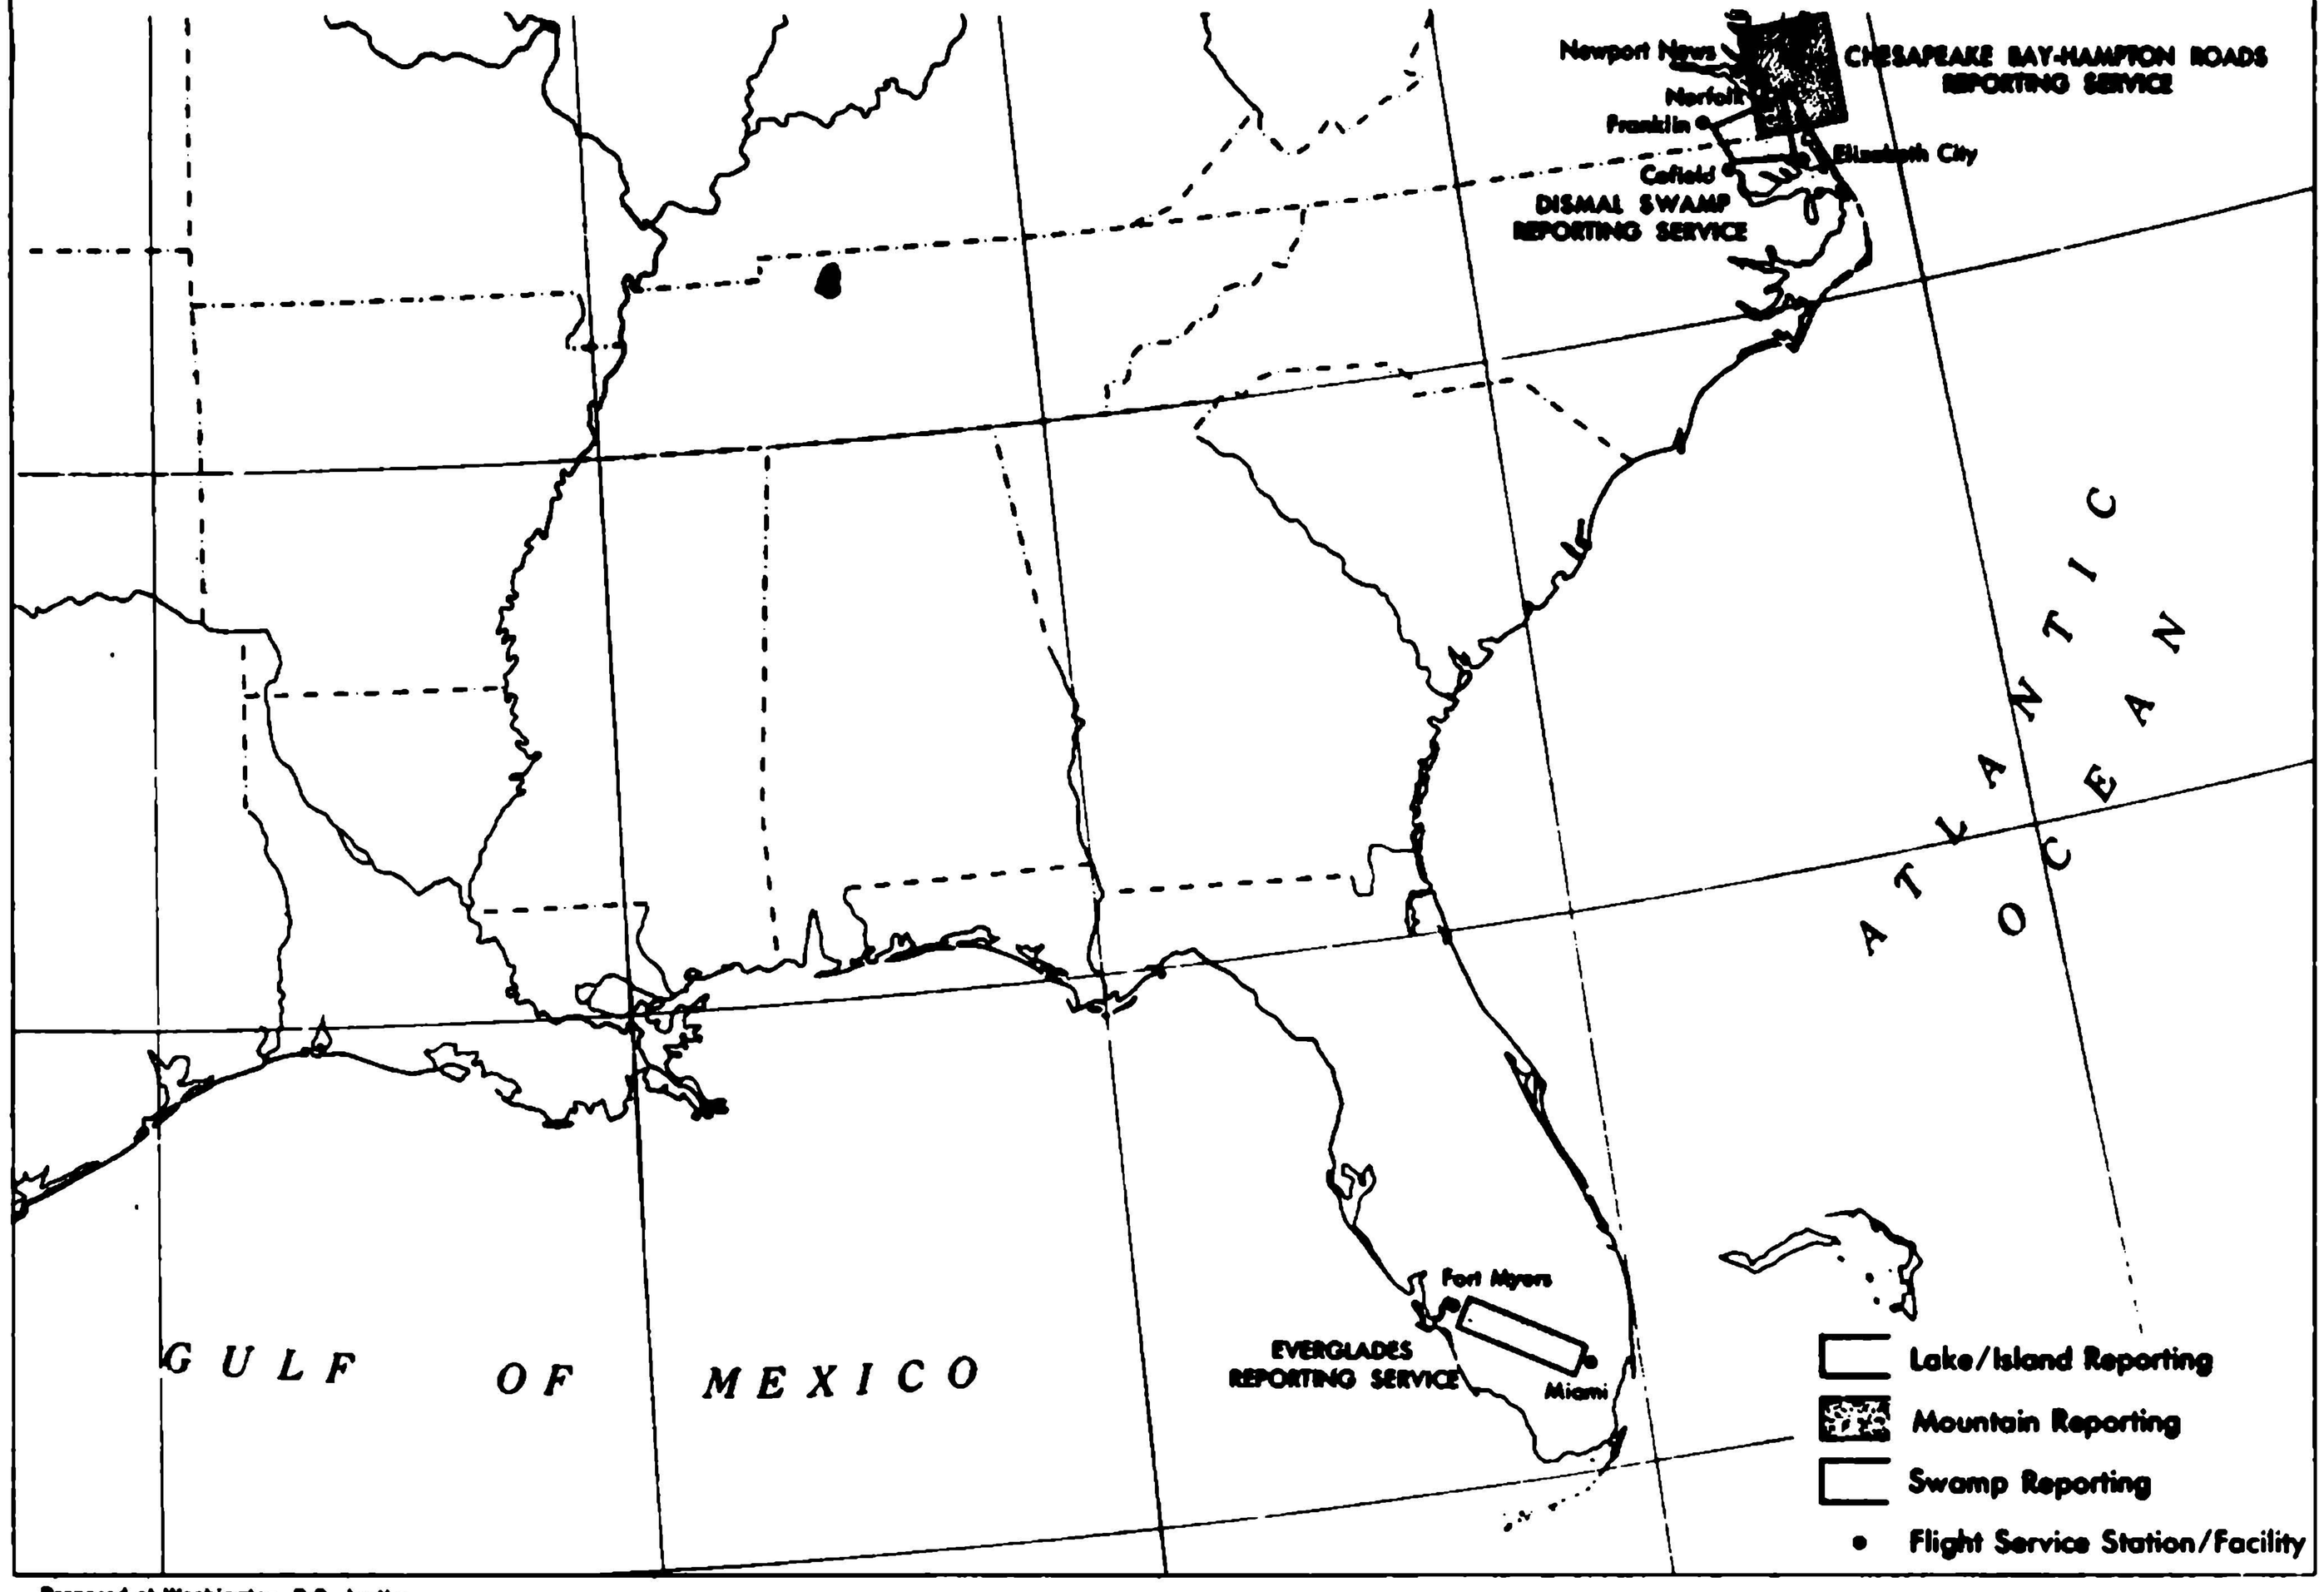
After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.



Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

LAKE, ISLAND AND MOUNTAIN REPORTING SERVICE

Flight Service Station (FSS)



Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

AIM-Jan. 7, 1965

III-67

ROCKY MOUNTAIN REPORTING SERVICE

This service is available to aircraft operating VFR (with or without flight plan) between Denver and Grand Junction via Corona Pass or Monarch Pass. This service can not be offered on an area or random route basis due to the unreliability of communications caused by terrain extremes. The routes via Corona Pass and Monarch Pass have been flight checked and communications found reliable at the altitudes published on the chart.

"Rocky Mountain Reporting Service" shall be available to all VFR aircraft upon request, whether or not operating on a regular flight plan.

REQUIREMENTS

1. Aircraft must be equipped with functioning 2-way radio capable of receiving VOR and transmitting 122.1mc.
2. Pilot must fly prescribed route at an altitude no less than established MRA (Minimum Reception Altitude).
3. Pilot must arrange for accurate time of departure to be received by the FAA facility through which the service was requested.
4. Pilot must radio a position report every ten minutes as follows, whether eastbound or westbound:

   CORONA ROUTE

   To Denver Radio while operating between Denver and Corona Pass (vicinity of Moffat Tunnel, west of Tolland, Colorado).

   To Eagle Radio (through Kremmling VOR) between Corona Pass and vicinity of Glenwood Springs.

   To Grand Junction Radio between vicinity of Glenwood Springs and Grand Junction.

   MONARCH ROUTE

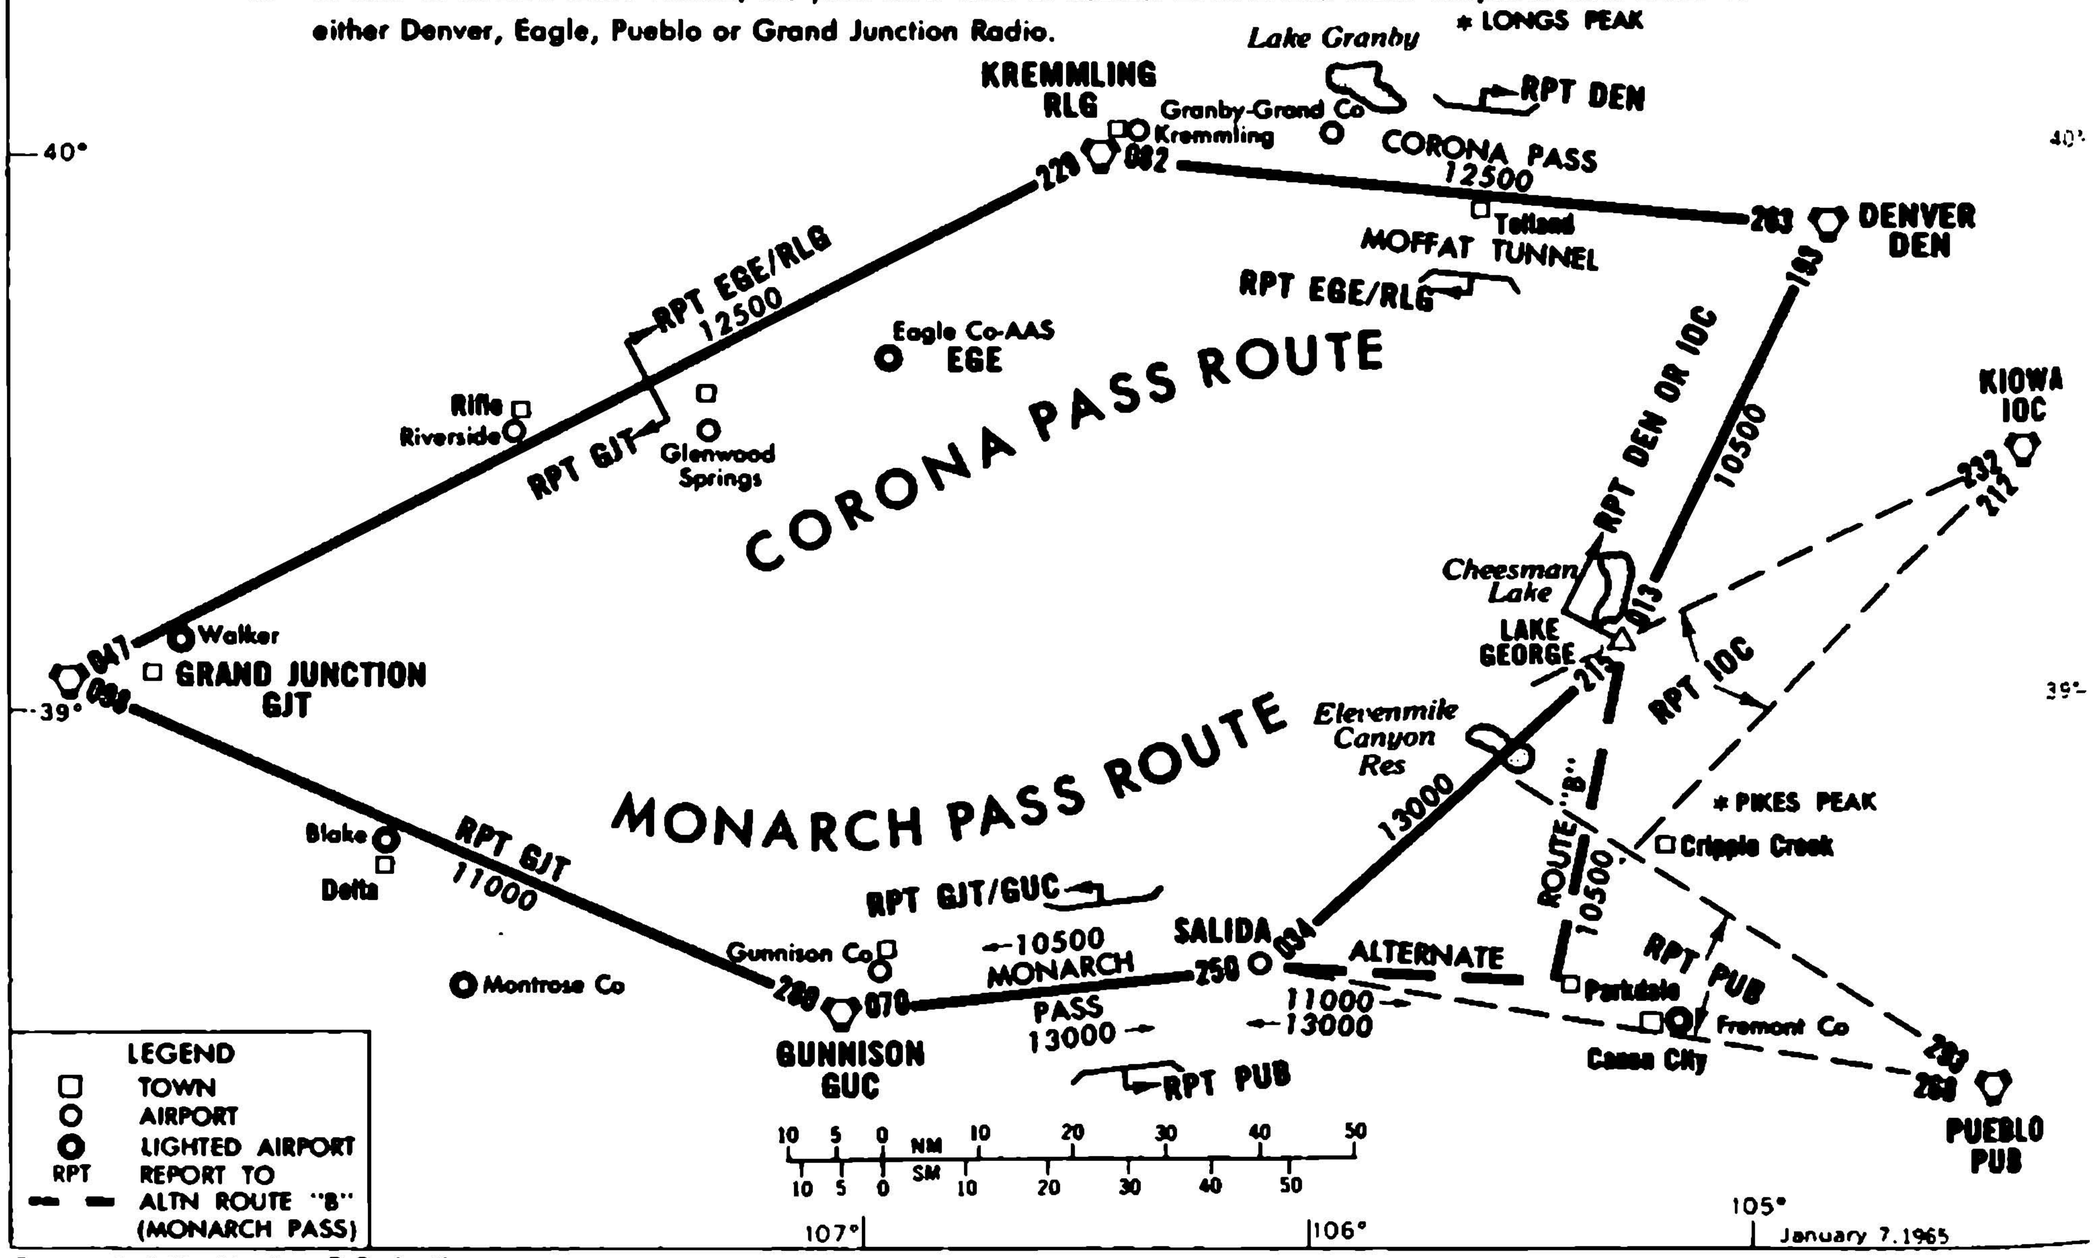
   To Denver Radio (through Denver or Kiowa VOR) between Denver and Lake George Intersection (Cheesman Reservoir). To Denver Radio (through Kiowa VOR only) between the Intersection and Elevenmile Reservoir, or west of Cripple Creek, Colorado.

   To Pueblo Radio between Elevenmile Reservoir or west of Cripple Creek and Salida, Colorado.

   To Grand Junction Radio (through Gunnison VOR) between Salida and Grand Junction.

   Pilots may file for all or any portion of either route, i.e. on a flight from Denver to Grand Junction, a pilot may request the service from Denver to Kremmling only.

   (If contact with the aircraft is lost for more than 15 minutes, Search and Rescue will be alerted.)
5. The service may be terminated at any time upon request of the pilot.
6. In case of aircraft radio failure, the pilot must land at nearest airfield and make telephone notification to either Denver, Eagle, Pueblo or Grand Junction Radio.



Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

SPECIAL NOTICES

Special Notices of a general nature or universal application, and other than for a specific geographical location, are grouped together under General Notices. Special Notices pertinent to a specific geographic area are grouped together under Area Notices by state, then city, airport, or location within the state. The month and year the notice is initially inserted into the manual is provided at the conclusion of each Special Notice. A solid dot ● prefixes new or revised Special Notices.

GENERAL NOTICES

MILITARY CLIMB CORRIDORS

L FLIGHTS desiring to traverse these areas must obtain prior approval from the Appropriate Authority and maintain continuous listening watch on the appropriate frequency while traversing the corridor. The list of corridors, propriate authority and frequencies follows:

Corridor	Appropriate Authority	Frequencies
ngor (Dow AFB) Maine	Dow AFB Apch Ctl	126.2; 363.8; 122.5G
arieston AFB/Mun., S.C.	Charleston Apch Ctl	119.3; 319.8; 122.5G

T—Transmits G—Guards

CIVIL USE OF MILITARY FIELDS:

U.S. Air Force, Navy and Coast Guard Fields are open to civil fliers only in emergency or with prior permission; Army Air Fields are open to civil aircraft on authorization of the Air Field Commander.

For Air Force installations, prior permission should be requested at least 30 days prior to first intended landing from Headquarters USAF (AFOAPDA) via the Commanding Officer of the field concerned (who has authority to approve landing rights for certain categories of civil aircraft). For use of more than one Air Force installation, requests should be forwarded direct to Hq USAF (AFOAPDA), Washington, D.C. 20330.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned (who has the authority to approve landing rights for certain categories of civil aircraft).

For Coast Guard fields prior permission should be requested from the Commandant, U.S. Coast Guard via the Commanding Officer of the field.

However, with minor exceptions, authority to use Air Force and Navy fields is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity. Use of Coast Guard fields is limited to persons on government business only when there is no suitable civil airport in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

December 1964

HEAVY TRAFFIC AROUND MILITARY FIELDS

Pilots are advised to exercise vigilance when close proximity to most military airports. The airfields have an unusually heavy concentration jet aircraft operating within a 25 nautical m radius and from the surface to all altitudes. Tl precautionary note also applies to the larger d airports. BE ALERT, STAY ALIVE!

December 1

FLIGHTS ACROSS U.S. BORDERS:

All pilots contemplating flights across U.S. bord should refer to complete regulations in INTER TIONAL FLIGHT INFORMATION MANUAL, Volu 12, April 1964. Pilots must report for inspection at ti of each entry to avoid inconveniences, additional penses and penalties.

December 1

HELP PREVENT SMUGGLING BY AIR

All American pilots are asked to help Federal law forcement agencies in combating the smuggling of ille aliens and contraband into the U.S. by private aircr If you have information of any kind that might rel to smuggling by air, please contact the nearest U.S. I migration and Naturalization Service or U.S. Bureau Customs office at once. The local FAA office will pass information along for you, if you so desire. Awards original information are paid by Customs under certa circumstances.

December 1

●AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)

Automatic Terminal Information Service (ATIS) the continuous broadcast of recorded noncontrol inf mation in selected high activity terminal areas. purpose is to improve controller effectiveness and to lieve frequency congestion by automating the repeti transmission of essential but routine information.

ATIS is now available at high activity terminal a ports listed at the end of this Notice. Information su as ceiling, visibility, wind, altimeter, instrument a proach, and runways in use is continuously broadcast the voice feature of a TVOR/VOR/VORTAC located or near the airport, or on a discrete VHF tower f quency. Pilots of aircraft arriving or departing t terminal area can receive the continuous ATIS broa casts at times when cockpit duties are least pressi and listen to as many repeats as desired.

Sample Broadcast:

"THIS IS WASHINGTON NATIONAL AIRPORT I FORMATION BRAVO CEILING MEASURED TW THOUSAND, OVERCAST, VISIBILITY SI SMOKE. WIND ONE SIX ZERO DEGREES A FIVE. ALTIMETER TWO NINER NINER TW VOR RUNWAY ONE FIVE APPROACH IN US

LANDING RUNWAY ONE EIGHT. DEPARTURES ON RUNWAY ONE FIVE. NOTAM, GEORGETOWN RADIO BEACON OUT OF SERVICE. INFORM WASHINGTON APPROACH OR GROUND CONTROL ON INITIAL CONTACT THAT YOU HAVE RECEIVED INFORMATION BRAVO."

Pilots hearing the ATIS broadcast should, on initial ntact with the tower or approach control, repeat the ecific phonetic alphabet code word (Alpha, Bravo, arlie, etc.) appended to each ATIS message. This ill indicate that the pilot has received the latest inrmation and obviate the need for the controller to reat the information.

Example: ". . . I HAVE RECEIVED INFORMATION BRAVO"

ATIS broadcasts will be updated when there is a sigficant change in information contained therein. Terinal controllers will issue pertinent information to lots who do not acknowledge receipt of the ATIS mesge, or who acknowledge receipt by an alphabet code ord which is not current.

Pilots are urged to cooperate in the ATIS program ce it relieves frequency congestion on approach conol, ground control and local control frequencies.

SPECIAL CIVIL AIR REGULATION NO. 456

Effective immediately the provisions applicable under ecial Civil Air Regulation No. 456 will apply as fows:

Air traffic clearances to aircraft of Cuban registry not gaged in scheduled International Air Service in U.S. rspace will require that flight be conducted on one of e following routes and a landing be made at Kennedy ternational Airport. In the event alternates are necesry due to weather, such alternates will be Logan Interional Airport and Dulles International Airport in that der.

Flights from Montreal to Kennedy below FL 180 will routed via V-282, V-203, V-91, V-475, DPK. Those at 180 and above will be routed via St. Eustache V-91, B, J-75, ALB, POU, V-91, V-475, DPK. Flights from nnedy to Montreal below FL 180 will be routed via und Intersection, POU, V-487. Those at FL 180 and ve will be routed via Sound Intersection, POU, ALB, 75, PLB, V-91, St. Eustache.

Flights from Ottawa to Kennedy below FL 180 will be uted via MSS, V-203, ALB, V-91, V-475, DPK. Those FL 180 and above will be routed via G-1 Maxville, V-104, MSS, J-37, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Ottawa below FL 180 will be routed via Sound Intersection, POU, V-91, ALB, V-203, MSS. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-37, MSS, V-104, Maxville, G-1.

Flights from Toronto to Kennedy below FL 180 will be routed via V-368, V-252, BGM, V-270, V-34, V-475, DPK. Those at FL 180 and above will be routed via V-368, BUF, J-95, HUO, CMK, V-34, V-475, DPK. Flights from Kennedy to Toronto below FL 180 will be routed via HUO, V-126, AVP, V-36. Those at FL 180 and above will be routed via Northport Intersection, HUO, J-95, BUF, V-36.

All flights in both directions, between Kennedy and Cuba will be routed via the Tuna Intersection and the overwater Papa Route. These are the only routes which will be authorized. Reroutings which will traverse other U.S. airspace will not be authorized.

The procedures set forth herein will not apply at this time to overflights by aircraft of Cuban registry engaged in scheduled International Air Service. However, if circumstances subsequently warrant, a notam prescribing routes for such aircraft will be issued.

December 1964

Exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations

The Department of the Air Force has been issued an exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations to conduct certain Radar Bomb Scoring (RBS) training missions at or above Flight Level 300 within 75 nautical miles of the sites listed below. A navigation aid will be listed to define the center of the complex if such an aid is so located. If a NAVAID is not located at the center, the center will be defined by bearing/distance from a High Altitude Navigation Aid.

The NIKE/RBS Complexes used are:

Providence 280°/35NM
Windsor VORTAC
Presque Isle 087°/20NM
Kennedy VORTAC
Boston VORTAC
Rapid City 110°/33NM
Dupree VORTAC 010°/114NM
Syracuse VOR 018°/48NM

PILOT-TO-FORECASTER WEATHER SERVICE

Pilot-to-Forecaster Service (PTFS) in the general area of the Washington ARTCC is provided for the purpose of the direct pilot/forecaster exchange of meteorological information when **weather conditions are critical, changing rapidly** or **when the direct advice of a professional aviation meteorologist is considered necessary.** Routine requests for weather information or pilot reports should be directed to the nearest FAA Flight Service Station (FSS).

PTFS is available on the radio frequency of 122.6 megacycles (mc) within communications range of the following FAA FSS locations:

Washington, D.C.
Elkins, West Virginia
Richmond, Virginia
Roanoke, Virginia
Front Royal, Virginia
Rocky Mount, North Carolina

Air/ground calls should be made to "Washington Forecaster" for direct communications with a U.S. Weather Bureau Meteorologist who is currently familiar with weather in the area. This service is available from 1200Z to 0200Z (7:00 a.m. to 9:00 p.m., EST). Emergency weather service during other periods may be made available by contacting the flight service specialist (when VFR) or the Washington ARTCC (when IFR) and requesting that "Washington Forecaster" communicate on 122.6 mcs.

December 1964

•MEA, MCA, MOCA, MRA, MAA

Effective following immediately, following flight procedures are authorized V–115 & 875 CHA VOR to Riceville INT, Tenn. MEA 3000 ft; Riceville INT, Tenn. to Sweetwater INT, Tenn. MEA 4000 ft, MOCA 3300 ft; Sweetwater INT, Tenn. to TYS VOR MEA 3000 ft.

Effective 12–27–64 MEA V–49 MYS to ABB and V–171 LOU Livonia Int, Ind. raised to 3000 ft.

Effective 1/28/65, following flight procedures authorized: V–29 ART VOR to MSS VOR MEA 3000 ft, MOCA 1700 ft. Cancel Lisbon Int. N.Y. 045 ART and 182 OW.

Effective 2–4–65, following flight procedures authorized: V–46, Oyster INT, N.Y. to Clam INT, Mass. MEA 2000 ft, MOCA 1000 ft; Clam INT to ACK MEA 2000 ft, MOCA 1700 ft.

February 1965

VFR PRACTICE INSTRUMENT APPROACH PROCEDURES

VFR practice instrument approach procedures at the following locations are published for and used by USAF Air Training Command pilots:

Cotulla, Tex.	Radio Beacon	JAL–907–ADF
Draughon-Miller Arpt. Temple, Tex	VOR	JAL–809–VOR
Cotulla, Tex.	VOR	JAL–907–VOR
Howard County Arpt. Big Spring, Tex.	VOR	JAL–5019–VOR
Rock Springs, Tex.	VOR	JAL–111–VOR–3
Sequin AF Aux., Tex.	Beacon	AL–5223–ADF
Vance AFB, Woodring, Okla.	VOR	JAL–135–VOR–3

These approach charts are published by the USAF Aeronautical Chart and Information Center in a loose-leaf format. Civil aviation requests for these cha should be submitted to the Director, Coast and Geode Survey, 14th and Constitution Avenue, N.W., Attentic Distribution Division Washington, D.C. 20230.

December 1

SPECIAL CIVIL AIR REGULATION NO. SR 454

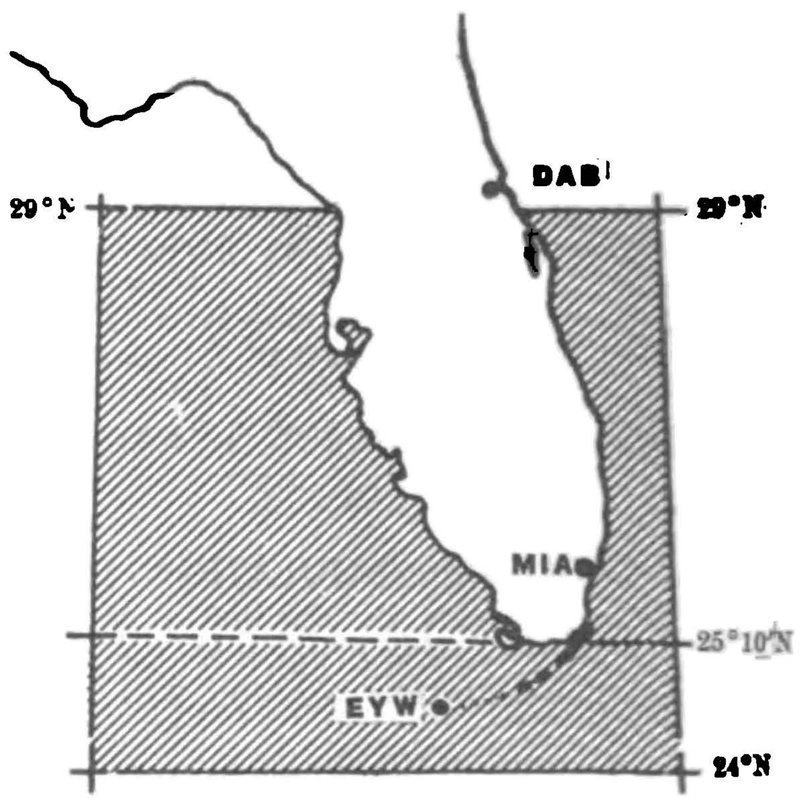
The following special rules of SR 454A are in eff No person may operate any civil aircraft:

(1) Over water and outside the land mass of the St of Florida beginning at 29°N lat., 85°W long., the clockwise to 29°N lat., 79°30′W long. to 24°N lat., 79° W long., to 24°N lat., 85°W long., to the point of beg ning or over land South of 25°10′N lat., unless:

(a) It is operated under a flight plan that has b approved by an FAA air traffic control facility; and

(b) the aircraft possesses functioning navigati and communications equipment necessary to maint two-way radio contact with air traffic control facilities all times during the operation, and the pilot in comma monitors the radio frequencies specified by air tra control.

SR 454A is applicable to the land mass between 25°1(and 29°00′N whenever activated by NOTAM.



•New Flight Assistance Service Facility Tests

Two new methods of providing flight assistance servic at airports will be field tested by FAA for a six-mon period beginning about January 1, 1965.

A part-time, Flight Service Facility (FSF) will evaluated at five airport locations—one in each FAA d mestic region. During open hours, these facilities w provide the terminal flight services now available at reg lar Flight Service Stations (FSSs).

An unmanned Airport Information Desk (AID) will tried at 16 other locations. It will provide "do-it-yoursel flight planning services and will have current weather i formation available and direct communications to th nearest FSS.

The five FSF test sites with control FSS shown in parenthesis are:

Myrtle Beach, South Carolina (at Cresent Beach) Florence, South Carolina)
Manhattan, Kansas (Salina, Kansas)
Junction, Texas (San Antonio, Texas)
Delta, Utah (Salt Lake City, Utah)

The AID test sites with control FSS shown in parenthesis are:

Jamestown, New York (Bradford, Pennsylvania)
Laconia, New Hampshire (Montpelier, Vermont)
Pittsfield, Massachusetts (Albany, New York)
Frankfort, Kentucky (Lexington CS/T)
Aiken, South Carolina (Florence, South Carolina)
Auburn, Alabama (Montgomery, Alabama)
Lakeland, Florida (Tampa, Florida)
Liberal, Kansas (Garden City, Kansas)
Marion, Indiana (Indianapolis, Indiana)
•Mt. Vernon, Illinois (St. Louis, Missouri)
Kerrville, Texas (San Antonio, Texas)
Ruidoso, New Mexico (Roswell, New Mexico)
Altus, Oklahoma (Wichita Falls, Texas)
Twin Falls, Idaho (Burley, Idaho)
Tacoma Industrial Airport, Washington (Seattle, Washington)
Aspen, Colorado (Denver, Colorado)

The FSF test facilities will be manned by flight service ecialists and will normally operate 12 hours a day, ven days a week. The hours of operation will be tailored the requirements of each location. Pilots may contact FSF within 15 nautical miles of the FSF airport by lling on 121.7, 121.9 mcs. and listening for reply on e same frequency. In radio calls, use the name of the SF airport followed by the word "radio"; e.g., "Cres-nt Beach radio this is N1234V, over."
The FSFs will also guard the 121.5 mc. emergency fre-ency during open hours for the test period.

Pilots should check NOTAM information for commissioning dates of each of the facilities listed above.

Pilots are invited to use and evaluate these services. Comments and suggestions should be forwarded to:

Washington •DISTRICT OF COLUMBIA

TEST EVALUATION OF VFR ARRIVAL AND DEPARTURE RADAR TRAFFIC INFORMATION SERVICE

VFR Radar Traffic Information Area

GENERAL PROCEDURES: The Washington VFR Radar Traffic Information Area is that airspace which extends upwards to an altitude of four thousand feet, MSL inclusive, and is encompassed by a line connecting the following points: Rockville, Laurel, Shadyside, Hughesvill, Indian Head, Centreville, and Herndon. (See chart on facing page.)

Pilots of aircraft without radio, as well as those unable to contact VFR Arrival or Departure Information Service on assigned frequencies, are urged to conform to routing via designated VFR arrival and departure routes.

Pilots operating VFR flights destined for Washington National Airport should follow the designated arrival and departure routes listed herein in order to maintain a safe, orderly flow of air traffic in the Washington area.

All aircraft arriving or departing Washington National Airport should proceed with caution when in the vicinity of Andrews AFB.

If destination is other than Washington National Airport, so advise.

THE RADAR SERVICE DESCRIBED HEREIN IS NOT INTENDED TO RELIEVE THE PILOT OF HIS RESPONSIBILITY FOR CONTINUAL VIGILANCE TO SEE AND AVOID OTHER AIRCRAFT. IT IS PROVIDED TO AID HIM IN HIS VISUAL SURVEILLANCE BY CALLING TO HIS ATTENTION PERTINENT TRAFFIC. PILOTS ARE REMINDED THAT THE SURVEILLANCE RADAR UTILIZED BY THE CONTROLLER DOES NOT PROVIDE ALTITUDE INFORMATION.

The following procedures should be adhered to by pilots of VFR flights desiring this service and having proper radio equipment when arriving at and departing from Washington National Airport.

ARRIVAL PROCEDURES: Arriving VFR flights desiring traffic information should contact Washington Traffic Information Service on 119.3 mcs/338.2 mcs UHF when approaching from Laurel, Shadyside RBN, and Hughesville; or on 120.1 mcs/306.3 mcs UHF when approaching from Indian Head, Centreville, Herndon, and Rockville. When practicable, pilots should follow the appropriate VFR arrival route as indicated (See Chart) and maintain listening watch on traffic information frequency until further advised. Landing information will be furnished to aircraft destined for Washington, and radar traffic information will be provided until the pilot is advisesd to contact the tower.

DEPARTURE PROCEDURES: VFR flights departing fr Washington Airport desiring traffic information shou request the service on initial contact to Ground Contr The pilot should also advise his proposed direction flight; e.g., "VFR Information Service, Laurel." F lowing take-off, the tower will advise the pilot when contact Washington Information Service and the f quency to be used. Flights proceeding to Laurel, Shad side, and Hughesville will use 119.3 mcs/338.2 mc UHF. Flights proceeding to Indian Head, Centrevil Herndon, and Rockville will use 120.1 mcs/306.3 mcs UH Pilots should depart the Washington Terminal area via t designated VFR departure route most nearly aligned wi their destination. They should also maintain listeni watch on the appropriate information service frequen until cleared to leave the frequency or beyond the peri eter fix.

Washington National Airport

Arrival Routes

Northeast—Report Laurel. Proceed well right of Was ington-Baltimore Parkway to Beltsville, then north Washington to Chain Bridge.

East—Report Shadyside RBN. Proceed via Brand wine to Fort Washington. Caution—Military conve tional and jet traffic vicinity of Andrews AFB Contr Zone.

Southeast—Report Hughesville. Proceed via Waldo to Fort Washington. Caution—Andrews jet penetrati inbound on Andrews VOR 187 degree radial descendi to cross Andrews LFR at 1500 feet MSL.

Southwest—Report Indian Head. Proceed on right si of Potomac River until past Mount Vernon.

West—Report Centreville. Proceed well right of U. Route 29 highway to Falls Church.

Northwest—Report Herndon. Proceed well right of P tomac River to Falls Church.

North—Report Rockville. Proceed well left of Potom River to Chain Bridge.

Departure Routes

Northeast—Proceed via west bank of Anacostia Riv to Riverdale and well right of Washington-Baltimo Parkway until past Beltsville Airport.

East—Proceed via Fort Washington and Brandywi to Shadyside.

Southeast—Proceed via Fort Washington and LaPlata.

Southwest—Proceed well right of Potomac River un past Woodbridge.

West—North departures proceed well right of U Route 29 highway until past Centreville. South dep tures proceed via Washington LFR to Manassas.

Northwest—North departures proceed via Potomac Riv until leaving the area. South departures proceed v Washington LFR to Fairfax.

TERMINAL RADAR SERVICE AREA

(An Evaluation of Terminal Area Positive Separation)

The Air Traffic Service, FAA, has developed a program to evaluate a concept of providing a positive separation service to aircraft operating within a terminal area. The airspace area where this evaluation will be conducted will be known as a Terminal Radar Service Area (TRSA). During the evaluation period, a true positive separation environment will not be guaranteed.

This program is in consonance with the report of the Task Force on air traffic control (Project Beacon) and the subsequent Air Traffic Service analysis of the report.

A program for positive separation of aircraft operating in terminal airspace, regardless of weather conditions, must be able to satisfy the many varied requirements of both the VFR and IFR users without imposing excessive restrictions to their operations, yet it must be within the capabilities of the air traffic control system.

In consideration of these two major stipulations, the program will initially be implemented on a voluntary basis, whereby pilot participation will be encouraged rather than required. In this respect, it is obvious that considerable cooperation and effort must be expended jointly by the Federal Aviation Agency (FAA) and the airspace users, if a realistic evaluation is to be made.

Generally, the objective of this evaluation is to determine the following:

1. Airborne equipment and pilotage requirements.
2. Operating personnel, equipment, procedural and airspace requirements.
3. Impact on the over-all terminal operation.
4. Capability of the air traffic control system to provide positive separation to all aircraft operating within a terminal area.
5. Need for regulatory action.

Following a thorough and complete analysis of this evaluation, FAA in cooperation with the users, will determine the necessary requirements for implementation of a positive separation system in high activity terminal areas, wherein all aircraft would be provided separation by the ATC system, irrespective of weather conditions.

The size and shape of the TRSA will vary depending upon operational requirements. This area may be shown as a circular radius or other configuration and should be no larger than absolutely necessary to adequately perform the control functions.

Implementation

On November 15, 1962, a TRSA program was implemented at Atlanta, Georgia, as the first of selected locations to thoroughly evaluate the program.

In addition to the following details and procedures, information has been provided on appropriate charts, other aeronautical flight information publications a through representative user organizations.

The Atlanta Terminal Radar Service Area is that airspace extending upward from the surface to and including 6,000 feet MSL within the Atlanta Airport Control Zone; and, in addition, that airspace extending from 2,000 feet MSL to and including 6,000 feet MSL within a 15 statute mile radius of the Atlanta Airport, excluding Dobbins AFB Control Zone and the airspace within a 1½ mile radius of the Edwards Skyport and the Gunn Airport; EXCEPT that the base of the airspace area within the Fulton County Airport control zone is 2,500 feet MSL.

Flight Procedures

1. **IFR Flights**—Aircraft operating within the Atlan TRSA shall be operated in accordance with curre IFR procedures.
2. **VFR Flights**

   a. Airports within the Atlanta TRSA:

      (1) Arriving aircraft will be expected to conta Atlanta Terminal Control on specified fr quencies and in relation to geographical fix listed in d. below.

      (2) Departing aircraft will be advised by the tow when to contact departure or terminal co trol and the frequency to be used.

   b. Airports underlying the Atlanta TRSA:

      (1) Unless flight will be conducted below the flo of the TRSA, arriving aircraft will be e pected to contact Atlanta Terminal Contr on specified frequencies and in relation geographical fixes listed in d. below.

      (2) Departing aircraft will be expected to conta Atlanta Terminal Control on the frequen specified in d. below as soon as possible afte becoming airborne if it is desired that flig be conducted within the TRSA.

   c. Transiting Aircraft—Aircraft desiring to trans the TRSA will be expected to contact Atlant Terminal Control on specified frequencies and i relation to geographical fixes listed in d. below.

   d. Frequencies and Fixes—En route aircraft shoul establish communications with Atlanta Termin Control approximately 25 miles from Atlanta Air port. Aircraft entering the TRSA north of Air way V-18N should use 119.8 or 381.6 MC; Aircraf entering the TRSA south of Airway V-18N shoul use 119.3 or 343.6 MC. Aircraft not equipped fo two-way communications on these frequencie should transmit on 122.7 MC and listen on th appropriate frequency specified above.

      In addition to published radio fixes and othe prominent geographical fixes, the following geo

ATC Procedures

1. The Atlanta TRSA is primarily a radar environment, and control will be predicated thereon. This does not preclude application of nonradar separation as required or deemed appropriate.
2. To facilitate radar identification of arriving and transiting VFR aircraft, ATC may request such aircraft to report their position in relation to fixes (prominent geographical or radio) within or outside the perimeter of the TRSA.
3. Radar headings and, if required, altitude assignments may be given to VFR flights operating within the TRSA.

NOTE.—Assignment of radar headings and/or altitudes are based on the provision that a pilot operating in accordance with VFR is expected to advise ATC if compliance with an assigned route, radar heading or altitude will cause the pilot to violate such rules.

4. Traffic information on observed but unidentified ra targets will be provided on a workload permitt basis.
5. When VFR aircraft are being held within the TR and control is based thereon, the ATC clearance v specify the distance (radius) and, if appropriate, direction from the geographical fix within wh holding is to be accomplished. In such cases, pilot will be advised when to EXPECT FURTH CLEARANCE.
6. During weather conditions equal to or better th basic VFR, 500 feet vertical separation may be e ployed between VFR flights and/or between VFR a IFR flights operating within the TRSA.
7. During weather conditions equal to or better th basic VFR, visual separation may be employed tween VFR flights and/or between VFR and I flights operating within the TRSA when a pilot ports the other aircraft in sight and advises that can maintain his own separation from such aircra
8. When IFR flights, operating in VFR weather con tions, are being sequenced with other traffic and t pilot reports the aircraft he is to follow is in sig the pilot may be advised to follow such traffic a may be cleared for a "visual approach."

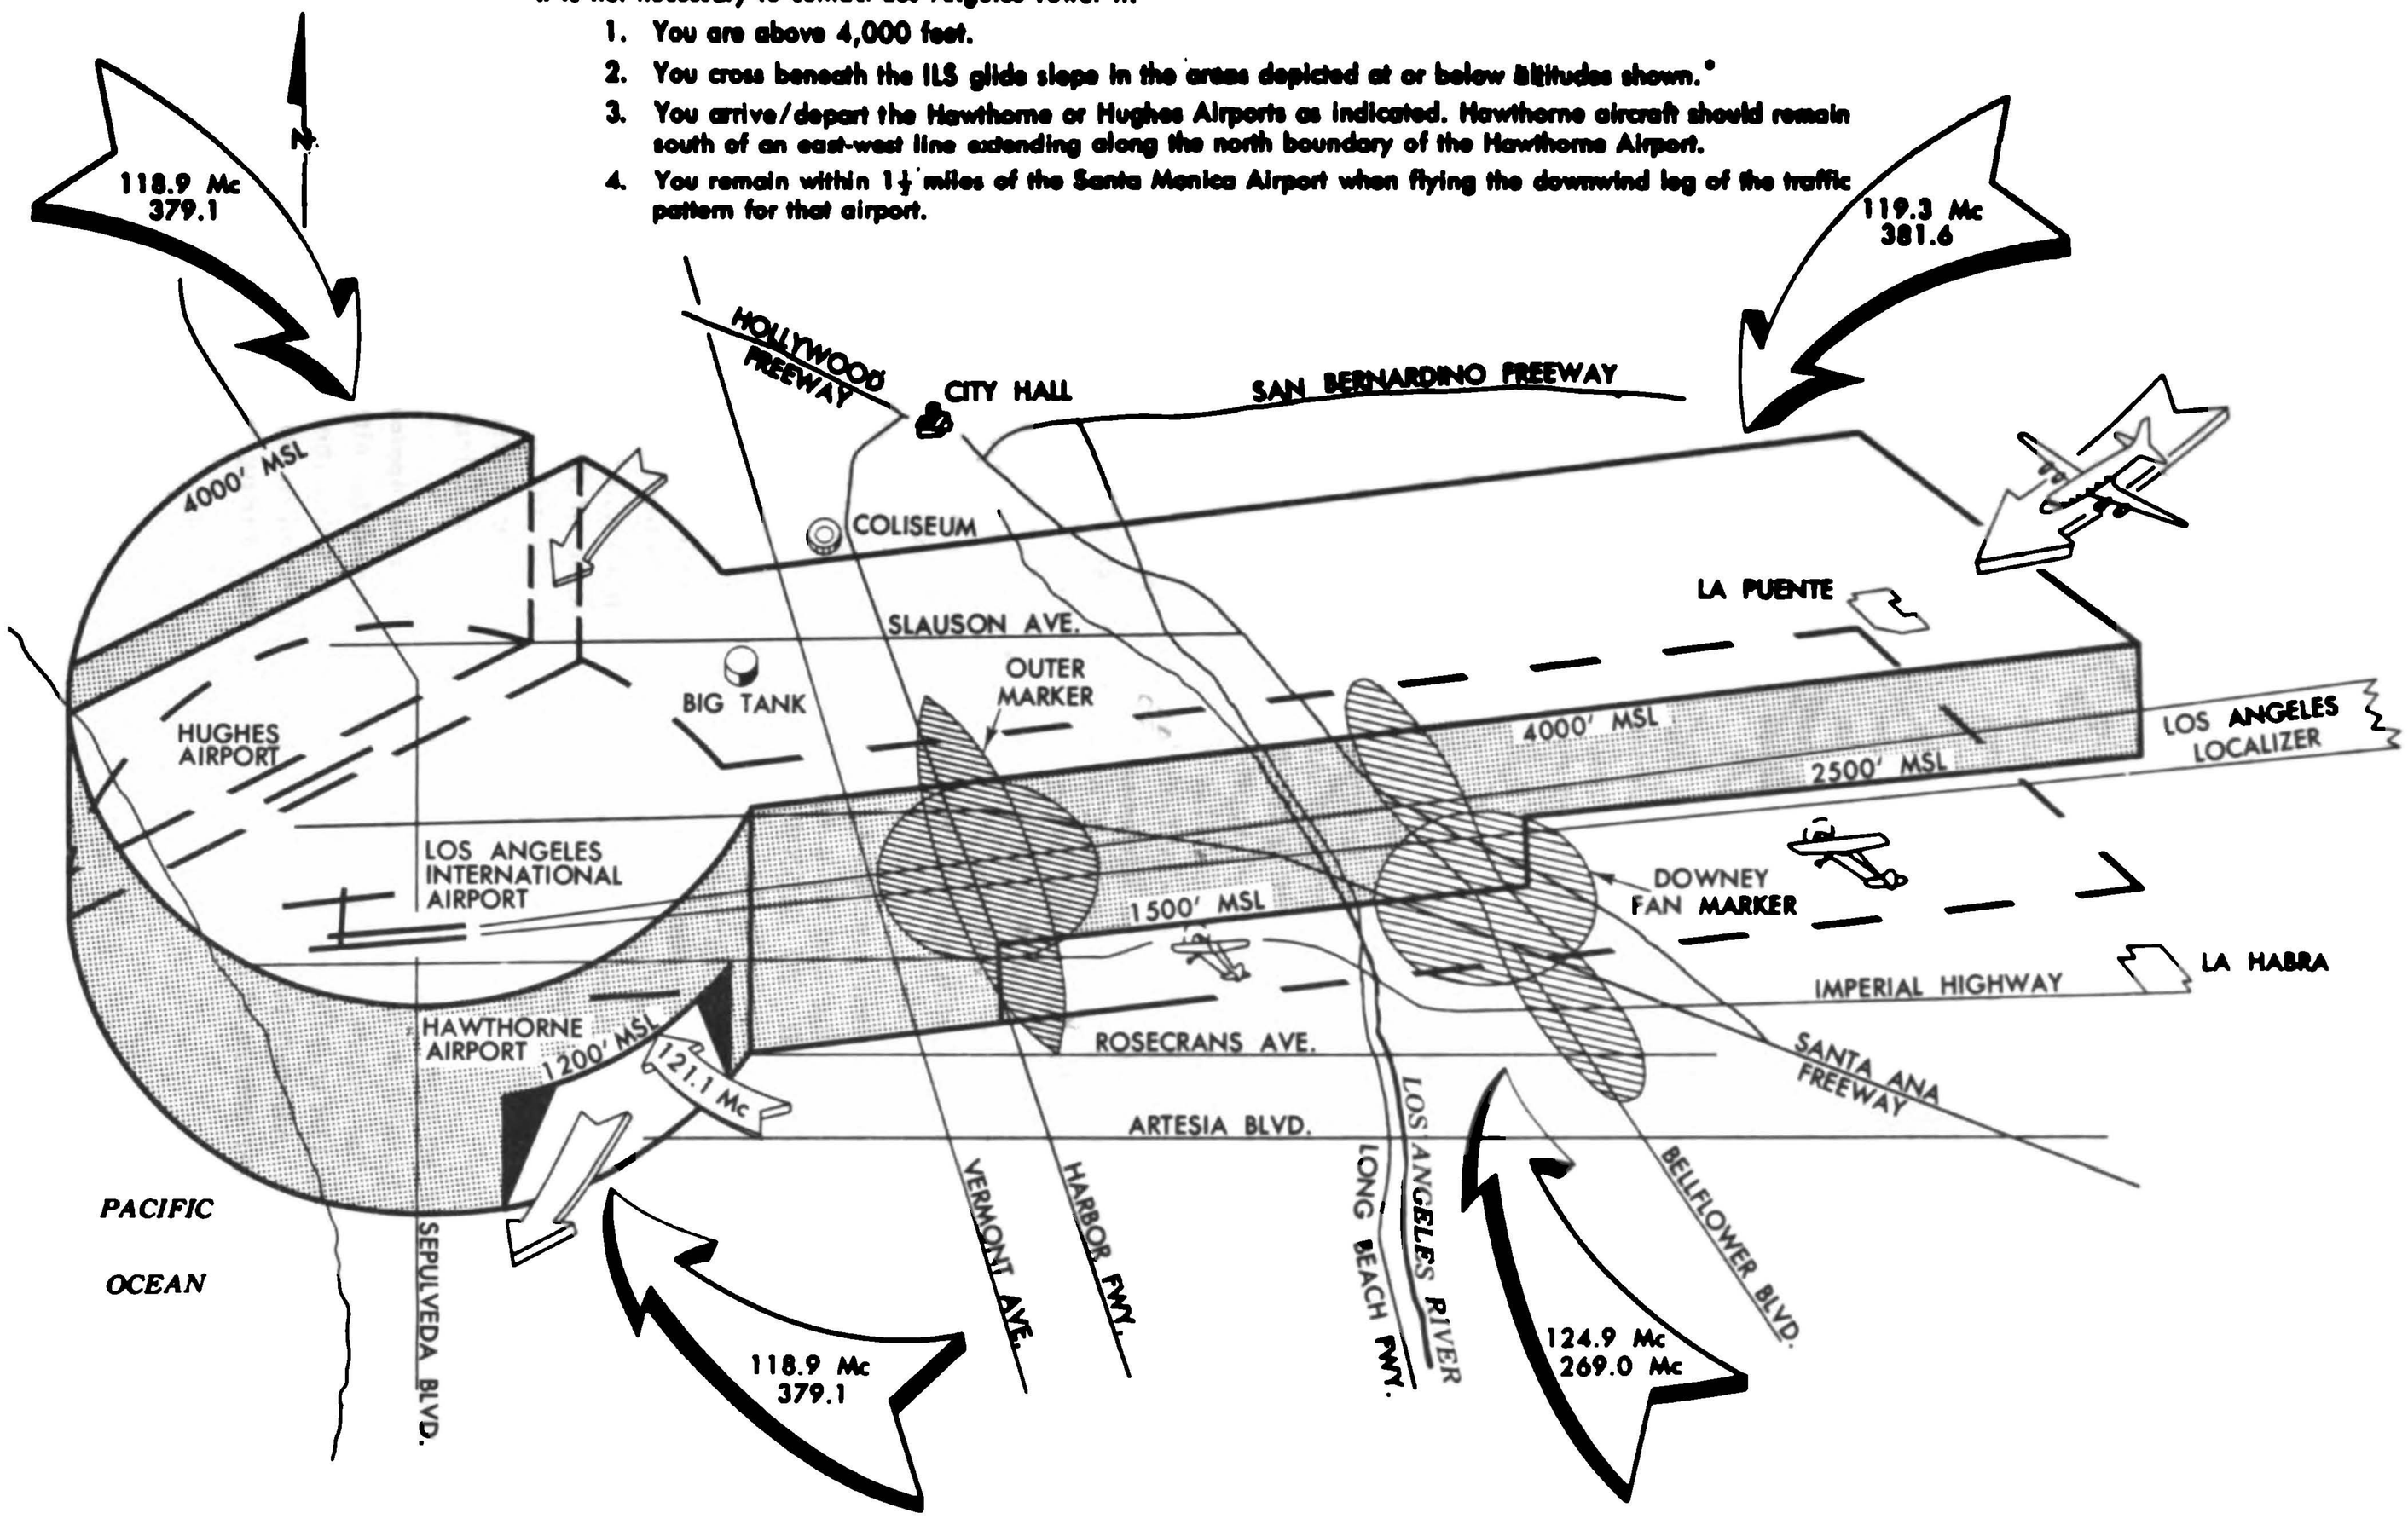
NOTE.—Basic VFR weather minima as set forth in F 91.105 shall apply within the Atlanta TRSA, except t special VFR weather minima set forth in FAR 91.107 a continue to be applicable within control zones. Appli tion of ATC procedures and separation minima within TRSA is not to be interpreted as relieving pilots of th responsibilities to see and avoid other traffic operating basic VFR weather conditions, to maintain appropri terrain and obstruction clearance, or to remain in weat conditions equal to or better than the established minir However, this does not preclude the pilot from request IFR handling, or while within the control zone, request clearance in accordance with special VFR.

LOS ANGELES TERMINAL AREA NOTICE

Prior to penetrating this area, VFR pilots are encouraged to contact Los Angeles Tower for traffic advisory service on the frequencies indicated for the direction of flight.

It is not necessary to contact Los Angeles Tower if:

1. **You are above 4,000 feet.**
2. **You cross beneath the ILS glide slope in the areas depicted at or below altitudes shown.***
3. **You arrive/depart the Hawthorne or Hughes Airports as indicated. Hawthorne aircraft should remain south of an east-west line extending along the north boundary of the Hawthorne Airport.**
4. **You remain within 1½ miles of the Santa Monica Airport when flying the downwind leg of the traffic pattern for that airport.**



*THIS DOES NOT CONSTITUTE AUTHORITY FOR A PILOT TO DEVIATE FROM FAR 91.79 OR OTHER APPLICABLE PROVISIONS OF THE FEDERAL AVIATION REGULATIONS.

Chicago ILLINOIS

PARALLEL ILS APPROACHES—CHICAGO O'HARE INTERNATIONAL AIRPORT

Effective April 11, 1964 a revised Parallel ILS 14R&L approach procedure Amendment 1 was effective for Chicago O'Hare International Airport. ILS, radar, communications, ATC procedures and flight procedures are employed as integral parts of a total system. Under the system, Chicago Approach Control may clear aircraft to conduct Parallel ILS Approaches to Runways 14L and 14R when wind conditions permit straight-in landings and when all components of the system—except airborne or ground glide slope equipment—are operating normally. Aircraft are radar vectored to the final approach course (localizer) of either runway and the pilot executes an ILS approach. The separation between localizer courses (6,510 feet) imposes certain requirements and techniques peculiar to parallel approaches.

Requirements: To conduct a Parallel ILS Approach, aircraft must be equipped with a functioning 75 mc marker (or ADF) and localizer receivers, and have the capability to simultaneously monitor both the assigned control frequency and the appropriate localizer voice frequency when advised by ATC.

ATC Concept and Procedures: Arriving IFR aircraft en route to O'Hare Airport will be cleared by Chicago Center to one of four outer fixes (Northbrook, Niles, Lakewood, or Warren) established in the O'Hare Terminal Area and changed over to Chicago Approach Control for further clearance. On initial contact, Chicago Approach Control will advise the pilot that PARALLEL ILS APPROACHES ARE IN PROGRESS. Upon receipt of this information, **pilots who do not have required equipment** or do not wish to conduct a Parallel ILS approach, or require a specific runway, or require a radar fix in lieu of Meadow Intersection for 14L, must advise Chicago Approach Control prior to departing the outer fix. This will enable the controller to plan and provide for individual handling.

Chicago Approach Control will clear aircraft to depart the outer fix on a specified heading and at a specified altitude FOR RADAR VECTOR TO RUNWAY 14 (RIGHT/LEFT) ILS FINAL APPROACH COURSE and will specify the appropriate localizer frequency (109.7 or 110.1). After departing the outer fix, aircraft will be descended to the appropriate ILS Intercept Altitude (2,200 or 3,200 feet m.s.l.) and provided a period of level flight prior to the ILS intercept in which the pilot may dissipate any excess speed accumulated during the descent.

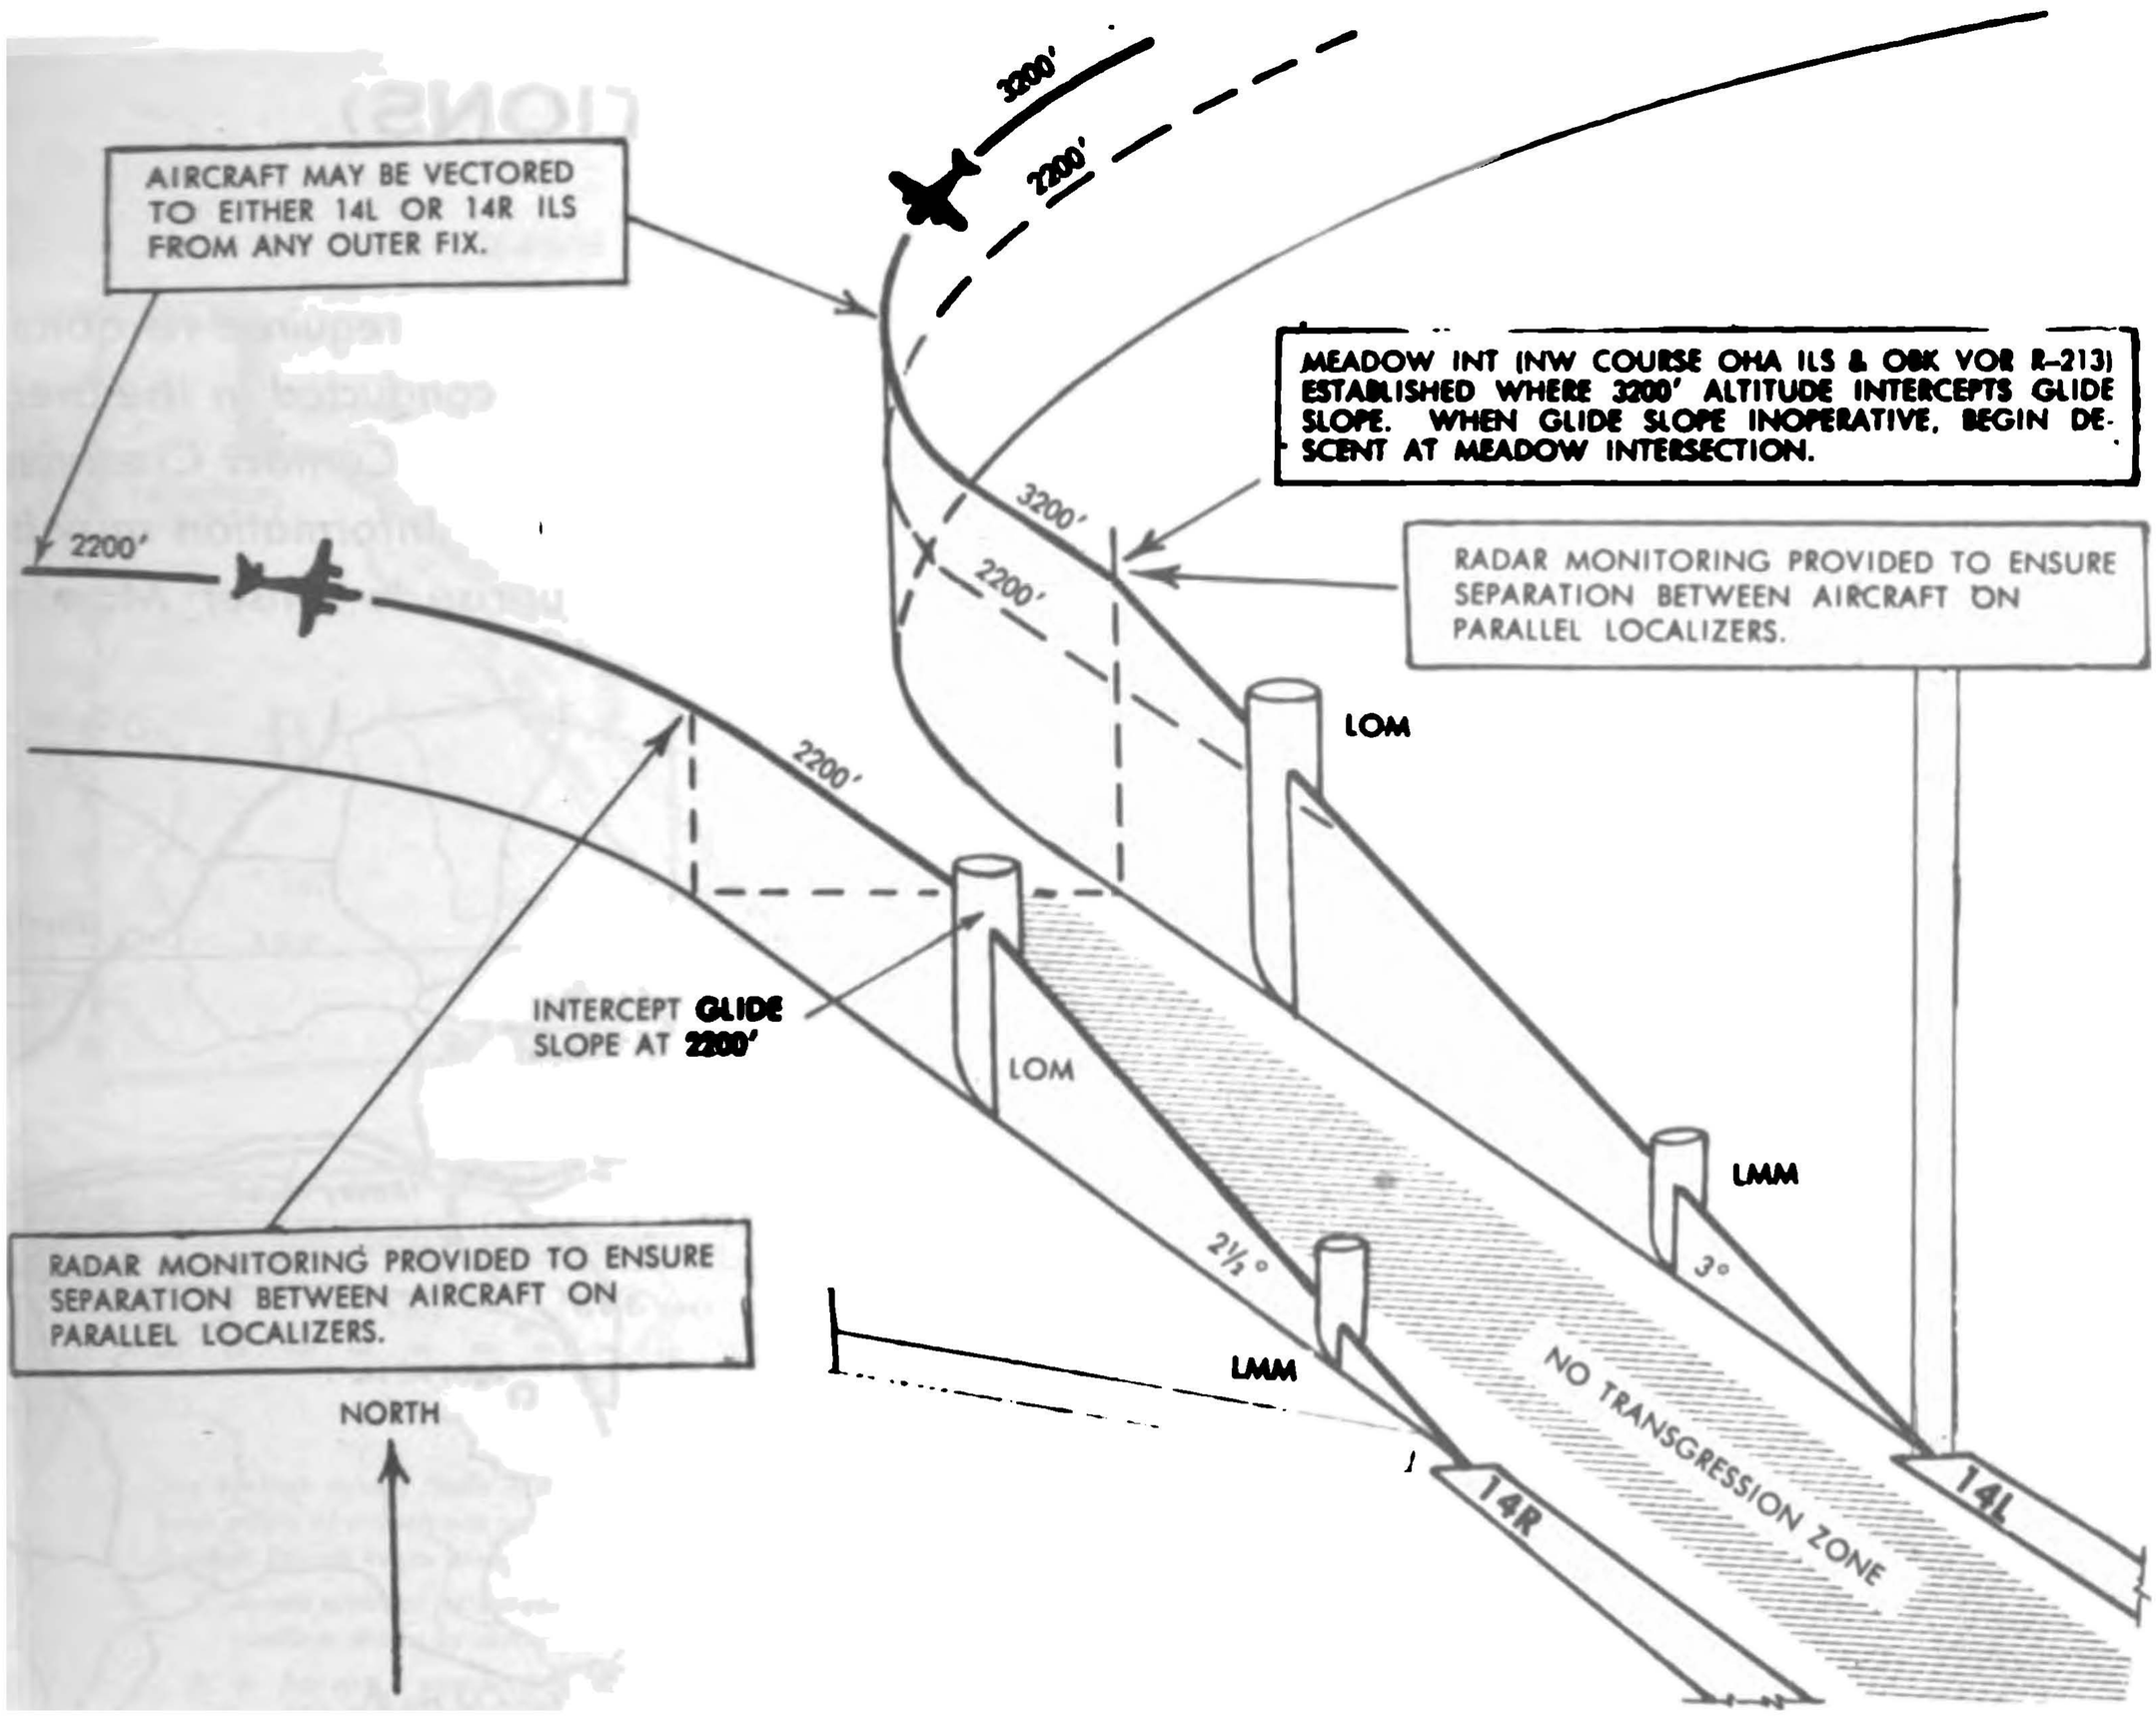
ATC Separation: Radar separation is provided between aircraft being vectored to, and while on, the same localizer course throughout the entire approach. Aircraft being vectored to Runway 14R will intercept that localizer course at 2,200 feet m.s.l. Aircraft being vectored to 14L will intercept that localizer course at 3,200 feet m.s.l., or higher. Since aircraft may be vectored to either l localizer course from any of the four outer fixes, a m mum of 1,000 feet vertical or 3 miles radar separat will be provided between the aircraft being vectored opposite ILS courses during the turn-on. The appro ate ILS Intercept Altitude is maintained by the aircr until intercepting the glide slope. After the turn-on i until aircraft are 2.3 miles northwest of the OM markers, a minimum of 1,000 feet vertical separation provided between aircraft on parallel ILS localli courses.

Localizer Interception: Aircraft will be vectored so as permit the pilot to intercept the appropriate ILS locali course at an angle not greater than 20°. After assign this final intercept heading, approach control will cl the aircraft for a parallel ILS approach. Subsequen the pilot will be changed over to O'Hare Tower and structed to monitor the appropriate localizer voice f quency (either 109.7 or 110.1 mc). When glide sl receiver or ground glide slope transmitter is inoperat the pilot will begin descent from 3,200 feet for 14L Meadow Intersection or descend from 2,200 feet for 1 at the LOM. When glide slope is out or not receive radar fix in lieu of Meadow Intersection will be provi upon pilots request or aircraft equipped with ILS VOR will start descent on 14L upon identification Meadow Intersection.

Radar Monitoring: All turn-ons and final approaches radar monitored regardless of weather conditions. Mo tor controllers will issue advisory information and c trol instructions as may be necessary to insure that craft on final approach remain within an area 1,500 either side of the localizer course. Since the prim responsibility for navigation rests with the pilot, advis information and control instructions issued on the lo izer voice frequency are limited to those necessary insure separation between aircraft. Pilots need acknowledge transmissions made by the monitor c troller on localizer voice frequency unless specific requested to do so.

A "no transgression zone" 3,510 feet wide is es lished equidistant between the centerlines of each lo izer course and displayed on the monitor radar sc Should an aircraft on final approach deviate from co and enter the "no transgression zone," the monitor troller will issue instructions as are necessary to alter course of that aircraft. Concurrently, immediate ac will be taken by the controller monitoring the adja localizer course to cause any aircraft in potential con with the intruding aircraft to alter its flight path.

Missed Approach: The missed approach procedure veloped for either runway is designed to provide sep tion from the adjacent runway. The pilot may be structed to execute the missed approach procedure at time during the approach.



AIRCRAFT MAY BE VECTORED TO EITHER 14L OR 14R ILS FROM ANY OUTER FIX.

SPECIAL AIR TRAFFIC RULES (VFR OR VFR CONDITIONS)

EFFECTIVE DECEMBER 10, 1964

Prior to conducting flight operations in the area shown, pilots are required to obtain information about operating altitudes of high speed special activities conducted in the area. Normally, special activities will use not more than two altitude levels. Contact Crestview Radio, Eglin AFB RAPCON, Tallahassee Radio, or Pensacola Radio. Information may be obtained by radio or telephone. This special rule is in effect sunrise to sunset Monday through Saturday.

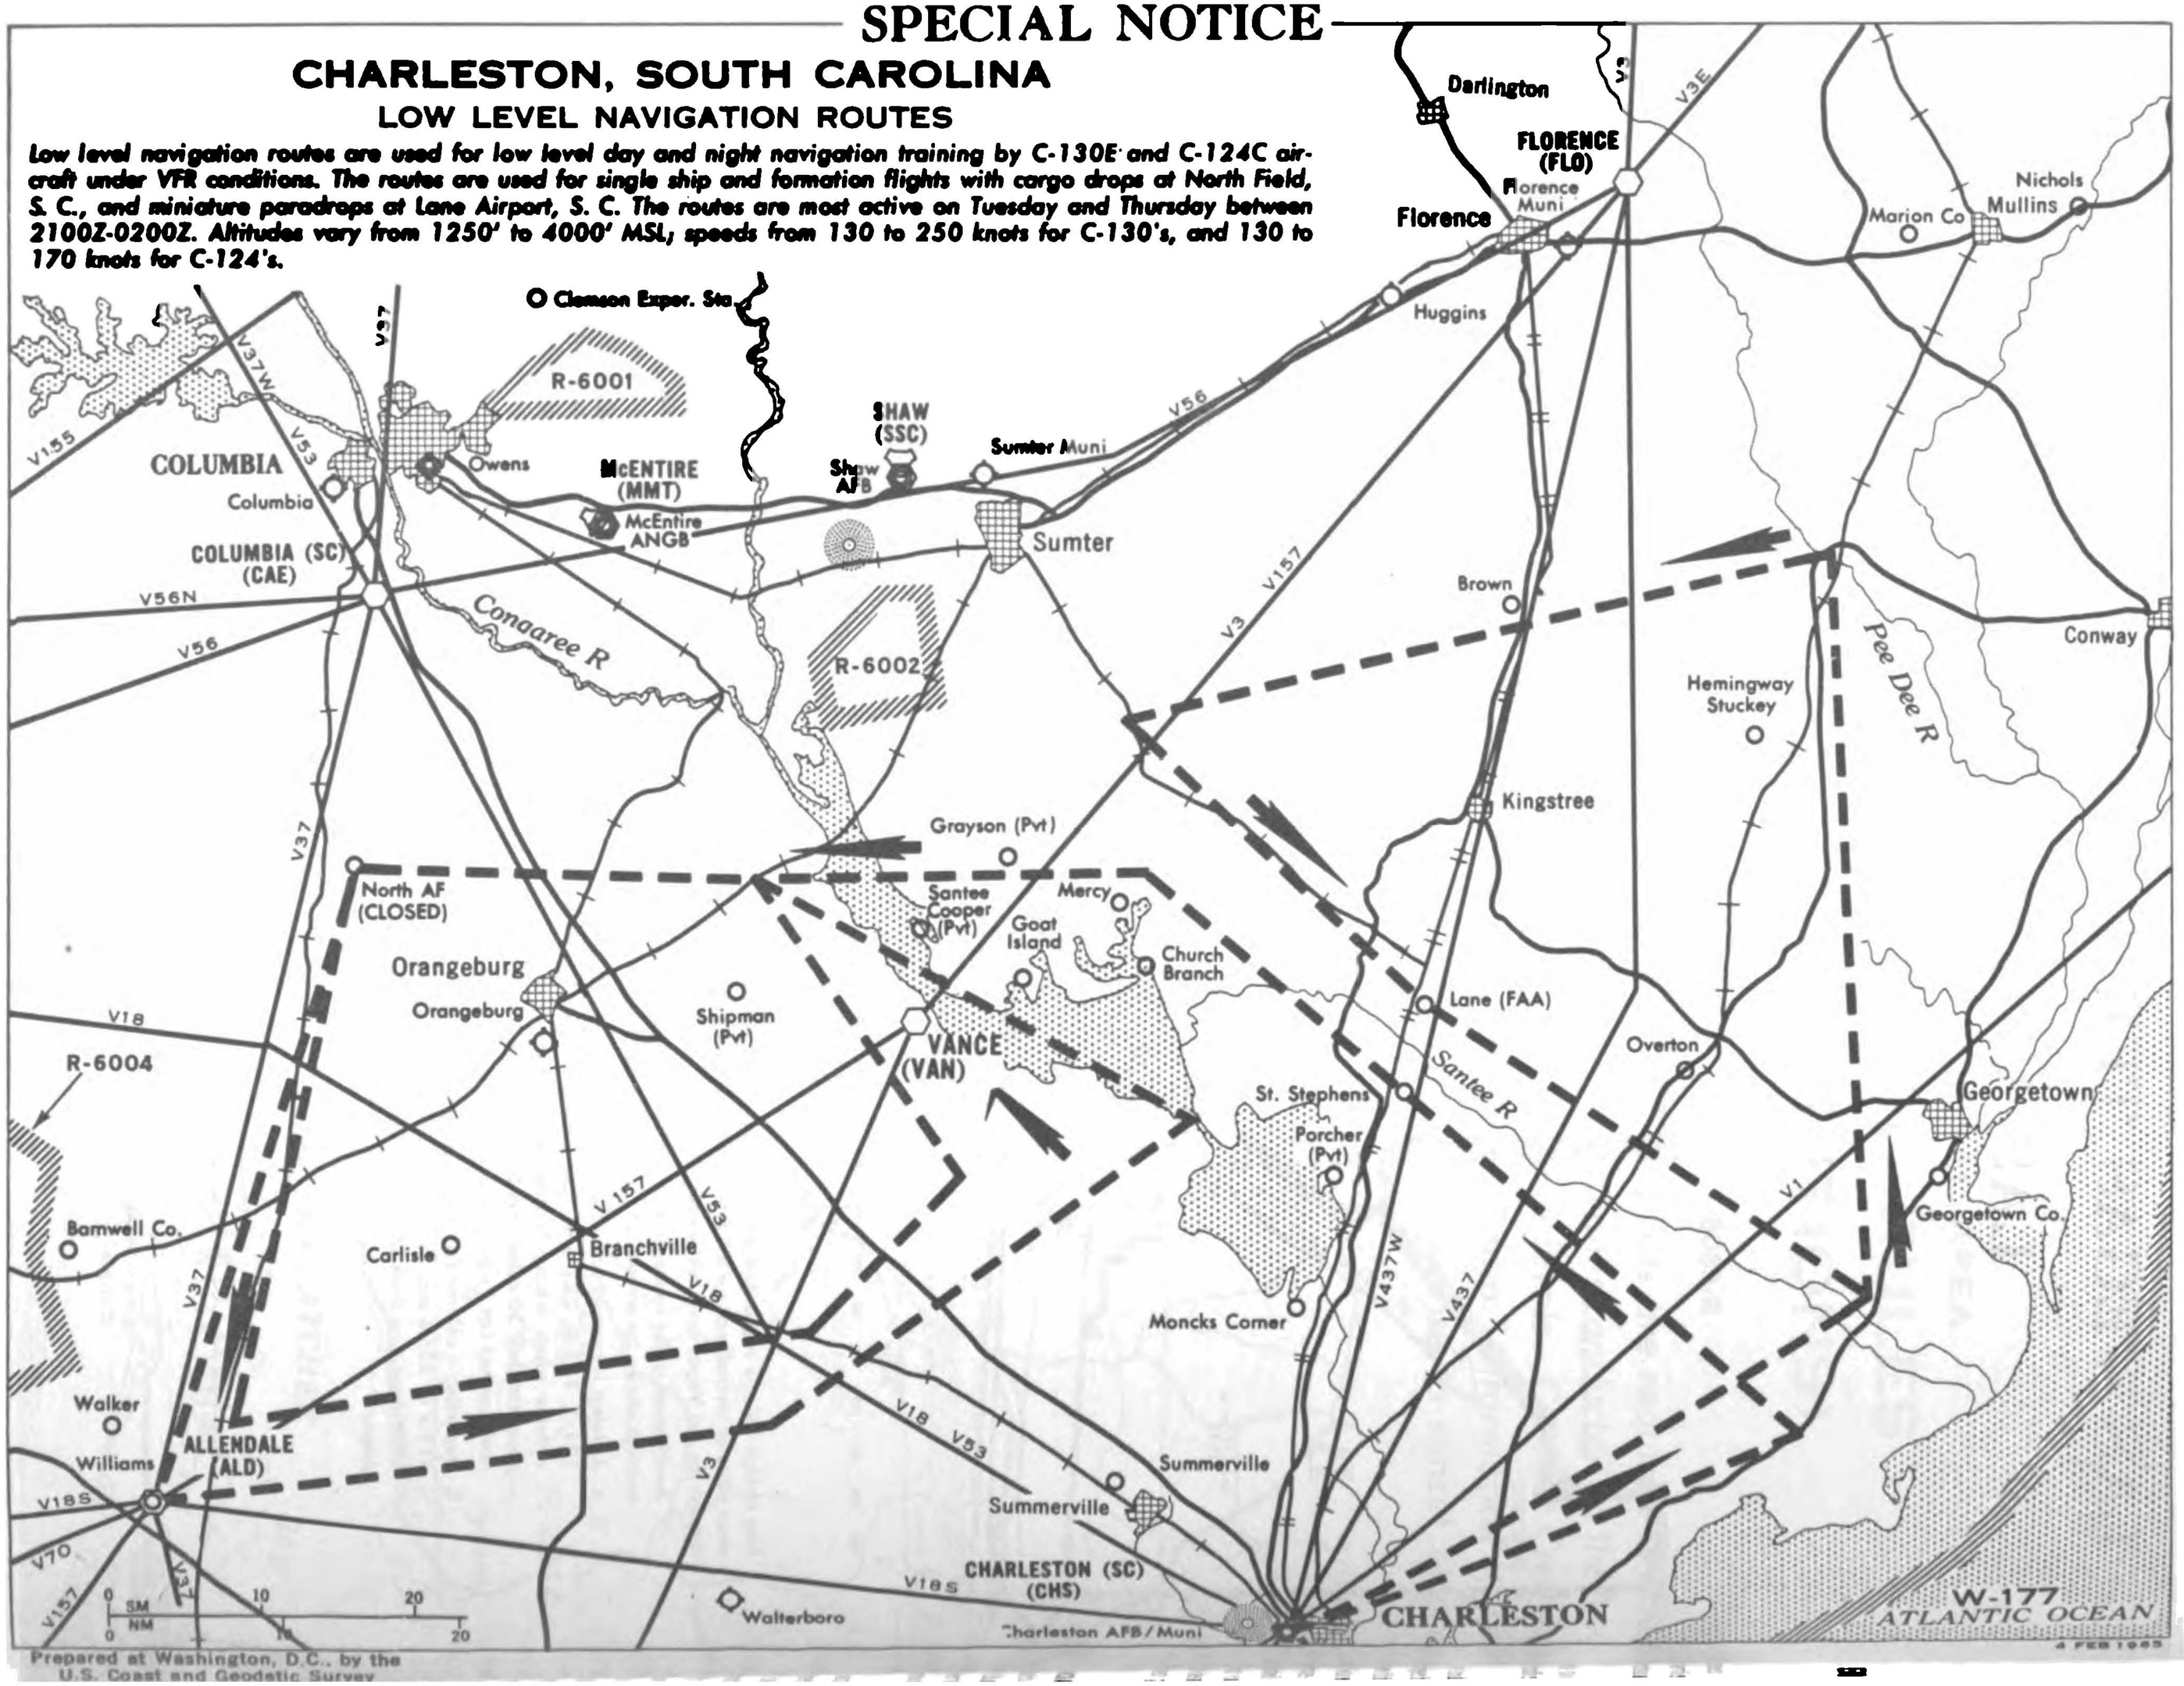
LOW LEVEL NAVIGATION ROUTES

Low level navigation routes are used for low level day and night navigation training by C-130E and C-124C aircraft under VFR conditions. The routes are used for single ship and formation flights with cargo drops at North Field, S. C., and miniature paradrops at Lane Airport, S. C. The routes are most active on Tuesday and Thursday between 2100Z-0200Z. Altitudes vary from 1250' to 4000' MSL, speeds from 130 to 250 knots for C-130's, and 130 to 170 knots for C-124's.



EXPANDED RADAR SERVICE FOR ARRIVING AND DEPARTING FLIGHTS IN TERMINAL AREAS

Certain approach control facilities are providing ex-nded radar service for arriving and departing flights thin their terminal areas. These services are designed :

1. Aid pilots to see and avoid other traffic by pro-ling radar traffic information on possible conflicting affic, and

2. Improve traffic flow by giving specific routes or adings to properly sequence arrivals.

erations where this service is provided are listed at the d of this Notice together with information on the signated service area and frequency to be used. Air-aft with limited communication equipment who desire e service but cannot contact approach or departure ntrol on the designated frequencies will be given serv-e to the extent practicable on frequencies available to e pilot.

ARRIVING AIRCRAFT: Pilots of arriving aircraft should ntact approach control on the assigned frequency/ies d "Request Radar Service" when reaching the perim-er of the service area and remain in communication ith the approach control until advised to contact the wer.

Approach control will advise pilots of the runway to be ed, wind direction and velocity, and traffic information. o establish the landing sequence, pilots will be given ding instructions if required and/or specific routes or adings to fly. When a pilot reports he has the aircraft is to follow in sight, he will be directed to follow it. hen a pilot of an IFR flight, operating in basic VFR eather conditions, is instructed to follow a preceding rcraft he will be cleared for a "visual approach." This earance may be issued whether or not the IFR flight is erating within the control zone. With a "visual ap-oach" clearance, the pilot operating on an IFR flight an in VFR conditions may deviate from the prescribed strument approach procedure and proceed to the air-rt with visual reference to the surface. Radar service ill be terminated when aircraft are told to contact the wer and the tower will assign a landing sequence mber.

DEPARTING AIRCRAFT: Departing VFR aircraft desiring affic information should "Request Radar Service" on itial contact with ground control and advise proposed rection of flight. Following takeoff, the tower will ad-se when to contact departure control and the frequency be used.

When radar contact is established, departure control ill provide traffic information until radar contact is lost or the flight has reached the perimeter of the service area. The pilot will be advised when radar service is terminated.

TRAFFIC INFORMATION: Standard radar separation will be provided between aircraft operating in accordance with Instrument Flight Rules until such time as the aircraft is sequenced and the pilot sees the aircraft he is to follow. Standard radar separation between VFR or between VFR and IFR aircraft will not be provided; instead, traffic information will be issued to the appropriate aircraft prior to the time less than 3 nmi exists between one identified VFR flight and another identified flight, either VFR or IFR. Traffic information on other observed but unidentified radar targets will be issued to the extent controller workload permits. Pilots may request radar vectors to avoid reported traffic and vectors will be given to the extent possible consistent with controller workload.

Pilot participation in this program is not mandatory but is strongly urged since the success of the program is largely dependent on full pilot participation.

THESE PROCEDURES ARE NOT TO BE INTERPRETED AS RELIEVING PILOT OF THEIR RESPONSIBILITIES TO SEE AND AVOID OTHER TRAFFIC OPERATING IN BASIC VFR WEATHER CONDITIONS, TO MAINTAIN APPROPRIATE TERRAIN AND OBSTRUCTION CLEARANCE, OR TO REMAIN IN WEATHER CONDITIONS EQUAL TO OR BETTER THAN THE MINIMA REQUIRED BY FAR 91.105. WHENEVER COMPLIANCE WITH AN ASSIGNED ROUTE OR HEADING IS LIKELY TO COMPROMISE SAID PILOT RESPONSIBILITY RESPECTING TERRAIN AND OBSTRUCTION CLEARANCE AND WEATHER MINIMA, APPROACH CONTROL SHOULD BE SO ADVISED AND A REVISED CLEARANCE OR INSTRUCTION OBTAINED.

LOCATIONS AT WHICH THE ABOVE RADAR SERVICE IS PROVIDED

John F. Kennedy Intl Airport, N.Y.

EFFECTIVE DATE: 18 AUGUST 1962

Area Within Which Service is Provided: Approximately 25 nautical mile radius of John F. Kennedy Intl Airport exclusive of LaGuardia, Newark, and Floyd Bennett NAS control zones. **Arrival Frequencies:** Aircraft flying to the airport, contact approach control on 120.8 mc. Aircraft not equipped for two-way communication on 120.8 mc should transmit 122.7 mc and listen on 120.8 mc. **Departure Frequencies:** N and W bound 123.9 mc or 269.4 mc; all others 121.1 mc or 269.4 mc.

Houston International Airport, Tex.

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 nmi from the airport. **Arrival Frequencies:** Aircraft flying to the airport on headings of 189° thru 037° contact approach control on 118.3 mc or 379.1 mc. Those flying headings of 038° thru 188° use 118.1 mc or 307.1 mc. Aircraft not equipped for two-way communication on those frequencies should transmit 122.5 mc and listen on the appropriate frequency specified above or a frequency/ies assigned by the facility. **Departure Frequencies:** 123.7 mc or 290.2 mc.

El Paso International Airport, Texas and Biggs AFB, Texas

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 mi from the airports. **Arrival Frequencies:** Aircraft should use 118.7 mc or 307.0 mc. Aircraft not equipped for two-way communications on those frequencies should transmit 122.7 mc and listen on the appropriate listed frequency. **Departure Frequencies:** The tower will advise pilots of departing VFR flights who have requested the service when to contact departure control and the frequency to be used.

Castle AFB Terminal Area Merced, Calif.

EFFECTIVE DATE: 1 JUNE 1963

AREA WITHIN WHICH SERVICE IS PROVIDED: 20 mi radius of Castle AFB, 4000 feet and below. Aircraft entering this area or, departing from airports within this area should contact Castle approach on 118.9 mcs, 137.65 mcs or 294.5 mcs. Aircraft not equipped for two-way communications an 118.9 mcs should transmit on 122.5 mcs and receive on 118.9 mcs or 114.2 mcs.

Los Angeles International Airport, California

EFFECTIVE DATE: 22 SEPTEMBER 1964

Area within which service is provided: 25 nmi. **Arrival fre** 045–224 degrees inbound, 119.3 or 381.6 mc. 225–04 d grees inbound, 124.9 or 280.0 mc. If not so equipp trans 122.7 mc and guard above freq or LAX VOR. **D parture Freq:** tower, 118.9 mc. then departure control 125.2 or 385.4 mc when outbound 225–045 degrees, 12 or 363.2 mc, 045–225 degrees.

Weir-Cook, Indianapolis, Indiana

EFFECTIVE DATE: 14 SEPTEMBER 1964

Area within which service is provided: 20 nmi, 4000' a below. **Arrival Freq:** 118.5 mc. **Departure freq:** ground contr 121.9 mc then Indianapolis Departure Radar Servic 121.3 mc. Enroute aircraft contact Indianapolis Termin Radar Service, 118.5 mc.

•Logan International Airport, Boston Mass.

EFFECTIVE DATE: 17 FEBRUARY 1965

Area in which service is provided: Approximately 25 nau tical mile radius of Logan International Airport. **A rival frequencies:** Aircraft flying to the airport on headin of 035° through 140° should use the frequencies 126 or 281.5 mcs. Those flying headings of 141° throu 034° use 120.6 or 263.1 mcs. Aircraft not so equipp should transmit on 122.5 mcs. and listen on the appr priate frequency. **Departure frequencies:** 119.1 or 343.6 mc

•Friendship Intl Airport, Baltimore, Maryland

EFFECTIVE DATE: 11 February 1965

AREA IN WHICH SERVICE IS PROVIDED: Approximately 1 mi radius. **Arrival freq:** In bound on 101° thru 281° u 121.1 mc or 360.8 mc; inbound on 282° thru 100° u 125.9 mc or 307.9 mc. **Departure freq:** 120.4 or 381.4 m when advised by tower.

MILITARY AERIAL REFUELING TRACKS

itary aircraft conduct refueling operations throughout the continental United States normally between 12,000 feet MSL and FL 240 on an IFR flight plan at assigned altitude(s). Refueling aircraft have right of way over other aircraft in accordance with FAR 91.67(c)

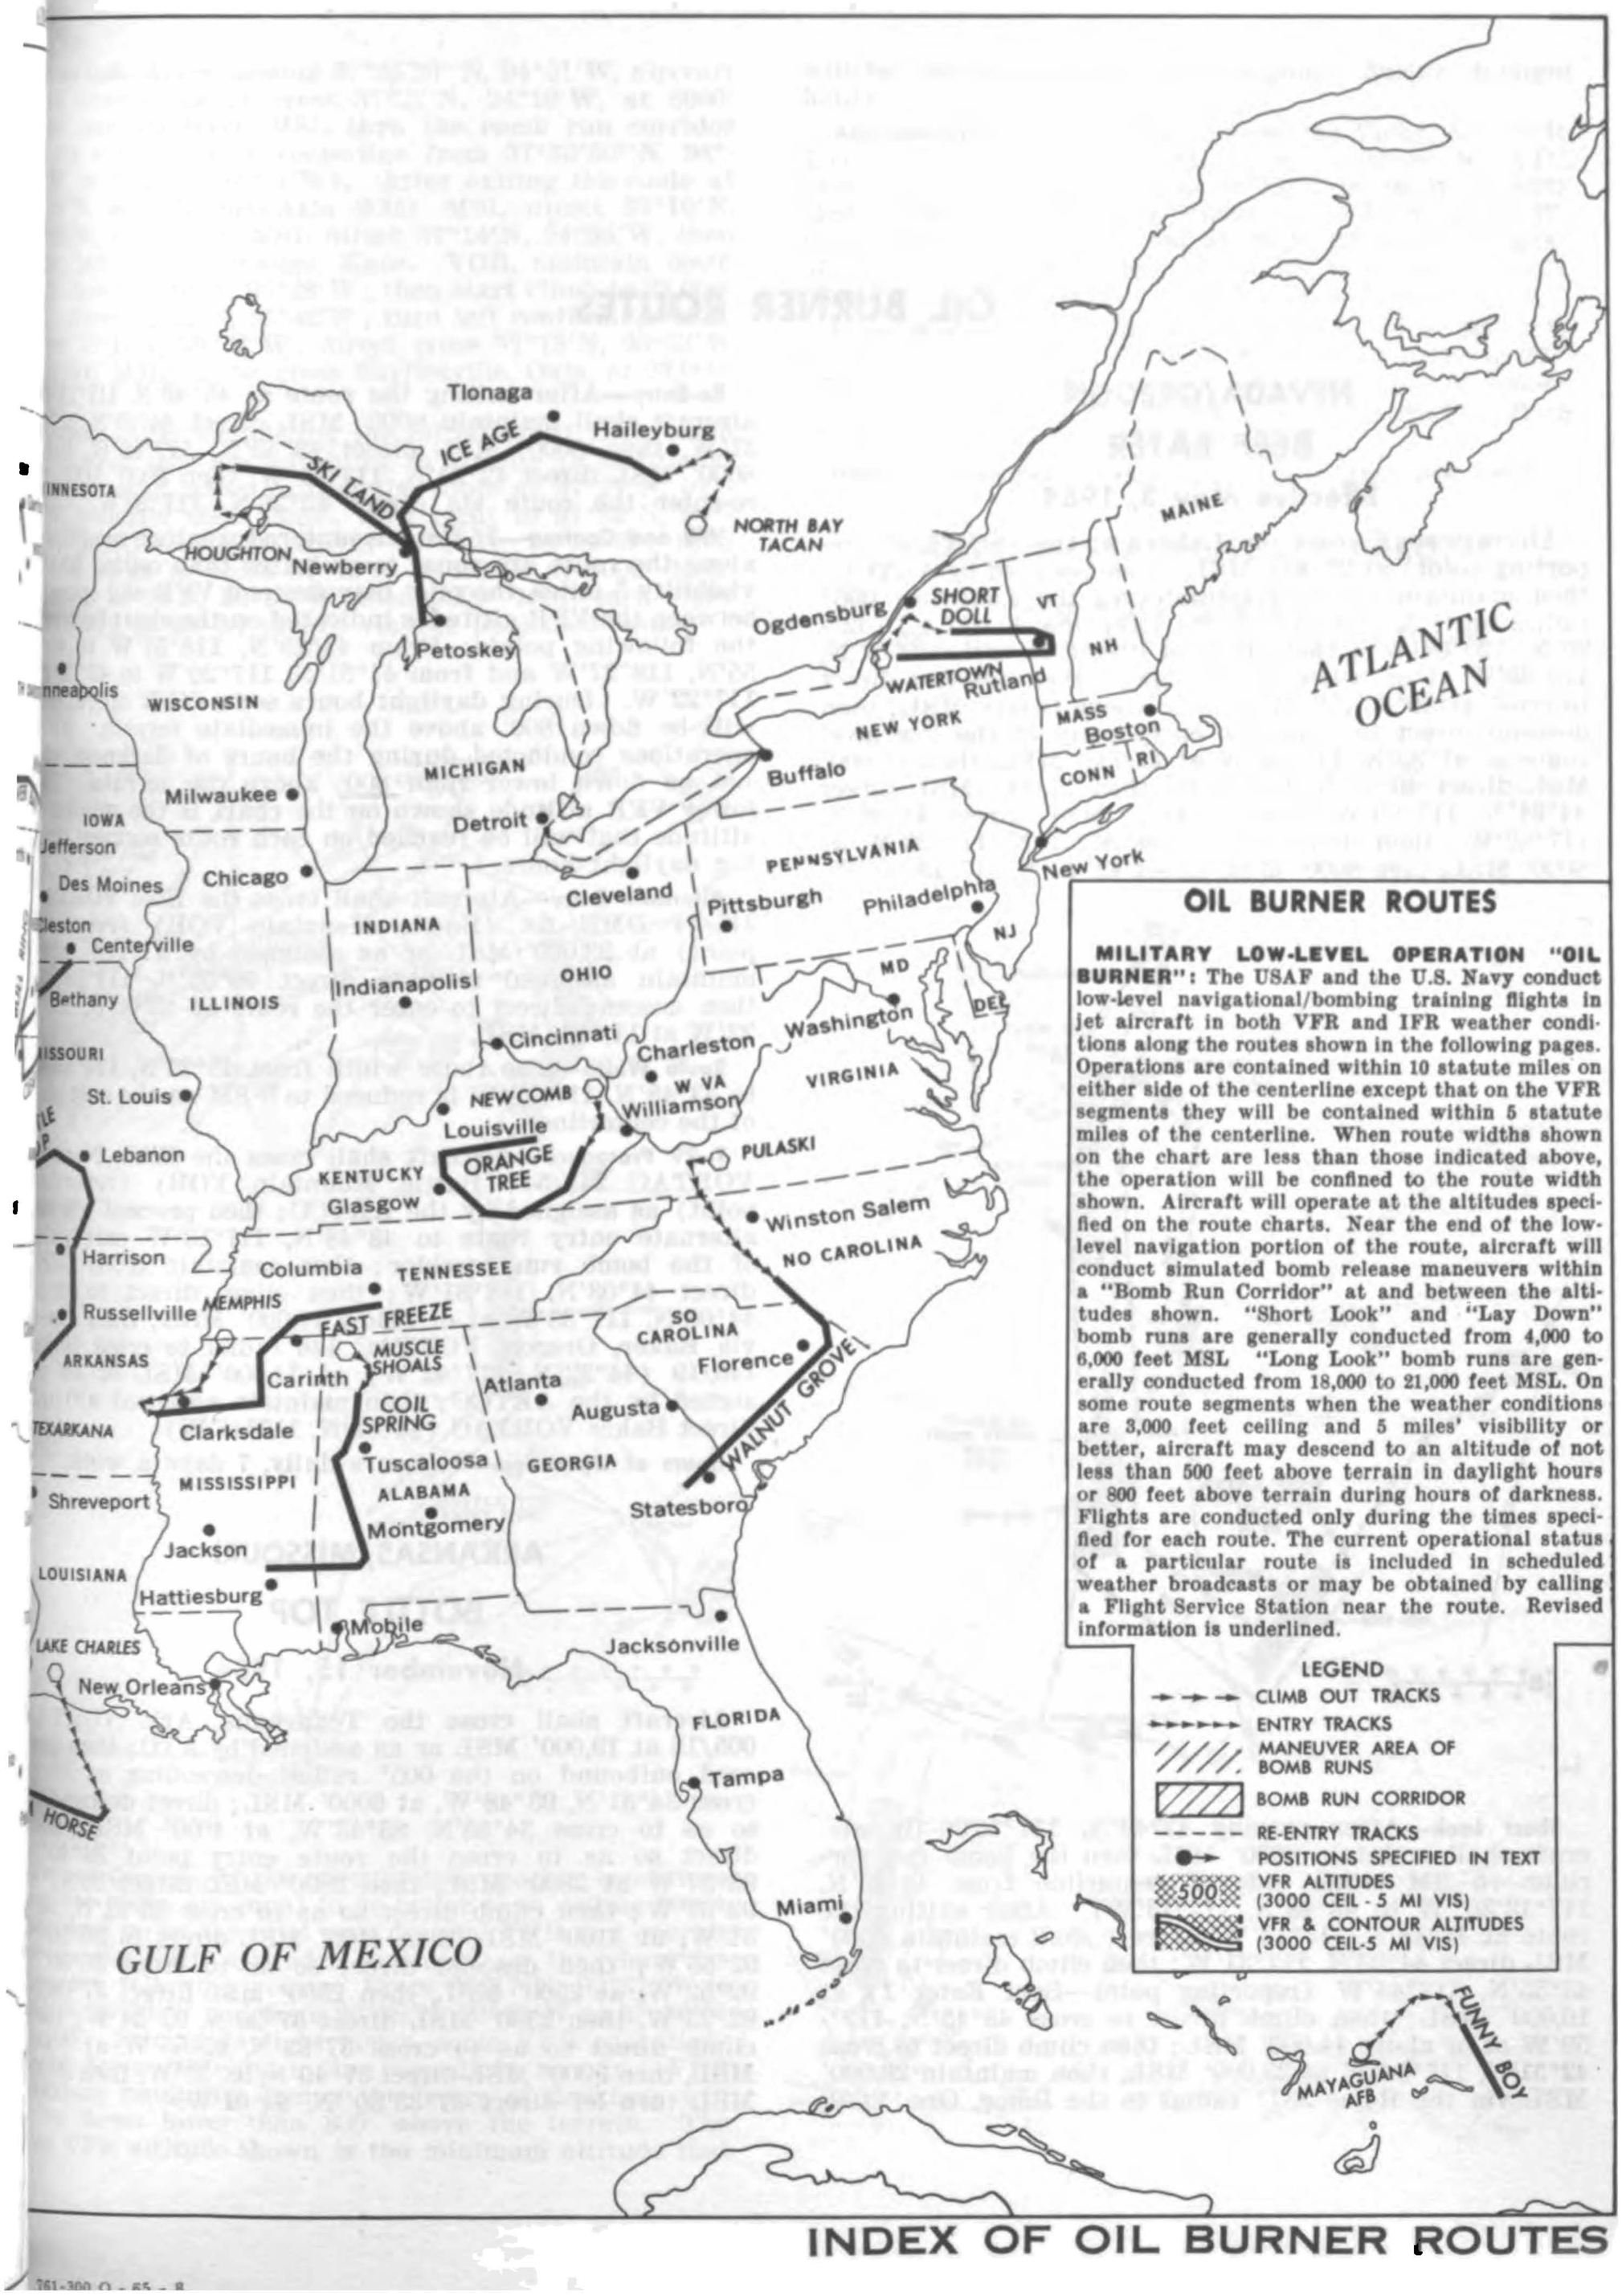
Prepared at Washington, D.C., by the U.S. Coast and Geodetic Survey

February 4, 1



OIL BURNER ROUTES

MILITARY LOW-LEVEL OPERATION "OIL BURNER": The USAF and the U.S. Navy conduct low-level navigational/bombing training flights in jet aircraft in both VFR and IFR weather conditions along the routes shown in the following pages. Operations are contained within 10 statute miles on either side of the centerline except that on the VFR segments they will be contained within 5 statute miles of the centerline. When route widths shown on the chart are less than those indicated above, the operation will be confined to the route width shown. Aircraft will operate at the altitudes specified on the route charts. Near the end of the low-level navigation portion of the route, aircraft will conduct simulated bomb release maneuvers within a "Bomb Run Corridor" at and between the altitudes shown. "Short Look" and "Lay Down" bomb runs are generally conducted from 4,000 to 6,000 feet MSL "Long Look" bomb runs are generally conducted from 18,000 to 21,000 feet MSL. On some route segments when the weather conditions are 3,000 feet ceiling and 5 miles' visibility or better, aircraft may descend to an altitude of not less than 500 feet above terrain in daylight hours or 800 feet above terrain during hours of darkness. Flights are conducted only during the times specified for each route. The current operational status of a particular route is included in scheduled weather broadcasts or may be obtained by calling a Flight Service Station near the route. Revised information is underlined.

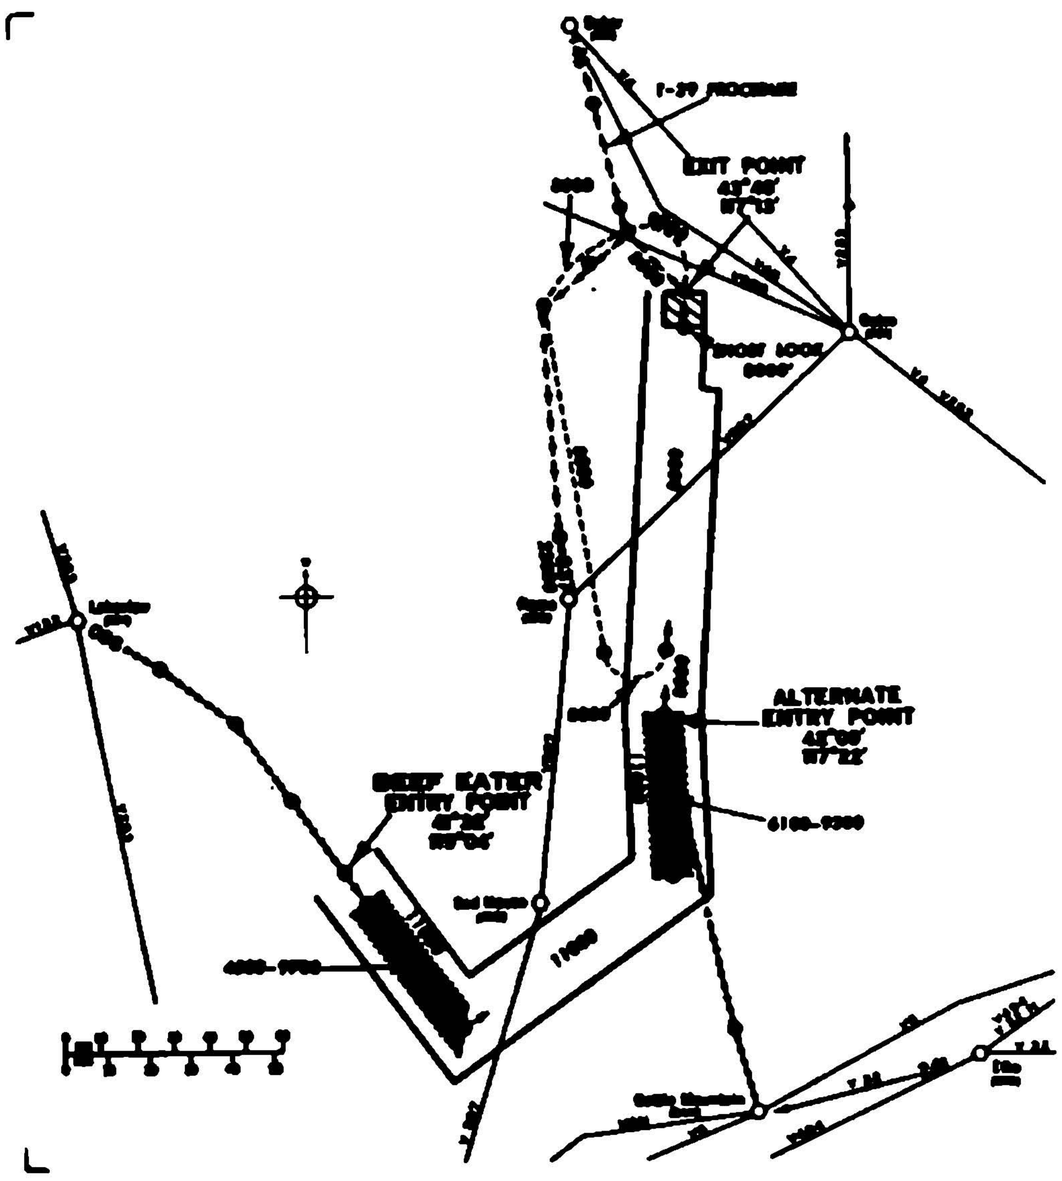
OIL BURNER ROUTES

NEVADA/OREGON

BEEF EATER

Effective May 3, 1964

Aircraft shall cross the Lakeview, Ore. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC; then maintain assigned altitude via the Lakeview 096° radial until 22 NM east of the Lakeview VORTAC (42°-20′N, 120°04′W); then descend direct to cross 42°07′N, 119°39′W at or below 23,000′ MSL; then descend direct to cross 41°49′N, 119°21′W at or above 16,000′ MSL; then descend direct to cross the entry point of the low level route at 41°32′N, 119°04′W at 11,000′ MSL, then 11,000′ MSL direct 40°55′N, 118°27′W, then 11,000′ MSL direct 41°31′N, 117°20′W, then 11,000′. MSL direct 42°09′N, 117°22′W; then descend to cross 42°26′N, 117°20′W at 8000′ MSL, then 8000′ MSL direct 43°40′N, 117°13′30″W.



Short Leek—After passing 43°40′N, 117°13′30″W aircraft shall maintain 8000′ MSL thru the bomb run corridor (5 SM either side of centerline from 43°40′N, 117°13′30″W to 43°48′N, 117°13′W). After exiting the route at 43°48′N, 117°13′W aircraft shall maintain 8000′ MSL direct 44°03′N, 117°31′W; then climb direct to cross 43°55′N, 117°44′W (reporting point—Beef Eater 1) at 10,000′ MSL; then climb direct to cross 43°45′N, 117°-59′W at or above 14,000′ MSL; then climb direct to cross 42°51′N, 117°54′W at 23,000′ MSL, then maintain 23,000′ MSL via the Rome 337° radial to the Rome, Ore. VOR

Re-Entry—After exiting the route at 43°48′N, 117°13′ aircraft shall maintain 8000′ MSL direct 44°03′N, 117° 31′W, then 8000′ MSL direct 43°45′N, 117°59′W, the 8000′ MSL direct 42°24′N, 117°41′W, then 8000′ MSL t re-enter the route via direct 42°26′N, 117°20′W.

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and opera between the VFR altitudes indicated on the chart betwe the following points: From 41°25′N, 118°57′W to 40° 55′N, 118°27′W and from 41°31′N, 117°20′W to 42°09′ 117°22′W. During daylight hours some VFR operatio will be flown 800′ above the immediate terrain. VF operations conducted during the hours of darkness wi not be flown lower than 800′ above the terrain. Th lower VFR altitude shown on the chart is the minimu altitude that will be reached on each route segment du ing daylight hours.

Alternate Entry—Aircraft shall cross the Elko VORTA 241/54 DME fix (Battle Mountain VOR) (reportin point) at 23,000′ MSL or as assigned by ARTCC, the maintain assigned altitude direct 40°55′N, 117°01′W then descend direct to enter the route at 42°09′N, 117° 22′W at 11,000′ MSL.

Route Width—The route width from 43°25′N, 117°15′ to 43°48′N, 117°13′W is reduced to 5 SM on the east sid of the centerline.

T-29 Procedure—Aircraft shall cross the Elko, Nevad VORTAC 241/54 (Battle Mountain VOR) (reportin point) as assigned by the ARTCC; then proceed via th alternate entry route to 43°48′N, 117°13′W exit poi of the bomb run corridor; then maintain 8,000′ MS direct 44°03′N, 117°31′W; then climb direct to cro 44°08′N, 117°33′W at or below 10,000′ MSL; then dire via Baker, Oregon, VORTAC 146 radial to cross Bak 146/19 (44°32′N, 117°42′W) at 14,000′ MSL or as a signed by the ARTCC; then maintain assigned altitu direct Baker VORTAC (44°51′N, 117°48′W).

Hours of Operation—24 hours daily, 7 days a week.

ARKANSAS/MISSOURI

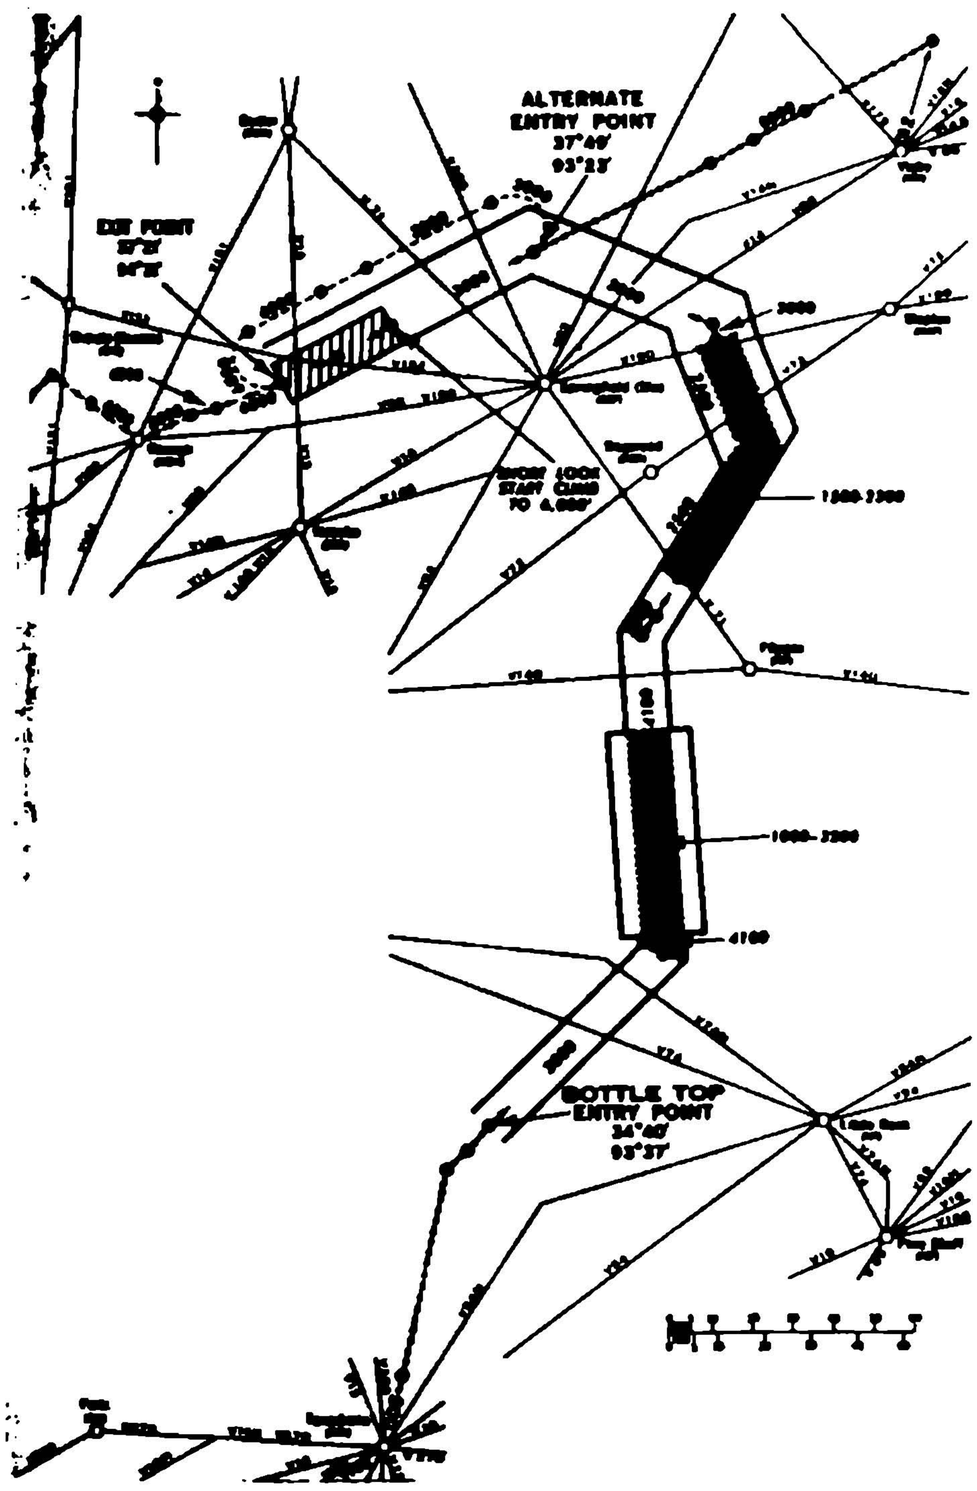
BOTTLE TOP

November 15, 1964

Aircraft shall cross the Texarkana, Ark. VORTA 005/15 at 19,000′ MSL or as assigned by ATC; then pr ceed outbound on the 005° radial descending so as cross 34°31′N, 93°48′W, at 6000′ MSL; direct descendi so as to cross 34°35′N, 93°43′W, at 4000′ MSL; th direct so as to cross the route entry point 34°40′ 93°37′W at 2800′ MSL, then 2800′ MSL direct 35°17′ 92°51′W; then climb direct so as to cross 35°21′N, 92 51′W, at 4100′ MSL, then 4100′ MSL direct to 36°26′ 92°55′W; then descend direct so as to cross 36°30′ 92°52′W, at 2500′ MSL, then 2500′ MSL direct 37°06′ 92°23′W, then 2500′ MSL direct 37°30′N, 92°34′W; th climb direct so as to cross 37°33′N, 92°35′W at 30 MSL, then 3000′ MSL direct 37°49′N, 93°23′W, then 30 MSL turn lef direct 37°33′30″N, 94°01′W.

Short Look—After passing 37°33'30"N, 94°01'W, aircraft all climb so as to cross 37°27'N, 94°16'W, at 6000' SL maintain 6000' MSL thru the bomb run corridor SM either side of centerline from 37°33'30"N, 94°-W, to 37°21'N, 94°31'W). After exiting the route at 21'N, 94°31'W maintain 6000' MSL direct 37°16'N, 49'W, then 6000' MSL direct 37°14'N, 94°56'W, then 0' MSL direct Oswego, Kans. VOR, maintain 6000' SL direct 37°16'N, 95°28'W; then start climb to 23,000' SL direct 37°22'N, 95°42'W; turn left continuing climb ect 37°17'N, 95°52'W; direct cross 37°13'N, 95°53'W 16,000' MSL; direct cross Bartlesville, Okla. at 23,000' SL

le-Entry—After completing the initial Short Look bomb , aircraft that are scheduled to execute an additional nb run shall, after exiting the route at 37°21'N, 94°-W, maintain 6000' MSL, turn right to 37°32'N, 94°-W, then 6000' MSL direct 37°41'N, 94°20'W; then cend so as to cross 37°46'N, 94°08'W at 3000' MSL ect to 38°00'N, 93°34'W, then 3000' MSL turn right 37°49'N, 93°23'W, thence via the published route.



VFR and Contour—If the encountered weather conditions ng the route are equal to or better than ceiling 3000', ibility 5 miles, the pilot may descend VFR and operate ween the VFR altitudes indicated on the chart be-een the following points: From 35°17'N, 92°51'W to 05'N, 92°53'W and from 36°38'N, 92°45'W to 37°30'N, 34'W. During daylight hours, some VFR operations l be flown 500' above the immediate terrain. VFR erations conducted during the hours of darkness will be flown lower than 800' above the terrain. The er VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Vichy, Mo. VOR-TAC 012/25 at 15,000' MSL or as assigned by ATC. Descend direct so as to cross 38°19'N, 92°08'W at 8000' MSL; then at 8000' MSL direct to 38°13'N, 92°22'W; then descend so as to cross 38°08'N, 92°34"W at 4000' MSL; then continue descent so as to cross 37°49'N, 93°23'W at 3000' MSL. Thence via published route.

Route Width—The route width from 34°40'N, 93°37'W to 35°21'N, 92°51'W and from 36°05'N, 92°53'W to 37°-06'N, 92°23'W is reduced to 5 SM either side of centerline and 5 SM on the south side of centerline from 37°33'N, 92°35'W to 37°21'N, 94°31'W.

Hours of Operation—0100Z to 1400Z, 7 days per week.

KANSAS/NEBRASKA/SOUTH DAKOTA

• BULL RING

Effective March 1 thru August 27, 1965

Aircraft shall cross the Sioux Falls VORTAC 269/55 (43°46′N, 98°02′W) at FL 230 or as assigned by ARTC; then descend direct so as to cross 43°02′N, 99°06′W at 8,000′ MSL; then at 8,000′ MSL direct to 42°54′N, 99°-17′W; then descend direct so as to cross 42°35′N, 99°31′W at 4,000′ MSL (Low Level Entry Point); then at 4,000′ MSL direct to 40°41′N, 99°38′W; then at 4,000′ MSL direct to 40°00′N, 100°10′W; then at 4,200′ MSL direct to 39°26′N, 100°36′W; then at 4,200′ MSL direct to 39°-13′N, 100°37′W; then at 4,100′ MSL direct to the entry point of the bomb run corridor at 38°50′N, 100°40′W.

Short Look and Lay Down—After passing 38°50′N, 100°-40′W aircraft shall maintain between 3,000′ MSL and 6,000′ MSL through the bomb run corridor (5 SM either side of centerline from 38°50′N, 100°40′W to 38°23′N, 100°43′W), the minimum IFR altitude through the bomb run corridor is 4,100′ MSL. After exiting the route at 38°23′N, 100°43′W, aircraft shall turn left climbing to 38°20′N, 100°26′W; then continue climb direct so as to cross 38°31′N, 100°24′W at 16,000′ MSL; then at 16,000′ MSL direct 38°40′N, 100°23′W; then at 16,000′ MSL turn left to 38°41′N, 100°41′W; then climb direct to the Dodge City, Kansas, VOR crossing 38°19′N, 100°24′W at FL 230; then at FL 230 to the Dodge City VOR.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall after passing 38°23′N, 100°43′W, turn left and climb so as to cross 38°20′N, 100°26′W at 8,000′ MSL; then at 8,000′ MSL direct 39°21′N, 99°30′W; then at 8,000′ MSL turn left to 39°31′N, 99°34′W then at 8,000′ MSL direct 39°31′N, 100°12′W; then start descent direct so as to cross 39°31′N, 100°28′ at 4,200′ MSL; then turn left at 4,200′ MSL to 39°26′N, 100°36′W; thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3,000′; visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 42°25′N, 99°32′W to 41°35′N, 99°35′W and from 39°13′N, 100°37′W to 38°-23′N, 100°43′W. During daylight hours, some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude on the chart is the minimum altitude that will be reached during daylight hours.

Route Width—The route width is reduced to 5 SM on each side of centerline from 40°53′N, 99°38′W to 39°-35′N, 100°30′W.

Hours of Operation—24 hours daily, 7 days a week.

KANSAS/MISSOURI/NEBRASKA

• CLEAR VIEW

Revised Effective December 24, 1964

Aircraft shall cross the St. Joseph, Mo. VOR at FL 240 or above, then proceed northwest on the St. Joseph VOR 293° radial, maintain FL 240 or above until 17 NM northwest of St. Joseph VOR; turn left direct 39°56′N, 96°12′W crossing this point at 9000′ MSL, descend to 3200′ MSL direct to the route entry point at 39°52′N, 96°39′W, maintain 3200′ MSL direct 39°43′N, 97°30′W, descend to 3100′ MSL direct 39°40′N, 98°30′W, climb to 3400′ MSL direct 39°31′N, 99°34′W, climb to 3800′ MSL direct 40°05′N, 99°45′W; maintain 3800′ MSL direct 40°26′N, 98°37′W.

Short Look—After passing 40°26′N, 98°37′W, proceed direct to 40°29′N, 98°27′W climbing so as to cross this point at 6000′ MSL; maintain 6000′ MSL through the bomb run corridor (5 SM either side centerline from 40°26′N, 98°37′W to 40°32′N, 98°09′W); after exiting the route at 40°32′N, 98°09′W, turn right climbing to cross 40°20′N, 98°03′W at 7000′ MSL; then at 70 MSL direct 40°16′N, 98°16′W; then start climb so as cross 40°10′N, 98°37′W at or below 14,000′ MSL; th turn left climbing so as to cross 39°54′N, 98°37′W 18,000′ MSL; then at 18,000′ MSL direct 39°33′N, 9 37′W; then climb so as to cross 39°21′N, 98°37′W at below 23,000′ MSL, then start climb so as to cross t Salina VORTAC 272/48 at FL 250.

ain. VFR operations conducted during the hours of arkness will not be flown lower than 800' above the errain. The lower VFR altitude shown on the chart is ie minimum altitude that will be reached on each route egment during daylight hours.

Alternate Entry—Aircraft shall cross the Goodland, Kans VOR at 23,000' MSL; and proceed northeast on the oodland VOR 053° radial maintaining 23,000' MSL ntil 35 NM nrtheast of Goodland VOR, then descend so s to reach 5500' MSL by the Hill City, Kansas VOR 7/49 NM fix; then descend to 3800' MSL direct 7°05'N, 99°45'W, thence via the published route.

Route Width—The route width from 39°31'N, 99°34'W the route exit point is 5 SM on the west and north de of the route centerline and 10 SM on the east and outh side of the route centerline.

Hours of Operation—0000Z to 2359Z Monday through Saturday.

ALABAMA/MISSISSIPPI

COIL SPRING

Revised Effective October 18, 1964

Aircraft shall cross Muscle Shoals, Alabama VOR at 0,000' MSL, or as assigned. Descend via Muscle Shoals OR 115° radial, cross Muscle Shoals VOR 115°/24 NM 12,000' MSL; turn right, descend to cross 34°19'N, °06'W at 8000' MSL, maintain 8000' MSL direct to e route entry point at 34°03'N, 87°33'W, direct 33°-5'N, 87°38'W, direct 33°28'N, 87°42'W; descend direct cross 33°15'N, 87°52'W at 5000' MSL, maintain 5000' SL direct 33°10'N, 87°56'W, direct 32°40'N, 87°48'W; escend to cross 32°31'N, 87°45'W at 2000' MSL, maintain 2000' MSL direct 31°41'N, 87°31'W, turn right to °33'N, 87°40'W, maintain 2000' MSL direct 31°36'N, 3°42'W; climb direct to cross 31°36'N, 88°46'W at 3000' SL, direct to cross 31°36'N, 88°55'W at 5000' MSL. n addition to the above, aircraft may climb to 3000' SL after 31°33'N, 87°40'W and maintain 3000' MSL 31°36'N, 88°55'W during the hours 0600Z–1200Z.

Short Look—After passing 31°36'N, 88°55'W aircraft all operate through the bomb run corridor at 5000' SL. In addition, aircraft may operate through the omb run corridor at 3000' MSL during the hours 0600Z–200Z. (The bomb run corridor is 5 SM either side enterline from 31°36'N, 88°55'W to 31°35'N, 89°14'W.) fter exiting the route at 31°35'N, 89°14'W, aircraft all cross 31°36'N, 89°30'W at 5000' MSL; start climb irect to cross 31°37'N, 89°56'W at 14,000' MSL (reorting point), maintain 14,000' MSL direct 31°33'N, 0°25'W; start climb direct 31°32'N, 90°36'W, turn right intercept Jackson, Miss. VORTAC 205° radial 56 NM x (31°42'N, 90°44'W) at or below 23,000' MSL, thence a 205° radial to cross 36 NM fix at FL 250, maintain L 250 or as assigned to Jackson VORTAC.

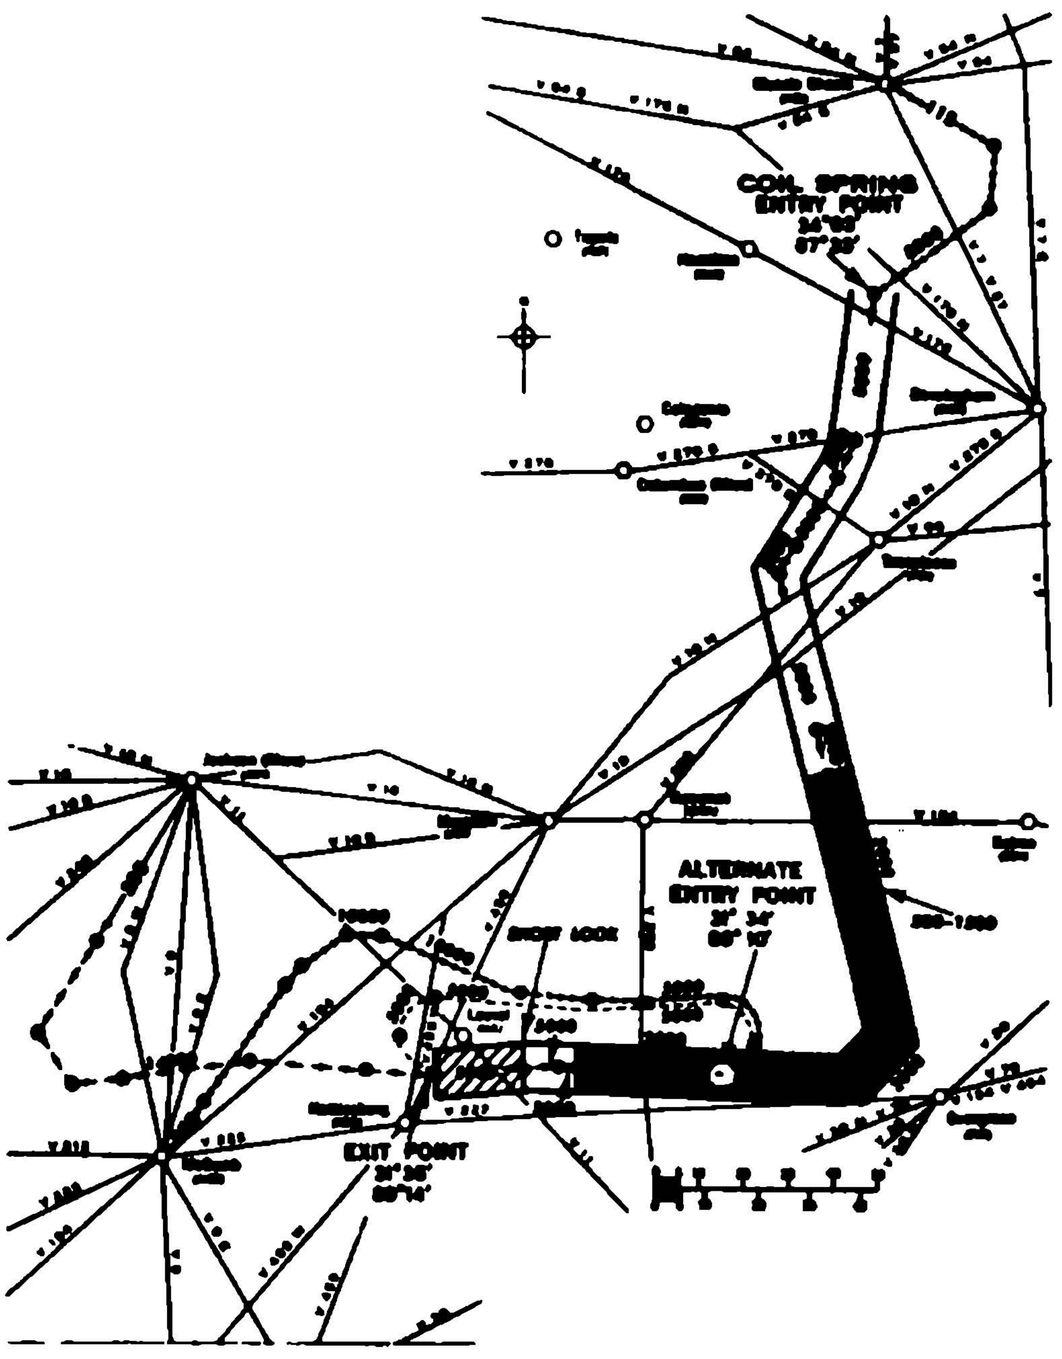
Re-Entry—Aircraft scheduled to execute an additional omb run shall, after exiting the route at 31°35'N, 9°14'W, turn right, cross 31°42'N, 89°22'W at 5000' SL, maintain 5000' MSL, turn right to 31°49'N, 89°-4'W, direct 31°48'N, 88°27'W; direct 31°48'N, 88°10'W; urn right, cross 31°40'N, 88°03'W at 3000' MSL; continue turn, cross 31°34'N, 88°10'W at 2000' MSL; thence a published route.

VFR and Contour—If the encountered weather conditions long the route are equal to or better than ceiling 3000', isibility 5 miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the hart between the following points: From 32°31'N, 87°-5'W to 31°36'N, 88°42'W. During daylight hours, some FR operations will be flown 500' above the immediate errain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum that will be reached on each segment during daylight hours.

Alternate Entry—Aircraft shall cross McComb, Miss. VOR (31°18'15"N, 90°15'29"W) at 23,000' MSL, or as assigned; maintain 23,000' MSL or as assigned via the McComb VOR 028° radial to 13 NM fix; start descent, cross McComb VOR 028° radial 41 NM fix at 15,000' MSL; cross 45 NM fix at 14,000' MSL; turn right, cross 32°01'N, 89°35'W at 10,000' MSL, maintain 10,000' MSL, turn right, 32°01'N, 89°27'W, direct 31°49'N, 88°55'W; descend direct, cross 31°48'N, 88°39'W at 6000' MSL; direct, cross 31°48'N, 88°27'W at 5000' MSL, maintain 5000' MSL direct 31°48'N, 88°10'W; turn right cross 31°40'N, 88°03'W at 3000' MSL continue turn, cross 31°34'N, 88°10'W at 2000' MSL; thence via the published route.

Route Width—The entire route is reduced to 5 SM either side of route centerline.

Hours of Operation—24 hours per day, 7 days a week.



DUCK FLAT

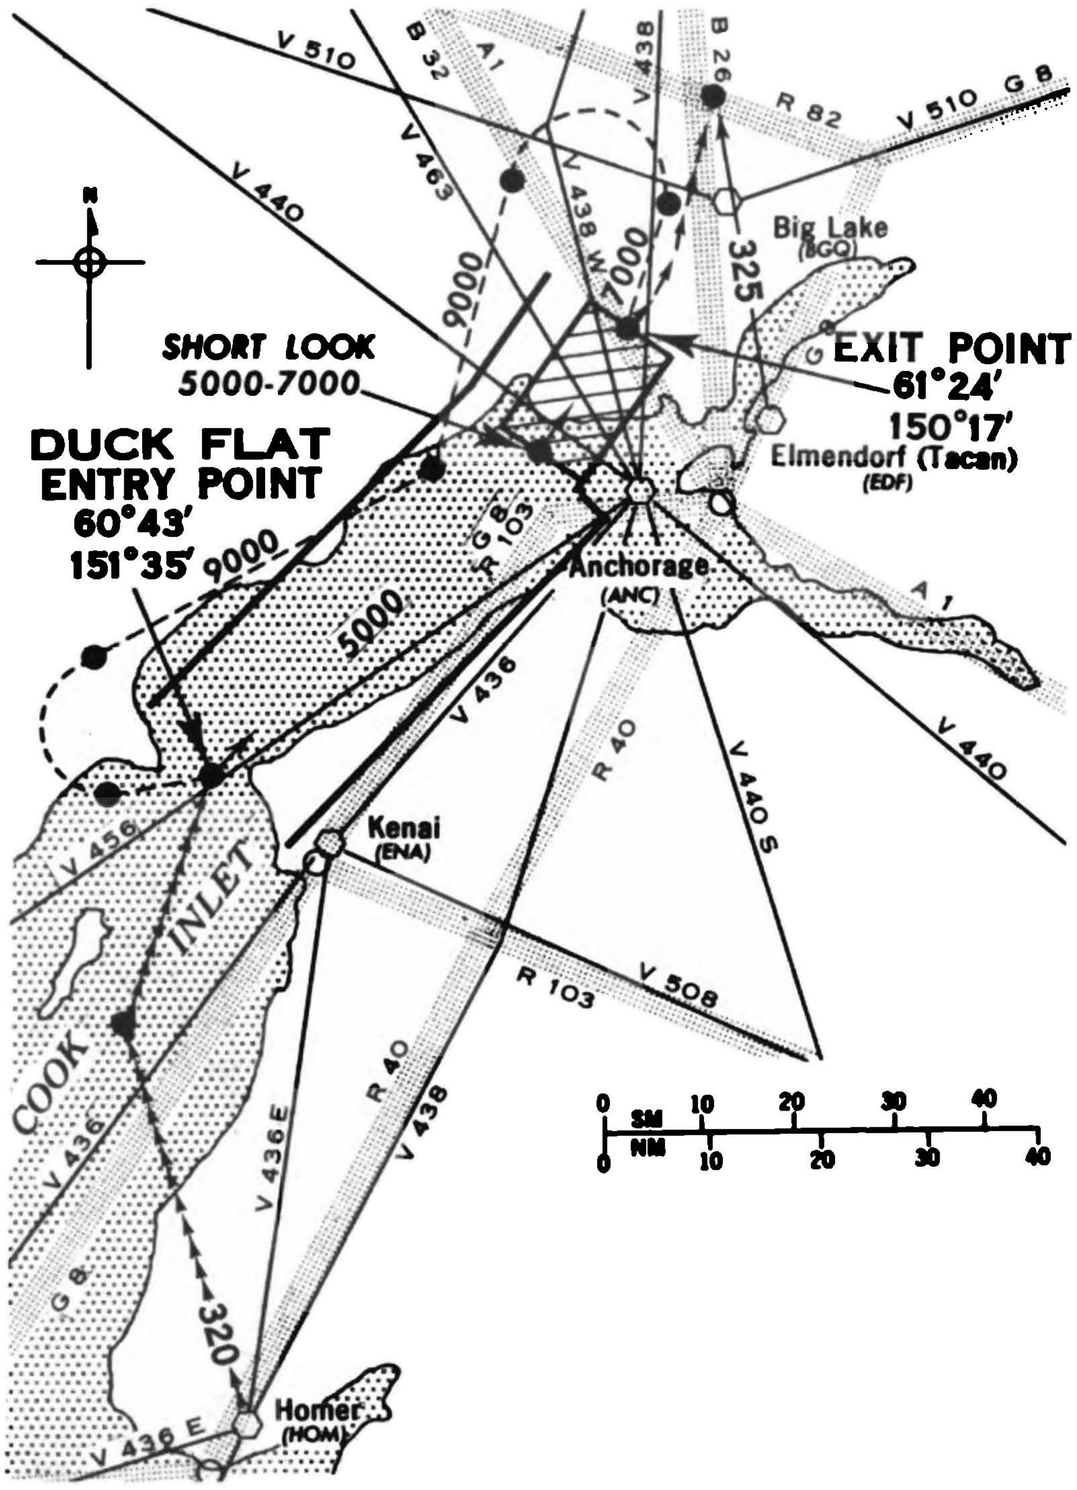
ALASKA

Effective June 16, 1963

Aircraft shall cross the Homer, Alaska VOR (reporting point) at FL 250 or as assigned by ARTCC, descend via the 320° radial of the Homer VOR to 60°20'N, 151°50'W, continue descent to cross the route entry point at 60°-43'N, 151°35'W at 5000' MSL, maintain 5000' MSL to 61°13', 150°34'W.

Short Look—After passing 61°13'N, 150°34'W aircraft shall maintain between 5000' MSL and 7000' MSL through the bomb run corridor (5 smi either side center-

line from 61°13′N, 150°34′W to 61°24′N, 150°17′W). After passing 61°24′N, 150°17′W (reporting point), the route exit point, aircraft shall climb to or maintain 7000′ MSL direct to the Elmendorf TACAN 325° radial 30 NM fix (Willow Intersection).



Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 61°24′N, 150°17′W, maintain 7000′ MSL to 61°35′N, 150°08′W, then turn left climbing to 9000′ MSL direct to 61°38′N, 150°38′W, then 9000′ MSL to 61°13′N, 150°54′W, then 9000′ MSL direct 60°53′N, 151°57′W, then a left descending turn to cross 60°41′N, 151°54′W at 7000′ MSL or above, direct to reentry the Duck Flat route at 60°43′N, 151°35′W at 5000′ MSL.

Route Width—The route width is reduced to 5 smi southeast of centerline from 61°13′N, 150°34′W to 61°24′N, 150°17′W.

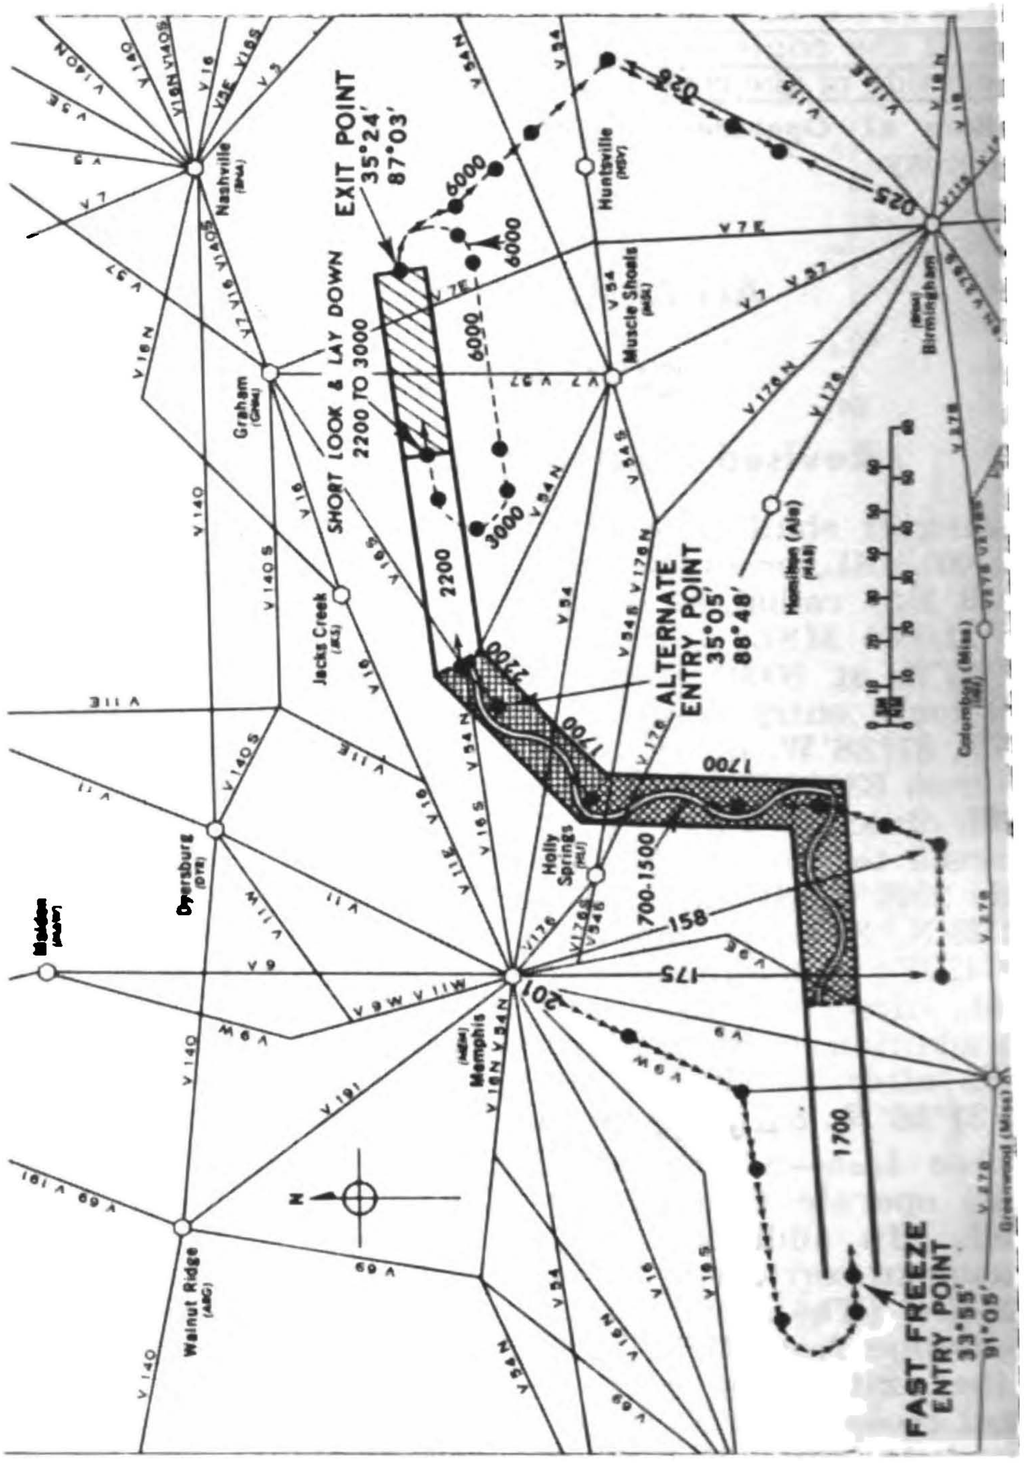
Hours of Operation—2000Z to 2400Z Monday through Friday.

ALABAMA/MISSISSIPPI/TENNESSEE

FAST FREEZE

Effective January 4, 1965 through March 27, 1965

Aircraft shall cross the Memphis, Tennessee, VORTAC at FL 250 or as assigned by ARTC; then maintain FL 250 or assigned altitude via the 201° radial of the Memphis VORTAC to the 26 NM DME fix (34°39′N, 90°-08′W); then descend direct so as to cross 34°17′ 90°21′W (201/50 NM DME fix of Memphis VORTA at FL 200; then descend direct so as to cross 34°14′ 90°40′W at 16,000′ MSL; then descend direct to 34°08′ 91°16′W; then turn left descending to 33°54′N, 91°13′W then continue descend direct so as to cross 33°55′N, 9 05′W at 1700′ MSL (low level entry point); then 1700′ MSL direct to 34°03′N, 89°12′W; then at 170 MSL direct to 34°47′N, 89°11′W; then at 1700′ MS direct to 35°05′N, 88°48′W; then at 2200′ MSL direct 35°13′N, 88°39′W; then at 2200′ MSL direct to 35°19′ 87°47′W.



Short Look and Lay Down—After passing 35°19′N, 87 47′W aircraft shall maintain between 2200′ MSL a 3000′ MSL through the bomb run corridor (5 statu miles either side of centerline from 35°19′N, 87°47′ to 35°24′N, 87°03′W). After exiting the route at 35 24′N, 87°03′W, aircraft shall turn right climbing so to cross 35°14′N, 86°47′W at 6000′ MSL; then at 600 MSL to 35°05′N, 86°38′W; then climb direct so as cross 34°58′N, 86°30′W at 10,000′ MSL or above; th climb direct so as to cross 34°43′N, 86°13′W at (026 NM DME fix of Birmingham, Alabama, VORTAC) 15,000′ MSL; then climb direct so as to cross 34°18′ 86°30′W (025/43 NM DME fix of Birmingham, Alabam VORTAC) at FL 220 or above; then climb direct so to cross 34°09′N, 86°36′W (025/33 NM DME fix Birmingham, Alabama, VORTAC) at FL 240.

Re-Entry—After completing the initial bomb run, ai craft that are scheduled to execute an additional bom run shall, after passing 35°24′N, 87°03′W, turn rig and climb so as to cross 35°13′N, 86°55′W at 6000′ MSL

en continue turn at 6000′ MSL to 35°10′N, 87°01′W; en at 6000′ MSL direct to 35°05′N, 87°46′W; then scend direct so as to cross 35°04′N, 87°56′W at 3000′ SL; then at 3000′ MSL turn right to 35°10′N, 88°-′W; then turn right descending so as to cross 35°17′-′N, 87°59′W at 2200′ MSL; then at 2200′ MSL direct 35°19′N, 87°47′W; thence via the published route.

VFR and Contour—If the encountered weather conditions ng the route are equal to or better than ceiling 3000′, sibility 5 miles, the pilot may descend VFR and oper-e between the VFR altitudes indicated on the chart tween the following points: From 34°00′N, 90°00′W 35°13′N, 88°39′W. During daylight hours, some VFR erations will be flown 500 feet above the immediate rain. VFR operations conducted during the hours of rkness will not be flown lower than 800 feet above the rain. The lower VFR altitude shown on the chart is e minimum altitude that will be reached on each route gment during daylight hours.

Alternate Entry—Aircraft shall cross the 175/83 NM ME fix of the Memphis, Tennessee, VORTAC (33°39′N, °53′W) at FL 200 or as assiged by ARTC; then de-nd direct to 33°39′N, 89°22′W (158/86 NM DME fix the Memphis VORTAC); then continue descent direct as to cross 33°50′N, 89°18′W at 10,000′ MSL or below; en descend direct so as to cross 34°03′N, 89°12′W at 00′ MSL; then descend direct so as to cross 34°19′N, °12′W at 1700′ MSL; then at 1700′ MSL direct to °47′N, 89°11′W; then at 1700′ MSL direct 35°05′N, °48′W; thence via the published route.

Route Width—The route width is reduced to 5 statute les on either side of centerline from 33°55′N, 91°05′W 35°24′N, 87°03′W.

Hours of Operation—24 hours daily, 7 days per week.

IOWA/MISSOURI

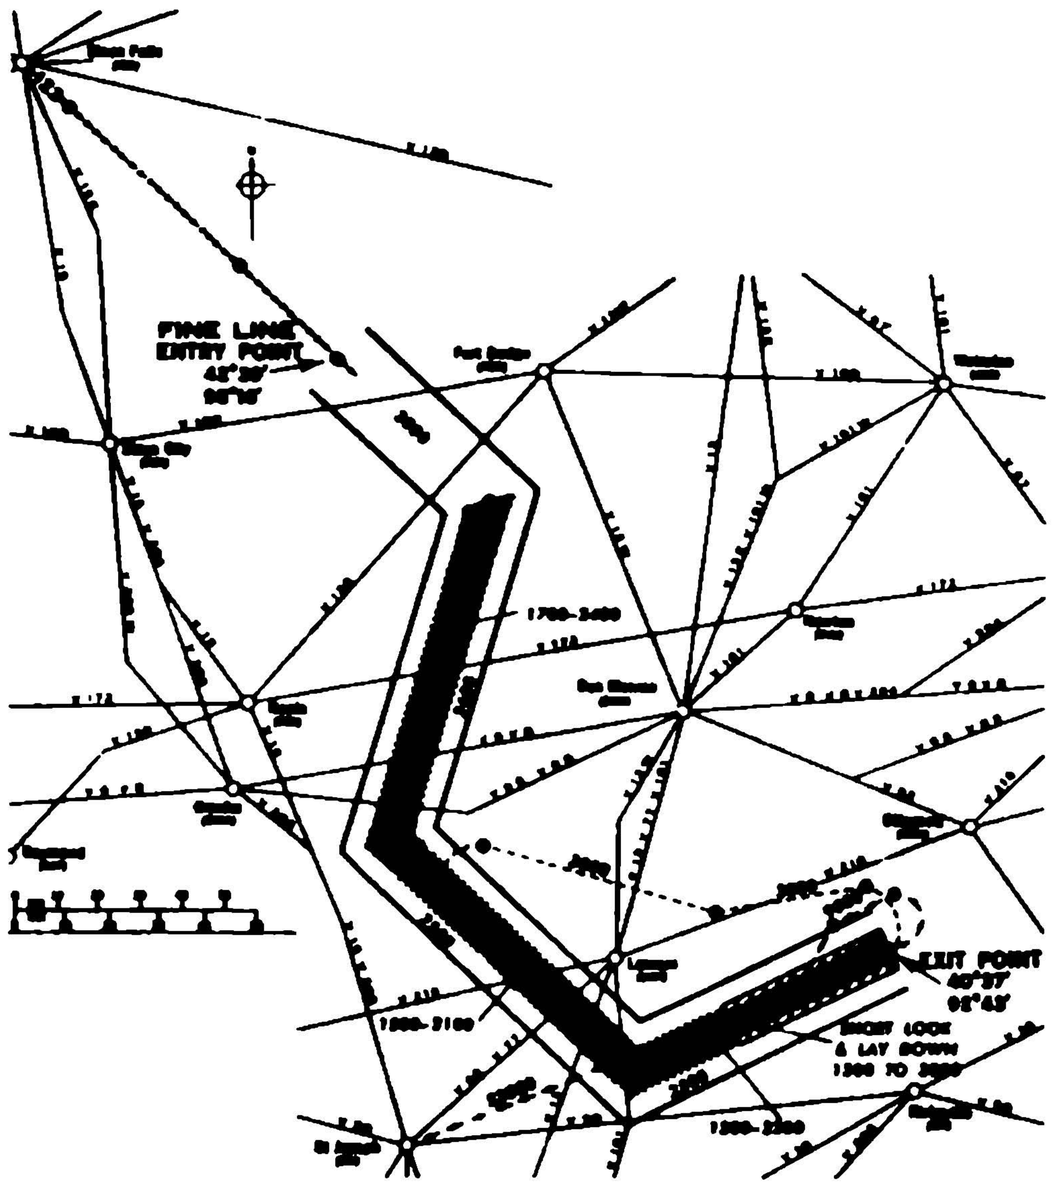
FINE LINE

Effective August 31 thru February 19, 1965

Aircraft shall cross the Sioux Falls, South Dakota ORTAC at 23,000′ MSL or as assigned by ARTCC and oceed via the 123° radial maintaining 23,000′ MSL or signed altitude until 13 NM southeast; then descend the 123° radial of the Sioux Falls VORTAC so as cross 42°58′N, 95°44′W at 11,000′ MSL or below; then scend direct so as to cross the route entry point 42°-′N, 95°16′W at 2800′ MSL; then at 2800′ MSL direct 42°10′N, 94°33′W; then at 2600′ MSL direct to 41°-′N, 95°01′W; then at 2500′ MSL direct to 40°12′N, °53′W; then at 2500′ MSL direct to 40°22′N, 93°27′W.

Short Look and Lay Down—After passing 40°22′N, 93°-′W, aircraft shall maintain between 1300′ MSL and 00′ MSL through the bomb run corridor (5 SM either le of centerline from 40°22′N, 93°27′W to 40°37′N, °43′W). The minimum IFR altitude through the cor-lor is 2500′ MSL. After exiting the route at 40°37′N, °43′W, aircraft shall turn left climbing so as to cross °48′N, 92°41′W at 9000′ MSL; then continue left turn aintaining 9000′ MSL to 40°42′N, 92°58′W; then climb as to cross 40°30′N, 93°08′W at 14,000′ MSL or below; en continue climb direct to 40°28′N, 93°09′W; then mb direct so as to cross 40°19′N, 93°42′W at 23,000′ SL; then at 23,000′ MSL direct to the St. Joseph, issouri VORTAC.

Re-Entry—After completing the initial bomb run, air-aft that are scheduled to execute an additional bomb n shall, after passing 40°37′N, 92°43′W, turn left and mb to or maintain 3000′ MSL to 40°50′N, 92°49′W; en at 3000′ MSL direct to 40°45′N, 93°30′W; then at 3000′ MSL direct to 40°59′N, 94°35′W; then turn left descending to intercept the Oil Burner Route at 40°48′N, 94°44′W; thence via the published route.



VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 42°10′N, 94°33′W to 40°37′N, 92°43′W. During daylight hours, some VFR operations will be flown 500 feet above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800 feet above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Hours of Operation—24 hours daily 7 days per week.

FLINT ROCK

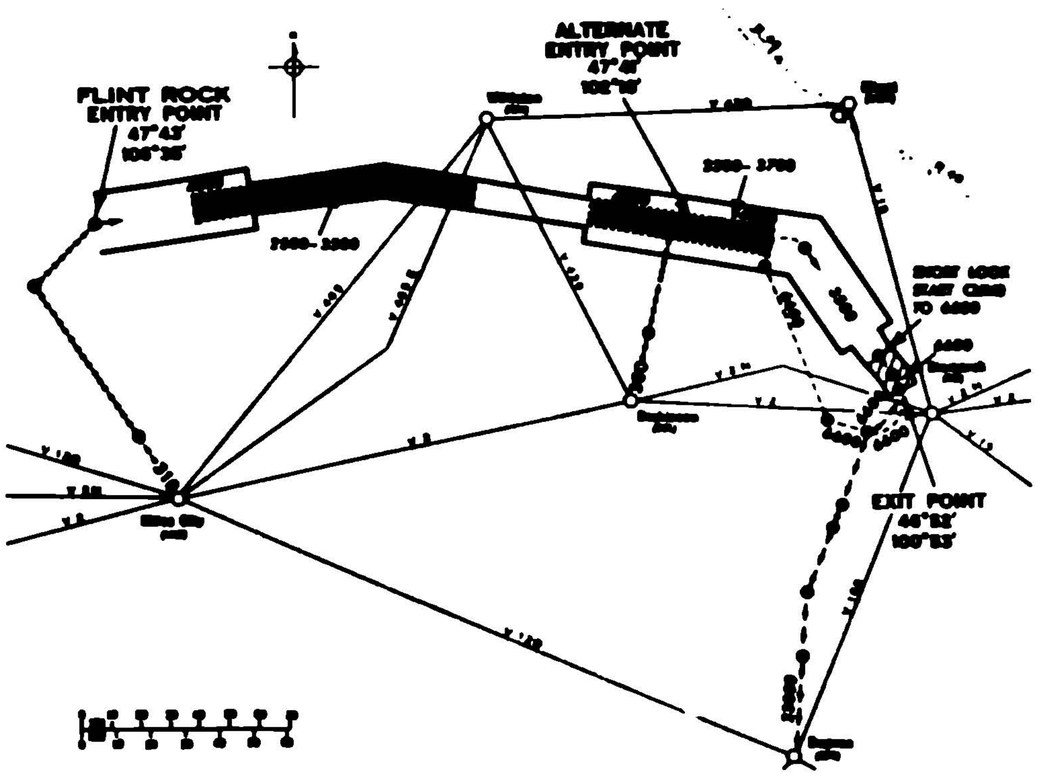
MONTANA/NORTH DAKOTA

Revised Effective June 14, 1964

Aircraft shall cross the Miles City, Mont. VORTAC (reporting point) at 23,000′ MSL, or as assigned by ARTCC, and proceed via the 310° radial, maintaining 23,000′ or as assigned, to 46°40′N, 106°14′W; then descend to cross 47°24′N, 107°00′W at or above 6000′ MSL; then continue descent so as to cross the route entry point, 47°43′N, 106°35′W, at 4000′ MSL; then at 4000′ MSL direct 47°57′N, 104°30′W; then at 4000′ MSL direct 47°35′N, 101°31′W; then descend to 3500′ MSL direct 47°02′N, 101°02′W.

Short Look—After passing 47°02′N, 101°02′W aircraft shall climb so as to cross 46°56′N, 100°56′W at 6600′ MSL; then at 6600′ MSL direct to the exit point 46°52′N, 100°53′W (bomb run corridor 5 SM either side of centerline from 47°02′N, 101°02′W to the exit point 46°52′N, 100°53′W); then maintaining 6600′ MSL turn right direct 46°39′N, 101°07′W; then start climb to 23,000′ MSL direct to 45°53′N, 101°35′W; direct to Dupree

VORTAC, climbing so as to cross 46°19′N, 101°19′W at or above 11,000′ MSL, crossing 46°13′N, 101°23′W at or below 19,000′ MSL; crossing 45°53′N, 101°35′W at 21,000′ MSL, and to reach 23,000′ MSL at a point 30 nautical miles northeast of the Dupree VORTAC.



Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an aditional Short Look bomb run shall, after passing 46°52′N, 100°53′W maintain 6600′ MSL direct 46°39′N, 101°07′W; then at 6600′ MSL make a right turn direct to 46°43′N, 101°24′W; then at 6600′ MSL direct 47°30′N, 101°49′W; then a right decending turn so as to reenter the route at 47°-35′N, 101°31′W at 3500′ MSL, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°48′N, 105°53′W to 47°53′N, 103°53′W and from 47°47′N, 103°03′W to 47°37′N, 101°45′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Dickinson, No. Dakota VORTAC (reporting point) at 15,000′ MSL, or as assigned by ARTCC; then proceed via the 360° radial of Dickinson VORTAC at 15,000′ MSL, or assigned flight level/altitude, direct to a point 20 NM north of the Dickinson VORTAC; then descend so as to cross 47°42′-30′′N, 102°27′W at 6000′ MSL; then a descending right turn so as to cross 47°41′N, 102°18′W at 4000′ MSL, thence via the published route.

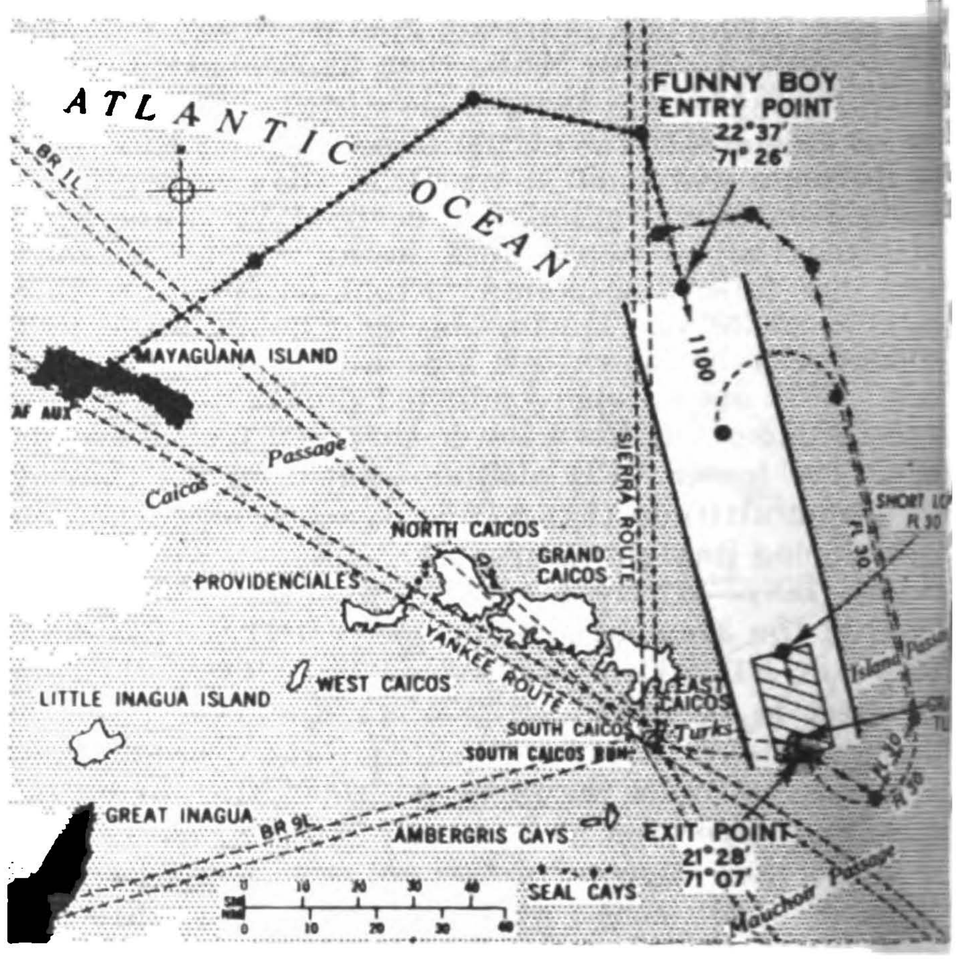
Route Width—The route width is reduced to 5 SM on either side of centerline from 47°50′N, 105°30′W to 47°-47′N, 103°03′W and from 47°07′N, 101°06′W to 46°52′N, 100°53′W.

Hours of Operation—0000Z to 2400Z, 7 days weekly.

FUNNY BOY

Revised Effective December 1, 1963

Aircraft shall cross 22°23′N, 73°02′W (Mayaguana AFB) at FL 270 or as assigned; maintain FL 270 or as assigned 22°41′N, 72°35′W (reporting point); start descent, cross 23°05′N, 72°00′W at FL 150; right turn, cross 23°00′N, 71°33′W at FL 90 or below; cross 22°37′ 71°26′W at 1100′ MSL; the route entry point, maint 1100′ MSL direct 21°43′N, 71°11′W.



Short Look—After passing 21°43′N, 71°11′W aircr shall climb to FL 30 and maintain FL 30 through t bomb run corridor (5 SM either side of centerline fr 21°43′N, 71°11′W to 21°28′N, 71°07′W). After exiti the low level route at 21°28′N, 71°07′W, maintain FL direct 21°21′N, 70°54′W; direct 21°33′N, 70°47′W; st climb cross 22°40′N, 71°06′W at FL 250 or above; l turn to 22°48′N, 71°16′W; cross 22°45′N, 71°30′W FL 290 or as assigned.

Re-Entry—After completing the initial bomb run, a craft scheduled to execute an additional bomb run sh after exiting the low level route at 21°28′N, 71°07′ maintain FL 30; direct 21°21′N, 70°54′W; direct 2 33′N, 70°47′W; direct 22°21′N, 71°01′W; left turn scend to cross 22°16′N, 71°20′W at 1100′ MSL; the via "Funny Boy" route.

Hours of Operation—0000Z to 2359Z Monday throu Saturday.

MICHIGAN/ONTARIO, CAN.

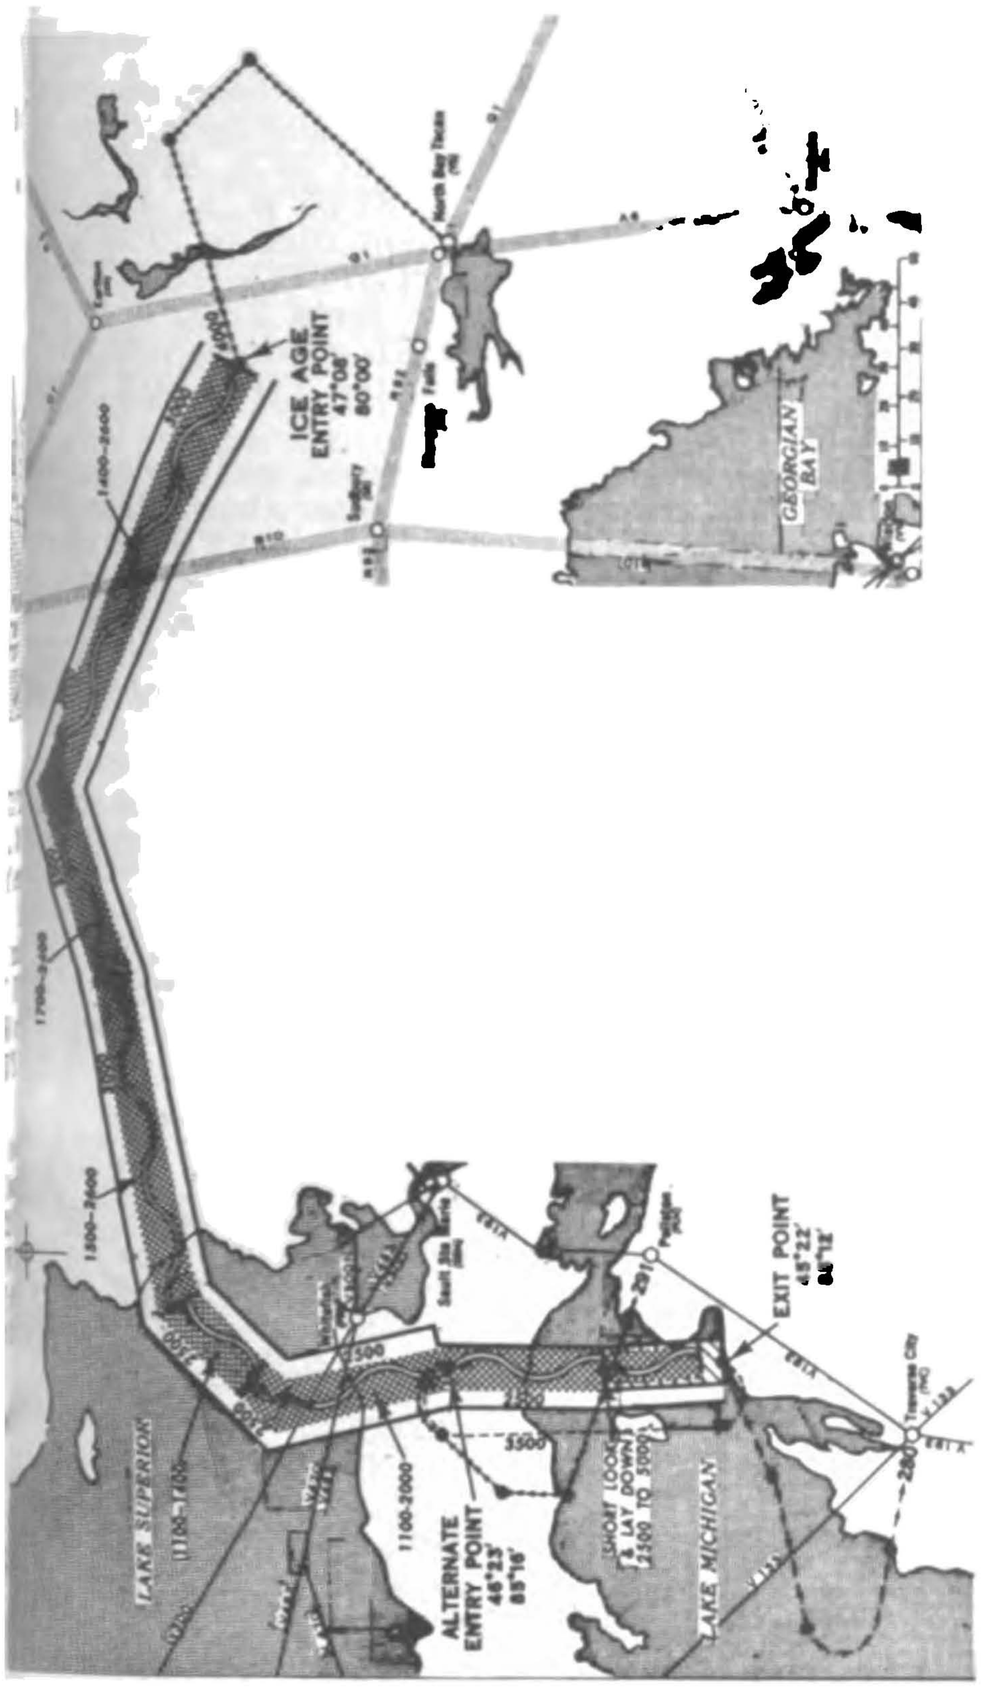
ICE AGE

Revised Effective September 6, 1964

Start descent over North Bay Ont. TACAN from 250 or as otherwise assigned to 17,000′ MSL direct 4 04′N, 78°25′W, descend to 10,000′ MSL direct to 47°2 78°49′W, descend to 4000′ MSL direct to 47°15′N, 7 25′W, maintain 4000′ MSL direct to low level entry po at 47°08′N, 80°00′W (aircraft shall maintain an altitu below 3500′ AGL on the low level route while in Ca dian airspace), descend so as to cross 47°22′N, 80°35 at 3000′ MSL, then maintain 3000′ MSL direct 47°58 82°15′W, then at 3000′ MSL direct to 47°40′N, 83°16′ then at 3000′ MSL direct 47°23′N, 85°00′W, then scend direct 47°06′N, 85°22′W at 2500′ MSL (termi tion of Canadian portion of route). Aircraft shall en the U.S.A. at 47°06′N, 85°22′W at 2500′ MSL, dir 47°00′N, 85°30′W at 2500′ MSL, direct 46°28′N, 85°16′ at 2500′ MSL, direct 45°48′N, 85°15′W at 2500′ MSL.

Short Look and Lay Down—After passing 45°48′N, 8 15′W aircraft shall maintain between 2500′ MSL a

)0' MSL through the bomb run corridor (5 SM either de of centerline from 45°48'N, 85°15'W to 45°22'N, 5°12'W. The minimum IFR altitude through the bomb n corridor is 2500' MSL); after passing 45°22'N, 85°-5'W then turn right climbing so as to cross 45°10'N, 5°47'W at 10,000' MSL; then climb direct so as to cross 5°01'N, 86°33'W at 12,000' MSL. Turn left to intercept 0° radial of the Traverse City VOR climbing so as to ss Traverse City VOR 280/25 at 21,000' MSL. Conue climbing via the Traverse City VOR 280° radial so to cross the Traverse City VOR at FL 250.



Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 45°22'N, 85°12'W turn right climbing so as to cross 45°21'N, 85°32'W at 3,500' MSL, then at 3,500' MSL direct to 46°23'N, 85°-32'W; then turn right descending so as to cross 46°23'N, 85°16'W at 2500' MSL; thence via the "Ice Age" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°08'N, 80°00'W to 45°27'N, 84°13'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mich. VOR at 20,000' MSL, or as assigned by ARTCC; then proceed via the 291° radial of the Pellston VOR at 20,000' MSL or assigned altitude until crossing the Pellston VOR 291/15; then descend direct so as to cross 45°55'N, 85°55'W at 8000' MSL; then continuing descent turn right direct so as to cross 46°00'30''N, 85°55'W at or below 4000' MSL; then continue descent so as to cross 46°23'N, 85°37'W at 2500' MSL, then at 2500' MSL turn right to 46°23'N, 85°16'W; thence via the "Ice Age" route.

Route Width—The route width is reduced to 5 statute miles east of centerline from 46°23'N, 85°16'W to 45°-22'N, 85°12'W.

Hours of Operation—0000Z to 2400Z, 7 days a week.

NEVADA

LITTLE SATIN

Revised Effective May 3, 1964

Aircraft shall cross 41°40'N, 115°49'W (Elko VOR-TAC 340°/55 NM DME fix) (reporting point) at 23,000' MSL or as assigned by ARTCC; then descend direct to cross the route entry point, 40°59'N, 116°30'W (Battle Mountain VOR 019°/31) at 14,000' MSL, then 14,000' MSL direct 40°10'N, 116°17'W; then descend to 13,000' MSL direct 39°42'N, 116°10'W, then 13,000' MSL direct 38°57'N, 116°26'W, then 13,000' MSL direct 38°34'N, 116°40'W, then 13,000' MSL direct 38°31'N, 118°12'W.

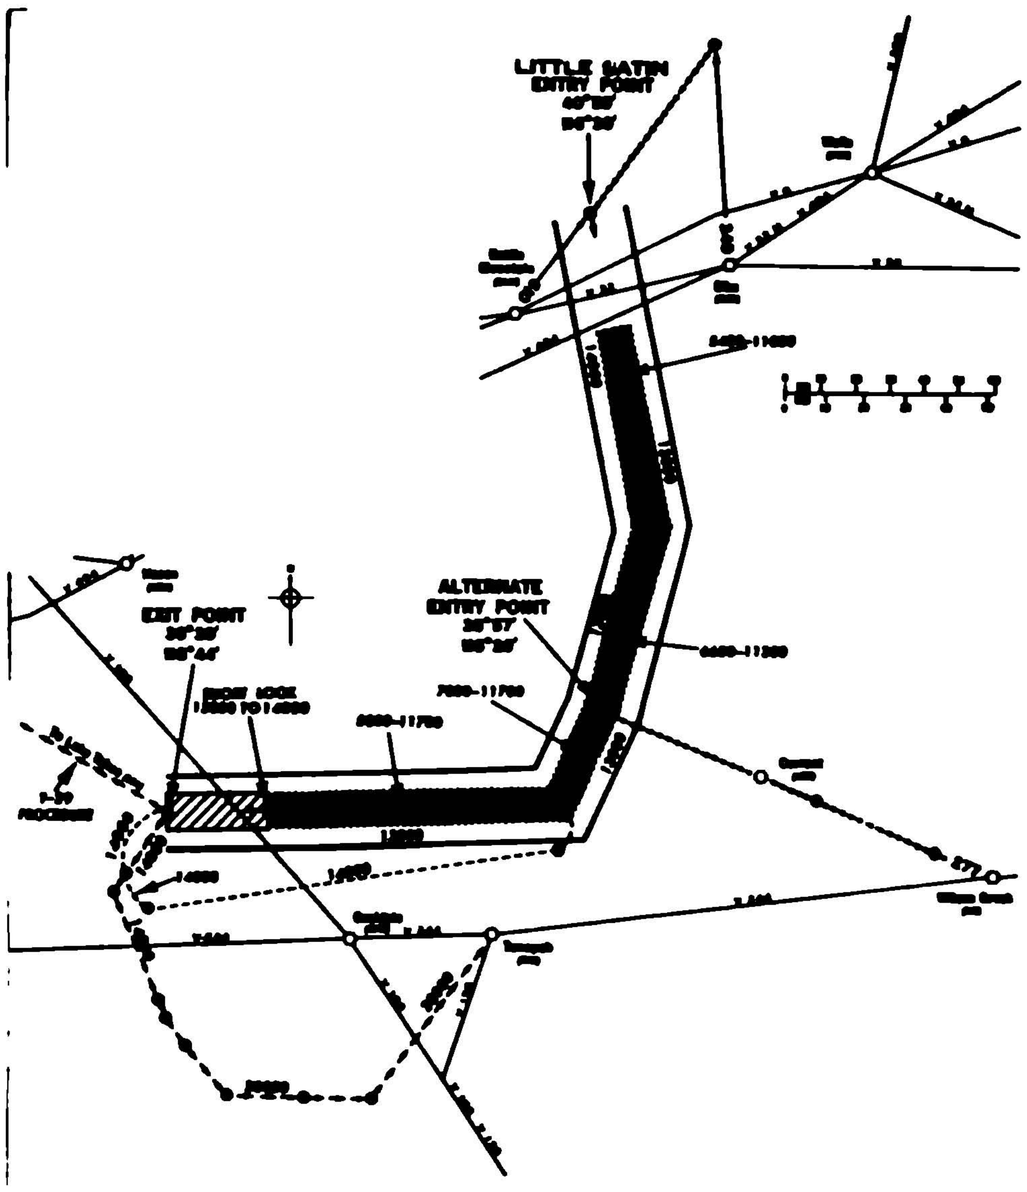
Short Look—After passing 38°31'N, 118°12'W aircraft shall operate between a maximum altitude of 14,000' MSL and a minimum of 13,000' MSL thru the bomb run corridor (5 SM either side of centerline from 38°31'N, 118°12' W to 38°30' N, 118°44' W). After exiting the route at 38°30'N, 118°44'W aircraft shall maintain 14,000' MSL direct 38°10'N, 119°00'W, then 14,000' MSL direct 37°43'N, 118°46'W (reporting point "Little Satin 2"); then climb direct to cross 37°40'N, 118°43'W at or above 14,300' MSL and 37°33'N, 118°37'W at or above 15,000' MSL; then climb to 20,000' MSL direct 37°21'N, 118°25'W, then 20,000' MSL direct to 37°21'N, 118°-00'W (reporting point "Little Satin 3"); then climb direct to cross 37°21'N, 117°40'W at 23,000' MSL, then 23,000' MSL direct to Tonopah, Nev. VOR.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°30'N, 118°44'W, maintain 14,000' MSL direct 38°15'N, 118°57'W, then 14,000' direct 38°06'N, 118°50'W (reporting point "Little Satin 1"), then 14,000' MSL direct 38°23'N, 116°40'W; then descend to 13,000' MSL direct to re-enter the route at 38°34'N, 116°40'W, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000' visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 40°30'N, 116°22'W to 38°31'N, 118°12'W. During daylight hours some VFR operations will be flown 800' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Wilson Creek, Nev. VOR (reporting point) at 23,000' MSL or as assigned by ARTCC, then maintain assigned flight level via the Wilson Creek VOR 277° radial until 15 NM northwest of the Wilson Creek VOR (38°21'N, 114°41'W);

then descend direct to cross 38°34′N, 115°18′W at or below 15,000′ MSL; then descend direct via the Currant, Nev. VOR to cross 38°57′N, 116°26′W at 13,000′ MSL, thence via the published route.



T–29 Procedure—Aircraft shall cross Wilson Creek, Nevada, VOR (38°15′N, 114°23′W) (reporting point) as assigned by the ARTCC; then proceed via alternate entry route to 38°30′N, 118°44′W exit point of the bomb run corridor; then climb to 14,000′ MSL or as assigned by the ARTCC direct Lake Tahoe, California, VOR (39°11′ N, 120°16′W).

Hours of Operation—24 hours daily, 7 days a week.

KENTUCKY/TENNESSEE

ORANGE TREE

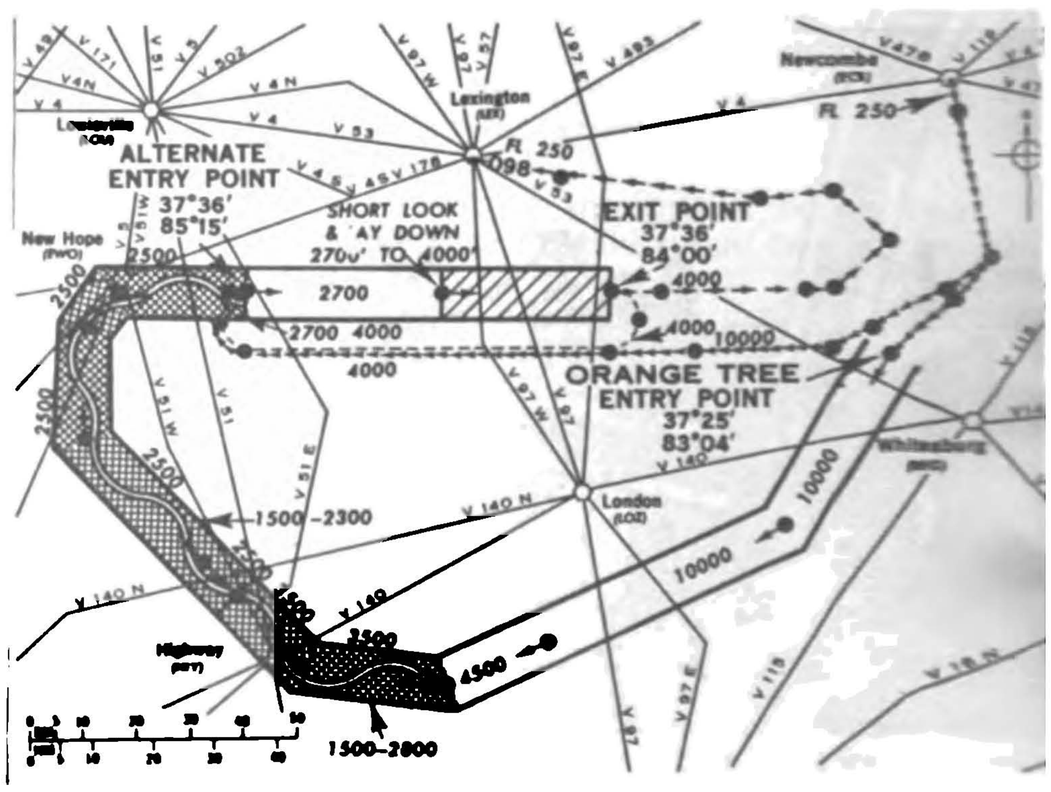
Revised Effective November 1, 1964

Aircraft shall cross the Newcomb, Kentucky VOR at FL 250; maintain FL 250 direct 38°05′N, 82°53′W; then start descend so as to cross 37°41′N, 82°48′W at 17,000′ MSL; cross 37°34′N, 82°55′W at 14,000′ MSL; then continue descent so as to cross the route entry point at 37°25′N, 83°04′W at 10,000′ MSL, then at 10,000′ MSL direct 36°57′N, 83°25′W, then at 10,000′ MSL direct 36°38′N, 84°13′W; then start descent so as to cross 36°-31′N, 84°33′W at 4500′ MSL; then descend so as to cross 36°31′N, 84°36′W at 3500′ MSL, then at 3500′ MSL direct 36°34′N, 85°03′W, then at 3500′ MSL direct 36°46′N, 85°16′W; then descend so as to cross 36°51′N, 85°22′W at 2500′ MSL, then at 2500′ MSL direct 37°11′N, 85°-47′W, then at 2500′ MSL direct 37°30′N, 85°46′W, then at 2500′ MSL turn right to 37°35′N, 85°42′W, then at 2500′ MSL direct 37°36′N, 85°17′W; then climb so as to cross 37°36′N, 85°15′W at 2700′ MSL, then at 2700′ MSL direct to 37°36′N, 84°35′W.

Short Look and Lay Down—After passing 37°36′N, 84°-35′W aircraft shall maintain between 2700′ MSL and 4000′ MSL through the bomb run corridor (5 SM eith side of centerline from 37°36′N, 84°35′W to 37°36′ 84°00′W; the minimum IFR altitude thru the bomb r corridor is 2700′ MSL). After exiting the route at 37 36′N, 84°00′W aircraft shall cross 37°36′N, 83°50′W 4000′ MSL; then at 4000′ MSL direct 37°36′N, 83°20′W then start climb direct 37°36′N, 83°15′W; cross 37°44′ 83°05′W at or below 9000′ MSL; continue climb dire 37°52′N, 83°15′W; then climbing direct so as to cro 37°51′N, 83°30′W at or below 17,000′ MSL; then via t Lexington VORTAC 098° radial climbing so as to cro 37°56′N, 84°11′W (Lexington VORTAC 098/14) at F 250, then at FL 250 direct to Lexington VORTAC.

Re-Entry—After completing the initial bomb run aircra that are scheduled to execute an additional bomb r shall, after exiting the route at 37°36′N, 84°00′W, tu right so as to cross 37°31′N, 83°55′W at 4000′ MS then at 4000′ MSL continue right turn to 37°26′N, 84 00′W, then at 4000′ MSL direct 37°26′N, 85°15′W; th turn right descending so as to cross 37°31′N, 85°20′ at 2700′ MSL, then at 2700′ MSL continue right turn 37°36′N, 85°15′W, thence via the "ORANGE TRE route.

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and opera between the VFR altitudes indicated on the chart b tween the following points: From 36°31′N, 84°33′W 37°36′N, 85°15′W. During daylight hours some VF operations will be flown 500′ above the immediate te rain. VFR operations conducted during the hours darkness will not be flown lower than 800′ above t terrain. The lower VFR altitude shown on the chart the minimum altitude that will be reached on each rou segment during daylight hours.



Alternate Entry—Aircraft shall cross the Newcomb, K VOR at FL 250, then at FL 250 direct 38°05′N, 82°53′W then start descent so as to cross 37°41′N, 82°48′W 17,000′ MSL; cross 37°35′N, 82°56′W at 14,000′ MSL cross 37°29′N, 83°08′W at 10,000′ MSL; then at 10,00 MSL direct 37°26′N, 83°15′W; direct 37°26′N, 83°42′W then start descent so as to cross 37°26′N, 84°00′W 4000′ MSL; then at 4000′ MSL direct to 37°26′N, 85 15′W; then turn right descending so as to cross 37°31′ 85°20′W at 2700′ MSL; then at 2700′ MSL direct 37°36′N, 85°15′W; thence via the established route.

Route Width—The route width is reduced to 5 statu miles on either side of centerline throughout the enti route.

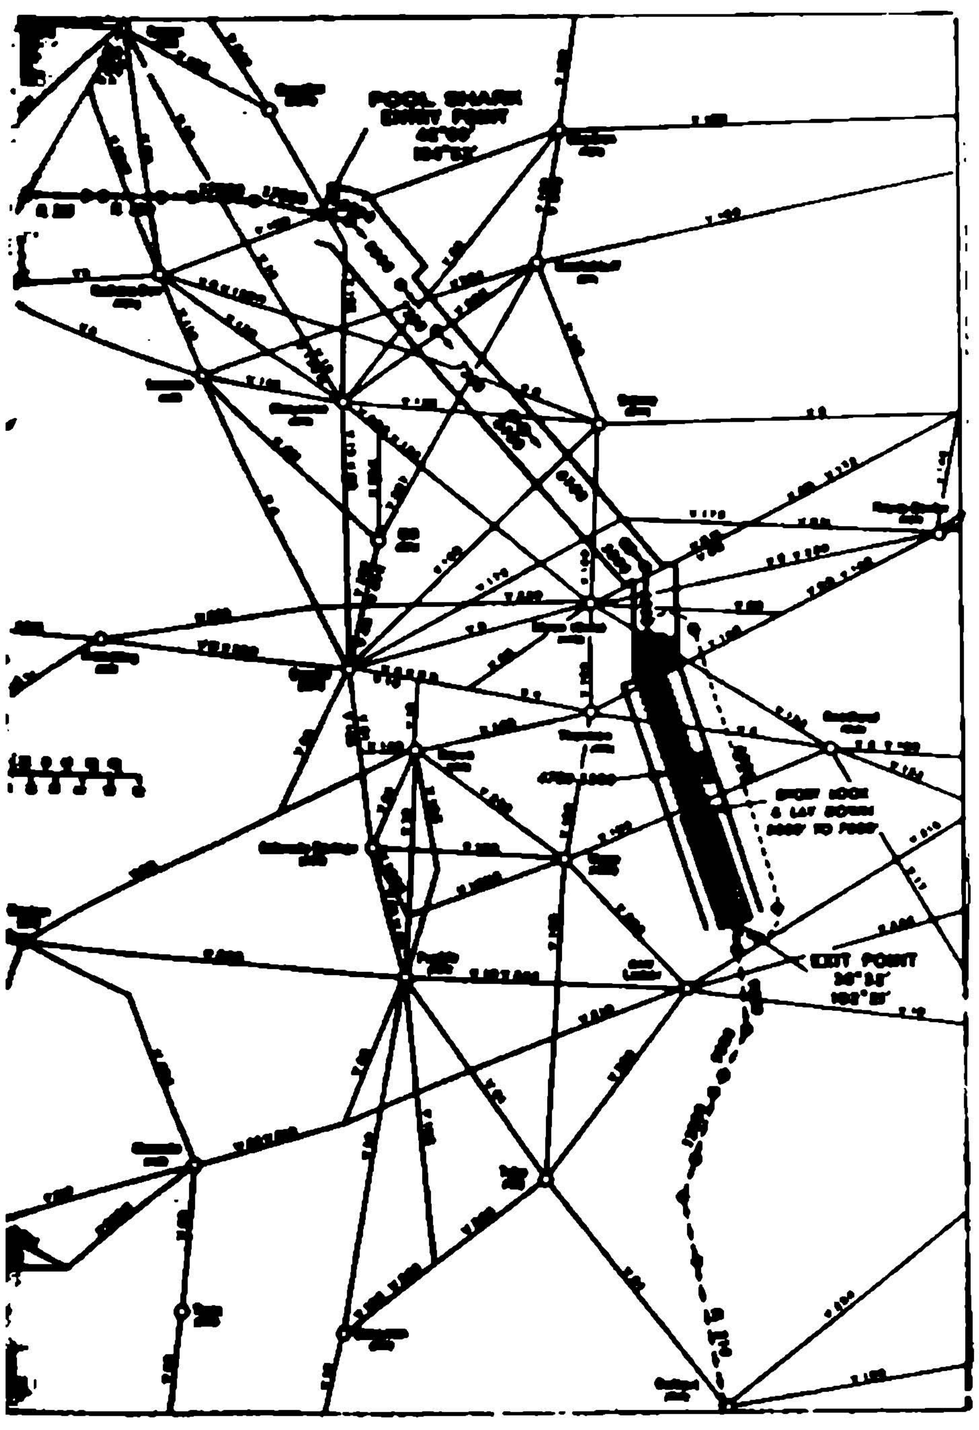
Hours of Operation—0000Z to 2400Z, 7 days weekly.

COLORADO/NEBRASKA/WYOMING

POOL SHARK

Effective January 4, 1965 through June 26, 1965

Aircraft shall cross 42°14'N, 107°07'W (Casper, yoming, VORTAC 201/63) at FL 220; then direct '14'N, 106°35'W; then descend direct to cross 42°14'N, 6°26'W at FL 200; then maintain FL 200 direct 42°-'N, 105°59'W; then descend direct to cross 42°14'N, 5°46'W at 17,000' MSL; then maintain 17,000' MSL ect 42°13'N, 105°20'W, then maintain 17,000' MSL ect to the route entry point at 42°09'N, 104°53'W, n descend direct to cross 42°07'N, 104°42'W at 16,000' SL; then descend direct to cross 41°47'N, 104°22'W at 0' MSL; then descend direct to cross 41°33'N, 104°-W at 7300' MSL; then direct 41°07'N, 103°39'W; n descend direct to cross 41°03'N, 103°35'W at 6100' SL; then 6100' MSL direct to 40°27'N, 102°57'W then cend direct so as to cross 40°25'N, 102°55'W at 5800' SL then at 5800' MSL direct to 40°20'N, 102°49'W; n 5800' MSL direct 39°47'N, 102°49'W; then 5800' SL direct 39°05'N, 102°33'W.



Short Look and Lay Down—After passing 39°05'N, 102°-W, aircraft shall maintain between 5800' MSL and 0' MSL through the bomb run corridor (5 SM either e of centerline from 39°05'N, 102°33'W to 38°32'N, 2°21'W). After exiting the route at 38°32'N, 102°-W; aircraft shall climb direct to cross 38°24'N, 102°-W at 9000' MSL; then maintain 9000' MSL direct 59'N, 102°18'W; then 9000' MSL direct 37°45'N, 2°27'W; then climb direct to cross 37°40'N, 102°31'W at 12,000' MSL; then 12,000' MSL direct 37°20'N, 102°-39'W; then climb direct to cross 37°09'N, 102°44'W at or above 16,000' MSL; then climb direct to cross 36°-49'N, 102°40'W at FL 210; then maintain FL 210 direct to Dalhart, Texas, VORTAC.

Re-Entry—After completing the initial bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 38°32'N, 102°21'W, turn left to cross 38°35'N, 102°04'W at 6000' MSL; then 6000' MSL direct to 40°00'N, 102°31'W; then turn left to cross 40°00'N, 102°49'W at 5800' MSL, thence via the published route.

Alternate Entry—None.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000', visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart bewteen the following points 40°00'N, 102°49'W to 38°-32'N, 102°21'W. During daylight hours some VFR operations will be flown 500' above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800' above the terrain. The lower VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Route Width—The route width is reduced to 5 SM on the NE side of the centerline from 41°47'N, 104°22'W to 40°20'N, 102°49'W, and to 5 SM on the west side of centerline from 40°20'N, 102°49'W to 39°47'N, 102°49'W.

Hours of Operation—24 hours daily, 7 days per week.

TEXAS

SEA HORSE

Revised Effective July 12, 1964

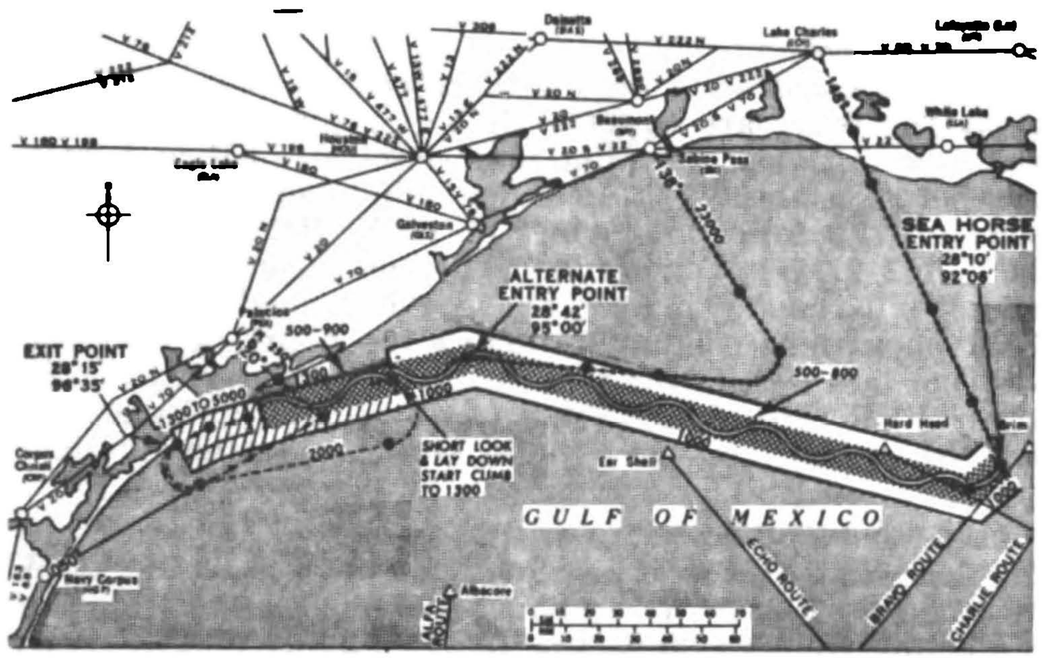
Aircraft shall cross the Lake Charles, La., VOR at 23,000' MSL, or as assigned; maintain 23,000' MSL or as assigned via the Lake Charles VOR 148° radial to to 25 NM fix; start descent, cross 20°31'N, 92°47'W at 19,000' MSL, descend direct to cross 28°55'N, 92°28'W at 15,000' MSL, descend direct to cross 28°28'N, 92°15'W at 8000' MSL or below, descend direct to cross 28°10'N, 92°06'W at 1000' MSL (Low level entry point). Maintain 1000' MSL, turn right to 28°03'N, 92°16'W, direct to 28°42'N, 95°00'W, direct to 28°35'N, 95°25'W.

Short Look and Lay Down—After passing 28°35'N, 95°-25'W climb to 1300' MSL direct 28°23'N, 96°12'W. After passing 28°23'N, 96°12'W aircraft shall maintain between 1300' and 5000' MSL through the bomb run corridor (5 SM either side of centerline from 28°23'N, 96°12'W direct 28°20'N, 96°25'W direct 28°15'N, 96°35'W). (The minimum IFR altitude through the bomb run corridor is 1300' MSL) to 28°15'N, 96°35'W, the route exit point, turn left to intercept the Navy Corpus VOR 050 radial (reporting point); then climb via the Navy Corpus VOR 050 radial to intercept the Palacios, Texas VOR 120 radial at 18,000' MSL or above. Climb via the Palacois VOR 120 radial so as to reach FL 250 at a point 18 NM southeast of the Palacios VOR, cross the Palacios VOR at FL 250.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 28°15'N, 96°-35'W turn left to intercept the Navy Corpus VOR 050° radial at 2000' MSL, maintain 2000' MSL direct 28°-22'N, 95°26'W; turn left descending so as to cross 28°-35'N, 95°25'W at 1300' MSL, thence via the published route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000',

visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 28°10′N, 92°06′W to 28°24′N, 96°09′W. During daylight hours, some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached during daylight hours.



Alternate Entry—Aircraft shall cross the Sabine Pass VOR at 23,000′ MSL or as assigned, then via Sabine Pass VOR 138° radial maintaining 23,000′ MSL until the 47 NM fix (29°02′N, 93°33′W). Start descent direct to cross 28°44′N, 93°19′W at 16,000′ MSL turn right, descend to cross 28°37′N, 93°58′W at 4000′ MSL; descend direct to cross 28°39′N, 94°21′W at 1000′ MSL direct 28°42′N, 95°00′W thence via published route.

Route Width—The route width is reduced to 5 SM north of the centerline from 28°35′N, 95°25′W to 28°15′N, 96°35′W.

Hours of Operation—24 hours daily, seven days per week.

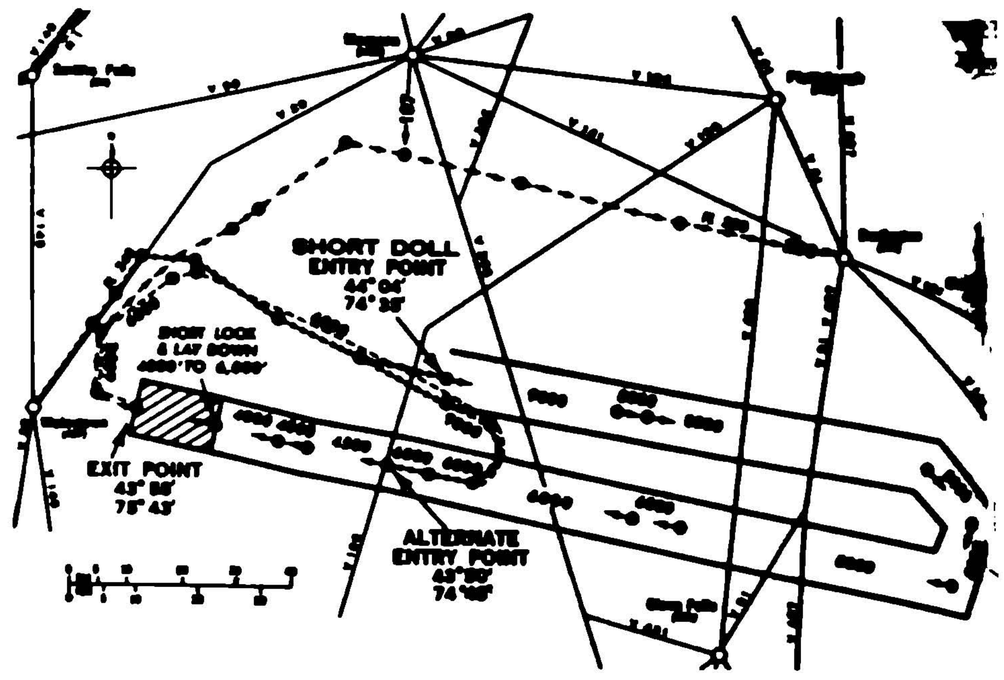
NEW YORK/VERMONT

SHORT DOLL

Effective September 6, 1964

Aircraft shall cross 43°57′N, 76°04′W (Watertown, New York VOR) at FL 290; descend, cross 44°11′N, 75°52′W at FL 250 or above ; cross 44°16′N, 75°47′W at FL 240; direct 44°22′N, 75°42′W; cross 44°22′N, 75°-30′W at 19,000′; cross 44°13′N, 75°12′W at 14,000′; cross 44°07′N, 74°54′W below 12,000′; cross 44°04′N, 74°35′W, the entry point to the low level route, at 9000′; maintain 9000′ direct 43°59′N, 73°58′W; descend, cross 43°58′N, 73°52′W at 8000′; maintain 8000′ direct 43°-50′N, 72°52′W; direct 43°41′N, 72°40′W; direct 43°31′N, 72°46′W; direct 43°40′N, 73°45′W; descend, cross 43°-42′N, 73°56′W at 6000′ MSL; direct 43°50′N, 74°48′W; descend, cross 43°52′N, 75°05′W at 4500′ MSL; descend, cross 43°53′N, 75°11′W at 4000′ MSL, maintain 4000′ MSL direct to the entry point of the bomb run corridor at 43°55′N, 75°25′W.

Short Look and Lay Down—After passing 43°55′N, 75°-25′W aircraft shall operate through the bomb run corridor between 4000′ and 6000′ MSL (the bomb run corridor is 5 SM either side of centerline from 43°55′N, 75°25′W to 43°58′N, 75°43′W). After exiting the low level route at 43°58′N, 75°43′W aircraft shall cross 44°-00′N, 75°51′W at 6000′ MSL, maintain 6000′ MSL direct 44°10′N, 75°51′W; direct 44°27′N, 75°22′W; climb, cross 44°30′N, 75°17′W at 13,000′ or below; cross 44°41′N, 74°58′W at 15,000′ or above (Burlington, Vt. VOR 2 radial); direct (via Burlington VOR 298 radial) cr 44°39′N, 74°45′W at 19,000′ (Massena, N.Y. VOR 1 radial); continue climb, cross 44°35′N, 74°19′W 23,000′; cross 44°29′N, 73°45′W at FL 280, maintain 280, direct 44°24′N, 73°11′W (Burlington, Vt. VOR).



Re-Entry—After completing the bomb run, aircr scheduled for an additional bomb run shall, after exiti the route at 43°58′N, 75°43′W; cross 44°00′N, 75°51′- at 6000′; maintain 6000′ direct 44°10′N, 75°51′W; dir 44°19′N, 75°35′W; direct 44°20′N, 75°30′W; direct 4 57′N, 74°26′W; right turn to 43°47′N, 74°30′W; the via the "Short Doll" route.

Alternate Entry—Aircraft shall cross 43°57′N, 76°04′ (Watertown, N.Y. VOR) at FL 290; descend, cross 4 11′N, 75°52′W at FL 250 or above; cross 44°16′N, 7 47′W at FL 240, direct 44°22′N, 75°42′W; cross 44°22′ 75°30′W at 19,000′; cross 44°13′N, 75°12′W at 14,00 cross 44°07′N, 74°54′W below 12,000′; cross 44°00 74°35′W at 9000′; maintain 9000°, direct 43°57′N, 7- 26′W; right turn to 43°47′N, 74°30′W; descend, cr 43°48′N, 74°39′W at 7000′ or below; cross 43°50′N, 7- 48′W at 6000′; thence via the "Short Doll" route.

Route Width—The entire low level route is reduced to SM either side of centerline.

Hours of Operation—0000Z to 2359Z, Monday thru Su day.

SOUTH DAKOTA

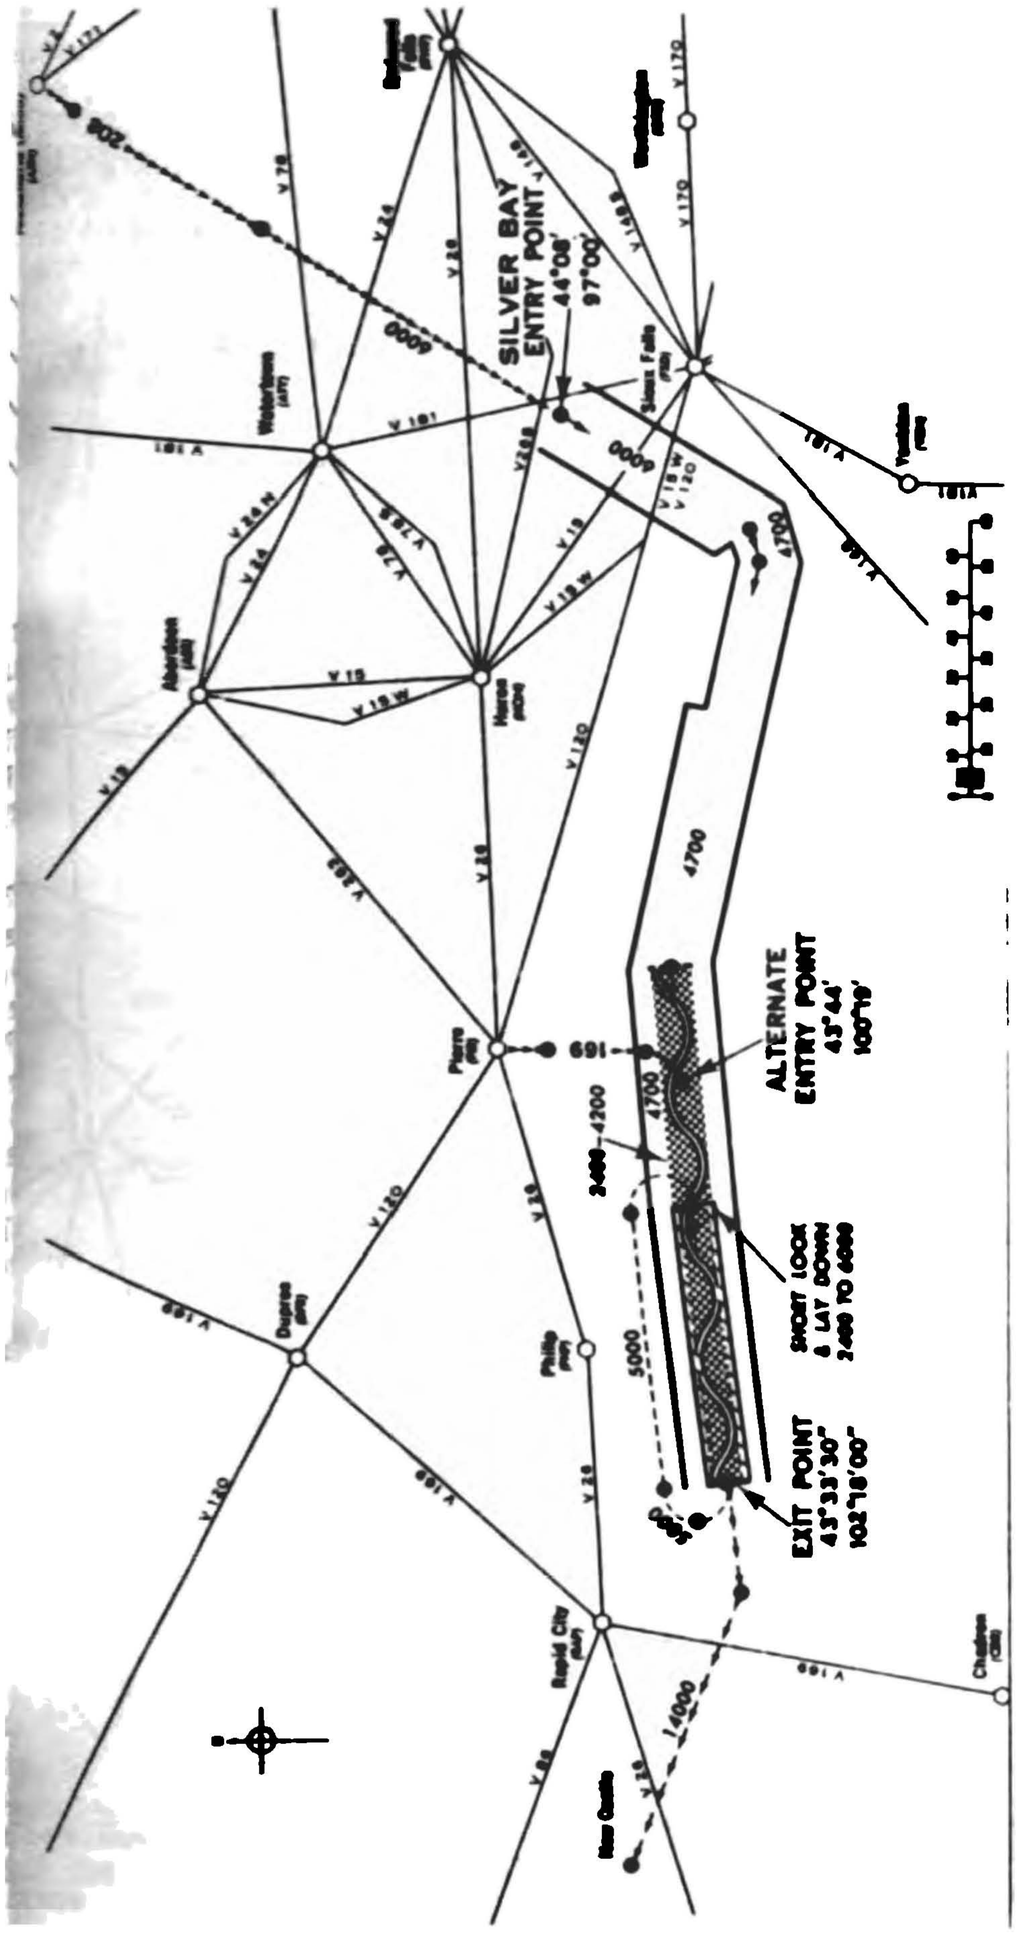
SILVER BAY

Effective October 18, 1964

Aircraft shall cross the Alexandria, Minn. VOR 20,000′ MSL or as assigned by ARTCC and proceed the Alexandria VOR 208° radial maintaining 20,000′ M or assigned altitude until 10 NM SW; then descend dir so as to cross 45°10′N, 96°00′W at 6000′ MSL; then 6000′ MSL direct 44°08′N, 97°00′W (low level ent point); then at 6000′ MSL direct 43°29′N, 97°35′W; th turn right descending so as to cross 43°27′N, 97°45′W 4700′ MSL; then at 4700′ MSL direct 43°47′N, 99°45′ then at 4700′ MSL direct to 43°42′N, 100°56′W.

Short Look and Lay Down—After passing 43°42′N, 10 56′W, aircraft shall maintain between 2400′ MSL a 6000′ MSL through the bomb run corridor (5 SM eith side of centerline from 43°42′N, 100°56′W to 43°3 30′′N, 102°18′W). The minimum IFR altitude throu the corridor is 4700′ MSL. After exiting the route 43°33′30′′N, 102°18′W aircraft shall climb so as to cr 43°30′N, 102°50′W at 14,000′ MSL; then at 14,000′ M direct to 43°51′N, 104°13′W. (New Castle, Wyomin

Re-Entry—After completing the initial bomb run aircraft hat are scheduled to execute an additional bomb run hall after exiting the route at 43°33′30′′N, 102°18′W urn right and climb or descend so as to cross 43°40′N, 02°29′W, at 5000′ MSL; then at 5000′ MSL continue urn to 43°47′N, 102°20′W; then at 5000′ MSL direct 3°55′N, 100°58′W; then turn right descending so as to ıtercept the Silver Bay route at 43°42′N, 100°56′W at 700′ MSL; thence via the published route.



VFR and Contour—If the encountered weather conditions long the route are equal to or better than ceiling 3000′, isibility 5 miles, the pilot may descend VFR and operate etween the VFR altitudes indicated on the chart be- ween the following points: From 43°47′N, 99°45′W to 3°33′30′′N, 102°18′W. During daylight hours some VFR perations will be flown 500′ above the immediate terrain. FR operation conducted during the hours of darkness ·ill not be flonw lower than 800′ above the terrain. The ›wer VFR altitude shown is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pierre, South Dakota VOR (reporting point) at 15,000′ MSL or below as assigned by ARTCC; then proceed via the Pierre VOR 169° radial maintaining 15,000′ MSL or assigned altitude until 10 NM south (44°13′N, 100°10′W); then descend direct to 43°52′N, 100°10′W; then turn right descending so as to cross 43°44′N, 100°19′W at 4700′ MSL; thence via the published route.

Route Width—The route width is reduced to 5 SM north of centerline between 43°29′N, 97°35′W to 43°35′N, 98°-30′W.

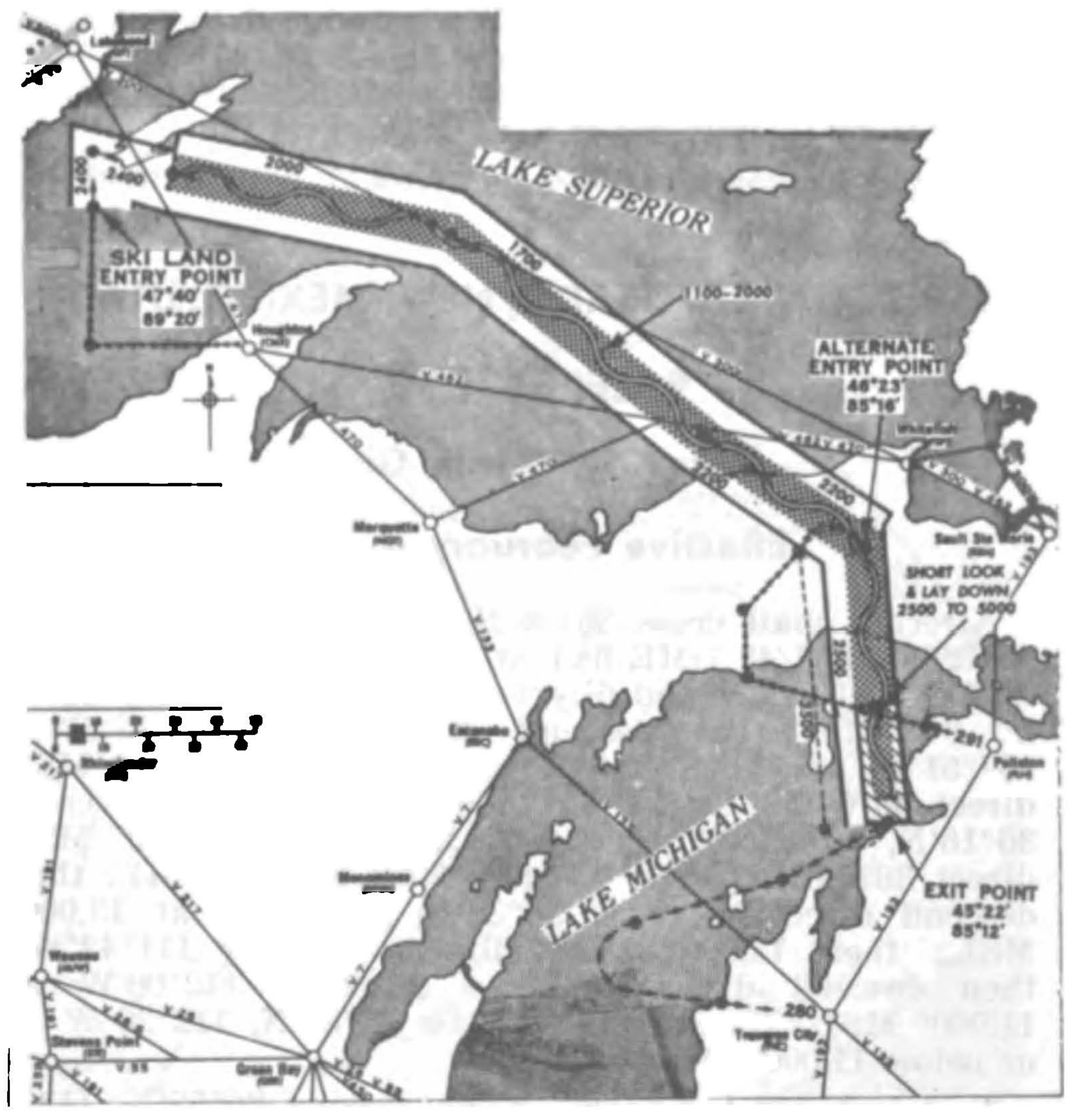
Hours of Operation—24 hours daily seven days per week.

MICHIGAN

SKI LAND

Effective September 6, 1964

Aircraft shall cross the Houghton, Michigan VOR at 20,000′ MSL or as assigned by ARTCC; then descend direct so as to cross 47°10′N, 89°20′W at 11,000′ MSL; then turn right continuing descent so as to cross the route entry point at 47°40′N, 89°20′W at 2400′ MSL, then at 2400′ MSL direct 47°52′′N, 89°20′W, then at 2400′ MSL direct 47°48′N, 88°55′W; then descend to 2000′ MSL direct 47°35′N, 87°25′W; then descend to 1700′ MSL direct 46°49′N, 86°06′W; then climb so as to cross 46°42′N, 85°52′W at 2200′MSL, then at 2200′ MSL direct 46°23′N, 85°16′W; then climb to 2500′ MSL direct 45°-48′N, 85°15′W.



Short Look and Lay Down—After passing 45°48′N, 85°15′W aircraft shall maintain between 2500′ MSL and 5000′ MSL through the bomb run corridor (5 SM either side of centerline from 45°48′N, 85°15′W to 45°22′N, 85°-12′W. The minimum IFR altitude through the bomb run corridor is 2500′ MSL); after passing 45°22′N, 85°12′W then turn right climbing so as to cross 45°10′N, 85°47′W at 10,000′ MSL; then climb direct so as to cross 45°01′N,

86°33′W at 12,000′ MSL. Turn left to intercept 280° radial of the Traverse City VOR climbing so as to cross Traverse City VOR 280/25 at 21,000′ MSL. Continue climbing via the Traverse City VOR 280° radial so as to cross the Traverse City VOR at FL 250.

Re-Entry—After completing the initial bomb run aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 45°22′N, 85°12′W, turn right climbing so as to cross 45°21′N, 85°32′W at 3500′ MSL, then at 3500′ MSL direct to 46°23′N, 85°37′W; then turn right descending so as to cross 46°23′N, 85°-16′W at 2500′ MSL; thence via the "Ski Land" route.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′, visibility 5 miles, the pilot may descend VFR and operate between the VFR altitudes indicated on the chart between the following points: From 47°48′N, 88°55′W to 45°27′N, 85°13′W. During daylight hours some VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness will not be flown lower than 800′ above the terrain. The lower VFR altitude shown on the chart is the minimum altitude that will be reached on each route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Pellston, Mich. VOR at 20,000′ MSL, or as assigned by ARTCC; then proceed via the 291° radial of the Pellston VOR at 20,000′ MSL or assigned altitude until crossing the Pellston VOR 291/15; then descend direct so as to cross 45°55′N, 85°55′W at 8000′ MSL; then continuing descent turn right direct so as to cross 46°09′30″N, 85°55′W at or below 4000′ MSL; then continue descent so as to cross 46°23′N, 85°37′W at 2500′ MSL, then at 2500′ MSL turn right to 46°23′N, 85°16′W; thence via the "Ski Land" route.

Route Width—The route width is reduced to 5 statute miles west and north of centerline from 47°40′N, 89°-20′W to 47°48′N, 88°55′W, and east of centerline from 46°23′N, 85°16′W to 45°22′N, 85°12′W.

Hours of Operation—0000Z to 2400Z, 7 days a week.

ARIZONA/COLORADO/NEW MEXICO/UTAH

•SLEEPY EYE

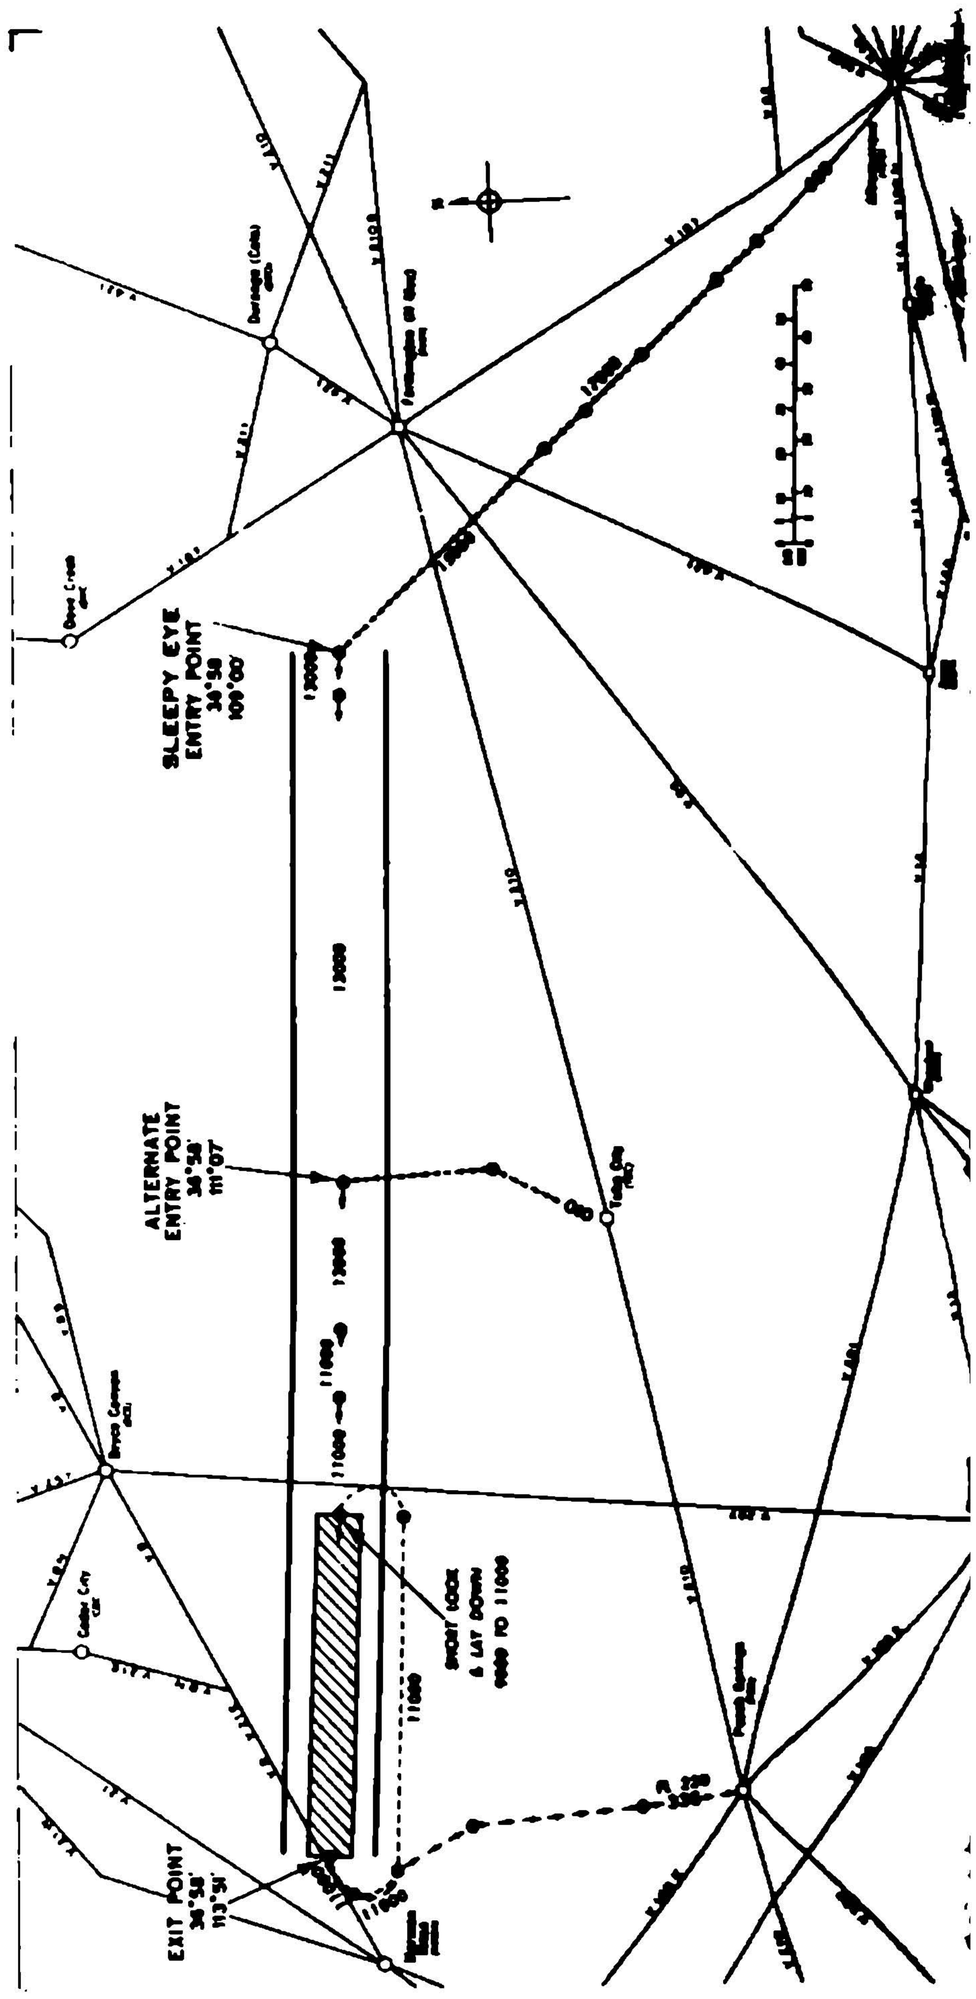
(Formerly "Main Gate")

Effective February 4, 1965

Aircraft shall cross 35°34′N, 107°24′W (Albuquerque VORTAC 305/43 DME fix) at FL 250 or assigned by the ARTCC; then descend direct to cross 35°42′N, 107°33′W at FL 210; then descend direct to cross 35°57′N, 107°51′W at 17,000′ MSL; then maintain 17,000′ MSL direct 36°09′N, 108°04′W; then descend direct to cross 36°16′N, 108°12′W at 15,000′ MSL; then 15,000′ MSL direct 36°58′N, 109°00′W (low level entry point); then descend direct to cross 36°58′N, 109°10′W at 13,000′ MSL; then 13,000′ MSL direct 36°58′N, 111°42′W; then descend direct to cross 36°58′N, 112°00′W at 11,000′ MSL; then direct to cross 36°58′N, 112°29′W at or below 11,000′ MSL.

Short Look and Lay Down—After passing 36°58′N, 112°-29′W aircraft shall operate between 9,000′ and 11,000′ MSL through the bomb run corridor (5 SM either side of centerline from 36°58′N, 112°29′W to 36°58′N, 113°-51′W). After exiting the route at 36°58′N, 113°51′W aircraft shall turn left climbing to cross 36°53′N, 114°-00′W at 11,000′ MSL; then maintain 11,000′ MSL direct to 36°44′N, 113°53′W; then climb via direct to cross 36°30′N, 113°42′W at or below 17,000′ MSL (reporting point "SLEEPY EYE" #1); then direct to cross 35°-58′N, 113°36′W (PGS 336/21 DME fix) at FL 230; th intercept and proceed via Peach Springs 336 radial Peach Springs (35°37′30″N, 113°32′W).

Re-Entry—After completing the initial bomb run, a craft that are scheduled to execute an additional bo run shall, after exiting the route at 36°58′N, 113°51′ turn left via direct to cross 36°53′N, 114°00′W at 11,(MSL; then 11,000′ MSL direct 36°44′N, 113°53′W; th 11,000′ MSL direct 36°44′N, 112°29′W; then turn l direct to cross 36°58′N, 112°29′W at or below 11,0 MSL; thence via published route.



Alternate Entry—Aircraft shall cross the Tuba C Arizona VOR (36°07′30″N, 111°16′W) (Report Point) at FL 240 or as asigned by the ARTCC: t maintain FL 240 or assigned altitude via Tuba City radial until 23 miles north (36°28′N, 111°04′W): t descend direct to cross 36°58′N, 111°07′W at 13,(MSL; thence via published route.

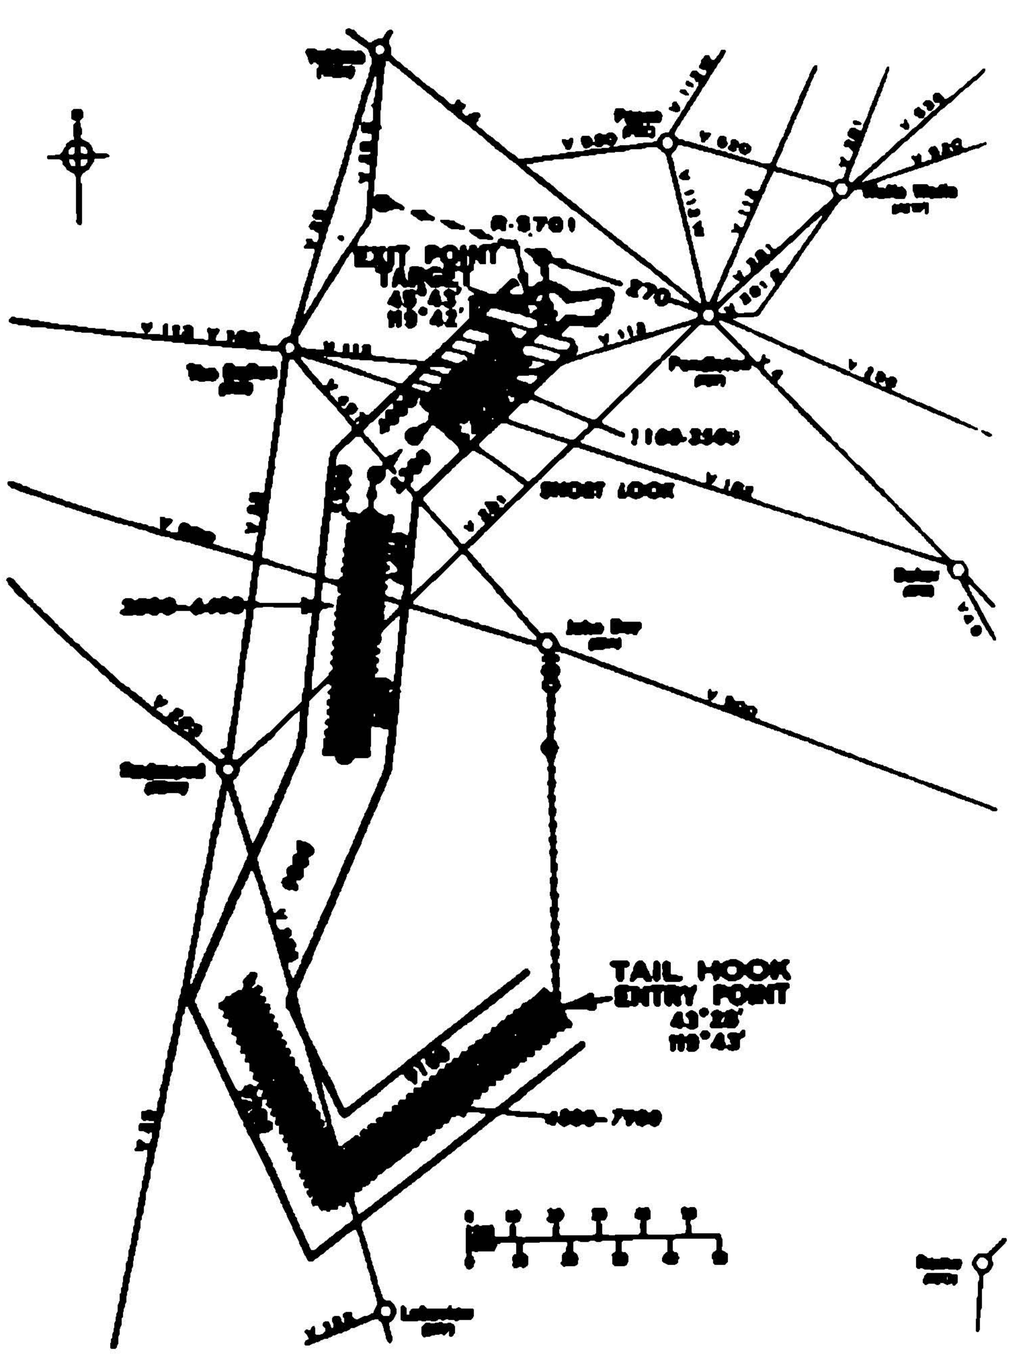
Hours of Operation—24 hours daily, 7 days a week.

OREGON

TAIL HOOK

Revised Effective February 12, 1964

Aircraft shall cross the John Day, Oregon VOR (reporting point) at 23,000′ MSL, or as assigned by Seattle RTCC; then proceed via the John Day VOR 160° radial, maintaining assigned altitude until 20 nautical miles south of the John Day VOR (44°19′N, 119°43′W); then descend to 9100′ MSL to the entry point of the low level route at 43°28′N, 119°43′W; then 9100′ MSL direct to 45°54′N, 120°45′W; then climb to 9200′ MSL direct to 46°31′N, 121°08′W; then descend to 9000′ MSL direct to 45°18′N, 120°39′W; then descend to 8300′ MSL direct 44°40′N, 120°36′W; then descend to 6400′ MSL direct 45°05′N, 120°31′W; then descend to 5300′ MSL direct 45°13′N, 120°30′W; then 5300′ MSL direct to 45°20′N, 120°19′W; then descend so as to cross 45°23′N, 120°13′W 4000′ MSL.



Short Look—After passing 45°28′N, 120°13′W, aircraft shall maintain 4000′ MSL until within Restricted Area 5701; after crossing RBS target located at 45°43′N, 119°42′W, the route exit point, aircraft shall make a climbing left turn so as to intercept the Pendleton, Oregon VORTAC 270° radial 34 nautical mile fix (reporting point) at or above 11,000′ MSL; then climb westbound on the Pendleton VORTAC 270° radial so as to cross the Pendleton VORTAC 270° radial 68 nautical mile fix at 16,000′ MSL.

VFR and Contour—If the encountered weather conditions along the route are equal to or better than ceiling 3000′ and visibility five miles, the pilot may descend VFR and operate VFR between the VFR altitudes indicated on the chart between the following points: From 43°28′N, 119°43′W to 43°31′N, 121°08′W, from 44°18′N, 120°39′W to 45°05′N, 120°31′W, and from 45°23′N, 120°13′W to restricted area R-5701. During daylight hours, VFR operations will be flown 500′ above the immediate terrain. VFR operations conducted during the hours of darkness shall not be flown lower than 800′ above terrain. The lower VFR altitude shown on the chart is the minimum altitude that shall be reached on each route segment during daylight hours.

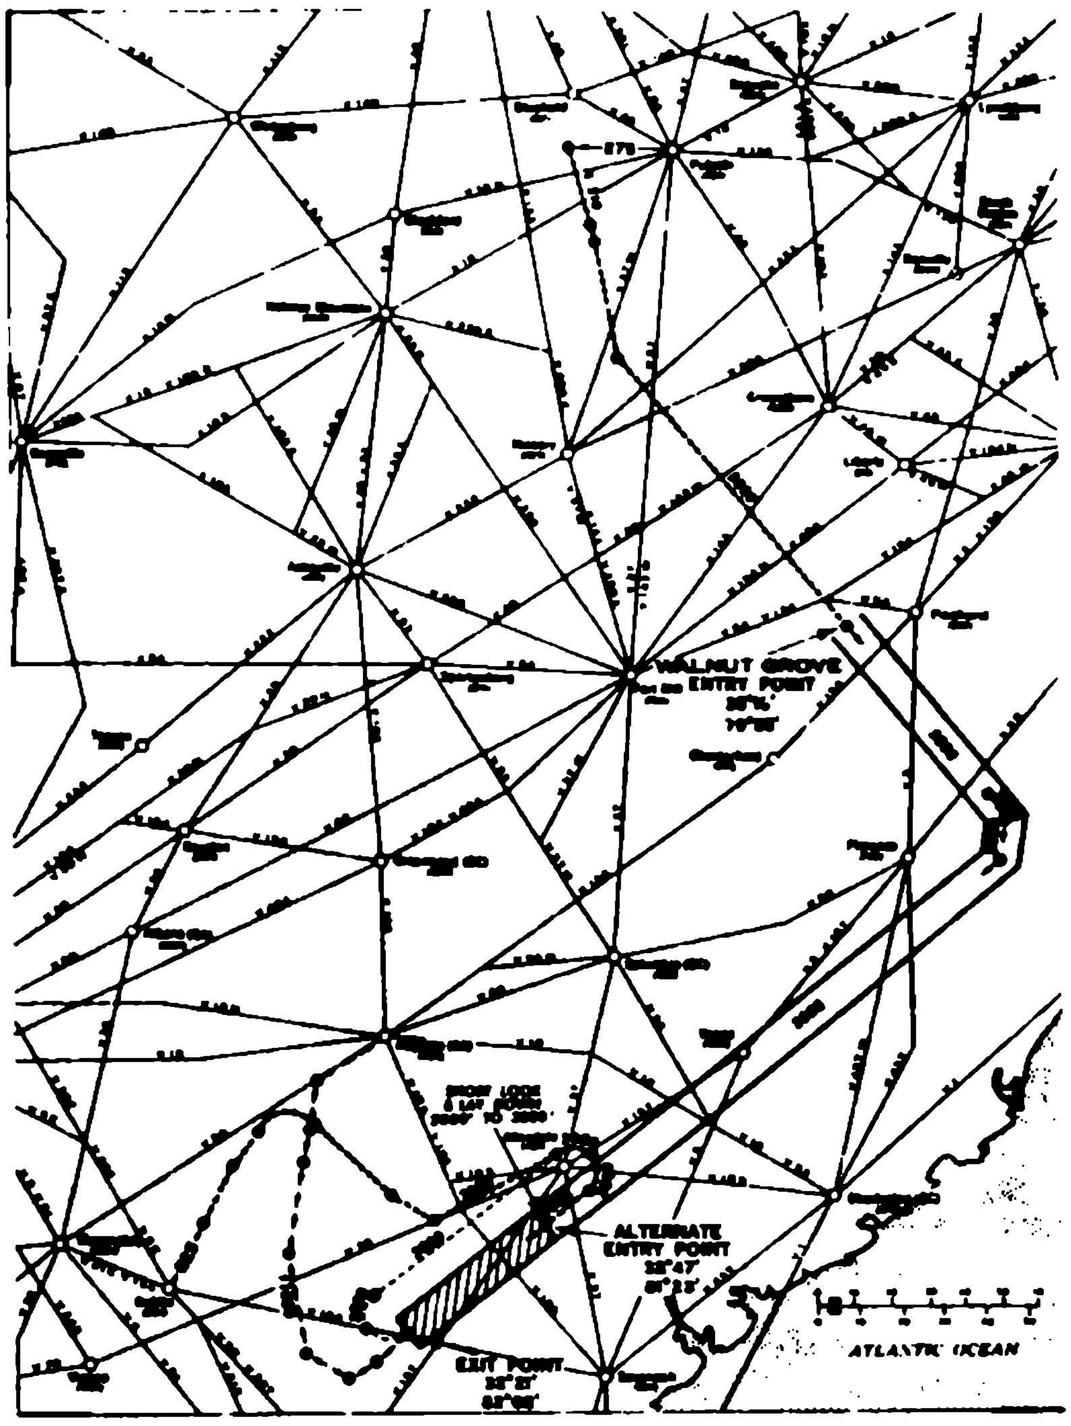
Hours of Operation—1600Z to 2400Z Monday thru Friday and 0000Z to 0800Z Tuesday thru Saturday.

GEORGIA/NORTH CAROLINA/SOUTH CAROLINA

WALNUT GROVE

Revised Effective January 4, 1965

Aircraft shall cross the Pulaski, Virginia VORTAC 275/25 DME fix (37°06′N, 81°14′W) at FL 210 or as assigned by ARTC; then maintain and cross 36°47′N, 81°08′W at FL 210; then descend direct so as to cross 36°43′N, 81°07′W at FL 180 or above; then descend direct so as to cross 36°15′N, 81°00′W at 5000′ MSL; then at 5000′ MSL direct to 35°10′N, 79°55′W (low level entry point); then at 5000′ MSL direct to 34°20′N, 79°16′W; then descend direct so as to cross 34°23′N, 79°11′W at 2000′ MSL; then at 2000′ MSL turn right to 34°13′N, 79°13′W; then at 2000′ MSL direct to 32°47′N, 81°23′W.



Short Look and Lay Down—After passing 32°47′N, 81°23′W aircraft shall maintain between 2000′ MSL and 3000′ MSL through the bomb run corridor (5 SM either side of center line from 32°47′N, 81°23′W to 32°21′N, 82°-

02′W). After exiting the route at 32°21′N, 82°02′W, aircraft shall climb to or maintain 3000′ MSL to 32°-14′N, 82°10′W; then climb direct so as to cross 32°10′N, 82°18′W at 6000′ MSL; then climb direct so as to cross 32°16′N, 82°30′W at 11,000′ MSL; maintain 11,000′ direct 32°40′N, 82°35′W; then climb direct so as to cross 33°02′N, 82°31′W at FL 180; cross 33°10′N, 82°29′W at FL 200; cross 33°22′N, 82°27′W at FL 230 or as assigned; then at FL 230 or as assigned direct to the Augusta, Georgia VOR.

Re-Entry—Aircraft that are scheduled to execute an additional bomb run shall, after exiting the low level route at 32°21′N, 82°02′W, turn right and descend or maintain 2000′ MSL to 32°22′N, 82°13′W; then at 2000′ MSL continue turn to 32°30′N, 82°11′W; then at 2000′ MSL direct to 33°04′N, 81°20′W; then at 2000′ MSL turn right to 33°04′N, 81°10′W; continue turn to 32°-55′N, 81°11′W; then at 2000′ MSL direct to 32°47′N, 81°23′W; thence via the published route.

Alternate Entry—Aircraft shall cross the Dublin, Georgia VOR (32°31′N, 83°08′W) at FL 260 or as assigned; then descend direct via the Dublin VOR 025° radial so as to cross 32°47′N, 82°59′W at FL 230; cross 33°01′N, 82°51′W at 17,000′ MSL; cross 33°09′N, 82°44′W at 15,000′ MSL; turn right to cross 33°11′N, 82°28′W at 13,000′ MSL; cross 32°54′N, 82°06′W at 3000′ MSL; then descend direct so as to cross 32°48′N, 81°54′W at 2000′ MSL; then at 2000′ MSL direct to 33°04′N, 81°20′W; then at 2000′ MSL turn right to 33°04′, 81°10′W; continue turn to 32°55′N, 81°11′W; then at 2000′ MSL direct to intercept the Walnut Grove route at 32°47′N, 81°23′W.

Route Width—The entire route width is reduced to 5 SM either side of centerline.

Hours of Operation—Primary entry 1900Z to 2300Z and from 0100Z to 1400Z, 7 days per week; alternate entry 24 hours per day, 7 days per week.

COLORADO/KANSAS/NEW MEXICO OKLAHOMA/TEXAS

ZERO HOUR

Revised Effective November 1, 1964

Aircraft shall cross 34°22′N, 105°40′30″W (Corona, New Mexico VOR) (reporting point) at FL 250 or as assigned by ATC, then descend direct to cross 34°33′N, 105°33′W at or below 23,000′ MSL; then descend direct to cross 34°40′N, 105°28′W at 22,000′ MSL; then descend direct to cross 34°45′N, 105°12′W at or below 18,000′ MSL; then descend direct to cross 34°53′N, 104°48′W at 10,000′ MSL; then descend direct to cross the route entry point at 34°47′N, 104°29′W at 7000′ MSL, maintain 7000′ MSL direct to 35°24′N, 104°08W, then 7000′ MSL direct to 36°37′N, 102°50′W; then descend direct to cross 36°49′N, 102°35′W at 6000′ MSL, maintain 6000′ MSL direct to 37°03′N, 102°17′W, then 6000′ MSL direct to 37°52′N, 103°10′W.

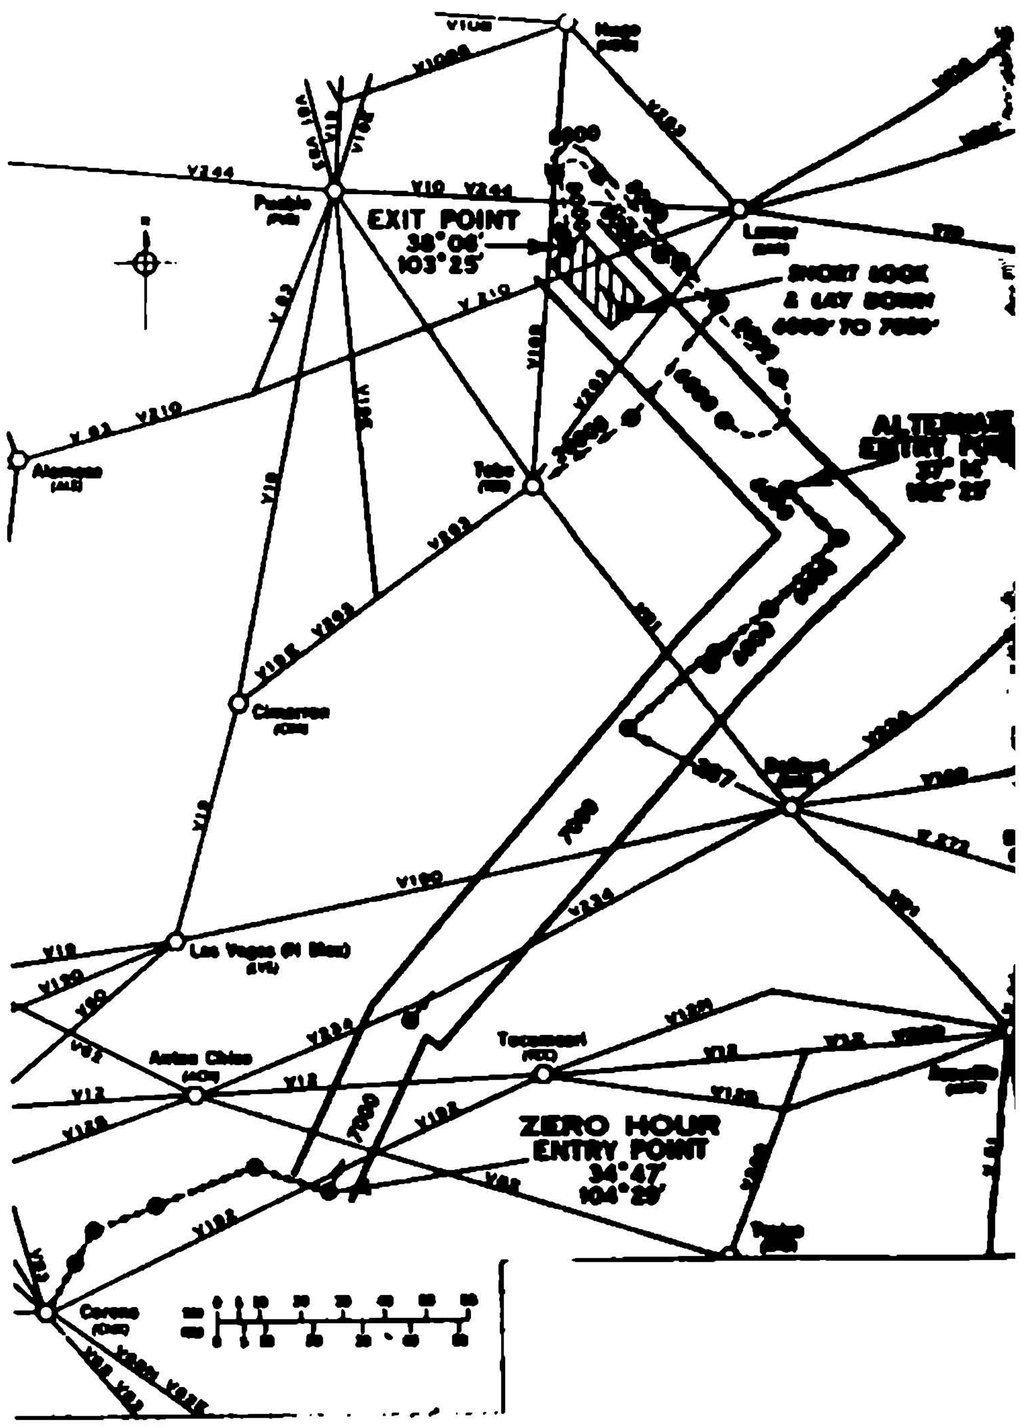
Short Look and Lay Down—After passing 37°52′N, 103°-10′W aircraft shall maintain between 6000′ and 7000′ MSL thru the bomb run corridor (5 SM either side of centerline from 37°52′N, 103°10′W to 38°06′N, 103°25′W). After exiting the route at 38°06′N, 103°25′W climb direct to cross 38°09′N, 103°26′W at 8000′ MSL, maintain 80 MSL direct to 38°22′N, 103°27′W, then 8000′ MSL dir to 38°21′N, 103°17′W; then 8000′ MSL direct 38°02′ 102°55′W; then direct to cross 37°53′N, 102°45′W 9000′ MSL; then climb direct to cross 37°30′N, 103°0 at FL 200; then maintain FL 200 direct to Tobe VO TAC.

Re-Entry—After completing the initial Short Look bo run aircraft that are scheduled to execute an additio bomb run shall, after exiting the route at 38°06′N, 10 25′W, climb direct to cross 38°09′N, 103°26′W at 80 MSL, maintain 8000′ MSL direct to 38°22′N, 103°27′ then 8000 MSL direct to 38°21′N, 103°17′W, then 80 MSL direct to 38°04′N, 103°00′W, then 8000′ MSL dir to 37°38′N, 102°31′W; then turn right descending to cr 37°29′N, 102°45′W at 6000′ MSL, thence via the p lished route.

Alternate Entry—Aircraft shall cross 36°23′N, 103°13′ (Dalhart VORTAC 287/37) (reporting point) at 15,0 MSL, maintain 15,000′ MSL direct to 36°39′N, 102°4 30′′W; then descend direct to cross 36°49′N, 102°35′ at 11,000′ MSL, maintain 11,000′ MSL direct to 37°03′ 102°17′W; then descend direct to cross 37°14′N, 10 29′W at 6000′ MSL, thence via the published route.

Route Width—The route width from 34°47′N, 104°29′ to 35°24′N, 104°08′W is reduced to 5 SM on the east si of centerline.

Hours of Operation—24 hours daily, 7 days per we



STANDARD INSTRUMENT APPROACH PROCEDURES ACTIONS

AIRMAN'S INFORMATION MANUAL

FLIGHT DATA AND SPECIAL OPERATIONS

SECTION III

EFFECTIVE 0501 Z **4 MARCH 1965**

To 0501 Z **1 APRIL 1965**

FEDERAL AVIATION AGENCY

AIRMAN'S INFORMATION MANUAL

INTRODUCTION

This Airman's Information Manual (AIM) has been developed by the Federal Aviation Agency as a pilot's operational manual replacing the Airman's Guide, Directory of Airports and Seaplane Bases, and the Flight Information Manual within the conterminous United States. The existing Alaska Airman's Guide and Chart Supplement and the Pacific Airman's Guide and Chart Supplement will continue to be published every 28 days.

The new AIM presents, in a single document, all information necessary for the planning and conduct of a flight in the National Airspace System. The content and format reflect user identified requirements and provide a "one package" approach.

The manual is divided into six sections, each composed of a specific category or family of information, fashioned into a format consistent with the operational needs of aviation. In contradistinction to previous flight information publications issued by FAA, the design concept of the AIM has provided for consolidation of similar information, segregation of air traffic control procedural information and its sequencing according to operational use, and the elimination of administrative and non-essential data.

The AIM is designed to be carried in the cockpit and may be used collectively or independently by sections. The manual is published as loose-leaf pages, and is three-hole punched to fit a standard three-ring binder.

New or amended textual or tabulated information except in the Airport/Facility Directory, is indicated by a solid dot ● prefixing the heading, paragraph, or line.

Each section of the AIM will be published at varying intervals during the year, depending on the stability or frequency or change of the information.

The various sections and the revision cycle of each are:

Section I	Basic Flight Manual	Semi-annually
Section II	ATC Operations and Procedures	Quarterly
Section III	Flight Data and Special Operations	Every 28 days
Section III-A	Notices to Airmen	Every 14 days
Section IV	Airport Directory	Semi-annually
Section IV-A	Airport/Facility Directory	Every 28 days

The above schedule provides a completely new manual every 6 months.

The revision cycle of Sections III and IV-A is every 28 days, the same as the IFR Enroute charts. Since the charts contains basically enroute information, the AIM serves as a supplementary publication, providing information for planning and terminal operations. Therefore, radio navigation aids are on the charts and unlike the Airman's Guide, are not tabulated in the AIM. Every effort has been made to minimize and eliminate duplication of information within publicatons and between publications and charts.

A brief description of the contents of each section in the AIM follows.

Section I—Basic Flight Manual

This section contains information of an instructional, educational, and training nature, assembled and presented in a systematic format, categorized by subject matter. The novice pilot, as well as the more experienced pilot will find here the basic fundamentals of knowledge for operating in the National Airspace System, information on adverse factors affecting safety of flight and health, and a list of available publications of general operational interest.

Section II—ATC Operations and Procedures

Section II is designed to serve as an official means of disseminating pertinent ATC information of interest to all pilots. The information governing flight operations, air traffic services, and procedures is presented in layman's language and avoids ambiguities which often result from individual interpretations of rules. Data is seqeunced in accordance with typical flight operations: Preflight, departure, enroute, arrival and landing procedures. In addition, supporting general procedures and information such as ADIZ, and SCATER procedures is included. Emergency procedures are combined and published at the end of the section.

Section III—Flight Data and Special Operations

Operational data most subject to change and which is not appropriate for inclusion within other sections of the AIM is carried in Section III. Because it contains critical flight data most subject to change, this section should be kept close at hand in the event of a divergence in enroute flight. Some of the most significant material contained in Section III is described below.

A glossary or explanation of aeronautical term or phrases used in the AIM, and a list of commonly used abbreviations.

Special Notices of pertinent current information of operational value for both preflight planning and enroute operations. These Special Notices are divided into three categories: General Notices—those of a general nature with universal application; Area Notices—those pertinent to a specific geographical area; and Regulatory Notices—these are condensations of changes to or new rules, parts, Advisory Circulars, Special Procedures and other regulatory matters of operational interest.

A Visual Navigation Chart Bulletin, as a means of updating the Sectional Charts, providing a cumulative tabulation of the major changes in aeronautical information occurring since the last chart publication date.

Detailed description tabulations and charts of Special Operations such as Oil Burner Routes and military refueling tracks.

Section III—A—Notices to Airmen

This section serves as a supplement, issued every fourteen days, to the AIM and provides operationally required data pertinent to the continuous NOTAMs carried in the daily teletypewriter NOTAM Summary (NOSUM), revisions to Oil Burner routes, and those airman advisories deemed essential to the safe conduct of flight.

Sections IV and IV–A—Airport Directory

Within Sections IV and IV–A there are provided an Airport Directory, a tabulation of ARTCC communications, frequencies, and a tabulation of Flight Service Stations.

Section IV contains the Airport Directory which is a listing of all known airports, heliports, and seaplane bases available for transient civil use within the conterminous United States, and indicates those airport services and facilities available at each. The seaplane tabulation and the heliport tabulation follow the airport tabulation. Military airports and privately owned and operated airports closed to civil aviation are not listed.

Section IV–A contains an Airport/Facility Directory providing an integrated tabulation of major airports, heliports and seaplane bases which have terminal navaids and communications facilities available at the airport. This tabulation combines all facilities and services available at each airport (heliport or seaplane base) or terminal area into a single listing.

In both Sections IV and IV–A, airports are listed alphabetically by geographical location (city or town) within each state. Airports tabulated in IV–A are cross-referenced in Section IV.

In Section IV–A, the Airport/Facility Directory is followed by the tabulation of all ARTC Center VHF communications frequencies. This, in turn, is followed by the tabulation of FSS's, which shows their telephone numbers, the number of the associated Weather Bureau Office, and other pertinent data.

The Master Alphabetical Index of the entire Manual is provided in this Section. This complete and comprehensive index lists all items of information, cross referenced

under all headings to which reference might reasonably be made, giving section and page number. Within the index, any reference involving emergency actions or procedures is printed in bold-face type.

Errors, Omissions, or Suggested Changes

Errors, omissions, or suggested changes should be forwarded to the Federal Aviation Agency, Air Traffic Service, Attention AT-600, Washington, D.C. 20553. Airport managers, operators and owners are urged to review data for their airport and report any errors or omissions to FAA at the address given above.

Procurement

● The Airman's Information Manual is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Orders should be accompanied by check or money order made payable to the Superintendent of Documents.

INTRODUCTION

Section III—FLIGHT DATA AND SPECIAL OPERATIONS

Section III is published every 28 days and contains operational flight data most subject to continuous change that is not appropriate for inclusion within other sections of the Manual. Because it contains such critical flight data, this section should be kept close at hand in the event of a divergence in en route flight.

The information in Section III is presented in various tabulations or grouping arrangements appropriate to the specific items. Typical examples are: Preferred Routes, VOR Receiver Check Points, Parachute Jumping Areas, and Substitute Route Structures.

As a means of updating the Sectional Charts produced by the Coast and Geodetic Survey, Department of Commerce, a Sectional Chart Bulletin is included in Section III. This bulletin provides a cumulative tabulation of the major changes in aeronautical information that have occurred since the last publicaton date (normally every 6 months) of each sectional chart. Only those changes to controlled airspace and special use airspace, airports, and radio navigation facilities that present a hazardous condition or impose a restriction on the pilot are listed, thereby continually providing the VFR pilot with the essential data for keeping his sectional charts current until they are reissued.

At the end of Section III are grouped detailed tabulations and charts of special operations and areas such as Oil Burner Routes, and military low altitude refueling tracks. This arrangement provides a consolidated presentation of areas and special operations that are not designated through rule-making procedures.

GLOSSARY OF AERONAUTICAL TERMS

I DEFENSE IDENTIFICATION ZONE (ADIZ)—The area of air-ace over land or water within which the ready identi-ation, the location, and the control of aircraft are re-ired in the interest of national security. For operat-: details see ADIZ procedures.

IPORT ADVISORY AREA—The area within five statute les of an uncontrolled airport on which is located a ght Service Station so depicted on the appropriate tional Aeronautical Chart.

IPORT ADVISORY SERVICE—A service provided by a Flight vice Station to enhance the safety of terminal oper-ons of airports where a station is operating but where re is no control tower.

IPORT SURFACE DETECTION EQUIPMENT (ASDE)—Radar ipment specifically designed to detect all principal tures on the surface of an airport, including vehicular ffic, and to present the entire picture on a radar indi-or console in the control tower. ASDE has a maxi-m range of four miles, though its 16 inch diameter pe usually displays an area of only one mile radius ut the control tower.

IPORT SURVEILLANCE RADAR (ASR)—Radar providing posi-n of aircraft by azimuth and range data without ele-ion data. It is designed for a range of 50 miles.

IPORT TRAFFIC AREA—The airspace within a circular it defined by a five statute mile horizontal radius m the geographical center of an airport at which an rative airport traffic control tower is located and ex-ding upwards from the surface to, but not including, 0 feet above the surface.

ROUTE SURVEILLANCE RADAR (ARSR)—Long range radar ich increases the capability of ATC for handling heavy route traffic. An ARSR site is usually located at some tance from the ARTCC it serves.

ROUTE TRAFFIC CONTROL CENTER (ARTCC)—A facility ablished to provide traffic control service to Instru-nt Flight Rules (IFR) flights operating within con-lled airspace and principally during the en route se of flight.

ITUDE RESERVATION (ALTRV)—Airspace utilization under scribed conditions, normally employed for the mass vement of aircraft or other special user requirements ich cannot otherwise be accomplished. ALTRV's are roved by the appropriate FAA facility.

ROACH CONTROL SERVICE—Air traffic control service, vided by a terminal area traffic control facility, for iving and or departing IFR flights and, on occasion, R flights.

AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)—The continuous broadcast of recorded noncontrol information in selected high activity terminal areas. Its purpose is to improve controller effectiveness and to relieve frequency congestion by automating the repetitive transmission of essential but routine information.

CARDINAL ALTITUDES OR FLIGHT LEVELS—"Odd" or "even" thousand-foot altitudes or flight levels. Examples: 5000, 6000, 7000, FL 250, FL 260, FL 270.

CEILING—The height above the ground or water of the lowest layer of clouds or obscuration phenomena that is reported as "broken," "overcast," or "obscuration" and not classified as "thin" or "partial."

CENTRAL ALTITUDE RESERVATION FACILITY (CARF)—An Air Traffic Service facility established to conduct the volume of coordination, planning and approval of special user requirements under the altitude reservation concept.

CONSOLAN—A low frequency, long-distance navaid used principally for transoceanic navigation.

CONTERMINOUS U.S.—Forty-eight states and the District of Columbia.

CONTINENTAL CONTROL AREA—The area, which includes that airspace within the conterminous United States at and above 14,500 feet MSL, excluding airspace less than 1,500 feet above terrain, and prohibited and restricted areas (except certain specified restricted areas).

CONTINENTAL U.S.—Forty-nine states. The original 48 states and Alaska.

CONTROL AREA—Controlled airspace extending upwards from a specified height above the surface of the earth. Unless otherwise provided in appropriate cases, control areas extend upward from 700 feet above the surface until designated from 1,200 feet above the surface or from at least 500 feet below the MEA, whichever is higher, to the base of the continental control area.

CONTROL ZONE—Controlled airspace extending upwards from the surface of the earth. Control zones may include one or more airports and are normally circular areas 5 statute miles in radius with extension where necessary to include instrument approach and departure paths.

CRUISE—The term "cruise" used instead of "maintain" in an ATC clearance indicates that descent from cruising altitude may be commenced at pilot's discretion without further clearance from ATC. "Cruise" is normally used only on relatively short flights in uncongested areas, and is authorization for the flight to proceed to, and make an approach at, destination.

DISCRETE FREQUENCY—A frequency assigned a particular function.

EXPECTED APPROACH CLEARANCE TIME (EAC)—The time at which it is expected that an arriving aircraft will be cleared to commence approach for a landing.

FINAL APPROACH—IFR—The flight path of an aircraft which is inbound to the airport on an approved final instrument approach course, commencing at the point of interception of said course and extending to the airport or the point where circling for landing or missed approach is executed.

FINAL APPROACH—VFR—A flight path of a landing aircraft in the direction of landing along the extended runway center line from the base leg to the runway.

FIX—A geographical position determined visually, by reference to one or more radio navigational aids, by celestial plotting, or by another navigational device.

FLIGHT ADVISORY SERVICE—Advice and information provided by a facility to assist pilots in the safe conduct of flight.

FLIP—Flight Information Publication.

FLIGHT LEVEL (FL)—A level of constant atmospheric pressure related to a reference datum 29.92" HG. For example: Flight Level 250 is equivalent to an altimeter indication of 25,000 feet, and Flight Level 265 to 26,500 feet.

FLIGHT SERVICE STATION (FSS)—A facility operated by the FAA to provide flight assistance service.

IFR CONDITIONS—Weather conditions below the minimum prescribed for flights under VFR.

INITIAL APPROACH—Initial approaches to a facility are normally made over specified routes to the primary navigation facility. When the approach fix is not the primary navigation facility, the transition routes are specified and shown on the particular AL chart. The minimum en route altitude for the route along which the pilot has been flying is normally used as the initial approach altitude. The high level initial approach altitude is usually termed "Initial Penetration Altitude" and is considered as the altitude at which the aircraft begins a penetration. This altitude is established for each particular procedure and is indicated on the associated AL chart.

INTERROGATOR—The ground-based surveillance radar beacon transmitter-receiver which scans in synchronism with a primary radar, transmitting discrete radio signals which repetitiously request all transponders, on the mode being used, to reply. The replies received are then mixed with the primary radar video to be displayed on the same plan position indicators.

JET ROUTES—A high altitude route system, at and above 18,000 feet MSL, predicated on a network of designated high altitude VHF/UHF facilities. (For operating procedures applicable to this system see ENROUTE).

JOINT USE RESTRICTED AREA—An area wherein an aircra may operate if prior permission has been granted l either the restricted area "using agency" or the "co trolling agency." (1) The using agency organization, military command whose activity within a restrict area necessitated the area being so designated; exce that, in the case of those Restricted Area/Military Clim Corridors which do not have a designated controlli agency, the using agency is a military air traffic contr facility which may be contacted for transit through t climb corridor. The using agency notifies the controlli agency whenever permission may be granted by t controlling agency for transit of, or flight within a r stricted area. (2) The controlling agency is a designat FAA facility which may authorize transit of a restrict area.

MAINTAIN—The altitude/flight level instructions in ATC clearance normally require that a pilot "maintai the altitude/flight level at which the flight will opera when in controlled airspace. Altitude/flight lev changes while en route should be requested prior to t time the change is desired.

MAXIMUM AUTHORIZED ALTITUDE (MAA)—The highest al tude on a Federal airway, jet route, or other direct rou for which a MEA is designated in F.A.R. Part 95 which adequate reception of navigation aid signals assured.

MINIMUM CROSSING ALTITUDES (MCA)—The lowest altitud at certain radio fixes at which an aircraft must cro when proceeding in the direction of a higher minimu en route IFR altitude.

MINIMUM EN ROUTE IFR ALTITUDE (MEA)—The altitude effect between radio fixes which assures acceptable na gational signal coverage and meets obstruction clearan requirements between those fixes.

MINIMUM OBSTRUCTION CLEARANCE ALTITUDE (MOCA)—T specified altitude in effect between radio fixes on VO airways, off-airway routes on route segments, whi meets obstruction clearance requirements for the ent route segment and which assures acceptable navigation signal coverage only within 22 nautical miles of a VO

MINIMUM RECEPTION ALTITUDE (MRA)—The lowest altitu required to receive adequate signals to determine speci VOR/VORTAC/TACAN fixes.

MODE—The number or letter referring to the speci pulse spacing of the signal transmitted by an interro tor.

RADAR BEACON (SECONDARY RADAR)—A radar system which the object to be detected is fitted with cooperati equipment in the form of a radio receiver/transmitt (transponder). Radio pulses transmitted from t searching transmitter/receiver (interrogator) site a received in the cooperative equipment and used to tri ger a distinctive transmission from the transponde This latter transmission, rather than a reflected sign is then received back at the transmitter/receiver site.

DAR ADVISORY SERVICE—The provision of advice or in-mation based on radar observation.

DIAL—A radial is a magnetic bearing extending from OR, VORTAC, or TACAN.

MARY RADAR—A radar system in which a minute por-n of a radio pulse transmitted from a site is reflected an object and then received back at that site.

HIBITED AREA—Designated airspace within which the ht of aircraft is prohibited.

GET—The indication displayed on a radar scope re-ting from a primary radar return or a radar beacon ly.

NSITION AREA—An area extending upward from 1,200 t or higher above the surface when designated to plement control zones; from 700 feet above the sur-e when designated in conjunction with an airport with control zone but for which an instrument approach cedure has been prescribed; or from 1,200 feet or her above the surface when designated in conjunc-n with airway route structures or segments. Unless erwise limited, transition areas terminate at the base he overlying control area or Continental Control Area.

NSPONDER—The airborne radar beacon receiver-trans-ter which automatically receives radio signals from interrogators on the ground, and selectively replies h a specific reply pulse or pulse group only to those errogations" being received on the mode to which it et to respond.

TOR—A heading issued to the pilot for the purpose of viding navigational guidance by means of radar.

BILITY, PREVAILING—The horizontal distance at which gets of known distance are visible over at least half he horizon. It is normally determined by an observer or close to the ground viewing buildings or other ilar objects during the day and ordinary city lights night. Under low visibility conditions the observa-ns are usually made at the control tower. Visibility REPORTED IN MILES AND FRACTIONS OF LES in the Aviation Weather Report. If a single ue does not adequately describe the visibility, addi-tional information is reported in the "Remarks" section of the report.

VISIBILITY, RUNWAY—The horizontal distance at which a stationary observer near the end of the runway can see an ordinary light (about 25 candlepower) at night or a dark object against the horizon sky in the daytime. In practice the human observer is used very little for this observation. Instead runway visibility is normally determined by a transmissometer (a photoelectric device calibrated in terms of a human observer). It is REPORTED IN MILES AND FRACTIONS OF MILES in the "Remarks" section of the Aviation Weather Report. A meter in the control tower gives the FAA traffic controller a continuous indication of the runway visibility at transmissometer locations. Runway visibility, where available, is used in place of prevailing visibility for the determination of minimums on a transmissometer runway. This program is gradually being replaced by Runway Visual Range at transmissometer locations.

VISIBILITY, RUNWAY VISUAL RANGE (RVR)—An instrumentally derived value, based on standard calibrations, that represents the horizontal distance a pilot will see down the runway from the approach end; it is based on the sighting of either high intensity runway lights or on the visual contrast of other targets—whichever yields the greater visual range. RVR, in contrast to prevailing or runway visibility, is based on what a pilot in a moving aircraft should see looking down the runway. RVR is horizontal, AND NOT SLANT, visual range. It is based on the measurement of a transmissometer made near the touchdown point of the instrument runway and is REPORTED IN HUNDREDS OF FEET. At the present time, RVR observations are automatically furnished to FAA tower controllers at approximately 25 locations from readout equipment connected to the remote transmissometer installation. RVR provides an additional operating minimum at fields equipped with specified navigational aids. For example, at the present time the RVR minimum at Newark is 2000 ft. (in combination with a minimum descent altitude of 218′ MSL) for both take-offs and landings regardless of the reported ceiling and visibility.

●**VOT (VERY HIGH FREQUENCY OMNITEST)**—A ground originating test signal used to check the accurate alignment of a VOR receiver.

hi-..... high-
hr..... hour
hvy..... heavy
hwy..... highway

ident..... identification
IFF..... Identification Friend from Foe
IFR..... Instrument Flihgt Rules
IFSS..... International Flight Service Station
ILS..... instrument landing system
imdtly.... immediately
inbnd..... inbound
indef..... indefinitely
info..... information
inop..... inoperative
inst..... instrument
int..... intersection
intl..... international
intsv..... intensive

J-bar..... jet runway barrier
kc..... kilocycles

lat..... latitude
lcl..... local
lclzr..... localizer
lctd..... located
lctn..... location
LFR..... Low/Medium frequency radio range
lgt..... light
lgtd..... lighted
lgtg..... lighting
LMM..... compass locator at middle marker ILS
lnd..... land
lndg..... landing
LOM..... compass locator at outer marker ILS
long..... longitude

M..... magnetic (after a bearing)
MAA..... maximum authorized altitude
mag..... magnetic
maj..... major
max..... maximum
mc..... megacycles
MCA..... minimum crossing altitude
MEA..... minimum enroute IFR altitude
meml..... memorial
MH..... Non-directional radio beacon (homing), power less than 50 watts
mi..... mile
min..... minimum or minute
MM..... middle marker ILS
MOCA.... minimum obstruction clearance altitude
mod..... modernization/modification
MRA..... minimum reception altitude
mrkd..... marked
mrkg..... marking
MSL..... mean sea level
mun..... municipal
natl..... national
navaid.... navigational aid
ngt..... night
nmi..... nautical mile/s
No..... number

obstn..... obstruction
oct..... octane
OM..... outer marker ILS
operg..... operating
opern..... operation
outbnd.... outbound

patn..... pattern
permly.... permanently
p-line..... pole line
pwr..... power

quad..... quadrant

rad..... radial
RAE..... Royal Aircraft Establishm visual glide slope indic
RAPCON.. radar approach control (US.
RATCC... radar air traff control cent (NAVY)
rbn..... radio beacon
rcv..... receive
rcvg..... receiving
rcvr..... receiver
rdo..... radio
reconstr... reconstructior
REIL..... runway end id tification lig
relctd..... relocated
rgt..... right
rng..... range
rnwy..... runway
ruf..... rough
RVR..... runway visual range
RVV..... runway visibi values

SIF..... Selective Ider fication Fe ture (of t basic Mark radar beac system)
sked..... schedule
smi..... statute mile.'s
SR..... sunrise
SS..... sunset
stn..... station
sys..... system

T..... true (after a bearing)
TACAN... UHF navigational facility—omnidirectional course and distance information
et..... tetrahedron
tc..... traffic
tof..... take-off
tmprly.... temporarily
tmpry.... temporary
trans..... transcribed
trml..... terminal
trng..... training
tsmt..... transmit
tsmtg..... transmitting
tsmtr..... transmitter
TV..... television
twr..... tower
txwy..... taxiway
UFN..... until further notice
unavbl.... unavailable
unclid ... uncontrolled
unlgtd.... unlighted
unmrkd... unmarked
VASI..... visual approach slope indicator
vcnty..... vicinity
VFR..... visual flight rules
VOR... .. VHF navigational facility—omnidirectional, course only
VOR-DME. collocated VOR navigational facility and UHF standard navigational facility and UHF standard distance measuring equipment
VORTAC.. collocated VOR and TACAN navigational facilities
VOT..... a VOR Receiver Testing Facility
vsby..... visibility
wea..... weather
WB ..... Weather Bureau
WIP..... work in progress
wt..... weight

THE NOTAM CODE

INTRODUCTION

The NOTAM Code provides for coding NOTAM information to reduce telecommunications transmission time and reduce translation difficulties in the International Service.

A NOTAM Code group contains 5 letters. The first letter is always the letter Q to indicate a code abbreviation for use in the composition of NOTAMs. The letter Q has been chosen to avoid conflict with any assigned radio call sign.

NOTAM code significations shall be amplified or completed where necessary by adding appropriate words, contractions, frequencies, location identifiers, place names, or figures. Approved abbreviations shall be used in preference to plain language whenever possible. The information necessary to complete a NOTAM code group, as indicated by a blank space, shall be given except when (1) the blank spaces are enclosed within parentheses or brackets to indicate their completion is optional; e.g., LHX QIEIK 15 MIN. Meaning: the LaJunta Colorado airport beacon is available on request at 15 minutes' notice; or (2) an alternative meaning shown in parentheses is selected and the blank space in this alternative meaning is complete; e.g., QAPOK 116.9. Meaning: the radio range on 116.9 Mc. resumed normal operation.

Expressions or words in parentheses which do not include blank spaces have the following significances:

(1) When following a blank space, signifies the explanation of information to be used in filling the preceding blank.

(2) When following a word or expression, signifies an alternative to the word or expression.

CODE GROUP FORMATION

5-letter NOTAM code groups are formed in the following manner:

(1) First Letter.—The letter Q.

(2) Second and Third Letters.—The appropriate combination of 2 letters, selected from the "2nd and 3rd letters" section of the code, identify the facility, service or danger to aircraft in flight being reported. The *second* letter has been restricted to A, E, I, O, or U. These letters also serve to classify the aid, facility, or service described: i.e., the letters A and E signify radio aids. The letter I signifies lighting facilities. The letters O and U signify airports, search and rescue, and dangers to aircraft in flight.

(3) Fourth and Fifth Letters.—The appropriate cominbation of 2 letters, selected from the "4th and 5th Letters" section, denote the operating status of the facility, service, or danger to aircraft being reported. The *fourth* letter has been restricted to A, E, I, O, or U.

DECODE

SECOND AND THIRD LETTERS

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	RADIO AIDS		
AA	. . . [*specify TWR, APP, ACC or FIC*] air traffic services receiver . . . kc/s. (*or* . . . Mc/s.).	AY	200 Mc/s. Distance Measuring Equipment.
AB	Inner marker, Instrument Landing System.	AZ	Station location marker VHF.
AC	. . . [*specify TWR, APP, ACC or FIC*] air traffic services transmitter . . . kc/s. (*or* . . . Mc/s.).	EA	En-route Surveillance Radar.
AD	Middle marker, Instrument Landing System.	EB	Broadcasting station (public).
AE	Outer marker, Instrument Landing System.	EC	CONSOL or CONSOLAN station.
AF	Fan-type marker.	ED	DECCA or DECTRA.
AG	Glide path, Instrument Landing System.	EE	Ground Controlled Approach System (GCA).
AH	Non-directional Beacon (NDB).	EF	Terminal Area Surveillance Radar.
AI	Instrument Landing System (ILS).	EG	Gee.
AJ	Radio range (other than VOR) and associated voice communications.	EH	Elevation element of the Precision Approach Radar (PAR).
AK	Radio receiving facilities.	EI	Monitoring device associated with . . . (*specify*) radio aid.
AL	Localizer, Instrument Landing System.	EJ	All air-ground facilities (except . . .).
AM	Locator, inner, Instrument Landing System.	EK	Precision Approach Radar (PAR).
AN	TACAN.	EL	LORAN.
AO	Locator, outers, Instrument Landing System.	EM	Azimuth element of the Precision Approach Radar (PAR).
AP	VOR (VHF Omnidirectional Radio Range) and associated voice communications.	EN	DME (1000 Mc/s. Distance Measuring Equipment).
AQ	VOR (VHF Omnidirectional Radio Range).	EO	Beam Approach Beacon System (BABS).
AR	Radio range (other than VOR).	EP	Radar responder beacon.
AS	Radio range leg.	EQ	Surveillance Radar Element (SRE) of GCA.
AT	Attentional signal.	ER	Radio transmitting facilities.
AU	Meteorological communications . . . kc/s. (*or* . . . Mc/s.).	ES	All radio-navigation facilities (except . . .).
AV	Voice communications . . . kc/s. (*or* . . . Mc/s.).	ET	Teletypewriter transmitting facility (ies).
AW	Unassigned.	EU	Radio direction-finding station . . . (*frequency or type*).
AX	Non-directional Beacon (NDB) and voice facility.	EV	VORTAC (the combination of VOR and TACAN).
		EW	Ground interrogator, SSR system.
		EX	Unassigned.
		EY	Ground movement radar.
		EZ	Unassigned.
	LIGHTING FACILITIES		
IA	Boundary lights.	ID	Channel lights.
IB	Aerodrome beacon.	IE	Light beacon.
IC	Unassigned.	IF	Floodlights.

DECODE

SECOND AND THIRD LETTERS (Contd.)

2nd & 3rd Letters	SIGNIFICATION	2nd & 3rd Letters	SIGNIFICATION
	LIGHTING FACILITIES (Contd.)		
IG	Angle-of-approach lights.	IP	Approach light system [type . . . {*specify LSA (low intensity) or LSB (high intensity*}] (for runway number . . .).
IH	Taxiway lights.		
II	Hazard beacon.		
IJ	Threshold lights (for runway number . . .).	IQ	Runway alignment beacon.
IK	Flares.	IR	Runway lights [type . . . {*specify LSA (low intensity) or LSB (high intensity)* }] (for runway number . . .).
IL	All landing area lighting facilities.		
IM	Identification beacon.	IS	Strip lights [for strip . . . (*number or magnetic direction*)].
IN	Unassigned.	IT–IY	Unassigned.
IO	Obstruction lights.	IZ	Airway course lights.

	AERODROMES — SEARCH AND RESCUE — DANGERS TO AIRCRAFT IN FLIGHT		
OA	Land aerodrome.	UB	Mooring buoys.
OB	Beaching facilities.	UC	Unassigned.
OC	Water aerodrome.	UD	Prohibited, restricted or danger area designated as . . . (*name or reference identification*).
OD	Meteorological forecast service.		
OE	Meteorological observation service.		
OF	Meteorological watch service.	UE	Aircraft.
OG	Runway arresting gear.	UF	Fixed balloons.
OH	Helicopter landing area.	UG	Bombing or aerial depth charge dropping.
OI–OL	Unassigned.		
OM	All runways [except number(s) . . .].	UH	Air exercises (*or* flying displays).
ON	Stopway for runway number.	UI	Gun or missile firing.
OO	Taxiway(s).	UJ	Glider flying.
OP	Rescue vessel.	UK	Demolition of explosives.
OQ	Ocean Station Vessel.	UL	Landing direction indicator.
OR	Refueling [. . . type fuel(s) *or* . . . octane].	UM	Mooring and docking facilities.
		UN	Parachute jumping exercises.
OS	Search and rescue aircraft [*specify VLR, LRG, MRG, SRG or HEL*].	UO–UP	Unassigned.
		UQ	Apron.
OT	Crash and fire fighting facilities.	UR	Runway(s) and number(s).
OU	Unassigned	US	Strip . . . (*number or magnetic direction*).
OV	. . . [*specify TWR, APP, ACC or FIC*] air traffic service.	UT	Grass landing area.
		UU	Unassigned.
		UV	Fog dispersal equipment.
OW–OY	Unassigned.	UW–UY	Unassigned.
OZ	Warship.	UZ	Runway threshold (number . . .).
UA	Alighting area.		

DECODE

FOURTH AND FIFTH LETTERS

4th & 5th Letters	SIGNIFICATION
	HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES
AA	Unassigned.
AB	Usable for length of . . . and width of . . .
AC	Covered by snow to a depth of . . . NOTE.—*This snow is not compacted.*
AD	Cleared of soft snow, full length and width.
AE	Totally free of snow and ice.
AF	Covered by [. . . (*type*)] ice to a depth of . . .
AG–AH	Unassigned.
AI	Operating without tone modulation.
AJ	Operating without coding.
AK	Covered by compacted snow to a depth of . . .
AL	Operating on reduced power.
AM	Snow clearance in progress [estimated time of completion is . . . (*date/time*)].
AN	Grass cutting in progress [estimated time of completion is . . . (*date/time*)].
AO	Marked by . . .
AP	Work is in progress [estimated time of completion is . . . (*date/time*)].
AQ	Work completed.
AR	Snow clearance completed.
AS	Grass cutting completed.
AT	Sanding is in progress [estimated time of completion is . . . (*date/time*)].
AU	Appears unreliable.
AV	Covered by ice patches.
AW	Height of snowbanks is . . . (*figures and units*).
AX	Braking action is . . . (A = *good*, B = *medium*, C = *poor*).*
AY	Are to avoid area, radius of danger being . . . (about the point . . .).
AZ	Will take place from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] (on the days of . . . between the hours of . . . and . . .) at . . . (*location*) (within the sector of . . . and a radius of . . .) at . . . height above . . . (*datum*).
EA	Unassigned.
EB	Location change to . . . effective . . . (*date/time*).
EC	Characteristics *or* identification *or* radio call sign changed to . . .
ED	Operating frequency(ies) will be changed to . . . kc/s. (*or* . . . Mc/s.) effective . . . (*date/time*).
EE–EG	Unassigned.
EH	Not heard.
EI–EL	Unassigned.
EM	Military operations only.
EN	Not available due to . . . (*specify reason*) from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
EO	Unassigned.
EP	Available on prior permission (of . . .) only.
EQ–ER	Unassigned.
ES	Out of service from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] due to the following condition(s) . . .
ET	Test operation only. NOT for operational use.
EU–EV	Unassigned.
EW	Completely withdrawn.
EX	Unassigned.
EY	Is outside the limits of its assigned ocean station.
EZ	Is within the limits of its assigned ocean station.
IA–IB	Unassigned.
IC	Report of apparent unreliability or track displacement hereby is cancelled.
ID	Available on request to . . .
IE	Unassigned.
IF	Flight checked and found reliable.
IG–IJ	Unassigned.
IK	Available on request (to . . .) immediately [*or* at . . . (*time period*) notice].
IL	Hours of service are now . . .
IM	Unassigned.
IN	Operative (*or* re-operative), activated (*or* re-activated) from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
IO	Operating normally.

DECODE

FOURTH AND FIFTH LETTERS (Contd.)

4th & 5th Letters	SIGNIFICATION
HAZARD OR STATUS OF OPERATION OR CONDITION OF FACILITIES (Contd.)	
IP	Track(s) reported to be displaced (. . . degrees) (. . . direction) of published bearing(s), other tracks probably have shifted.
IQ	To be used as radio beacon only.
IR	Magnetic track(s) towards station is are now . . . [will be . . . at . . . (*date/time*)].
IS	Operative (or *re*-operative) subject to conditions/limitations already published.
IT	Aircraft restricted to runways and taxiways.
IU	Unserviceable for aircraft heavier than . . . tons.
IV	Unsafe from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
IW–IZ	Unassigned.
OA–OF	Unassigned.
OG	Operative but ground checked only, awaiting flight check.
OH–OJ	Unassigned.
OK	Resumed normal operation.
OL	Track(s) ground checked, approved for instrument flying.
OM	Shut down for maintenance from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)]—disregard all signals.
ON–OQ	Unassigned.
OR	Previously promulgated shutdown has been cancelled.
OS	Unassigned.
OT	New facility in operation.
OU	Operating without interruption for voice transmissions from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
OV–OW	Unassigned.
OX	Exercising at . . . (*date/time, location and height above the specified datum*).
OY–OZ	Unassigned.
UA	Closed to all operations from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
UB–UC	Unassigned.
UD	Closed to all night operations from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)].
UE	Unassigned.
UF	Closed for an unknown duration due to flood.
UG	Closed for an unknown duration [*or* until . . . (*date/time*)] due to ice or snow.
UH	Closed for an unknown duration [*or* until . . . (*date/time*)] due to thaw.
UI	Closed from . . . (*date/time*) for an unknown duration [*or* until . . . (*date/time*)] for maintenance.
UJ–UL	Unassigned.
UM	Operating in an unmonitored status.
UN–US	Unassigned.
UT	Operative but caution advised due to following condition(s) . . .
UU	Suitable for . . . (*specify*) equipped aircraft only.
UV	Covered by slush to a depth of . . .
UW	Covered by water to a depth of . . .
UX–UZ	Unassigned.

NOTICE TO THE EDITOR

This sheet should only be used to submit changes, corrections or comments concerning the Airman's Information Manual. Just tear out, fold, staple and mail. No postage is necessary.

NOTE: All inquiries and information concerning subscriptions to these publications, and change of address should be sent to the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402

PARACHUTE JUMPING AREAS

The following tabulation lists all known parachute jumping sites in the United States. Unless otherwise indicated, all activities are conducted during daylight hours and under VFR conditions.

ALABAMA

Fort Rucker, Cairns AAF: 5 mi radius. Week-ends and holidays 1200–SS; intermittently week-days. Up to 14,500′ MSL.

Headland Mun Arpt: 1 mi E. 1200 LST to sunset. Sundays. Up to 12,000′.

ARIZONA

Glendale, Luke AFB: Daily 1500Z to 0500Z. Up to 5100′ MSL.

Marana Air Park: Daily weekends, and evenings. Up to 6,500; occasionally 10,000′ MSL and 24,000′ MSL.

Phoenix, Deer Valley Arpt: 4 mi WSW. Up to 14,000′ MSL; 3 mi ESE. Up to 7000′ MSL.

Scottsdale, Thunderbird Academy Airport: 1 mi W. Up to 10,000′ MSL.

Tucson, Ryan Fld: Up to 12,000′.

ARKANSAS

Clarksville Arpt: Weekends; contact Ft. Smith Rdo for info concerning unscheduled ngt and holiday activities. Up to 13,000′ MSL.

Fayetteville: 1 mi NNW Razorback Arpt. Mon thru Sat 2200GMT–sunset. Suns and holidays 1400 GMT– sunset.

Jonesboro Mun Arpt: Weekends, with unscheduled parachuting week days. For confirmation of activities contact Walnut Ridge FSS.

Marion: 1 nmi W. 1500Z–SS, Sat and Sun. Up to 13,000′ MSL.

CALIFORNIA

Irvin: 1½ mi SW. 0800–SS Sat and Suns. Up to 15,000′ MSL.

Jovenal Arpt: 0.5 mi W of rnwy, weekends and holidays 1600 to 0300Z occasional jumps week days 0000–0300Z; up to 10,000′.

Black Point: Sky diving weekends up to 12,500′.

Black Point: 6 mi NE Hamilton AFB. Mon thru Sat up to 1500′ MSL.

Calistoga Arpk: Weekends.

Camp Pendleton, Oceanside (San Diego Co.): E half of V23/V165 arwys between San Clemente and Oceanside. All drops made within the Oceanside Corps Maneuver Area from 1,200 to 4,500′. Day and ngt. Current info may be obtained from FSS San Diego, Calif.

Clear Lake: Into Clear Lake at 39°05′N, 122°51′W. Mon thru Sat. Up to 4400′ MSL.

El Centro NAF: 0700–1600P (1500–2400Z) Mon-Fri. Up to FL 400.

Elsinore, Skylark Fld: Up to 13,700′ MSL. Moderate weekdays, hvy weekends and holidays.

Fort Irwin (Bicycle Lake AAF): Weekends, holidays, and occasionally weekdays. Up to 12,000′ MSL.

Fort Ord (Fritzsche Control Zone): Free fall parachute activity weekends, holidays, and occasionally wkdays, from alts ranging from 2800′–15,000′, opening at absolute alts of 2000′–2500′. Center of drop zone lctd at 36°38′N, 121°46′W in Restricted Area R-2511. Ctc Fritzsche Twr for advisory info.

Fresno Air Terminal: 5½ mi NE. Sundays. From 12,500′.

Fresno, Chandler Arpt: 5 mi W. Heavy activity weekends, holidays, and occasionally weekdays. Up to 15,000′.

Hollister Mun: 1 mi NE. Weekends and occasionally week days. 12,500′ MSL.

Lancaster, Wm. J. Fox Fld: Weekends and holidays, one half mile S of arpt. Up to 15,000′ MSL.

Lake Berryessa: Lat 38°31′, 122°12′. Mon thru Sat. Up to 2000′ MSL.

Lakeside (San Diego Co.): 8 mi ENE Gillespie Fld, Santee, Calif., two mi out of ctl area. Daily, greatest activity weekends. Up to 15,000′.

Lincoln Mun Arpt: Weds 1200 to 2200 and weekends and holidays from sunrise to 2200, 1½ to 2 mi SW.

Livermore, Sky Ranch Arpt: Greatest activity on weekends.

Lodi, Linds Arpt: Weekends. 0.5 mi NE on V23 arwy btn Linden and Sacramento VORs. Up to 9,500′.

Lost Hills, Kern Co. No. 9 Arpt: Daily up to 16,000′ MSL.

Milpatas, King Skylanes Arpt: 3 mi E; Weekends. From 12,500′.

Ojai, Henderson Arpt: Weekends from 14,000′ MSL 3 mi SW.

Ojai, Lake Casitas: 1 mi NE. Up to 14,500′ MSL. Weekends and holidays.

Piru: Tues-Fri. 2 mi E. Up to 14,500′.

San Diego, Brown Fld: NW corner of fld. Weekdays, morning hrs. Up to 15,000′.

San Diego–County Arpt (Gillespie Fld): Up to 20,000′ MSL, chute opening alt aprxly 2700–3000′ MSL in vcnty of arpt.

San Diego, Otay Reservoir: Weekdays and ngts. Up to 15,000′.

San Diego Co.: 5 mi ESE Brown Fld, adj Mexico. Weekdays and ngts. Up to 15,000′.

Santa Maria Arpt: Weekends and holidays. Up to 15,000′ MSL. 6 NW.

Schellville, Sonoma Valley Arpt: Sunrise to sunset Suns.

Taft Arpt: About 6 mi E. Daily, up to 20,000′.

COLORADO

Aurora, Colfax Air Park: 2 mi W and 2 mi SE. Sat, Suns and holidays. Up to 18,500′ MSL.

Colorado Springs, Butts AAF: Weekends btn 2300 and 20,000′.

Colorado Springs, USAF Academy Air Strip: Dalgt hrs Sat, Sun and holidays; week days 0500–0800 and 1600–1900. Up to 15,000′ MSL.

Greeley, Weld Co Mun Arpt: Weekends 1500–0200. 4½ mi SSE from 7500′ AGL.

Littleton, Columbine Arpt: 2 mi S. Up to 13,500′ AGL.
Longmont Mun Arpt: Weekends and holidays up to 15,000′.

CONNECTICUT

Burlington, Johhnycake Arpt: Sat & Suns 1600–2200Z. Up to 5000′ AGL.

DELAWARE

Delmar-State Line Arpt: 4 mi radius. Up to 12,500′. Weekends and holidays.
Selbyville, American Skyways Arpt: Weekends and holidays. From 15,000′.

FLORIDA

Buchan Arpt: 7 mi S of Venice. Weekends and holidays. Up to 15,500′.
Clewiston, Airglades Arpt: Up to 12,000′.
Deland Mun Arpt: Up to 7,000′ daily and weekends.
•**Eglin AFB Aux #9 (Hurlburt Fld):** Unscheduled. Up to 12,500′.
Fort Lauderdale: 2 mi NE rdo bcn. Weekends and holidays. Up to 12,000′.
Homestead AFB: Occasionally. Up to 1,000′ MSL.
Howey Arpt: Weekends. Up to 10,000′.
Kissimmee Arpt: Daily and weekends. Up to 12,000′.
Marianna Mun Arpt: 5 mi radius; weekends during daylight hrs and intermittently daily Mon thru Fri and at ngt. Up to 12,500′.
Palatka, Kay Larkin Arpt: Weekends.
•**Sanford NAS:** Sat, Sun and holidays; weekdays 1500–SS. Up to 12,500′.
Santa Rosa Island: Daily. Up to 12,500′.
•**Umatilla Arpt:** 32 NM 325° rad Orlando VOR. Weekends 1700Z to 2230Z. Up to 7500′.
Venice Arpt: 7 mi S. Weekends and holidays. Up to 15,500′.
Williston Mun Arpt: Weekends.
Zephyrhills Arpt: Sundays. Up to 12,500′.

GEORGIA

Cleveland, White Co Arpt: Weekends. Up to 12,500′.
Dawson, Terrell Co Arpt: Intermittently daily and weekends. Up to 10,000′.
Stockbridge, Bellah Fld: Weekends. Up to 15,500′.
Villa Rica, Flying S Ranch: 2 mi NE. Sats and Suns. Up to 12,500′ AGL.

ILLINOIS

Aledo, Mercer Co Arpt: Evening and weekends. Up to 10,000′.
Alton, Civic Meml Arpt: Weekends, holidays and occasional weekdays. Up to 12,500′.
Breese Arpt: ½ mi N. Up to 7,000′.
Chicago, Hammond Arpt: Weekends. Up to 12,500′.
Danville, Vermillion Co Arpt: Weekends. Within 1½ mi. Up to 12,500′ MSL.
Hebron Arpt: Daily.
•**Hillsboro:** 3 mi SSE. Weekends, holidays and occasionally weekdays. Up to 12,500′.
Kankakee, Greater Kankakee Arpt: Weekends. From 4000′.

INDIANA

Ramsey, Glen Aire Ranch Arpt: Weekends within 5 mi radius. Up to 14,500′.
Rising Sun Arpt: Sundays. Within 5 mi radius. Up to 14,500′.
Seymour, Freeman Fld: Weekends and holidays. Up to 18,000′.

IOWA

Council Bluffs Mun Arpt: 1 mi S; up to 15,000′.
Muscatine Arpt: 10 mi radius. Evening and weekends. Up to 12,500′.

KANSAS

Fort Riley Military Reservation: Sky diving operations to 10,000′, weekends and holidays.
•**Mulvane Arpt:** Weekends and intermittently at other times Up to 22,000′. Occasionally ngts.
Salina Mun Arpt: Evenings and weekends. From 12,500′

KENTUCKY

•**Fort Knox:** 3 mi SW of Godman AAF weekends and holidays, 1800–2200Z. Up to 10,000′.
Henderson City Co. Arpt: 149° radial EVV VOR 8.1 nmi Up to 10,000′ MSL.
Hopkinsville, Christian Co. Arpt: 4 mi NNE. Tues evening and Weekends. Up to 12,500′.
Madisonville, Athey Arpt: Suns and holidays 0700–SS. Up to 12,500′.
Thornhill: 133° radial CVG VOR 15 nmi. Weekends. Up to 12,000′ MSL.

LOUISIANA

De Ridder, Beauregard Parish Arpt: Sky diving from 12,000′
Fort Polk, Polk AAF: 2 nmi radius.
Hammond Arpt: Intermittently. Up to 10,000′.

MAINE

Augusta State Arpt: Sundays, 3 mi SE.
Sanford: Unscheduled jumps from 2700′ to 12,500′.
Wiscasset Arpt: Weekends. Up to 12,000′.

MARYLAND

Cumberland, Mexico Farms Arpt: Up to 3000′. Most activity weekends.
Eldersburg, Robert E. Lee Arpt: 3 mi S EMI VOR. Up to 12,500′ MSL. Most activity weekends.
Elkton, Lovett Arpt: Weekends. Up to 3000′.
Mitchellville, Freeway Arpt: 4 mi E. Weekends and holidays Up to 12,000′.

Menomonee Falls, Aero Park Arpt: 2200–SS Mon thru Fri. Up to 12,500' MSL.

Ossee: 3 mi W. Sundays. Up to 10,000'.

PREFERRED ROUTES

A system of preferred routes has been established to guide pilots in planning their route of flight, to minimize route changes during the operational phase of flight, and to aid in the efficient orderly management of the air traffic using federal airways. The preferred routings which follow are designed to serve the needs of airspace users and to provide for a systematic flow of air traffic in the major terminal and en route flight environments. Cooperation by all pilots in filing preferred routes will result in fewer traffic delays and will better provide for efficient departure, en route and arrival air traffic control service.

The following list will hereafter appear in EACH issue of the AIRGI.

This list contains preferred routes for the low altitude stratum (below 18,000 feet MSL).

Low Altitude Stratum—A distinctive numbering system (800 Series) has been introduced to indicate some of the preferred routes in this stratum and thereby eliminate the present lengthy route descriptions. Many of the preferred routes, however, retain the common basic airway numbers or use the two systems of numbering in combination. Additional designations of "800 Series Airways" will be made where simplicity and convenience to both pilots and controllers dictate such assignments.

Preferred Route Starting and Terminating Fixes—Preferred routes generally commence and terminate at fixes on or near the perimeter of t terminal area.

Depicted on the Area Charts, produced by Coast and Geodetic Surve are the normal routes between the airport and the preferred route startin terminating fixes. Whenever a fix is shown in **bold-face** type, pilots shou refer to the appropriate Area Chart for the routing he may expect prior or after that fix as appropriate.

Preferred routes beginning/ending with an airway number indicate th the airway essentially overlies the airport and flights are normally clear directly on the airway. All preferred routes are listed alphabetically un the name of the departure airport. Major airports in close proximity a listed under the principal airport and categorized as a metropolitan are e.g., Chicago Metro Area. Official location identifiers are used in the rou description for VOR/VORTAC navaids. L/MF navaids are identified by t identifier and type: e.g., MIV/LFR, DOV/Rbn. Intersection names a spelled out. Where two navaids or an intersection and a navaid follow succession, the route is direct.

(L20, 23)=Enroute chart numbers.

STANDARD INSTRUMENT DEPARTURES (SIDs)

(Explantory information is provided in Section II–8)

CALIFORNIA

Fresno Air Terminal

In narrative form only

PINEDALE ONE DEPARTURE

Via direct Fresno VORTAC, then via (transition) or assigned route). Castle Transition—Via Fresno 273 and astle 150 radials to Castle VOR.

BOWLES ONE DEPARTURE

Via direct Fresno radio Beacon: then a 135 magnetic earing from the Fresno radio beacon to intercept the Los anos 084 radial at or above 3,000 feet; then via Los anos 084 radial to the Fresno 141 radial. Pixley Transi- on—Turn right via Fresno 141 and Bakersfield 322 dials to Bakersfield. Exeter Transition—Continue via os Banos 084 radial to intercept and proceed via Fresno 3 and Portersville 323 radials to Porterville.

● Ontario Intl Airport

Effective February 4, 1965

Ontario Colton One Departure—Change name to read: ntario Colton Three Departure. Ontario College One eparture—Change name to read: Ontario College Three eparture.

CONNECTICUT

Bradley Field, Windsor Locks

Narrative form only

AVON TWO DEPARTURE

Departure headings from all runways will be as- gned prior to take-off. Via Poughkeepsie VOR 089 dial to Poughkeepsie VOR. Maintain at or below 000 feet for 3 minutes after departure; Cross Madison OR 348 radial at or below 6,000 feet. Cross Bridge- ort VOR 357 radial at and maintain (as assigned by TC), then via (assigned route).

STAFFORD THREE DEPARTURE

Departure headings from all runways will be assigned rior to take-off. Via direct to V146, thence via V146 Putnam VORTAC; thence via Putnam VORTAC 100° dial to V16, V16 to Millis Intersection. Maintain at r below 3,000 feet for 3 minutes after departure; Cross utnam VORTAC at (as assigned by ATC). Thence via assigned route).

MADISON THREE DEPARTURE

Departure headings from all runways will be assigned prior to take-off. Via 360° radial Hartford VOR to Hartford VOR; thence direct Madison VOR; thence V475 to Deer Park VOR. Maintain at or below 3,000 feet for 3 minutes after departure; Cross Madison VOR at (as assigned by ATC), thence via (assigned route).

HARTFORD THREE DEPARTURES

Via direct Hartford VOR. Hartford VOR 258 radial to Yale Intersection. Cross Madison VOR 360 radial at or below 4,000 feet. Cross Yale Intersection at (as assigned by ATC), then via (assigned route).

Concurrently cancel Avon One. Stafford Two, Madison Two, Hartford Two Departures.

● DISTRICT OF COLUMBIA

Washington National Airport

Effective March 4, 1965

LANHAM TWO DEPARTURE

LANHAM TWO DEPARTURE NOT USABLE WHEN WASHINGTON NATIONAL IS TAKING OFF NORTH AND ANDREWS AFB IS LANDING SOUTH. **Takeoff Runway 3**—Turn right after departure, heading 050 for vector to Riverdale intersection. **Takeoff Runway 33**—Maintain runway heading, for vector to Riverdale intersection. **Takeoff Runway 36**—Turn right after departure heading 090 for vector to Riverdale intersection. **Takeoff Runway 15**—Turn right after departure heading 190 for vector to intercept Westminster VOR 186 radial. Cross Riverdale intersection at or above 3,000 feet. **Takeoff Runway 18**—Maintain runway heading for vector to intercept Westminster VOR 186 radial. Cross Riverdale intersection at or above 3,000 feet. **Takeoff Runway 21**—Turn left after departure heading 170 for vector to intercept Westminster VOR 186 radial. Cross Riverdale intersection at or above 3,000 feet. Baltimore VORTAC 231 radial, Kenton VORTAC 270 radial to SWAN POINT intersection. Cross Nottingham VOR 360 radial at 5,000 feet. Then via (transition) or (assigned route). **New Castle Transition,** Via New Castle VORTAC 231 radial to New Castle VORTAC. **Woodstown Transition,** via Kenton VORTAC 270 radial, Woodstown VOR 239 radial to Woodstown VOR. **Kenton Transition,** via Baltimore VORTAC 103 radial Kenton VORTAC 251 radial to Kenton VORTAC.

Concurrently cancel Lanham One Departure.

NEW YORK

Hancock Airport, Syracuse

In narrative form only

KIRKVILLE ONE DEPARTURE

Via front course Syracuse ILS and Georgetown VOR 352 radial to Georgetown VOR; cross Syracuse ILS LOM at 2,000 feet; cross Utica VOR 277 radial at 5,000 feet. Then via (assigned route). Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

MONROE ONE DEPARTURE

Via front course Syracuse ILS, Georgetown VOR 352 radial to West Monroe Intersection, cross Syracuse ILS LOM at 2,000 feet. Then via (transition) or (assigned route). Florence Transition—Via Syracuse VORTAC 050 radial and V145 to Utica VOR. Syracuse Transition—Via Syracuse VORTAC 050 radial to Syracuse VORTAC. Pulaski Transition—Via Georgetown VOR 352 radial and V29 to Pulaski Intersection. Take-off Runway 14—Turn left after departure direct to Syracuse ILS LOM.

OHIO

Youngstown Mun Arpt.

In narrative form only

SALEM THREE DEPARTURE

Via Youngstown VOR 197 radial to Ellwood City VORTAC 302 radial. Cross Akron VORTAC 084 radial at 3000 or above. Then via Ellwood City VORTAC 302 radial to the Ellwood City VORTAC. Cross Ellwood City VORTAC (as assigned by ATC), then via assigned route.

Departing aircraft shall be established on the Youngstown VOR 197 radial within 10 miles of the Youngstown VOR.

RHODE ISLAND

T. F. Green Arpt., Providence

In narrative form only

WARWICK ONE DEPARTURE

Takeoff Rnwy 5L/R–34—turn right to 160 heading as soon as practicable after leaving 500′. Climb on 160 heading to intercept Quonset Pt. VOR 038 radial. Takeoff Rnwy 16—Maintain rnwy heading to intercept Quonset Pt. VOR 038 radial. Takeoff Rnrwy 23L/R—Turn left to 090 heading as soon as practicable after leaving 500′. Climb on 090 heading to intercept Quonset Pt. VOR 038 radial. Radar vector to Providence VOR 132 radial to Quonset Pt. VOR 038 radial to Quonset Pt. VOR thence via Quonset Pt. VOR 218 radial to V–46. Cross Quonset Pt. VOR at 5000′ or below. Cross Norwich VORTAC 124 radial at 7000′. Cross Hampton VORTAC 082 radial (as assigned by ATC) then via (assigned route).

STERLING TWO DEPARTURE

Takeoff Runway 34–5L/R—turn left to 250 heading as soon as practicable after leaving 500 feet. Climb on 25[illegible] heading to intercept Providence VOR 284 radial. Takeoff Runway 23L/R–16—turn right to 340 heading as soon as practicable after leaving 500 feet. Climb on 340 heading to intercept Providence VOR 284 radial. Radar vector to Providence VOR 284 radial thence via Providence VOR 284 radial to Sterling VHF intersection. Cross Sterling VHF intersection at / as assigned by ATC/then via/transition/or/assigned/route. Riverhead Transition via V16 V879.

●UTAH

Salt Lake City Mun No. 1 Arpt

Effective April 1, 1965

Cancel Stansbury Three Departure.

Philadelphia Int'l. Airport, Philadelphia

Utah

Salt Lake City Mun. No. 1 Airport, Salt Lake City

Wyoming

Casper Air Terminal, Casper
Cheyenne Mun. Airport, Cheyenne

SUBSTITUTE ROUTE STRUCTURE
SHUT DOWN OF ENROUTE NAVIGATION AIDS

An extensive Airways Modernization Program is currently being effected, which requires the scheduled temporary shutdown of selected enroute navigation aids. This action will affect associated airways/routes, MEA's, etc., and will obsolete related information shown on the Enroute Low-Altitude, and High-Altitude U.S. charts. These facilities may be shutdown and/or returned to operation during the period between publication dates of the Enroute U.S. Charts. During this shutdown period the following Substitute Route Structure is operational. NOTAMS are published to cover any change in status of these facilities and pilots are advised to check NOTAMS thoroughly prior to each operation. Pilots are further advised to contact FAA Flight Service Stations regarding any doubtful status of enroute navigation aids or airways.

CALIFORNIA

FORT JONES "FJS" VOR SHUTDOWN

April 8, VOR will be shut down until aprxly April 16. For substitute route structure during shutdown use the following:

Low Altitude

SECTIONAL CHART BULLETIN

The purpose of this Bulletin is to provide a tabulation of the major changes in aeronautical information that have occurred since the last publication date of each Sectional Aeronautical Chart. The general policy is to include only those changes to controlled airspace and special use airspace that present a hazardous condition or impose a restriction on the pilot; major changes to airports and radio navigational facilities, thereby providing the VFR pilot with the essential data necessary to update and maintain his chart current. When the Sectional Aeronautical Chart is republished, the corrective tabulation will be removed from this Bulletin.

•ABERDEEN

39th Edition, March 4, 1965

No hazardous changes.

•ALBANY

54th Edition, February 4, 1965

Delete Brizee-Harmon arpt 43°05'N, 77°29'W. Delete Deposit arpt 42°03'N, 75°25'W. Change Utica VOR freq 113.9 to 108.6. Add obstn 1430' MSL 42°23'15''N, 72°24'14''W. Add obstn 1275' MSL 43°39'24''N, 73°10'-12''W. In western border change Buffalo VORTAC freq 116.5 Ch 112 to 116.4 Ch 111.

•ALBUQUERQUE

54th Edition, March 4, 1965

Delete 700' transition area at Otto VOR.

•AROOSTOOK

41st Edition, April 30, 1964

Delete Green arpt 46°02'N, 68°16'W. Realign Red 9 airway direct from Montmorency RBn to Bagotville RBn. Add obstn 740' MSL 46°09'00''N, 70°12'17''W. Add obstn 525' MSL 46°10'45''N, 71°20'00''W. Add obstn 625' MSL 46°52'50''N, 71°19'35''W. Add obstn 349' MSL 47°00'00''N, 70°31'00''W. Add obstn 433' MSL 47°16'40''N, 70°12'00''W. Add obstn 593' MSL 46°-36'05''N, 65°55'50''W. Add Burtts RBn freq 350, ident LI, class MHW 46°03'52''N, 66°52'13''W. Add Charlo (Pvt) RBn freq 203, ident CL, class HW 47°59'N, 66°20'W. Extend Loring AFB Military Climb Corridor R-3902 1 mi S & 6 mi N. Realign Fredericton LFR W leg from 103°M to 096°M. Delete Presque Isle LFR 46°44'N, 68°04'W. Add Quebec VOR freq 112.8, ident QB class BVOR M.V. 19°W 46°42'20''N, 71°37'36''W. Realign airway V 318 direct from Houlton to Quebec Add V314 airway direct from MILLINOCKET to QUEBEC (135°M QUEBEC).

•AUSTIN

EL PASO RDO: TACAN unusable beyond 30 nmi MOCA from 265° clockwise thru 300°.

FORT WORTH, GREATER SOUTHWEST RDO TACAN unusable beyond 30 nmi below 3000′ MSL.

HOUSTON RDO: TACAN unusable beyond 35 nmi b low 2500′ MSL 085–210°.

GALVESTON RDO: TACAN unusable beyond 20 nr below 3000′ MSL 040–075 °acct crs roughness.

LUBBOCK RDO: VOR unusable on 004° rad from to 25 nmi acct freq interference.

PALACIOS RDO: TACAN unusable 265–330° ac roughness.

WACO RDO: TACAN unusable beyond 13 nmi belo 5000′ MSL 175–195°.

WINK RDO: TACAN unusable beyond 17 nmi below 70 MSL 030–080°.

UTAH

CEDAR CITY RDO: VOR unusable beyond 40 nmi b low 17,500′ MSL 065–090°; below 22,000′ MSL 0 100°; below 24,000′ MSL 100–140°; below 20,0 MSL 140–150°; below 17,000′ MSL 150–170° acco reduced coverage.

DELTA RDO: VOR unusable beyond 40 nmi belo 16,000′ MSL 040–080° acct reduced coverage.

HANKSVILLE RDO: VORTAC coverage restricted fro 160 thru S to 190° 26nmi at 14,000′ MSL.

LUCIN RDO: VOR unusable beyond 40 nmi belo 15,000′ MSL 180–220°; below 12,000′ MSL 280–310 below 11,000′ MSL 310–330° account reduced covera

MILFORD: Jet Route 107 from Milford, Utah V to Rock Springs, Wyo. VOR continuous navigati signal coverage does not exist over the entire rou segment below 28,000′. VOR moderate to hvy roug ness over mountain ridges on 072 rad 10 mi out. TACAN momentary crs excursion and roughness excess of 3° exists on TACAN rads.

OGDEN RDO: VORTAC unusable beyond 40 nmi b low 21,000′ MSL 360–055°; below 16,500′ MSL 0 thru 075°; below 22,000′ MSL 075 thru 130° accou reduced coverage.

PROVO RDO: VORTAC unusable beyond 40 nmi belo 15,000′ MSL 010–035°; below 16,000′ MSL 035–05 below 15,000 MSL 275–285°; below 14,000′ MSL 28 295° acct reduced coverage. VOR roughness exists or mountain ridges N thru E btn 15 and 20 nmi.

SALT LAKE CITY RDO: VORTAC unusable beyo 40 nmi below 19,000′ MSL 010–020°; below 20,0 MSL 020–030°; below 23,000′ MSL 030–060°; belo 24,000′ MSL 060–080°; below 19,000′ MSL 080–09 below 17,000′ MSL 095–125°; below 16,000′ MSL 12 140°; below 16,000′ MSL 195–210°; below 10,0 MSL 280–290°; below 16,000′ MSL 350–010° acct r duced coverage.

VERMONT

BURLINGTON RDO: VOR unusable beyond 35 nm from 080° clockwise to 105°; 25 nmi 115–135°; 30 nm 135–155° at MOCA.

ONTPELIER RDO: VOR unusable beyond 30 nmi 205–220°; beyond 25 nmi 220–235°; beyond 30 nmi 234–280° at MOCA.

VIRGINIA

3OOKE RDO: TACAN distance unusable beyond 30 nmi 230° clockwise to 270° MOCA.

ERNDON RDO: VOR portion of VORTAC unusable elow 2500′ MSL. Beyond 30 nmi from 050–075°; eyond 20 nmi from 075–095°; beyond 35 nmi from 05°–120°; beyond 20 nmi from 165°–215° acct of rs roughness. V39 E 209° usable 5000′ and above eyond 20 nmi.

.WRENCEVILLE RDO: VOR unusable below 1800′ MSL beyond 8 nmi 215–250°; 14,500′ MSL to 18,000′ MSL 215–270° account roughness. MEA V–155 3000′ MSL btn LVL VOR and Franklinton, N.C. Int. MEA 5–454, 5000′ MSL btn LVL VOR and LIB VOR. 'hangeover point 82 nmi from LIB VOR.

NDEN RDO: DME unusable below 3500′ beyond 25 nmi 40–180°; below 5000′ 180–225° acct reduced coverage.

)NTEBELLO RDO: VOR unusable 110–220° beyond 5 nmi at MOCA. 058 rad unusable above 14,500′.

'LASKI RDO: VORTAC unusable beyond 35 nmi rom 045° clockwise to 060° at MOCA.

'ANTICO MCAS RDO: Use LFR as H facil only.

)ANOKE RDO: Woodrum VOR unusable beyond 30 nmi from 360 to 285°, 20 nmi 286–360° at MOCA. H facil unusable beyond 40 nmi from 240 to 010° elow 6000′ due excessive needle oscillation.

WASHINGTON

:LLINGHAM RDO: Intermittent roughness may be bserved on V–23 below 6000′ MSL from 40 nmi thru 0 nmi S of VOR.

:AH BAY RDO: H facil unusable 100–130° below 5 0′ MSL acct terrain.

YMPIA RDO: VORTAC' unusab'e below 7500′ MSL t 40 nmi 210-260°. TACAN unusab'e below 15,000′ ISL 260-270° at 40 nmi; below 9500′ MSL at 35 nmi 70–280° account reduced coverage. VOR 348° rad unusable below 4500′ MSL beyond 24 nmi.

S'O RDO: VOR unusable below 6500′ MSL beyond 0 nmi 150–210°; below 5500′ MSL 210–270° acct re-

duced coverage. Coverage within R-6715 from 270–320° not flt checked.

PORT ANGELES RDO: VOR coverage 40 nmi: 220–110° at 7000′; 110 140° at 14,500′; 140–150° at 20,500′; 150–170 °at 29,000′; 170–190° at 20,500; 190–220° at 16,000′.

SEATTLE RDO: LFR NW crs has splits and multiples beyond 20 nmi. VOR unusable beyond 10 nmi 158° clockwise 165°. 300° rad unusable below 14,000 within 40 nmi.

WALLA WALLA RDO: VOR coverage at 40 nmi restricted below 6000′, 355-020° and 148–176°; below 7500′ from 130–150°; below 10,500′ from 020–060° and 110-130°; below 12,700′ from 065-110°.

WENATCHEE RDO: VOR unusable beyond 20 nmi below 20,000′ MSL 000–020° beyond 30 nmi below 20,000′ MSL 020-075° beyond 40 nmi below 14,000′ MSL 075-090° below 18,000′ MSL 090–190° below 10,000′ MSL 190–240°.

WEST VIRGIN'A

BEC'KLEY RDO: VOR unusable beyond 20 nmi 325–350° below 5000′ acct crs roughness, excluding 335° rad at Montgomery Int. Voice reception Charleston FSS unreliable below 7500′ MSL 40 nmi radius Beckley VOR 030–180°. Reception satisfactory with acft o:er VOR or MEA.

WISCONSIN

LA C'ROSSE RDO: VOR unusable 100–150° and 230–060° below 3300′ MSL beyond 20 mi.

MILWAUKEE RDO: Timmerman VOR unusable beyond 35 mi 300–310° below 3400′ MSL acct reduced coverage. Alarm status MKE VOR indicated by transmission of unkeyed 1020 cycle ident signifying unusability for nav and indicating imminent equipment transfer shutdown.

WYOMING

BOYSEN RESERVOIR RDO: VORTAC has mementary crs excurisions and roughness all radials.

DUNOIR RDO: VOR restricted to awy rad use only.

SHERIDAN RDO: VORTAC unusable below 40 nmi below 17,000′ MSL 160–175°; below 15,000′ MSL 175–200° and below 16,500′ MSL 300–230° acct reduced coverage.

VOR RECEIVER CHECK POINTS

The list of VOR airborne check points and ground check points is given on the following pages. Use of the Check Points is explained in Section I–4.

NOTE: The information is provided in the following order: Facility name (plus airport name, if needed bearing in degrees magnetic from the VOR; location of the check point (distances in nautical miles); a: altitude (in feet MSL, if any).

AIRBORNE

Abilene, Tex. (Municipal): 047°; 10.1 nmi silos in center of Ft. Phantom alternate for lgt acft 099° 9 nmi ctl twr and bcn.

Alexandria, La. England AFB): 329°; over water tank.

Alexandria, La. (Esler): 152°; over hangar 3.6 nmi from VOR.

Alexandria, Minn.: 223.5°; over apch end of rnwy 22.

Allendale, S.C.: 342°; over N/S rnwy on Barnwell Co. Arpt.

Anniston, Ala.: 082°; in center of segmented circle, distance 9.5 nmi; 2000′.

Appleton, Ohio: 238°; over ctl twr Columbus, Ohio-Port Columbus Airport; 2500′.

Asheville, N.C. (Mun): 278°; over ctl twr 13.6 nmi from VOR; 3000′.

Athens, Ga.: 308°; 3 nmi over center of three rdo twrs.

Atlanta, Ga.: Lctn #1—012°; over end rnwy 09L. Lctn #2—020°; over end rnwy 27R.

Augusta, Ga. (Bush Field): 141°; directly over No. 17 of rnwy #17; 300′.

Augusta, Me. (State): 257°; over LFR, 1.8 nmi from AUG VOR; 1500′.

Austin, Tex. (Mueller Mun): 178°; Freeway Int aprxly 0.9 nmi N of Mueller Mun Arpt.

Bakersfield, Calif. (Meadows Fld): 127°; over apch end rnwy 30; 1200′.

Bangor, Me.: 072°; over FSS Bldg., Old Town Arpt; 1000′.

Bartlesville, Okla. (Phillips): 161°; over Phillips oil tank—white ½ mi E of arpt trml.

Baton Rouge, La. (Ryan): 064°; over tank S side of arpt.

Beatrice, Nebr.: 360°; over RR at Princeton, Nebr.; 2500′.

Beaumont, Tex. (Jefferson County): 056°; water twr aprxly 0.4 mi NE of NE end of rnwy 2.

Bellingham, Wash.: 145°; N end of rnwy 16–34; 660′.

Big Spring, Tex.: 199°; over the rdo bcn; 1000′ AGL.

Billings, Mont. (Municipal): 073°; Intersection of rnwys 4–22 and 9–27; 4600′.

Blackstone, Va.: 123°; beacon lgt Lawrenceville, Va. Arpt; 1500′.

Bloomington, Ill. (Mun): 030°; lctd 11 nmi NE of BMI VOR at railroad crossing river; 2000′.

Boise, Idaho (Air Trml): 086°; over dam outlet S e: Lucky Peak Reservoir, 8.5 nmi from VOR; 5000′.

Bozeman, Mont.: 145°; over BZN rdo bcn; 5000′.

Brownsville, Tex. (Rio Grande Valley Intl): 244°; wat twr in bldg area of arpt.

Brownwood, Tex: 167°; over arpt bcn.

Brunswick, Ga. (McKinnon): 023°; at arpt rotating b con.

Burlington, Iowa: 296°; over rdo twr 3 nmi NNW Burli ton Arpt.

Burlington, Vt. (Municipal): 030°; over arpt control t 4.4 nmi from VOR; 2000′.

Butler, Mo.: 073°; over FSS bldg.

Butte, Mont.: 094°; intersection of rnwy 29–33; 6500′.

Carleton, Mich. (Detroit-Wayne-Major): 031°; the E and NW/SE rnwys SE of new ctl twr; 2200′.

Casper, Wyo. (Air Trml): 201°; over intersection rnw 21–25–30; 6300′.

Centralia, Ill. (Mun): 027°; at apch end of rnwy 36.

Chadron, Nebr.: 014°; railroad intersection 1.5 nmi N a bndry.

Champaign, Ill.: 175°; over grain elevator 8 nmi S Pesotum, Ill.; 2000′.

Cleveland, Ohio (Cleveland-Hopkins): 079°; over Cle land Rbn (H) distance 13.5 nmi; 1500′.

Colorado Springs, Colo. (Peterson Fld): 320°; over mic wave twr, 6.8 nmi.

Colts Neck, N.J.: 084°; over awy bcn twr at NE corn of Red Bank, N.J. Arpt.

Concord, N.H. (Mun): 132°; over rdo twr (old LFR) nmi.

Corpus Christi, Tex. (Intl): 187°; over grain elevator 1 n E of arpt.

Cotulla, Tex.: 255°; rotating bcn on the Cotulla Intl A

Crescent City, Calif. (McNamara Fld): 104°; over Tar farm E side of town; 1000′.

Crossville, Tenn (Meml Arpt): 333°; 11 nmi over met hangar.

Cut Bank, Mont.: 312°; over center rnwy 31; 4800′.

Daggett, Calif.: 224°; over center twr LFR; 2500′.

Danville, Ill. (Vermillion Co.): 194°; int of rnwys 21 a 17; 1700′.

Dayton, Ohio (Mun): 131°; over new trml bldg, 10 nmi; 2500′.

ytona Beach, Fla. (Mun) : 157° ; over remote ctld air/gnd facility antenna.

ster, Ala. (Pryor) : 092° ; over intersection of rnwy and taxiway 236° from HSV ; 1000′.

lla, Utah: 346° ; at apch end of rnwy 34 ; 4900′.

ver, Colo.: 189° ; over EGW rdo bcn ; 5800′.

s Moines, Iowa: 356° ; center twr of DSM LFR, 4.2 nmi from VOR.

glas, Ariz. (Bisbee-Douglas Intl) : 119° ; over intersection rnwy 12–30 and 17R–35L ; 4700′.

blin, Ga. (Municipal) : 067° ; over SW end NE/SW rnwy.

ho, Idaho (Municipal) : 335° ; FAA Communications Bldg ; 5200′.

gle Lake, Tex.: 181° ; over center of football fld 0.5 nmi SW of Eagle Lake Arpt.

Dorado, Ark. (Goodwin) : 228° ; trml bldg E side of arpt.

nsburg, Wash. (Bowers) : 255° ; center, W end of rnwy 7–25 ; 2300′.

oria, Kans.: 046° ; over schoolhouse Neosho Rapids, Kans., 8.5 nmi 2500′.

ville, Wash.: 200° ; centerline, SW end of rnwy 2–20 ; 1500′.

rgreen, Ala.: 100.7° ; arpt bcn lgt twr lctd on Evergreen (Middleton) Arpt., 15.3 nmi from VOR.

go, N.Dak. (Hector) : 360° ; lctd apch end Hector Fld rnwy 35.

rrington, Mo.: 195° ; over center of Open Air Theater NE of the town of Fredericktown and 7.0 nmi from VOR : 2300′.

yetteville, Ark.: 183° ; VORTAC ; white circle on arpt ; 2500′.

yetteville, N.C.: 239° ; over water twr at Parktown, N.C. 8.0 nmi ; 1200′.

more, Calif.: 210° ; at CAV rdo bcn 1800′.

dley, Ohio: 048° ; over the Ohio Oil Company Admin Bldg at 2000′ ; aprxly 5 nmi from FDY VOR.

d, Mich. (Bishop) : Pontiac VOR 332° ; over apch end rnwy 9 ; 2200′.

ng Cloud, Minn.: 349° ; 4.5 nmi over smokestack at Glen Lake Sanatorium ; 2000′.

t Leonard Wood, Mo. (Forney AAF) : 351° ; water twr N side E–W hvy dist 4.9 nmi from transmitter.

t Smith, Ark.: 232° ; water tank at N edge of arpt ; 1300′.

ata, Calif.: 358° ; over intersection of rnwys Arcata Arpt ; 500′.

una, Calif. (Rohnerville) : 128° ; over apch end of rnwy 11 ; 1400′.

ino, Calif. (Air Trml) : 133° ; over apch end rnwy 11 ; 500′.

ge, Okla.: 094° ; over LFR ; 3000′.

lveston, Tex.: 110° ; arpt terminal bldg.

rion City, Kans.: 100° ; Cimarron, Kans. at RR tracks and Main St.

rcester, Mass.: 169° ; hangar mrkd "WORCESTER" on roof, Worcester Arpt ; 1000′.

a Bend, Ariz.: 193° ; over apch end of rnwy 35 of Gila Bend Aux. Fld ; 1500′.

Goodland, Kans. (Mun) : 083° ; over water twr NE edge of town of Brewster, Kans., 16 nmi ; 4000′.

Gordonsville, Va.: 305° ; over intersection of rnwy and center txwy Charlottesville-Abermarle Arpt., 16 nmi from GVE–VOR ; 2000′.

Grand Forks, N. Dak.: 315° ; over Int N/S and E/W rnwys ; 1900′.

Grand Island, Nebr.: 141° ; over smoke stack 5.5 nmi from VOR ; 3100′.

Grand Junction, Colo. Walker Fld) : 059° ; int rnwys 29 and 22 ; 6500′.

Grants, N. Mex.: 295° ; in flt over FSS adj to rnwy ; 7000′.

Great Falls, Mont.: 026° ; center NE end rnwy 3–21 ; 3900′.

Hallsville, Mo.: 225° ; 14 nmi Int of E/W and N/S rnwys over Columbia Mun Arpt., Mo. ; 2000′.

Harlingen, Tex.: 149° ; over rot bcn on Mun Arpt.

Harrisburg, Pa. (York State) : 109° ; over triangle formed by rnwys : 2000′.

Hattiesburg, Miss. (Mun) : 149° ; over water twr and rotating lgt bcn on arpt 10 nmi, 800′.

Hayes Center, Neb.: 258° ; 28 nmi over center of town of Enders, Neb. ; 4500′.

Hibbing, Minn.: 311° ; over FSS Bldg ; 2400′.

Hickory, N.C.: 225° ; over end rnwy 24.

Hill City, Kans.: 057° ; Hill City Arpt bcn lgt 23 nmi from the VOR.

Hobart, Okla.: 352° ; centerline of N/S rnwy 100′ above the elevation of the rnwy.

Hobbs, N. Mex. (Lea County) : 030° ; over circle on runup pad apch end rnwy 3.

Hoquaim, Wash. (Bowerman) : 037° ; W end and center rnwy 6 ; 500′.

Houghton, Mich. (County Mem'l) : 241° ; WHDF com. bdcst twr 3.5 nmi from VOR ; 2100′.

Houlton, Me.: 042° ; over Admin Bldg on E side of flt and 5.5 nmi from VOR ; 1500′.

Houma, La.: 117° ; over intersection of rnwys 17–35 and 11–29.

Houston, Tex. (Andrau) : 276° ; arpt bcn on arpt ; 500′.

Houston, Tex.: 099° ; over intersection of E/W txwy and parking ramp of Ellington Field.

Huron, S. Dak. ((Howes) : 153° ; lctd over HON/SBH ; 2000′.

Hutchinson, Kans.: 032° ; apch end rnwy 3 Hutchinson Mun Arpt.

Imperial, Calif.: 313° ; apch end of rnwy 32 ; 200′.

International Falls, Minn.: 142° ; RR bridge over stream of Ericsburg, Minn 5.4 nmi ; 2200′.

Jackson, Miss. (Hawkins) : 189° ; over arpt intersection of rnwys 11–29 and 34L–16R.

Jackson, Tenn. (McKellar) : 267° ; over bcn twr above arpt ; 1000′.

Joliet, Ill.: 102° ; over centerline of NW end of NW/SE rnwy ; 1500′.

Keeler, Mich.: 266° ; over intersection of N/S and E/W rnwys at Ross Fld, Benton Harbor, Mich. ; 1600′.

Kennebunk, Me.: 061° ; over Portland Arpt control twr 18.5 nmi from Kennebunk VOR ; 1500′.

Kirksville, Mo.: 138° ; over water twr at La Plata, Mo. (8.2 nmi from VOR).

Kokomo, Ind.: 097°; over int NW/SE and NE/SW rnwys Marion Mun Arpt., Ind., 17.5 nmi from VOR; 1000′.

La Crosse, Wis.: 321°; 5 nmi LFR; alt 1800′.

Lafayette, Ind.: 135°; over Purdue Univ Stadium, 2100′.

Lake Charles, La. (Mun): 253°; over rotating bcn on ctl twr, 6.2 nmi.

Lamoni, Iowa ((Lamoni): 041°; over hwy "Y" 1 nmi W of Leon, Iowa.

Laredo, Tex.: 315°; over arpt bcn 9.5 DME.

●**Laurel, Miss.** (Municipal): 025°; over water twr and rotating lgt bcn on arpt. 17.5 nmi from HBG VOR, 800′.

Lewistown, Mont.: 072°; above center of rnwy 7; 5200′.

Lexington, Ky. (Blue Grass): 305°; arpt ctl twr 7.6 nmi from LEX VOR; 2500′.

Liberal, Kans.: 056°; elevator 8.5 nmi NE Liberal, Kans. along Railroad.

Litchfield, Mich.: 051°; NE/SW rnwy Reynolds Fld, Jackson, Mich.; 2000′.

Livingston, Mont.: 109°; over ant of Livingston "H" facility; 5700′.

London, Ky.: 027°; trml bldg 3.7 nmi from LOZ VOR; 2500′.

Lufkin, Tex.: 328°; rotating bcn on Angelina Co. Arpt.

Macon, Ga. (Mun): 246°; 4.0 nmi from VOR over water tank; 2000′.

Malden, Mo.: 349°; RR crossing 0.5 nmi E of Dexter, Mo.

Manchester, N.H. (Grenier Fld-Manchester Mun): 341°; over former USAF arpt ctl twr E side 17–35 rnwy. 5.0 nmi; 1500′.

Marquette, Mich.: 120°; 5.5 nmi over NW tip of Pelesier Lake; 2000′.

Marshall, Tex.: 320°; water twr N of arpt.

Marshall, Mo. (Meml): 321° BWR; over MHL VORTAC Bldg; 2000′.

Marysville, Calif. (Yuba County): 067°; intersection of rnwys; 1500′.

Massena, N.Y. (Richards): 297°; Admin Bldg; 1500′.

McComb, Miss. (Pike County): 248°; revolving arpt bcn.

Medford, Oreg.: 212° (VOR); over rdo twr, 4.8 nmi 3000′.

Merced, Calif.: 289°; (Castle VOR); over end rnwy 30; 650′.

Midland, Tex. (Air Trml): 170°; over apch ends of rnwys 22 and 28; 1000′.

●**Miles City, Mont.**: 031°; over apch end of rnwy 4, 3000′.

Millinocket, Me. (Mun): 317°; over FSS Bldg; 1500′.

Milwaukee, Wis. (General Mitchell); 123°; over MKE LFR.

Minneapolis, Minn. (Crystal Arpt): 166°; over apch end rnwy 13L. 4.9 nmi VORTAC; 1500′ nmi.

Minot, N. Dak.: 241°; apch end rnwy 26; 1900′.

Montebello, Va. (Preston Glenn near Lynchburg, Va.): 192°; intersection all rnwys; 2500′.

Montgomery, Ala. (Dannelly): 319°; over water twr, distance 6.1 nmi from VORTAC.

Muskegon, Mich. (County): 256°; over Muskegon LFR; 1500′.

Myrtle Beach, S.C. (AFB): 061°; over apch end rnwy 5 Crescent Beach Arpt.; 500′.

Napa, Calif. (County): 045°; over rotating bcn on arpt 500′.

Naperville, Ill.: 328°; over RR underpass lctd ½ nmi N of the DuPage County Arpt; 2000′.

Nashville, Tenn.: 242°; WSM rdo twr near Brentwood Tenn., 10.2 nmi from VOR.

Neola, Iowa: 047°; over grain elevator Harlan, Iowa 2500′.

Neosho, Mo.: 343°; center triangle formed by the intersection of 3 rnwys of Joplin, Mo., Mun Arpt.

NewBern, N.C.: 259°; Int of E/W rnwys Oak Grove (navy arpt.

●**New Orleans, La.** (Lakefront Arpt): 081°; over Lakefront twr.

Newton, Iowa: 142°; lctd apch end NW/SE rnwy.

Norfolk, Nebr.: 095°; over racetrack town of Stanton Nebr.; 2600′.

North Bend, Oreg.: 254°; intersection rnwy 22–31; 750′.

North Platte, Nebr. (Lee Bird): 82.6°; over water tr Brady, Nebr.; 4000′.

Oklahoma City, Okla. (Will Rogers): 100°; rdo bcn st 1800′.

Oklahoma City, Okla. (Wiley Post): 041°; OKC VOR I rnwys 17–35 and 12–30; 1800′.

Omaha, Nebr. (Eppley Fld): 309°; centerline of SE e of NW/SE rnwy.

O'Neil, Nebr.: 115°; at intersection of E/W road and t railroad ½ nmi SE of Inman, Nebr.

Ontario, Calif. (Intl: 347°; over and parallel with tw btn rnwy 21 and 25; 2300′.

Oshkosh, Wis.: 017°; WOSH Commercial Bcst twr 3 nmi from VOR.

Ottumwa, Iowa (Mun); 303°; int of rnwys 32 and 22.

Peck, Mich.: 163°; over apch end rnwy 3 on St. Clair (Arpt; 2200′.

Philip, S.D.: 156°; over 2712′ twr 5 nmi from VOR; 330

Phoenix, Ariz.: 256°; centerline rnwy 8R–26L; 2800′.

Picayune, Miss.: 140°; over rotating lgt bcn on arpt.

Worland, Wyo. (Municipal) : 010° Boysen Reservoir VORTAC ; over taxi strip between Trml Bldg and rnwy 16–34 ; 5200′.
Worthington, Minn.: 047° ; over grain elev at Brewster, Minn. ; 2800′.
Yakima, Wash.: 246° ; intersection N/S and E/W rnwys ; 1600′.
Yankton, S.D.: 256° ; 7 nmi over twr ; 2500′.
Yuma, Ariz. (MCAS/Yuma Intl) : 166° ; centerline rnwy 17–35 ; 400′.

GROUND

Aberdeen, S. Dak. (Saunders) ; 304° ; midway and center of N/S taxi strip leading from S edge ramp on E side arpt.

Albany, Ga.: 149.5°; center of tie down area on N edge or ramp.

Alexandria, La. (Esler Fld): 151°; 3.5 nmi in front Admin Bldg.

Alice, Tex. (Jim Wells Co. Mun): 270°; on taxi strip N of hangar.

Allentown, Pa. (Allentown-Bethlehem-Easton): 178°; on rnwy 17 near the intersection of rnwy 24.

Amarillo, Tex. (AFB/MUN): 207°; lctd 985′ SE of centerline on NE end of the NE/SW rnwy.

Amarillo, Tex. (Tradewind Arpt): 003°; Send on curve of taxiway 50′ W apch end rnwy 35 centerline.

Anderson, S.C. (Mun): 038°; on ramp in front of trml bldg.

Ardmore, Okla. (Mun): 045°; adjt to S end of NS rnwy.

Atlantic City, N.J. (Pomona) **NAFEC**: Lctn #1—313°; on runup pad at apch end rnwy 13, 250′ from centerline rnwy 13–31. Lctn #2—230°; on runup pad at apch end rnwy 4, 500′ from centerline rnwy 4–22. Lctn #3—208°; on runup pad at apch end rnwy 35, 250′ from centerline of rnwy 17–35. Lctn #4—121°; on runup pad at apch end rnwy 31, 250′ from centerline of rnwy 13–31.

Baltimore, Md. (Friendship Int'l): Lctn #1–293°; centerline of rnwy 10–28 on old runup pad. Lctn #2—290°; 400′ N of centerline of rnwy 10–28 on runup pad.

Bartlesville, Okla. (Phillips): Lctn #1—167°; S end parallel taxi strip. Lctn #2—166°; N end parallel taxi strip. Lctn #3—166°; opposite trml parallel taxi strip.

Beaumont, Tex. (Jefferson County): 051°; W edge of N end of parking ramp.

Bemidji, Minn: 130°; SE corner of Trml ramp.

Big Spring, Tex. (Howard County): 140°; ctr of runup area to rnwy 16.

Binghamton, N.Y. (Broome County): 077°; 400′ S of ctl twr on S ramp south.

Bismark, N. Dak.: 275°; intersection of N/S taxi strip and the apch end of rnwy 13.

Blythe, Calif. (Riverside Co.): 048°; on ramp 500′ in front of FSS Bldg.

Boise, Idaho (Air Trml): 084°; center N/S taxiway between rnwys 28L–10R and 28R–10L on fld.

Bowling Green, Ky. (Bowling Green-Warren County): 021°; taxiway in front of Admin Bldg.

Bristol, Tenn. (Tri-City): 282°; SW end of ramp in front of trml bldg.

Brownsville, Tex. (Rio Grande Valley Intl): 248°; apch end rnwy 13L.

Carlsbad, N. Mex.: 334°; immediately W of FSS and twr bldg on ramp.

Chattanooga, Tenn. (Lovell): 332°; centerline S taxiway at point 175′ NE of centerline rnwy 32.

Cheyenne, Wyo.: 199°; on yellow line on taxi strip immediately SE or apch end rnwy 8.

Chicago (West Chicago), Ill. (Du Page Co.): 067°; 5.2 nmi on SW corner of N parking ramp at int of txwy to rnwy 15 and txwy paralleling rnwy 15–33.

Childress, Tex.: 353°; intersection of edge of ramp at center taxi strip.

Cincinnati, Ohio: (See Covington, Ky.).

College Station, Tex.: 095°; on W edge of parking ramp of Easterwood Arpt.

Columbia, S.C. (Owens Fld): 022°; compass rose on parking ramp.

Columbia, S.C. (Mun): 331°; circle 450′ S of ctl twr at 235′.

Columbus, Ga. (Muscogee Co.): 145°; pointed circle W end of main ramp area.

Columbus, Miss. (Lowndes County): 095°; at center taxiway between parking ramp and rnwy.

Covington, Ky. (Greater Cincinnati): 043°; rnwy 27 E of intersection rnwys 27 and 22.

Cross City, Fla. (Site 58, MEM–TPA): 298°; taxiway near wind indicator and rotating bcn lgt.

Dalhart, Tex.: 170°; SE corner of main ramp.

Dallas, Tex. (Addison): 159°; intersection of center and parallel taxiways.

Danville, Va. (Mun); 338°; S of trml bldg center of intersection of txwy to rnwy 6 and txwy to rnwy 2.

Dickinson, N. Dak.: 182°; intersection of E/W txwy and N/S txwy.

Dodge City, Kans.: 150° center of NW end of NW/S rnwy.

Dothan, Ala. 186°; intersection of ramp and taxi strip NW of trml bldg.

Dubuque, Iowa: 335°; on ramp in front of terminal bldg.

Duluth, Minn.: 012°; center of intersection formed by taxi strips leading to rnwys 31 and 2 just off SE corner of ramp.

Duncan, Okla. (Halliburton Fld): 328°; trml ramp.

Dyersburg, Tenn.: 250°; intersection of ramp and center taxi strip.

East Hartford, Conn. (Rentschler): 347°; lctd at taxi strip near N side of ctl twr.

Eau Claire, Wis.: 180°; center of concrete ramp 150′ W of Arpt Opern Office.

Elizabeth City, N.C. (CGAS): Lctn #1—028°; lctd on taxiway leading from CG ramp.

Elko, Nev.: 329°; on apron just off NE end of rnwy 5–23.

Elmira, N.Y. (Chemung County): 066°; midpoint of short taxistrip between rnwy 10 and 6 at W side of apron aprxly 198′ S of C/L rnwy 10 and 374′ N of C/L rnwy 6.

Erie, Pa. (Erie-Port Erie): 059°; txwy apchg rnwy 6.

Eugene, Oreg. (Mahlon-Sweet): 068°; apch to apron immediately W of the Amin Bldg.

Fayetteville, N.C. (Grannis): 305°; on rnwy turnoff in front of ctl twr.

Florence, S.C.: 235°; on taxiway W of the end of rnwy 1.

Fort Benning, Ga. (Lawson AAF): Lctn #1—021°; run up area on txwy at apch end of rnwy 20. Lctn #2—019° run up area on txwy W ctl twr at intersection of rnwy 02–20 and 14–32. Lctn #3—055°; run up area on txwy S of ctl twr at junction with rnwy 14. Lctn #4—130°; run up area on txwy at apch end of rnwy 32.

Fort Dodge, Iowa: 118°; 6.1 nmi from VOR on W edge of trml bldg.

Ft. Lauderdale, Fla (Hollywood Intl Arpt) : 120° ; on ramp in front of Trml Bldg.

Fort Myers, Fla. (Page) : 172° ; N side of Trml ramp.

Fort Riley, Kans. (Marshall AAF) : 030° ; on SE corner of tie down area and taxiway apchg rnwy 4.

Fort Rucker, Ala. (Cairns AAF) : Lctn #1—019° ; run up area on txwy apch end rnwy 13. Lctn #2—035° ; NW of Int rnwy 13 and 18. Lctn #3—040° ; run up area on txwy Int rnwy 13 and 18. Lctn #4—059° ; run up area on txwy N of apch end rnwy 24. Lctn #5—063° ; run up area on txwy S apch end rnwy 24. Lctd #6—058° ; run up area on txwy at Int rnwy 24 and 36. Lctn #7—078° ; run up area on txwy W of apch end rnwy 36. Lctn #8—062° ; on run up area txwy N of apch end rnwy 6.

Fort Stockton, Tex.: 116° ; on ramp N of terminal.

Goldsboro, N.C. (Seymour Johnson AFB) : 028° ; run up pad at apch end rnwy 8.

Green Bay, Wis. (Austin-Straubel) : 141° ; intersection of circular taxi strip, W of Admin Bldg., and taxi strip leading to intersection of S and SE rnwys.

Greensboro, N.C.: 213° ; Ramp in front of twr.

Greenwood, Miss.: 060° ; central taxiway adj to ramp.

Greenwood, S.C. (County) : 251° on taxiway apch end of rnwy 9.

Gulfport, Miss.: 098° ; on arpt.

Harrison, Ark.: 131° ; Int taxiway and ramp.

Helena, Mont. (City-Co.) ; taxiway adj to apch end rnwy 26.

Hobbs, N. Mex. (Lea County) : 030° ; on runup pad apch end rnwy 3.

Hot Springs, Ark.: 245° ; taxiway adj to rnwy 5.

Houston, Tex.: 292° ; NE end rnwy 12.

Hyannis, Mass. (Barnstable Mun) : 243° ; ictd on rnwy apron for rnwy 24.

Idaho Falls, Idaho (Fanning Fld) : 007° ; junction of N/S txwy and rnwy 16–34, at NE corner of arpt.

Ithaca, N.Y. (Tompkins Co.) : 202° ; at bend in txwy, 375′ from centerline of NW/SE rnwy.

Jamestown, N. Dak.: 258° ; junction of taxi strip leading from hangar with SW taxi strip.

Johnstown, Pa. (Cambria County) : 155° ; taxiway to rnwy 33.

Junction, Tex. (Kimble County) : 143° ; N edge of parking ramp.

Key West, Fla. (Boca Chica) : 091° ; W just N of apch end of rnwy 7.

Key West, Fla. (Int'l) : 131° ; NW portion of ramp.

Kinston, N.C. (Stallings) : 230° ; 500′ in front of Admin Bldg.

Klamath Falls, Oreg.: 294° ; 154′ N of txway in front of Admin Bldg., and 36′ from E edge of ramp.

Lafayette, La.: Lctn #1—350° ; on taxiway at N end N/S rnwy. Lctn #2—343° ; on taxiway at S end N/S rnwy.

La Grange, Ga.: 106° ; on compass rose at taxi strip intersection aprxly 500′ due S of Admin Bldg.

Lancaster, Pa.: Intersection or ramp and txwy leading to intersection of rnwys.

Lansing, Mich. (Capital City) : 053° ; center of apch end rnwy 5.

Laramie, Wyo. (Brees) : 100° ; on loading ramp.

Laredo, Tex. (AFB) : Lctn #1—137° ; off end of ramp on taxiway 2, 4.8 nmi. Lctn #2—131° ; off S end of ramp on taxiway 6, 4.0 nmi.

Laredo, Tex.: 315° ; on ramp adj to apch hcn.

Las Vegas, Nev. (McCarran Fld) : 351° ; on run-up area W side rnwy 19.

Las Vegas, N. Mex.: 231°, concrete ramp N of FSS Bldg.

Lawton, Okla.: 349° ; on trml apron at the point intersecting the S taxi strip.

Little Rock, Ark. (Adams) : 314° ; on taxi strip adj to junction rnwy 14.

Longview, Tex. (Gregg County) : 125° ; txwy adj to rnwy 13 to end of rnwy 13.

Louisville, Ky. (Bowman) : 329° ; taxiway W of rnwy 1.

Louisville, Ky. (Standiford) : 301° ; taxiway between ramp and rnwy 19.

Lubbock, Tex.: 111° ; W edge of ramp N of trml bldg.

Lufkin, Tex.: (Angelina Co. Arpt) : 328° ; Intersection of ramp and taxiway in front of Trml Bldg.

Mansfield, Ohio (Mun) : 133° ; at intersection of NW and SW taxiways.

Marfa, Tex. (Alpine) : 108° ; S edge of ramp in front of FSS.

Marianna, Fla.: 310° ; ESE end taxiway 6.

Marshall, Tex. (Harrison Co Arpt) : 318° ; Int of E and N/S taxiway in front of N ramp.

Martinsburg, W. Va.: 281° ; near apch end of rnwy 35.

Mason City, Iowa: 356° ; on centerline S end of N/S rnwy.

McAlester, Okla. (Mun) : 350° ; taxistrip at terminal ramp.

McAllen, Tex. (Miller Int'l) : Lctn #1—040° ; at intersection E/W txwy and N/S txwy. Lctn #2— 012° ; in front airline trml on gate two loading spot,.

Melbourne, Fla. (Eau Gallie) : 146° ; 220′ E of FSS.

Meridian, Miss. (Ky) : 121° ; from run up ramp for rnwy 23.

Midland, Tex. (Air Trml) : Lctn #1—188° ; center of warm up pad for rnwy 10. Lctn #2—178° ; int txwy C and ramp in front of Trml Bldg.

Mineral Wells, Tex.: 307° ; intersection of txwy and NW rnwy.

Missoula, Mont. (County) : 340° ; 5′ from edge of ramp in front of Admin Bldg.

Mobile, Ala. (Bates) : 107° ; Int of N/S and E/W txwys E of rnwy 18–36. 109.5° ; Int of W ramp and W txwy.

Monroe, La. (Selman) : 033° ; arpt ramp in front of twr structure adj to the txwy leading to intersection of rnwys 17–35 & 4–22.

Muscle Shoals, Ala.: 289° ; eastern end of E/W rnwy 11–29 equi-distance from end and both sides of rnwy.

Nantucket, Mass. (Memorial) : 241° ; taxiway apchg rnwy 24.

Needles, Calif. (Site 25B, LAX–AMA) : 253° ; on ramp in front of Admin Bldg.

New Bern, N.C.: 088° ; on compass rose at ramp.

New Orleans Intl, La. (Moisant Fld) : 235° ; center of perimeter txwy 100′ S of rnwy 10.

Norfolk, Va. (Mun) : 031° ; center of txwy "E", 250′ NW of centerline of rnwy 22.

Oakland, Calf. (Metro-Oakland Int'l): 081°; middle of pad between rnwys 27L and 27R.

Olympia, Wash.: 347°; on ramp in front of Admin Bludg.

Orlando, Fla. (Herndon): 300°; midpoint of N/S taxiway on W bndry of arpt.

Paducah, Ky. (Barkley): 040°; on txwy apchg end of rnwy 22.

Palacious, Tex.: 119°; intersection NW end NW/SE rnwy and S txwy strip.

Panama City, Fla. (Bay Co. Arpt): 195°; N/S txwy 1050' N or Term bldg.

Paris, Tex. (Cox Fld): 348°; intersection of N/S and E/W txwys.

Parkersburg, W. Va. (Wood County): Lctn #1—209°; run-up area N side of rnwy 28. Lctn #2—207°; on txwy near intersection rnwys 16 and 21.

Pasco, Wash.: 020°; S of int ofN/S txwy and rnwy 20L.

Paso Robles, Calif.: 248°; 150' S of Admin Bldg on parking ramp, indicated by circle and sign.

Pecos, Tex. (Mun): 133°; on ramp adj to center taxiway.

Pellston, Mich. (Emmet Co.): 239°; intersection of centerlines of N/S rnwy and E/W txwy of arpt.

Pendleton, Oreg.: 076°; 200' W of Admin Bldg.

Peoria, Ill. (Greater Peoria): 098°; at SW corner of service ramp E side of fld.

Philadelphia, Pa. (North Philadelphia): 215°; on taxi strip between ramp and rnwy 10.

Philipsburg, Pa. (Black Moshannon-State): 252°; rnwy intersection.

Pierre, S. Dak.: 250°; in front of municipal hangar.

Pine Bluff, Ark. (Grider): 179°; center txwy at junction N/S rnwy.

Ponca City, Okla.: 101°; taxi strip at junction to trml ramp.

Pontiac, Mich.: 114°; center of warmup pad S of apch end rnwy 27.

Pueblo, Colo.: 244°; painted circle with arrow on ramp W of Admin Bldg.

Quincy, Ill. (Quincy-Baldwin Fld): 030° at intersection of NE/SW and NW/SE taxi strips N of trml bldg.

Raleigh, N.C.: 244°; end rnwy 5.

Rapid City, S. Dak.: 320°; in front of Admin Bldg adj to center taxi strip.

Raymond, Nebr. (Lincoln AFB/Mun): 174° run up pad of rnwy 35R along centerline of N/S txwy.

Redding, Calif. (Mun): 310°; intersection txwy and rnwy 12.

Redmond, Oreg.: 066°; on ramp in front of Admin Bldg 60' W of centerline of txwy to rnwy 10–28.

Reno, Nev.: 240°; lctd on concrete runup mat for rnwy 16.

Riverton, Wyo. (Mun): 178°; txwy between Admin Bldg and rnwy.

Roanoke, Va. (Woodrum): 099°; filled area rnwy 27.

Rochester, Minn.: 030°; of taxiway that enters apch end of rnwy 31.

Rochester, N.Y. (Monroe Co.): 149°; on ramp in front of ctl twr 415' from centerline rnwy 1–19 and 305' from centerline of rnwy 7–25.

Rock Springs, Wyo.: Lctn #1—266°; in center of turn around E end rnwy 25. Lctn #2—261°: in cente of turn-around W end rnwy 7.

Rockford, Ill.: 112°; apex of txwys at center of arpt.

Rocky Mount, N.C.: 263°; right 3 rnwy 33, marker.

Rome, Ga. (Russeell Fld): 348°; Intersection of taxiway 200' S of the terminal bldg.

Saginaw, Mich. (Tri-City): 280°; lctd on NE parkit ramp 12' from field edge near center txwy.

St. Paul, Minn., (Downtown Arpt): 291°; over drain i center of int parking ramp and taxiway in front o trml bldg.

St. Petersburg, Fla. (Pinellas County Int'l): 255°; parki ramp 500' SE of ctl twr.

St. Thomas, V.I. (Charlotte Amalie, Truman): 118°: o center point of arpt txwy on line 3 mi WNW.

Salinas, Calif. (Mun): 257°; rgt shoulder rnwy 21, direct in front of trml bldg.

Salisbury, Md. (Salisbury-Wicomico County): 243°; ram front of ctl twr.

San Angelo, Tex. (Mathis): 236°; E edge of ramp in fro of twr.

San Antonio, Tex. (Stinson Mun): Lctn #1; 329R, run u area at apch end rnwy 9. Lctn #2: 335R, on W en ramp opposite hangars 1 and 2.

San Juan, Puerto Rico (Intl): 081°; lctd on taxiway N trml bldg.

Santa Barbara, Calif.: 198°; gate 2 in front of trml bld over Figure 2 painted on apron.

Santa Catalina, Calif.: 346°; SW corner apch end rnwy Santa Catalina Arpt.

Santa Fe, N. Mex. (New Municipal): 334°; at junctio main intersection txwy and ramp.

Sarasota, Fla. (Bradenton): 172°; on ramp 800' N trn bldg.

Scottsbluff, Nebr. (Mun: 240°; NE edge ramp opposi trml bldg and W of txwy leading to rnwy 30 aprx 3000' from apch end.

Seattle, Wash. (Seattle-Tacoma Int'l): 028°; 30' near ed of ramp S and W of Admin Bldg.

Sioux City, Iowa: 314°; painted circle directly in front new twr.

Sioux Falls, S. Dak.: 148°; in line with E edge of txwy of ctl twr, 75' S from N edge of parking ramp.

South Bend, Ind. (St. Joseph Co.): 178°; center of weste N/S txwy 200' N of N edge of trml ramp.

Spartanburg, S.C. (Municipal): Lctn #1—192°; at com pass rose on ramp.

Springfield, Ill. (Capital): 214°; in front of twr at inte section NW/SE and NE/SW taxi strips.

Springfield, Mo.: 191°; at bend in N/S txwy 400' S of end of taxi strip.

Stinson, Tex. (Mun Arpt): Lctn #1, 329°: runup area a apch end runway 09. Lctn #2, 335°: on W end o ramp opposite hangars 1 and 2.

Thermal, Calif.: 328°; ramp 250' in front of hangar.

Topeka, Kans. (Philip Billard Arpt): 212°; N/S taxiwa W of tetrahedron.

Truth or Consequences, N. Mex.: 155°; on SE/NW txwy ad to wind cone.

Tucumcari, N. Mex.: Letn #1—255°; over square metal plate letd on hangar ramp paved area. Letn #2—266°; over painted orange circle, letd on taxi strip 100' off end of rnwy 8.

Tulsa, Okla. (Int'l): Letn #1—260°; W end rnwy 8. Letn #2—266°; on txwy SW corner AAL ramp. Letn #3—265°; in runup position for rnwy 17R.

Tuscaloosa, Ala. (Van De Grauff): 241°; point letd on centerline of txwy midway between ramp and rnwy.

Twin Falls, Idaho (Joslin): 030°; on parking strip apron 300' SW of Admin Bldg.

Vero Beach, Fla.: 112°; on taxiway adj to wind sock adj to rnwy 11–29.

Vichy, Mo.: 241°; on center line of NE/SW rnwy 125' from NE end Rolla National Arpt.

Victoria, Tex. (Victoria Co.-Foster): 126°; apch end rnwy 13L.

Waco, Tex., (Muni): 132°; ramp N of terminal.

Walla Walla, Wash. (City-County): 025°; ctr of txwy apch rnwy 20, mrkd.

Walnut Ridge, Ark.: 050°; taxi strip at parking apron adj to tetrahedron.

Watertown, N.Y. (Mun): 048°; ramp in front of Admin. Bldg.

Watertown, S. Dak.: 184°; letd SE corner of ramp near taxiway leading to rnwy 12–30.

Wausau, Wis. (Alexander): 338°; 100' N of wind tee, 30' from S edge of concrete trml ramp where concrete ramp terminates and blacktop ramp begins.

Wenatchee, Wash. (Pangborn Fld): 45°; front of Administration Bldg.

Westfield, Mass.:304°; from center of compass rose letd end of rnwy 15.

Wheeling, W. Va. (Wheeling-Ohio County): 219°; txwy on E side of ramp.

Williamsport, Pa., (Williamsport-Lycoming Co.): 237°; Int of txwy to rnwy 9 and center txwy.

Woodring, Okla.: 348°; ramp W of Term. Bldg.

Youngtown, Ohio: 182° compass rose end of rnwy 18.

Zanesville, Ohio: 010°; on arpt 270' NE of intersection of NE/SW and NW/SE taxistrips on centerline of NE/SW taxistrip.

VFR AIRPORT TRAFFIC PATTERNS

(In accordance with FAR PART 91.89(c)(3))

Airports	*Runways*	*Departure Procedures*	*Traffic Patterns Alts.*
Atlanta, Ga.	9R, 9L	No turns until 3 miles, 2500′ for *large acft.	
	27R, 27L	No turns until 3 miles, 2500′ for *large acft.	
	15	No turns by *large acft. over more populated areas until 3 mi., 2500′.	
	21	Turn south when speed & altitude permit, or as directed by ATC.	
Betts AAF, Tobyhanna Supply Depot, Pa.	14	Right hand tfc pattern.	
Burlington Mun., Vt.		Single engine.	1140′ MSL
		Multi engine.	1340′ MSL
•Caldwell-Wright, Fairfield, N.J.	27	Acft shall not start crosswind leg until well past the school lctd ¼ mi to the right of the extended rnwy centerline and ¼ mi from the arpt.	1000′ AGL (all rnwys)
Chicago–Midway, Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
Chicago–OHare I'ntl Arpt., Ill.		Turbine powered acft climb as rapidly as possible.	2000′ AGL
•Dover ABF, Del.	01	Right hand tfc pattern.	
	31	Right hand tfc pattern.	
•Fresno Air Terminal, Calif.	29R	*Large reciprocating and turboprop aircraft*–climb on rnwy heading to 1000′ AGL, before starting left turn prior to leaving or continuing to oper in the left tfc pattern.	Turbojets–2000′ AGL Turboprops and large reciprocating engine aircraft–1500′ AGL
	25	*Large reciprocating and turboprop aircraft*–climb on rnwy heading to 1000′ AGL before starting left turn prior to leaving or continuing to oper in the left tfc pattern.	
	29R	*Turbojets*–climb on rnwy heading until past Fresno State College before making right turn out of tfc or continuing to oper in the right tfc pattern.	
Gardner, Kans.	East	Recommend alt not above 400′ AGL until cross-wind leg northbound. Exit pattern NW to remain clear of tfc patterns of Olathe NAS, 3.5 mi NE.	
Jennings Arpt, La.	13, 17, 22	Right hand tfc pattern.	
Kansas City Fairfax Mun., Kans.		Acft under 12,500 lbs.	600′ AGL

* Large acft—acft weighing over 12,500 lbs maximum certificated take-off weight.

Airports	*Runways*	*Departure Procedures*	*Traffic Patterns Alts.*
ake Charles, La.	15, 22	Right hand tfc pattern. 1000' slow acft pattern; 1500' turbine powered fixed-wing acft.

	34	Right turn after takeoff.	
orrance Mun., Calif.	11L	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 45 degrees from the runway departure heading and continue climb.	
	11L	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Crenshaw Boulevard, turn left 90 degrees to the departure runway heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the right of the cross wing leg course.	
	11R	All aircraft—Climb on departure rnwy heading to 1500'.	
	29R	Large aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 45 degrees from the runway departure heading and continue climb.	
	29R	Light aircraft—Upon reaching an altitude of 500 feet MSL but not prior to reaching Hawthorne Boulevard, turn right 90 degrees to runway departure heading (cross wind leg), thence depart the traffic pattern climbing 45 degrees to the left of the cross wind leg course.	
	29L	All aircraft—Upon reaching an altitude of of 500 feet MSL, make left turn from the departure runway heading to intercept an area approximately over the Pacific Coast Highway, then proceed in a westerly direction until reaching 1,500 feet MSL or the shoreline.	
ilkes-Barre Scranton, Avoca, Pa.	16, 22	Right hand tfc pattern.	
inona, Minn., Max Conrad Fld		Right tfc NW.	

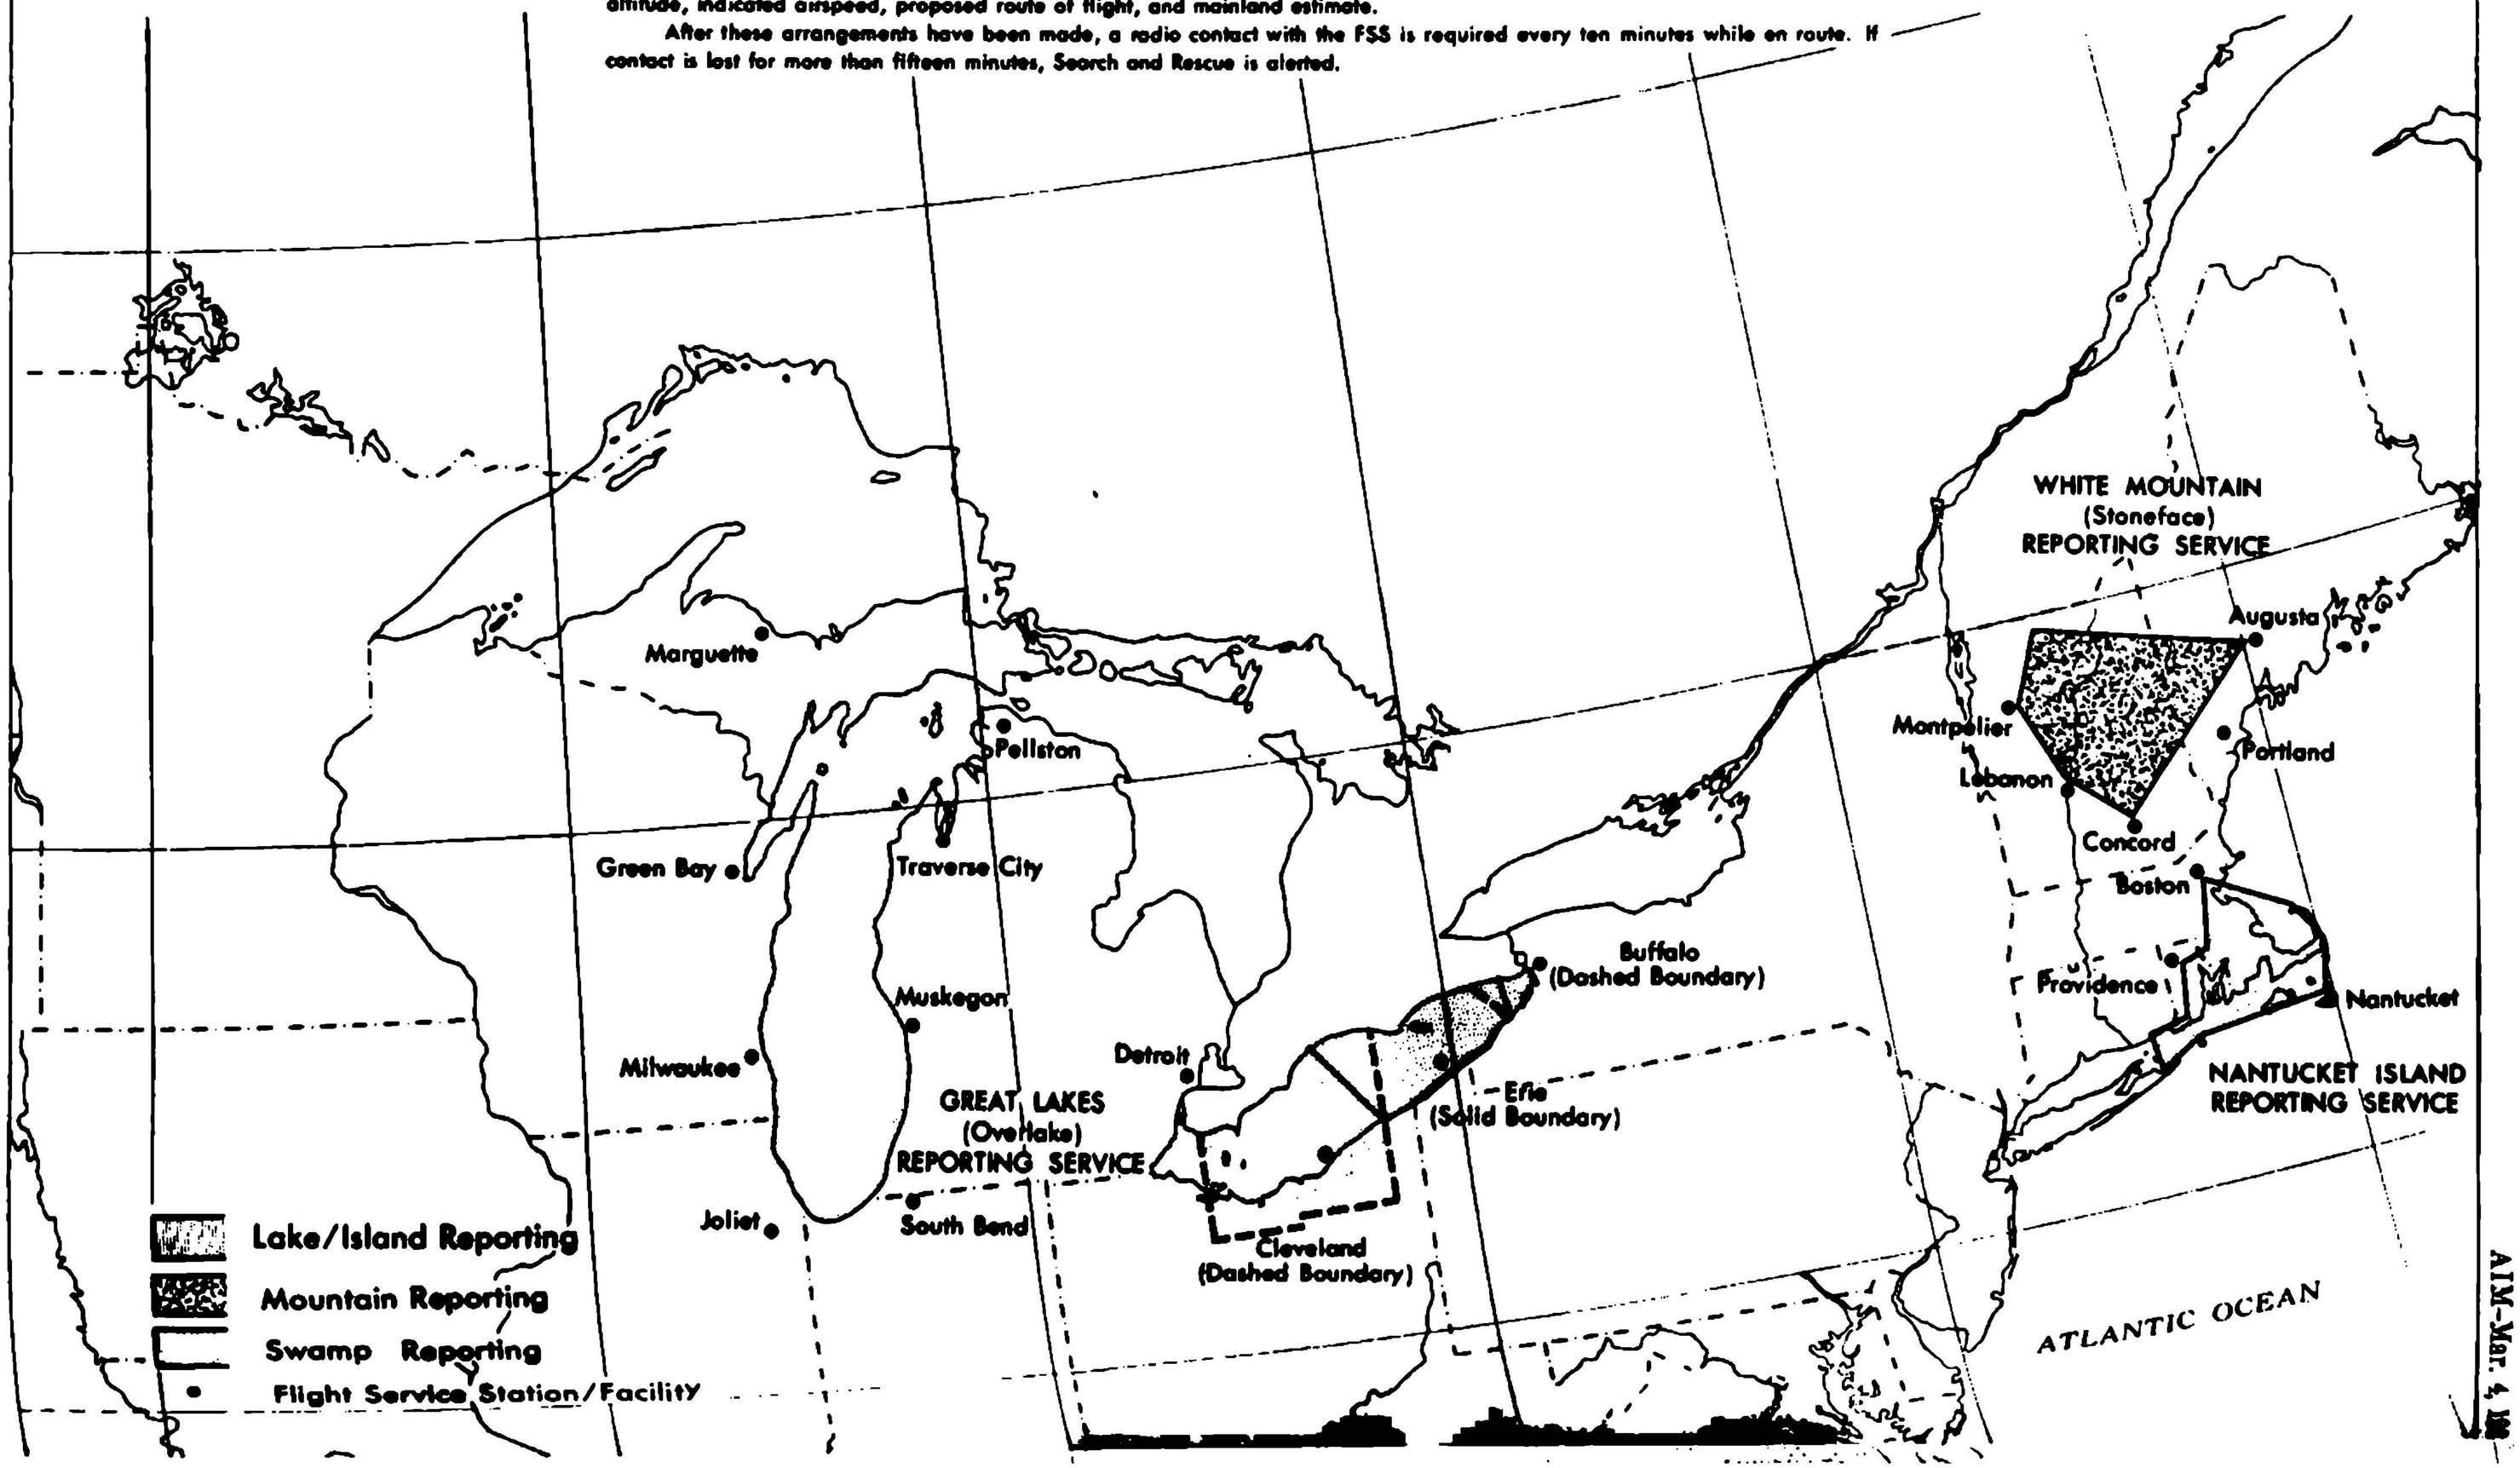
LAKE, ISLAND AND MOUNTAIN REPORTING SERVICE

Flight Service Station (FSS)

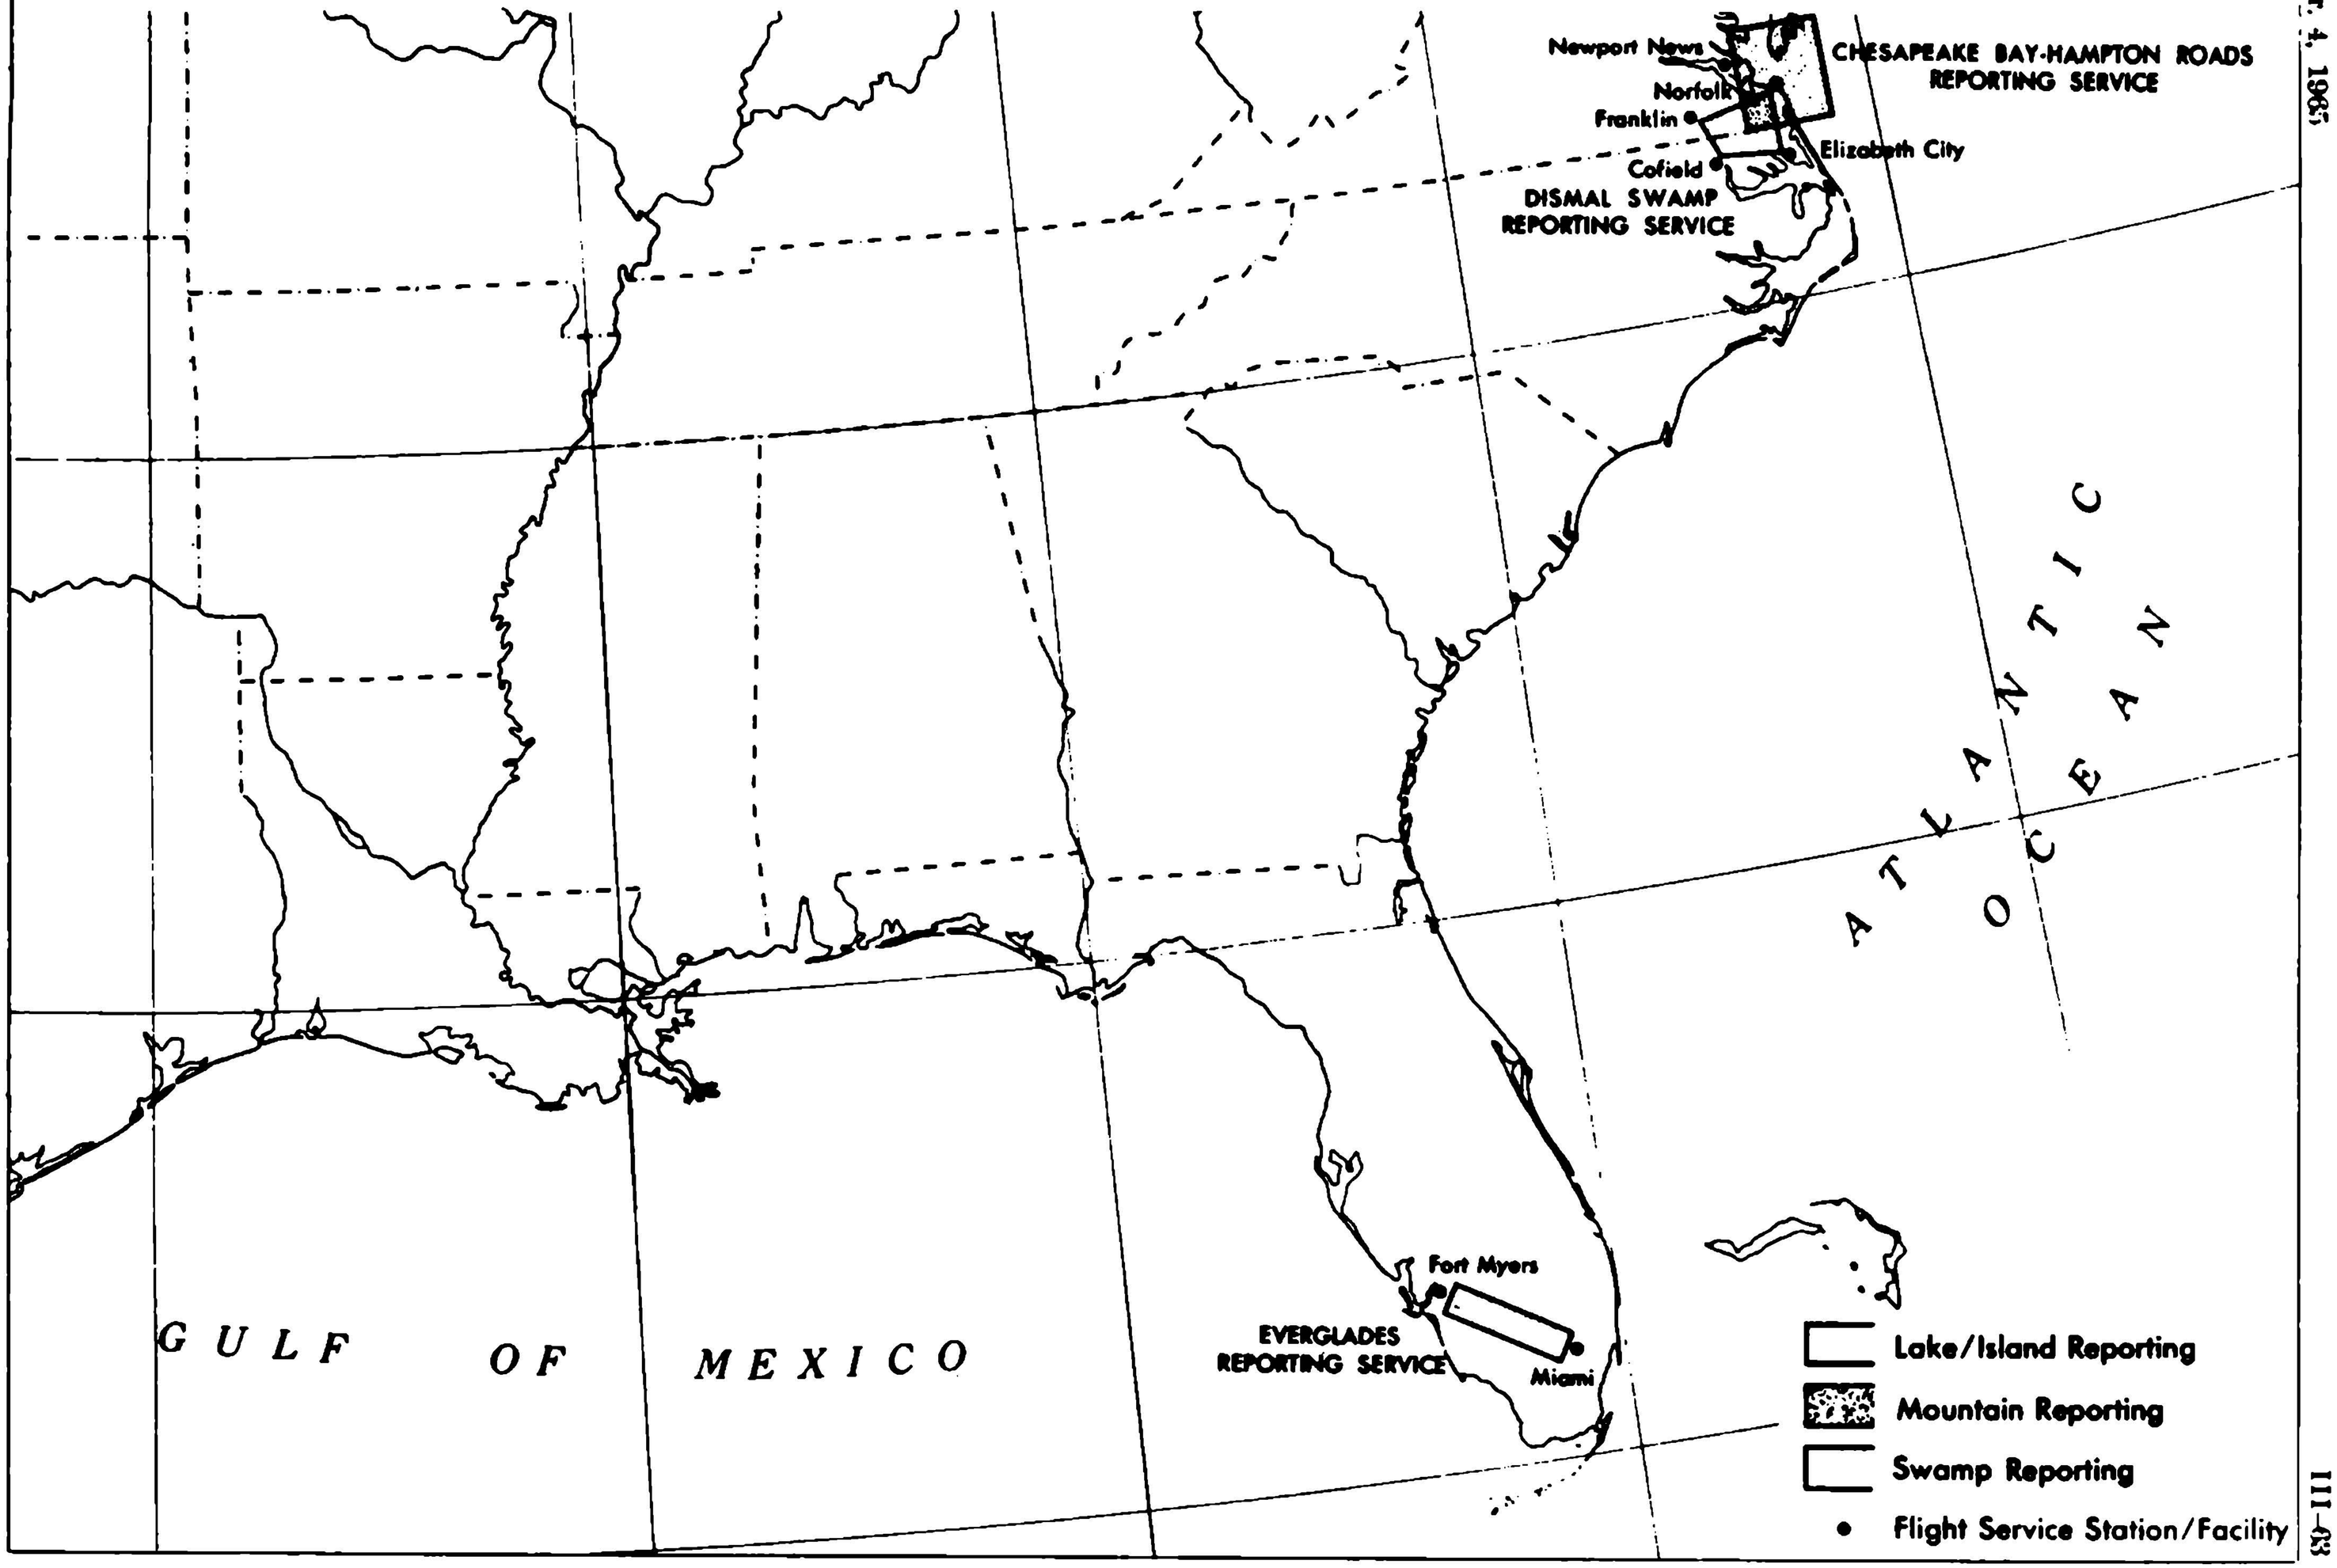
This service provides flight monitoring where regularly traveled VFR routes cross large bodies of water, swamps, and mountains, for the purpose of expeditiously alerting Search and Rescue facilities when required.

Areas covered, associated Flight Service Stations, and the name of the service, "Stoneface", "Overlake", etc., are indicated on the following charts. To obtain this service, contact the FSS by telephone or radio giving present position, type aircraft, altitude, indicated airspeed, proposed route of flight, and mainland estimate.

After these arrangements have been made, a radio contact with the FSS is required every ten minutes while en route. If contact is lost for more than fifteen minutes, Search and Rescue is alerted.



LAKE, ISLAND AND MOUNTAIN REPORTING SERVICE
Flight Service Station (FSS)



109°
—43°

ROCKY MOUNTAIN REPORTING SERVICE

This service is available to aircraft operating VFR (with or without flight plan) between Denver and Grand Junction via Corona Pass or Monarch Pass. This service can not be offered on an area or random route basis due to the unreliability of communications caused by terrain extremes. The routes via Corona Pass and Monarch Pass have been flight checked and communications found reliable at the altitudes published on the chart.

"Rocky Mountain Reporting Service" shall be available to all VFR aircraft upon request, whether or not operating on a regular flight plan.

REQUIREMENTS

1. Aircraft must be equipped with functioning 2-way radio capable of receiving VOR and transmitting 122.1mc.
2. Pilot must fly prescribed route at an altitude no less than established MRA (Minimum Reception Altitude).
3. Pilot must arrange for accurate time of departure to be received by the FAA facility through which the service was requested.
4. Pilot must radio a position report every ten minutes as follows, whether eastbound or westbound:

CORONA ROUTE

To Denver Radio while operating between Denver and Corona Pass (vicinity of Moffat Tunnel, west of Tolland, Colorado).

To Eagle Radio (through Kremmling VOR) between Corona Pass and vicinity of Glenwood Springs.

To Grand Junction Radio between vicinity of Glenwood Springs and Grand Junction.

MONARCH ROUTE

To Denver Radio (through Denver or Kiowa VOR) between Denver and Lake George Intersection (Cheesman Reservoir). To Denver Radio (through Kiowa VOR only) between the Intersection and Elevenmile Reservoir, or west of Cripple Creek, Colorado.

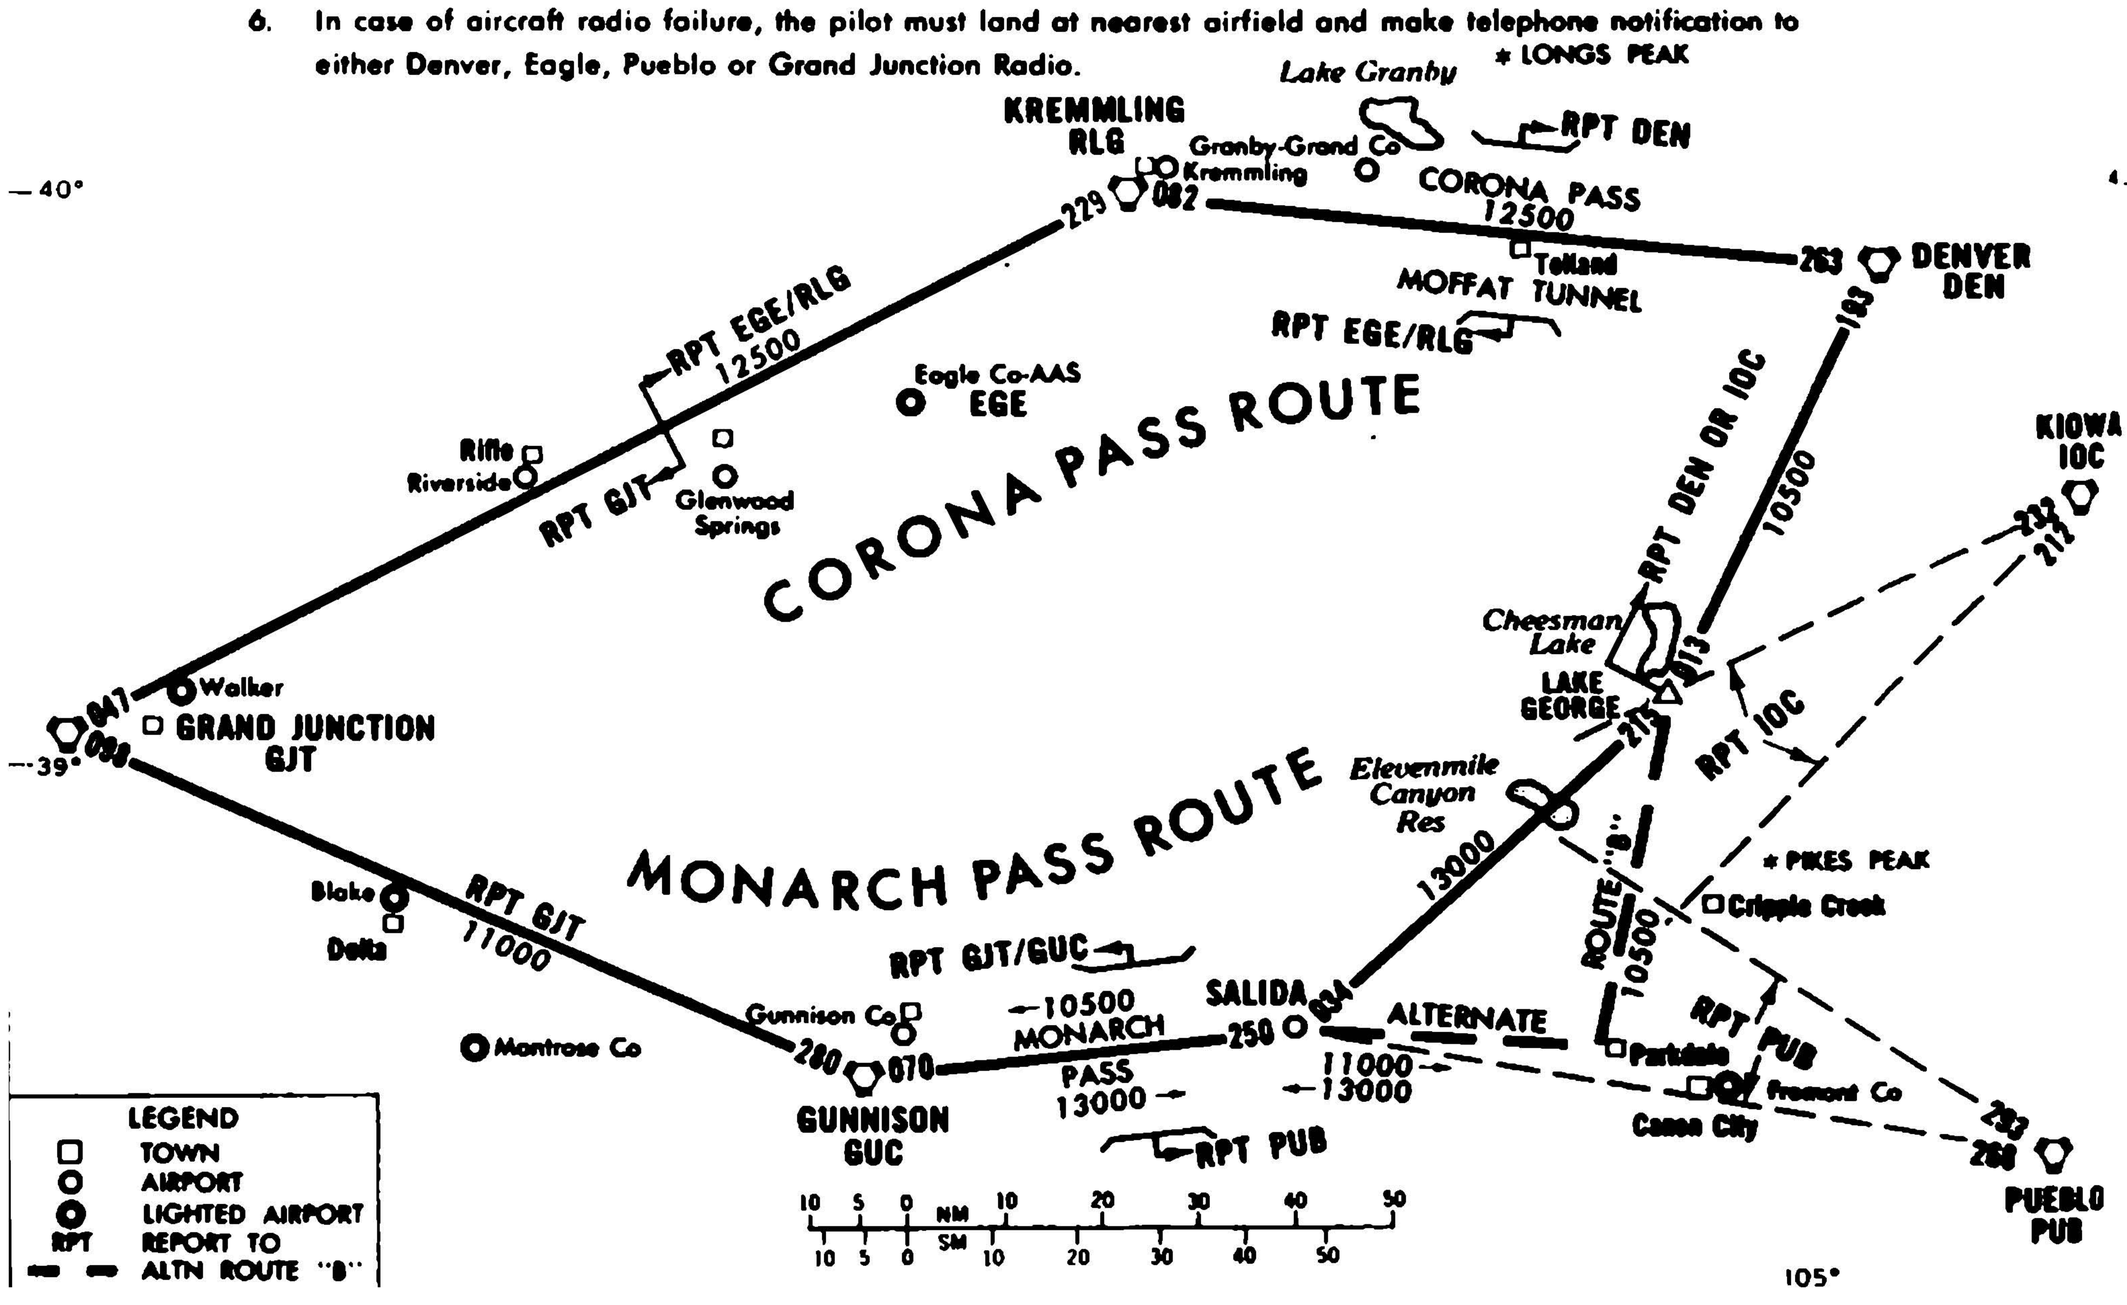
To Pueblo Radio between Elevenmile Reservoir or west of Cripple Creek and Salida, Colorado.

To Grand Junction Radio (through Gunnison VOR) between Salida and Grand Junction.

Pilots may file for all or any portion of either route, i.e. on a flight from Denver to Grand Junction, a pilot may request the service from Denver to Kremmling only.

(If contact with the aircraft is lost for more than 15 minutes, Search and Rescue will be alerted.)

5. The service may be terminated at any time upon request of the pilot.
6. In case of aircraft radio failure, the pilot must land at nearest airfield and make telephone notification to either Denver, Eagle, Pueblo or Grand Junction Radio.



SPECIAL NOTICES

Special Notices of a general nature or universal application, and other than for a specific geographical location, are grouped together under General Notices. Special Notices pertinent to a specific geographic area are grouped together under Area Notices by state, then city, airport, or location within the state. The month and year the notice is initially inserted into the manual is provided at the conclusion of each Special Notice. A solid dot ● prefixes new or revised Special Notices.

GENERAL NOTICES

MILITARY CLIMB CORRIDORS

ALL FLIGHTS desiring to traverse these areas must obtain prior approval from the Appropriate Authority and maintain continuous listening watch on the appropriate frequency while traversing the corridor. The list of corridors, appropriate authority and frequencies follows:

Corridors	Appropriate Authority	Frequencies
Bangor (Dow AFB) Maine	Dow AFB Apch Ctl	126.2; 363.8; 122.5G
Charleston AFB/Mun., S.C.	Charleston Apch Ctl	119.3; 319.8; 122.5G
Columbus (Lockbourne AFB), Ohio	Columbus Apch Ctl	123.7; 122.5G; 360.6
Falmouth (Otis AFB), Mass.	Otis RAPCON	124.7; 118.2; 122.5G
Glasgow (Glasgow AFB), Mont.	Glasgow AFB Apch Ctl	126.2; 236.6; 122.5G; 363.8
Goldsboro (Seymour Johnson AFB), N.C.	Seymour Johnson Apch Ctl	119.7; 122.5G
Grand Forks (Grand Forks AFB), N.D.	Grand Forks AFB Apch Ctl	118.1; 363.8; 122.5G
Grandview (Richards-Gebaur AFB), Mo.	Olathe RAPCON	363.8; 124.7; 122.5G
Hampton Roads (Langley AFB), Va.	Norfolk Apch Ctl	350.3; 125.7; 122.5G
Houston (Ellington AFB), Texas	Houston Apch Ctl	118.1; 284.6; 122.5G
Limestone (Loring AFB), Me.	Loring AFB Apch Ctl	122.5G; 363.8
Madison (Truax Fld), Wisc.	Truax Tower	120.1; 350.3; 122.5G
Marquette Co. (K.I. Sawyer AFB), Mich.	Sawyer Apch Ctl	122.5G; 119.1; 259.3; 363.8
Merced (Castle AFB), Calif.	Castle AFB Apch Ctl	118.9; 122.5G; 379.4
Minot AFB, North Dakota	Minot AFB Apch Ctl	363.8; 118.5; 122.5G
Mt. Clemens (Selfridge AFB), Mich.	Selfridge AFB Apch Ctl	126.2; 363.8; 122.5G

T—Transmits
G—Guards

CIVIL USE OF MILITARY FIELDS:

U.S. Air Force, Navy and Coast Guard Fields are open to civil fliers only in emergency or with prior permission; Army Air Fields are open to civil aircraft on authorization of the Air Field Commander.

For Air Force installations, prior permission should be requested at least 30 days prior to first intended landing from Headquarters USAF (AFOAPDA) via the Commanding Officer of the field concerned (who has authority to approve landing rights for certain categories of civil aircraft). For use of more than one Air Force installation, requests should be forwarded direct to Hq USAF (AFOAPDA), Washington, D.C. 20330.

For Naval Installations, prior permission should be requested from the Chief of Naval Operations (OP 532) via the Commanding Officer of the field concerned (who has the authority to approve landing rights for certain categories of civil aircraft).

For Coast Guard fields prior permission should be requested from the Commandant, U.S. Coast Guard via the Commanding Officer of the field.

However, with minor exceptions, authority to use Air Force and Navy fields is granted only to aircraft on government business, or when no suitable civil airport is available in the vicinity. Use of Coast Guard fields is limited to persons on government business only when there is no suitable civil airport in the vicinity.

When instrument approaches are conducted by civil aircraft at military airports, they shall be conducted in accordance with the procedures and minimums approved by the military agency having jurisdiction over the airport.

December 1964

HEAVY TRAFFIC AROUND MILITARY FIELDS

Pilots are advised to exercise vigilance when in close proximity to most military airports. These airfields have an unusually heavy concentration of jet aircraft operating within a 25 nautical mile radius and from the surface to all altitudes. This precautionary note also applies to the larger civil airports. BE ALERT, STAY ALIVE!

December 1964

FLIGHTS ACROSS U.S. BORDERS:

All pilots contemplating flights across U.S. borders should refer to complete regulations in INTERNATIONAL FLIGHT INFORMATION MANUAL, Volume 12, April 1964. Pilots must report for inspection at time of each entry to avoid inconveniences, additional expenses and penalties.

December 1964

HELP PREVENT SMUGGLING BY AIR

All American pilots are asked to help Federal law enforcement agencies in combating the smuggling of illegal aliens and contraband into the U.S. by private aircraft. If you have information of any kind that might relate to smuggling by air, please contact the nearest U.S. Immigration and Naturalization Service or U.S. Bureau of Customs office at once. The local FAA office will pass the information along for you, if you so desire. Awards for original information are paid by Customs under certain circumstances.

December 1964

•AUTOMATIC TERMINAL INFORMATION SERVICE (ATIS)

Automatic Terminal Information Service (ATIS) is the continuous broadcast of recorded noncontrol information in selected high activity terminal areas. Its purpose is to improve controller effectiveness and to relieve frequency congestion by automating the repetitive transmission of essential but routine information.

ATIS is now available at high activity terminal airports listed at the end of this Notice. Information such as ceiling, visibility, wind, altimeter, instrument approach, and runways in use is continuously broadcast on the voice feature of a TVOR/VOR/VORTAC located on or near the airport, or on a discrete VHF tower frequency. Pilots of aircraft arriving or departing the terminal area can receive the continuous ATIS broadcasts at times when cockpit duties are least pressing and listen to as many repeats as desired.

Sample Broadcast:

"THIS IS WASHINGTON NATIONAL AIRPORT INFORMATION BRAVO. CEILING MEASURED TWO THOUSAND, OVERCAST, VISIBILITY SIX. SMOKE. WIND ONE SIX ZERO DEGREES AT FIVE. ALTIMETER TWO NINER NINER TWO. VOR RUNWAY ONE FIVE APPROACH IN USE

LANDING RUNWAY ONE EIGHT. DEPARTURES ON RUNWAY ONE FIVE. NOTAM, GEORGETOWN RADIO BEACON OUT OF SERVICE. INFORM WASHINGTON APPROACH OR GROUND CONTROL ON INITIAL CONTACT THAT YOU HAVE RECEIVED INFORMATION BRAVO."

Pilots hearing the ATIS broadcast should, on initial contact with the tower or approach control, repeat the specific phonetic alphabet code word (Alpha, Bravo, Charlie, etc.) appended to each ATIS message. This will indicate that the pilot has received the latest information and obviate the need for the controller to repeat the information.

Example: ". . . I HAVE RECEIVED INFORMATION BRAVO."

ATIS broadcasts will be updated when there is a significant change in information contained therein. Terminal controllers will issue pertinent information to pilots who do not acknowledge receipt of the ATIS message, or who acknowledge receipt by an alphabet code word which is not current.

Pilots are urged to cooperate in the ATIS program since it relieves frequency congestion on approach control, ground control and local control frequencies.

SPECIAL CIVIL AIR REGULATION NO. 456

Effective immediately the provisions applicable under Special Civil Air Regulation No. 456 will apply as follows:

Air traffic clearances to aircraft of Cuban registry not engaged in scheduled International Air Service in U.S. airspace will require that flight be conducted on one of the following routes and a landing be made at Kennedy International Airport. In the event alternates are necessary due to weather, such alternates will be Logan International Airport and Dulles International Airport in that order.

Flights from Montreal to Kennedy below FL 180 will be routed via V-282, V-203, V-91, V-475, DPK. Those at FL 180 and above will be routed via St. Eustache V-91, PLB, J-75, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Montreal below FL 180 will be routed via Sound Intersection, POU, V-487. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-75, PLB, V-91, St. Eustache.

Flights from Ottawa to Kennedy below FL 180 will be routed via MSS, V-203, ALB, V-91, V-475, DPK. Those at FL 180 and above will be routed via G-1 Maxville, V-104, MSS, J-37, ALB, POU, V-91, V-475, DPK. Flights from Kennedy to Ottawa below FL 180 will be routed via Sound Intersection, POU, V-91, ALB, V-203, MSS. Those at FL 180 and above will be routed via Sound Intersection, POU, ALB, J-37, MSS, V-104, Maxville, G-1.

Flights from Toronto to Kennedy below FL 180 will be routed via V-308, V-252, BGM, V-270, V-34, V-475, DPK. Those at FL 180 and above will be routed via V-308, BUF, J-95, HUO, CMK, V-34, V-475, DPK. Flights from Kennedy to Toronto below FL 180 will be routed via HUO, V-126, AVP, V-36. Those at FL 180 and above will be routed via Northport Intersection, HUO, J-95, BUF, V-36.

All flights in both directions, between Kennedy and Cuba will be routed via the Tuna Intersection and the overwater Papa Route. These are the only routes which will be authorized. Reroutings which will traverse other U.S. airspace will not be authorized.

The procedures set forth herein will not apply at this time to overflights by aircraft of Cuban registry engaged in scheduled International Air Service. However, if circumstances subsequently warrant, a notam prescribing routes for such aircraft will be issued.

December 1964

Exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations

The Department of the Air Force has been issued an exemption from the provisions of Section 91.109 of Part 91 of the Federal Aviation Regulations to conduct certain Radar Bomb Scoring (RBS) training missions at or above Flight Level 300 within 75 nautical miles of the sites listed below. A navigation aid will be listed to define the center of the complex if such an aid is so located. If a NAVAID is not located at the center, the center will be defined by bearing/distance from a High Altitude Navigation Aid.

The NIKE/RBS Complexes used are:

Providence 280°/35NM
Windsor VORTAC
Presque Isle 087°/20NM
Kennedy VORTAC
Boston VORTAC
Rapid City 110°/33NM
Dupree VORTAC 010°/114NM
Syracuse VOR 018°/48NM

PILOT-TO-FORECASTER WEATHER SERVICE

Pilot-to-Forecaster Service (PTFS) in the general area of the Washington ARTCC is provided for the purpose of the direct pilot/forecaster exchange of meteorological information when **weather conditions are critical, changing rapidly or when the direct advice of a professional aviation meteorologist is considered necessary.** Routine requests for weather information or pilot reports should be directed to the nearest FAA Flight Service Station (FSS).

PTFS is available on the radio frequency of 122.6 megacycles (mc) within communications range of the following FAA FSS locations:

Washington, D.C.
Elkins, West Virginia
Richmond, Virginia
Roanoke, Virginia
Front Royal, Virginia
Rocky Mount, North Carolina

Air/ground calls should be made to "Washington Forecaster" for direct communications with a U.S. Weather Bureau Meteorologist who is currently familiar with weather in the area. This service is available from 1200Z to 0200Z (7:00 a.m. to 9:00 p.m., EST). Emergency weather service during other periods may be made available by contacting the flight service specialist (when VFR) or the Washington ARTCC (when IFR) and requesting that "Washington Forecaster" communicate on 122.6 mcs.

December 1964

Efctv 3/4/65, following flight procedures authorized: V–219, SUX to MKT, MEA 6000 ft, MOCA 2600 ft; MKT to FGT, MEA 2900 ft, MOCA 2500 ft.

March 1965

VFR PRACTICE INSTRUMENT APPROACH PROCEDURES

VFR practice instrument approach procedures at the following locations are published for and used by USAF Air Training Command pilots:

Cotulla, Tex.	Radio Beacon	JAL–907–ADF
Draughon-Miller Arpt. Temple, Tex	VOR	JAL–809–VOR
Cotulla, Tex.	VOR	JAL–907–VOR
Howard County Arpt. Big Spring, Tex.	VOR	JAL–5019–VOR
•Killeen, Tex. Hood AAF	VOR	JAL–5031–VOR
Rock Springs, Tex.	VOR	JAL–111–VOR–3
Sequin AF Aux., Tex.	Beacon	AL–5223–ADF
Vance AFB, Woodring, Okla.	VOR	JAL–135–VOR–3

These approach charts are published by the USAF Aeronautical Chart and Information Center in a loose-leaf format. Civil aviation requests for these charts should be submitted to the Director, Coast and Geodetic Survey, 14th and Constitution Avenue, N.W., Attention: Distribution Division Washington, D.C. 20230.

December 1964

SPECIAL CIVIL AIR REGULATION NO. SR 454A

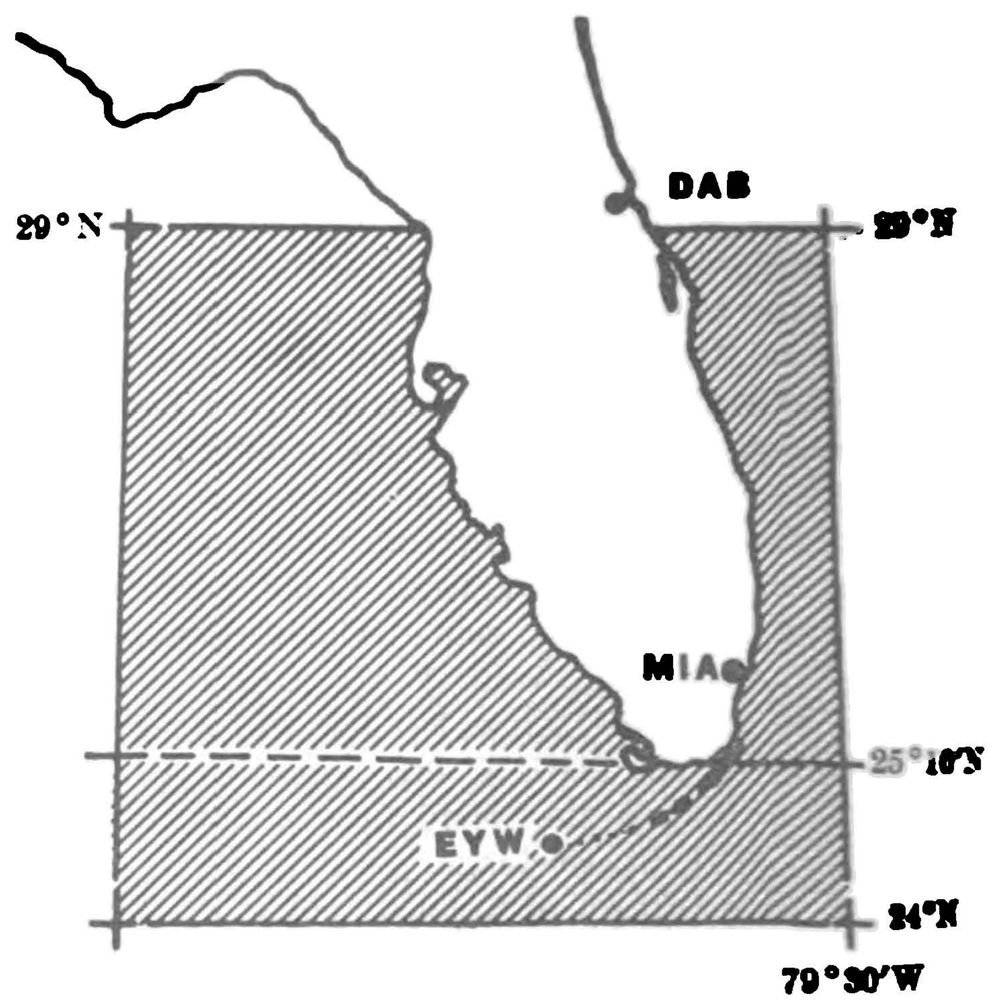
The following special rules of SR 454A are in effect. No person may operate any civil aircraft:

(1) Over water and outside the land mass of the State of Florida beginning at 29°N lat., 85°W long., thence clockwise to 29°N lat., 79°30′W long. to 24°N lat., 79°30′W long., to 24°N lat., 85°W long., to the point of beginning or over land South of 25°10′N lat., unless:

(a) It is operated under a flight plan that has been approved by an FAA air traffic control facility; and

(b) the aircraft possesses functioning navigation and communications equipment necessary to maintain two-way radio contact with air traffic control facilities at all times during the operation, and the pilot in command monitors the radio frequencies specified by air traffic control.

SR 454A is applicable to the land mass between 25°10′N and 29°00′N whenever activated by NOTAM.



lew Flight Assistance Service Facility Tests

e FAA is testing a modernized FSS configuration ield test of two new types of low cost facilities for t assistance service at local airports. The tests will nd through June 30, 1965.

ght Service Facility (FSF): An FSF is operated by FAA t service specialists during the busy hours of each It is equipped with transmit/receive on 121.7 mcs. airport advisory service and 121.5 mcs. for emery communications; weather observing instruments; her teletypewriters; and communications into the system. FSFs provide airport advisory service request); aviation weather observations; pilot fing; and flight plan handling. Toll-free Communions with the control FSS will be available 24-hours . During the hours the FSF is operating, pilots ing or departing the FSF airport may contact the for airport advisory service when within 15 nautiniles. Call and listen on 121.7 mcs. Use the name e FSF airport followed by the word "radio": ble Radio this is N1234V over."

e location of test FSF with control FSS in parenis and local hours of FSF operation are:

Delta Municipal Airport, Delta, Utah (Salt Lake City FSS) 0600–1800.
Kimble County Airport, Junction, Texas (San Antonio FSS) 0600–1800.
Manhattan Municipal Airport, Manhattan, Kansas (Salina FSS) 0600–1800.
Crescent Beach Airport, Myrtle Beach, S. C. (Florence FSS) 0600–1800.

rport Information Desk (AID): An AID is an unmanned ity designed for pilot self-service briefing, flight ning and filing of flight plans. A desk and flight ning material will be available at all AID locations, ly during daylight hours. In addition, some AIDs have weather instruments and weather teletypeers. Toll-free communications with the control FSS be available 24 hours daily.

e AID test sites with control FSS shown in parenis are:

Aiken, South Carolina—(Florence, South Carolina)
Altus, Oklahoma—(Wichita Falls, Texas)
Aspen, Colorado—(Denver, Colorado)
Auburn, Alabama—(Montgomery, Alabama)
Frankfort, Kentucky—(Lexington, Kentucky (S/T)
Jamestown, New York—(Bradford, Pennsylvania)
Kerrville, Texas—(San Antonio, Texas)
Laconia, New Hampshire—(Montpelier, Vermont)
Lakeland, Florida—(Tampa, Florida)
Liberal, Kansas—(Garden City, Kansas)
Marion, Indiana—(Indianapolis, Indiana)
Mt. Vernon, Illinois—(St. Louis, Missouri)
Pittsfield, Massachusetts—(Albany,New York)
Ruidoso, New Mexico—(Roswell, New Mexico)
Tacoma Industrial Airport, Washington—(Seattle, Washington)
Twin Falls, Idaho—(Burley, Idaho)

Pilots are invited to use and evaluate these services. Comments and suggestions should be sent to:

Director, Air Traffic Service
Federal Aviation Agency
800 Independence Avenue, S.W.
Washington, D.C. 20553

Washington DISTRICT OF COLUMBIA

TEST EVALUATION OF VFR ARRIVAL AND DEPARTURE RADAR TRAFFIC INFORMATION SERVICE

VFR Radar Traffic Information Area

GENERAL PROCEDURES: The Washington VFR Radar Traffic Information Area is that airspace which extends upwards to an altitude of four thousand feet, MSL inclusive, and is encompassed by a line connecting the following points: Rockville, Laurel, Shadyside, Hughesvill, Indian Head, Centreville, and Herndon. (See chart on facing page.)

Pilots of aircraft without radio, as well as those unable to contact VFR Arrival or Departure Information Service on assigned frequencies, are urged to conform to routing via designated VFR arrival and departure routes.

Pilots operating VFR flights destined for Washington National Airport should follow the designated arrival and departure routes listed herein in order to maintain a safe, orderly flow of air traffic in the Washington area.

All aircraft arriving or departing Washington National Airport should proceed with caution when in the vicinity of Andrews AFB.

If destination is other than Washington National Airport, so advise.

THE RADAR SERVICE DESCRIBED HEREIN IS NOT INTENDED TO RELIEVE THE PILOT OF HIS RESPONSIBILITY FOR CONTINUAL VIGILANCE TO SEE AND AVOID OTHER AIRCRAFT. IT IS PROVIDED TO AID HIM IN HIS VISUAL SURVEILLANCE BY CALLING TO HIS ATTENTION PERTINENT TRAFFIC. PILOTS ARE REMINDED THAT THE SURVEILLANCE RADAR UTILIZED BY THE CONTROLLER DOES NOT PROVIDE ALTITUDE INFORMATION.

The following procedures should be adhered to by pilots of VFR flights desiring this service and having proper radio equipment when arriving at and departing from Washington National Airport.

ARRIVAL PROCEDURES: Arriving VFR flights desiring traffic information should contact Washington Traffic Information Service on 119.3 mcs/338.2 mcs UHF when approaching from Laurel, Shadyside RBN, and Hughesville; or on 120.1 mcs/306.3 mcs UHF when approaching from Indian Head, Centreville, Herndon, and Rockville. When practicable, pilots should follow the appropriate VFR arrival route as indicated (See Chart) and maintain listening watch on traffic information frequency until further advised. Landing information will be furnished to aircraft destined for Washington, and radar traffic information will be provided until the pilot is advisesd to contact the tower.

DEPARTURE PROCEDURES: VFR flights departing th Washington Airport desiring traffic information sho request the service on initial contact to Ground Cont The pilot should also advise his proposed direction flight; e.g., "VFR Information Service, Laurel." I lowing take-off, the tower will advise the pilot whe contact Washington Information Service and the quency to be used. Flights proceeding to Laurel, Sha side, and Hughesville will use 119.3 mcs/338.2 m UHF. Flights proceeding to Indian Head, Centrev Herndon, and Rockville will use 120.1 mcs/306.3 mcs U Pilots should depart the Washington Terminal area via designated VFR departure route most nearly aligned t their destination. They should also maintain listen watch on the appropriate information service freque until cleared to leave the frequency or beyond the per eter fix.

Washington National Airport

Arrival Routes

Northeast—Report Laurel. Proceed well right of Wa ington-Baltimore Parkway to Beltsville, then north Washington to Chain Bridge.

East—Report Shadyside RBN. Proceed via Bra wine to Fort Washington. Caution—Military con tional and jet traffic vicinity of Andrews AFB Con Zone.

Southeast—Report Hughesville. Proceed via Wald to Fort Washington. Caution—Andrews jet penetrat inbound on Andrews VOR 187 degree radial descend to cross Andrews LFR at 1500 feet MSL.

Southwest—Report Indian Head. Proceed on right s of Potomac River until past Mount Vernon.

West—Report Centreville. Proceed well right of R Route 29 highway to Falls Church.

Northwest—Report Herndon. Proceed well right of P tomac River to Falls Church.

North—Report Rockville. Proceed well left of Poto River to Chain Bridge.

Departure Routes

Northeast—Proceed via west bank of Anacostia Ri to Riverdale and well right of Washington-Baltim Parkway until past Beltsville Airport.

East—Proceed via Fort Washington and Brandyw to Shadyside.

Southeast—Proceed via Fort Washington and LaPlata

Southwest—Proceed well right of Potomac River u past Woodbridge.

West—North departures proceed well right of R Route 29 highway until past Centreville. South dep tures proceed via Washington LFR to Manassas.

Northwest—North departures proceed via Potomac Riv until leaving the area. South departures proceed v Washington LFR to Fairfax.

TERMINAL RADAR SERVICE AREA

(An Evaluation of Terminal Area Positive Separation)

The Air Traffic Service, FAA, has developed a program to evaluate a concept of providing a positive separation service to aircraft operating within a terminal area. The airspace area where this evaluation will be conducted will be known as a Terminal Radar Service Area (TRSA). During the evaluation period, a true positive separation environment will not be guaranteed.

This program is in consonance with the report of the Task Force on air traffic control (Project Beacon) and the subsequent Air Traffic Service analysis of the report.

A program for positive separation of aircraft operating in terminal airspace, regardless of weather conditions, must be able to satisfy the many varied requirements of both the VFR and IFR users without imposing excessive restrictions to their operations, yet it must be within the capabilities of the air traffic control system.

In consideration of these two major stipulations, the program will initially be implemented on a voluntary basis, whereby pilot participation will be encouraged rather than required. In this respect, it is obvious that considerable cooperation and effort must be expended jointly by the Federal Aviation Agency (FAA) and the airspace users, if a realistic evaluation is to be made.

Generally, the objective of this evaluation is to determine the following:

1. Airborne equipment and pilotage requirements.
2. Operating personnel, equipment, procedural and airspace requirements.
3. Impact on the over-all terminal operation.
4. Capability of the air traffic control system to provide positive separation to all aircraft operating within a terminal area.
5. Need for regulatory action.

Following a thorough and complete analysis of this evaluation, FAA in cooperation with the users, will determine the necessary requirements for implementation of a positive separation system in high activity terminal areas, wherein all aircraft would be provided separation by the ATC system, irrespective of weather conditions.

The size and shape of the TRSA will vary depending upon operational requirements. This area may be shown as a circular radius or other configuration and should be no larger than absolutely necessary to adequately perform the control functions.

Implementation

On November 15, 1962, a TRSA program was implemented at Atlanta, Georgia, as the first of selected locations to thoroughly evaluate the program.

In addition to the following details and procedures, information has been provided on appropriate charts, other aeronautical flight information publications a through representative user organizations.

The Atlanta Terminal Radar Service Area is that airspace extending upward from the surface to and including 6,000 feet MSL within the Atlanta Airport Control Zone; and, in addition, that airspace extending from 2,000 feet MSL to and including 6,000 feet MSL within a 15 statute mile radius of the Atlanta Airport, excluding Dobbins AFB Control Zone and the airspace within a 1½ mile radius of the Edwards Skyport and the Gunn Airport; EXCEPT that the base of the airspace area within the Fulton County Airport control zone is 2,500 feet MSL.

Flight Procedures

1. **IFR Flights**—Aircraft operating within the Atla TRSA shall be operated in accordance with curr IFR procedures.
2. **VFR Flights**

   a. Airports within the Atlanta TRSA:

      (1) Arriving aircraft will be expected to cont Atlanta Terminal Control on specified f quencies and in relation to geographical fi listed in d. below.

      (2) Departing aircraft will be advised by the to when to contact departure or terminal c trol and the frequency to be used.

   b. Airports underlying the Atlanta TRSA:

      (1) Unless flight will be conducted below the fl of the TRSA, arriving aircraft will be pected to contact Atlanta Terminal Cont on specified frequencies and in relation geographical fixes listed in d. below.

      (2) Departing aircraft will be expected to cont Atlanta Terminal Control on the frequen specified in d. below as soon as possible af becoming airborne if it is desired that fli be conducted within the TRSA.

   c. Transiting Aircraft—Aircraft desiring to trav the TRSA will be expected to contact Atla Terminal Control on specified frequencies and relation to geographical fixes listed in d. below.

   d. Frequencies and Fixes—En route aircraft shou establish communications with Atlanta Termi Control approximately 25 miles from Atlanta A port. Aircraft entering the TRSA north of A way V-18N should use 119.8 or 381.6 MC; Aircra entering the TRSA south of Airway V-18N shou use 119.3 or 343.6 MC. Aircraft not equipped f two-way communications on these frequenc should transmit on 122.7 MC and listen on t appropriate frequency specified above.

      In addition to published radio fixes and oth prominent geographical fixes, the following fi

Gunn Field	"	Northeast
City of Conveyors	"	East
City of Griffin	119.3/343.6	Southeast
City of Newnan	"	Southwest
Chattahoochee River	"	Southwest and West

ATC Procedures

1. The Atlanta TRSA is primarily a radar environment, and control will be predicated thereon. This does not preclude application of nonradar separation as required or deemed appropriate.
2. To facilitate radar identification of arriving and transiting VFR aircraft, ATC may request such aircraft to report their position in relation to fixes (prominent geographical or radio) within or outside the perimeter of the TRSA.
3. Radar headings and, if required, altitude assignments may be given to VFR flights operating within the TRSA.

NOTE.—Assignment of radar headings and/or altitudes are based on the provision that a pilot operating in accordance with VFR is expected to advise ATC if compliance with an assigned route, radar heading or altitude will cause the pilot to violate such rules.

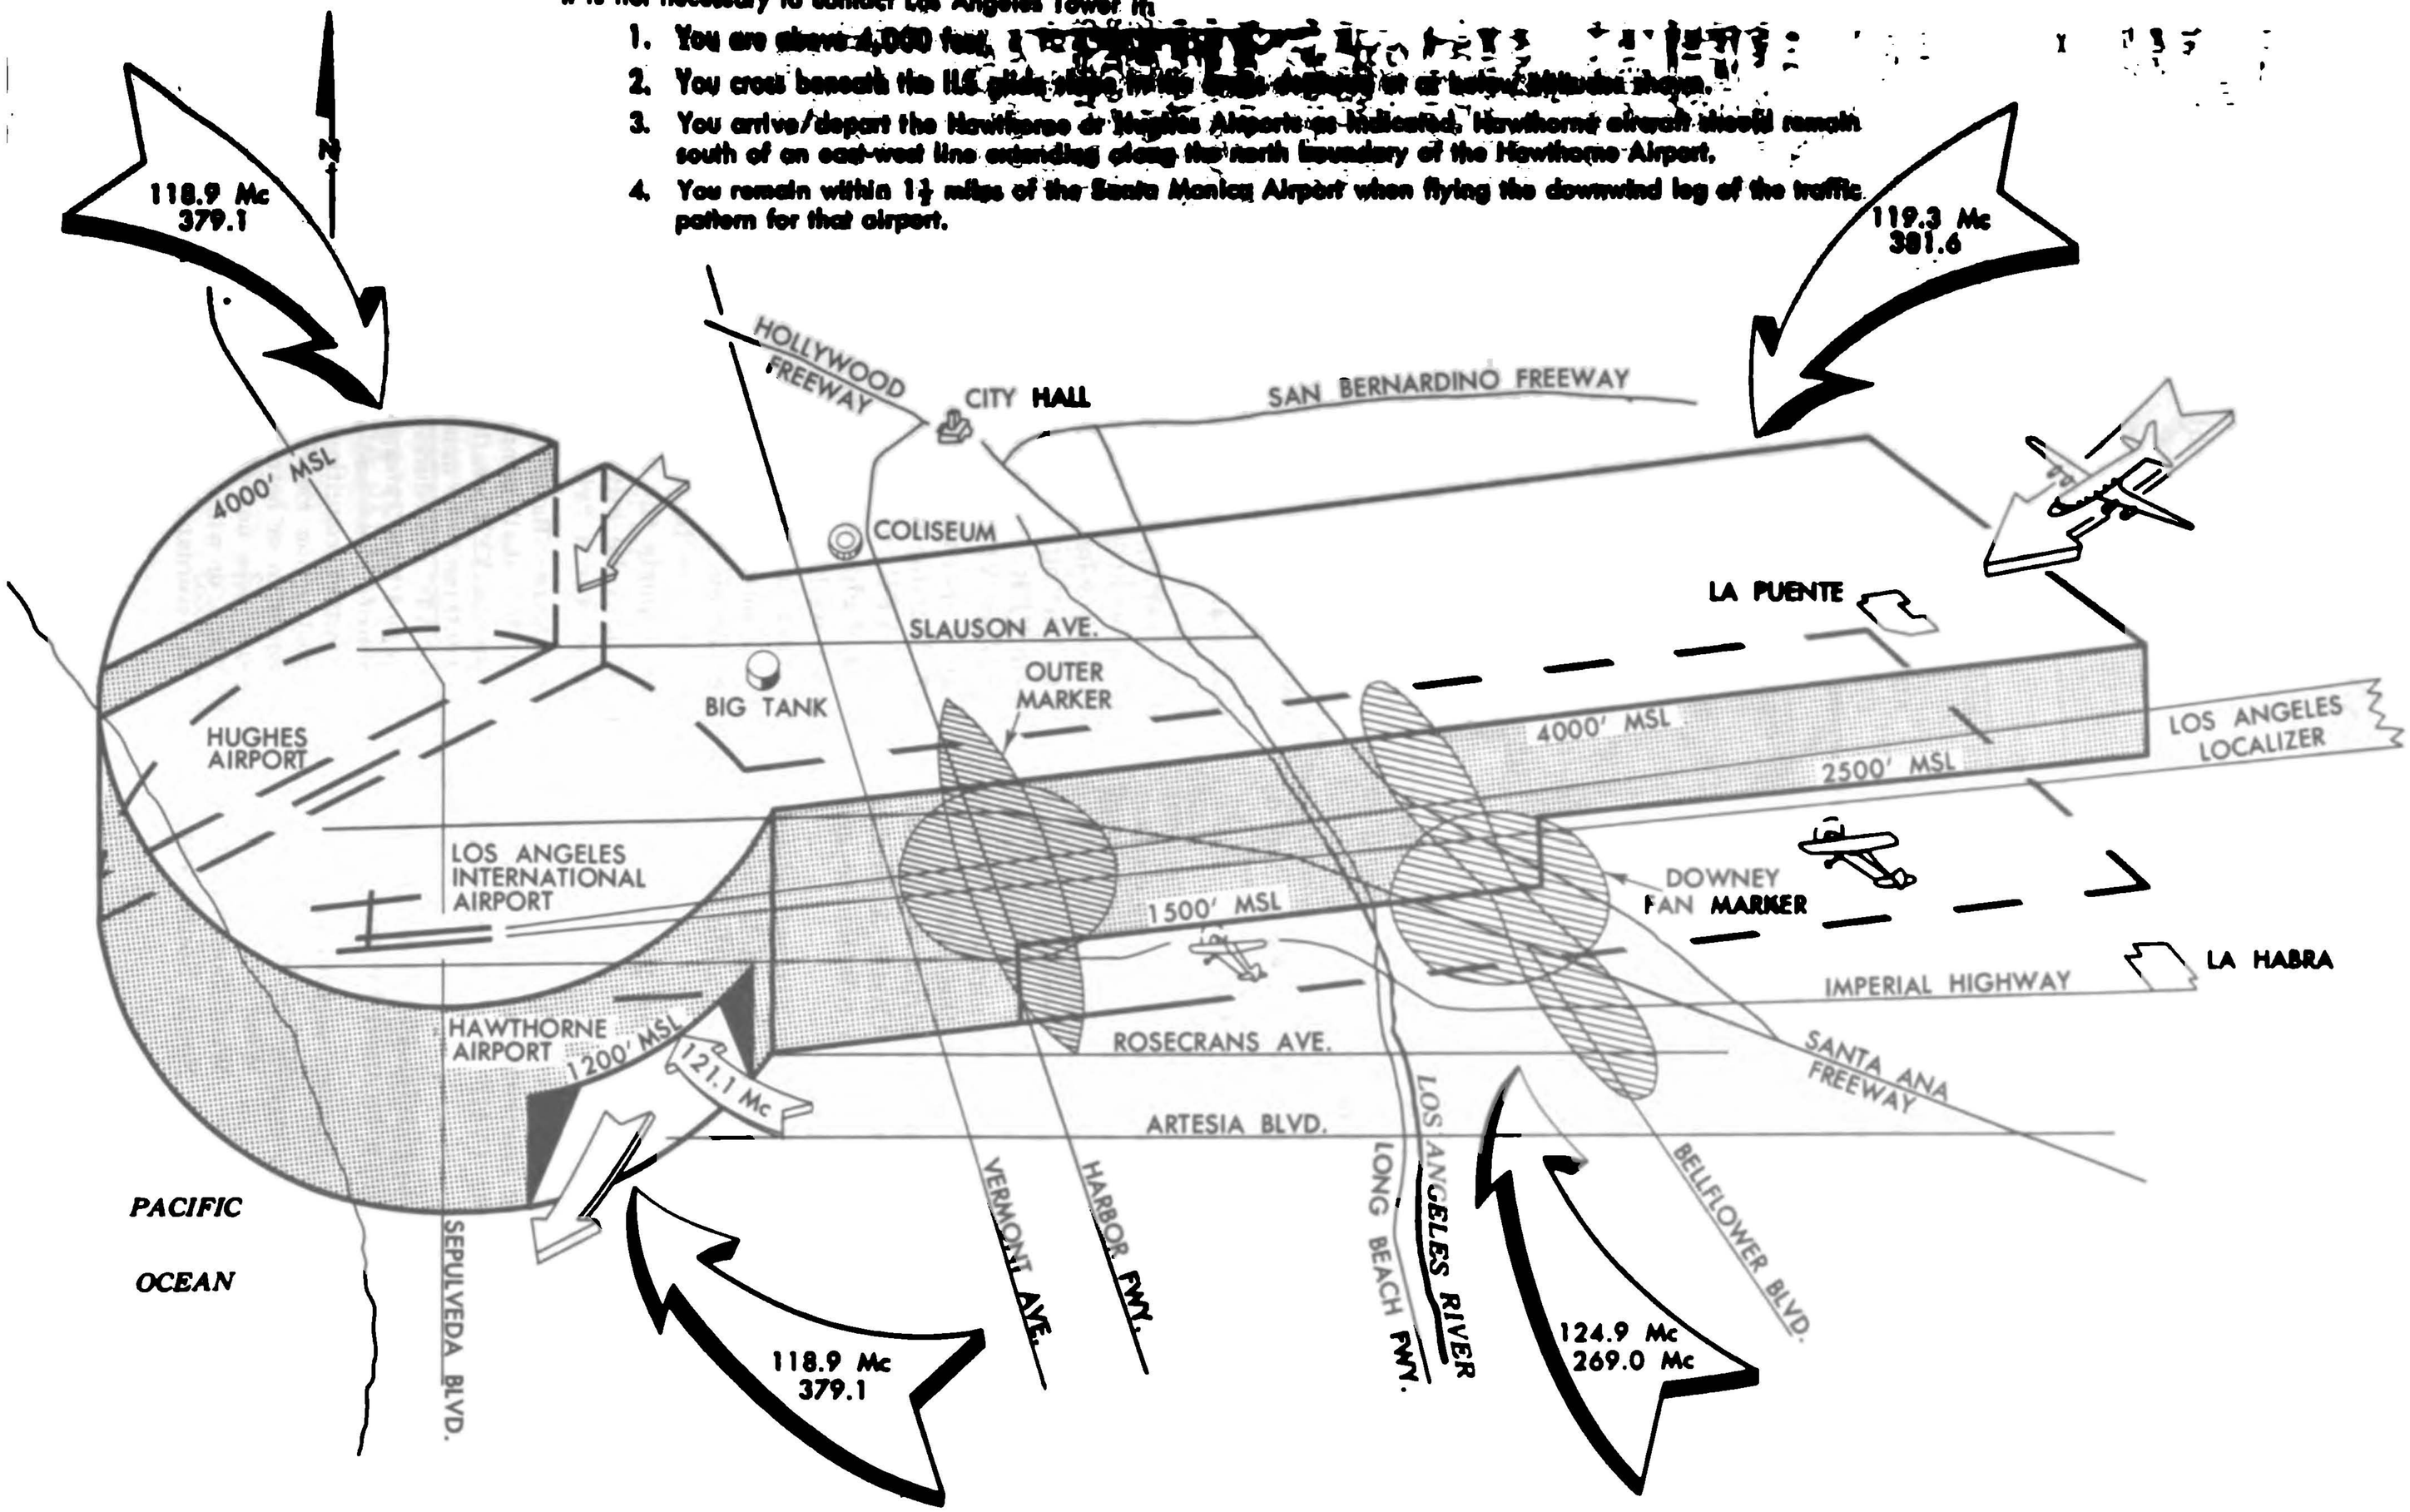
4. Traffic information on observed but unidentified rad targets will be provided on a workload permitti basis.
5. When VFR aircraft are being held within the TR and control is based thereon, the ATC clearance w specify the distance (radius) and, if appropriate, t direction from the geographical fix within whi holding is to be accomplished. In such cases, t pilot will be advised when to EXPECT FURTHI CLEARANCE.
6. During weather conditions equal to or better th basic VFR, 500 feet vertical separation may be e ployed between VFR flights and/or between VFR a IFR flights operating within the TRSA.
7. During weather conditions equal to or better th basic VFR, visual separation may be employed tween VFR flights and/or between VFR and I flights operating within the TRSA when a pilot ports the other aircraft in sight and advises that can maintain his own separation from such aircr
8. When IFR flights, operating in VFR weather con tions, are being sequenced with other traffic and pilot reports the aircraft he is to follow is in sig the pilot may be advised to follow such traffic a may be cleared for a "visual approach."

NOTE.—Basic VFR weather minima as set forth in F 91.105 shall apply within the Atlanta TRSA, except special VFR weather minima set forth in FAR 91.107 sh continue to be applicable within control zones. Appli tion of ATC procedures and separation minima within TRSA is not to be interpreted as relieving pilots of th responsibilities to see and avoid other traffic operating basic VFR weather conditions, to maintain appropr terrain and obstruction clearance, or to remain in weat conditions equal to or better than the established mini However, this does not preclude the pilot from reques IFR handling, or while within the control zone, reques clearance in accordance with special VFR.

...rior to penetrating this area, VFR pilots are encouraged to contact Los Angeles Tower for traffic advisory service on the frequencies indicated for the direction of flight.

It is not necessary to contact Los Angeles Tower if:

1. You are above 4,000 feet.
2. You cross beneath the ILS glide slope in the [illegible] or at higher altitudes shown.
3. You arrive/depart the Hawthorne or Hughes Airports as indicated. Hawthorne aircraft should remain south of an east-west line extending along the north boundary of the Hawthorne Airport.
4. You remain within 1½ miles of the Santa Monica Airport when flying the downwind leg of the traffic pattern for that airport.



*THIS DOES NOT CONSTITUTE AUTHORITY FOR A PILOT TO DEVIATE FROM FAR 91.79 OR OTHER APPLICABLE PROVISIONS OF THE FEDERAL AVIATION REGULATIONS.

Merced CALIFORNIA

CASTLE TERMINAL RADAR SERVICE AREA

Implementation

On March 1, 1965, a TRSA program was implemented at Merced, California, in the Castle AFB terminal area. The service is designed using the concepts developed by the Federal Aviation Agency for the Atlanta, Georgia, area and, in addition, includes procedures peculiar to the operation of military aircraft. The service is mandatory for use by the USAF pilot. All civil and other military pilots are encouraged to participate on a voluntary basis.

The Castle Terminal Radar Service Area is that airspace extending upward from the surface to and including 7,000 feet MSL within the Merced Control Zone; and, in addition, that airspace extending from 1,500 feet MSL to and including 7,000 feet MSL within a 15 nautical mile radius of the Castle Airport, excluding the airspace 3,000 feet MSL and above within Victor Airway 23.

Flight Procedures

1. **IFR Flights**—Aircraft operating within the Castle TRSA shall be operated in accordance with current IFR procedures.

2. **VFR Flights:**

a. Airports within the Castle TRSA:

(1) Arriving aircraft will be expected to contact Castle Approach Control on specified frequencies and in relation to geographical fixes listed in d. below.

(2) Departing aircraft will be expected to contact Castle Departure Control on a frequency specified in d. below.

b. Airports underlying the Castle TRSA:

(1) Unless flight will be conducted below the floor of the TRSA, arriving aircraft will be expected to contact Castle Approach Control on a frequency specified and in relation to geographical fixes listed in d. below.

(2) Departing aircraft will be expected to contact Castle Departure Control on a frequency specified in d. below as soon as possible after becoming airborne if it is desired that flight be conducted within the TRSA.

c. Transiting Aircraft: Aircraft desiring to transit the TRSA will be expected to contact Castle Approach Control on a frequency specified and in relation to geographical fixes listed in d. below.

d. Frequencies and Fixes: En route aircraft should establish communications with Castle Approach Control approximately 25 nautical miles from the Castle Airport.

(1) Frequencies:

(a) Civil: 118.9 mc Transmit and Receive
122.5 mc Transmit
114.2 mc Receive

(b) Military: 294.5 mc (jet aircraft)
301.5 mc (conventional aircraft)
137.65 mc (VHF only equipped aircraft)

(2) Fixes: In addition to published radio fixes, the following geographical fixes may be used by pilots:

Fix	Location
City of Modesto	West–Northwest
Crows Landing (NAS)	West
City of Gustine	West–Southwest
City of Los Banos	South–Southwest
City of Dos Palos	South
City of Chowchilla	East–Southeast
City of Madera	East–Southeast
City of Mariposa	East–Northeast
Don Pedro Reservoir	North
City of Oakdale	Northwest

ATC Procedures

1. The Castle TRSA is primarily a radar environme and control will be predicated thereon. This does n preclude application of nonradar separation as requir or deemed appropriate.

2. To facilitate radar identification of arriving a transiting VFR aircraft, ATC may request such aircra to report their position in relation to fixes (prominen geographical or radio) within or outside the perimeter the TRSA.

3. Radar headings and, if required, altitude assig ments may be given to VFR flights operating within t TRSA.

NOTE.—Assignment of radar headings and/or altitu are based on the provision that a pilot operating in acc ance with VFR is expected to advise ATC if complia with an assigned route, radar heading or altitude will ca the pilot to violate such rules.

4. Traffic information on observed but unidentifi radar targets will be provided on a workload permitti basis.

5. When VFR aircraft are being held within the TR and control is based thereon, the ATC clearance w specify the distance (radius) and, if appropriate, t direction from the geographical fix within which holdi is to be accomplished. In such cases, the pilot will advised when to EXPECT FURTHER CLEARANCE.

6. During weather conditions equal to or better th basic VFR, 500 feet vertical separation may be employ between VFR flights and/or between VFR and IF flights operating within the TRSA.

7. During weather conditions equal to or better th basic VFR, visual separation may be employed betwe VFR flights and/or between VFR and IFR flights op ating within the TRSA when a pilot reports the oth aircraft in sight and advises that he can maintain h own separation from such aircraft.

8. When IFR flights, operating in VFR weather co ditions, are being sequenced with other traffic and t pilot reports the aircraft he is to follow is in sight, t pilot may be advised to follow such traffic and may cleared for a "visual approach."

NOTE.—Basic VFR weather minima as set forth in FA 91.105 shall comply within the Castle TRSA, except th special VFR weather minima set forth in FAR 91.107 sh continue to be applicable within control zones. Applicati of ATC procedures and separation minima within the TRS is not to be interpreted as relieving pilots of their respon bilities to see and avoid other traffic operating in basic VF weather conditions, to maintain appropriate terrain a obstruction clearance, or to remain in weather conditio equal to or better than the established minima. However this does not preclude the pilot from requesting IFR ha dling, or while within the control zone, requesting clearan in accordance with special VFR.

Chicago ILLINOIS

PARALLEL ILS APPROACHES—CHICAGO O'HARE INTERNATIONAL AIRPORT

Effective April 11, 1964 a revised Parallel ILS 14R&L approach procedure Amendment 1 was effective for Chicago O'Hare International Airport. ILS, radar, communications, ATC procedures and flight procedures are employed as integral parts of a total system. Under the system, Chicago Approach Control may clear aircraft to conduct Parallel ILS Approaches to Runways 14L and 14R when wind conditions permit straight-in landings and when all components of the system—except airborne or ground glide slope equipment—are operating normally. Aircraft are radar vectored to the final approach course (localizer) of either runway and the pilot executes an ILS approach. The separation between localizer courses (6,510 feet) imposes certain requirements and techniques peculiar to parallel approaches.

Requirements: To conduct a Parallel ILS Approach, aircraft must be equipped with a functioning 75 mc marker (or ADF) and localizer receivers, and have the capability to simultaneously monitor both the assigned control frequency and the appropriate localizer voice frequency when advised by ATC.

ATC Concept and Procedures: Arriving IFR aircraft en route to O'Hare Airport will be cleared by Chicago Center to one of four outer fixes (Northbrook, Niles, Lakewood, or Warren) established in the O'Hare Terminal Area and changed over to Chicago Approach Control for further clearance. On initial contact, Chicago Approach Control will advise the pilot that PARALLEL ILS APPROACHES ARE IN PROGRESS. Upon receipt of this information, **pilots who do not have required equipment** or do not wish to conduct a Parallel ILS approach, or require a specific runway, or require a radar fix in lieu of Meadow Intersection for 14L, must advise Chicago Approach Control prior to departing the outer fix. This will enable the controller to plan and provide for individual handling.

Chicago Approach Control will clear aircraft to depart the outer fix on a specified heading and at a specified altitude FOR RADAR VECTOR TO RUNWAY 14 (RIGHT/LEFT) ILS FINAL APPROACH COURSE and will specify the appropriate localizer frequency (109.7 or 110.1). After departing the outer fix, aircraft will be descended to the appropriate ILS Intercept Altitude (2,200 or 3,200 feet m.s.l.) and provided a period of level flight prior to the ILS intercept in which the pilot may dissipate any excess speed accumulated during the descent.

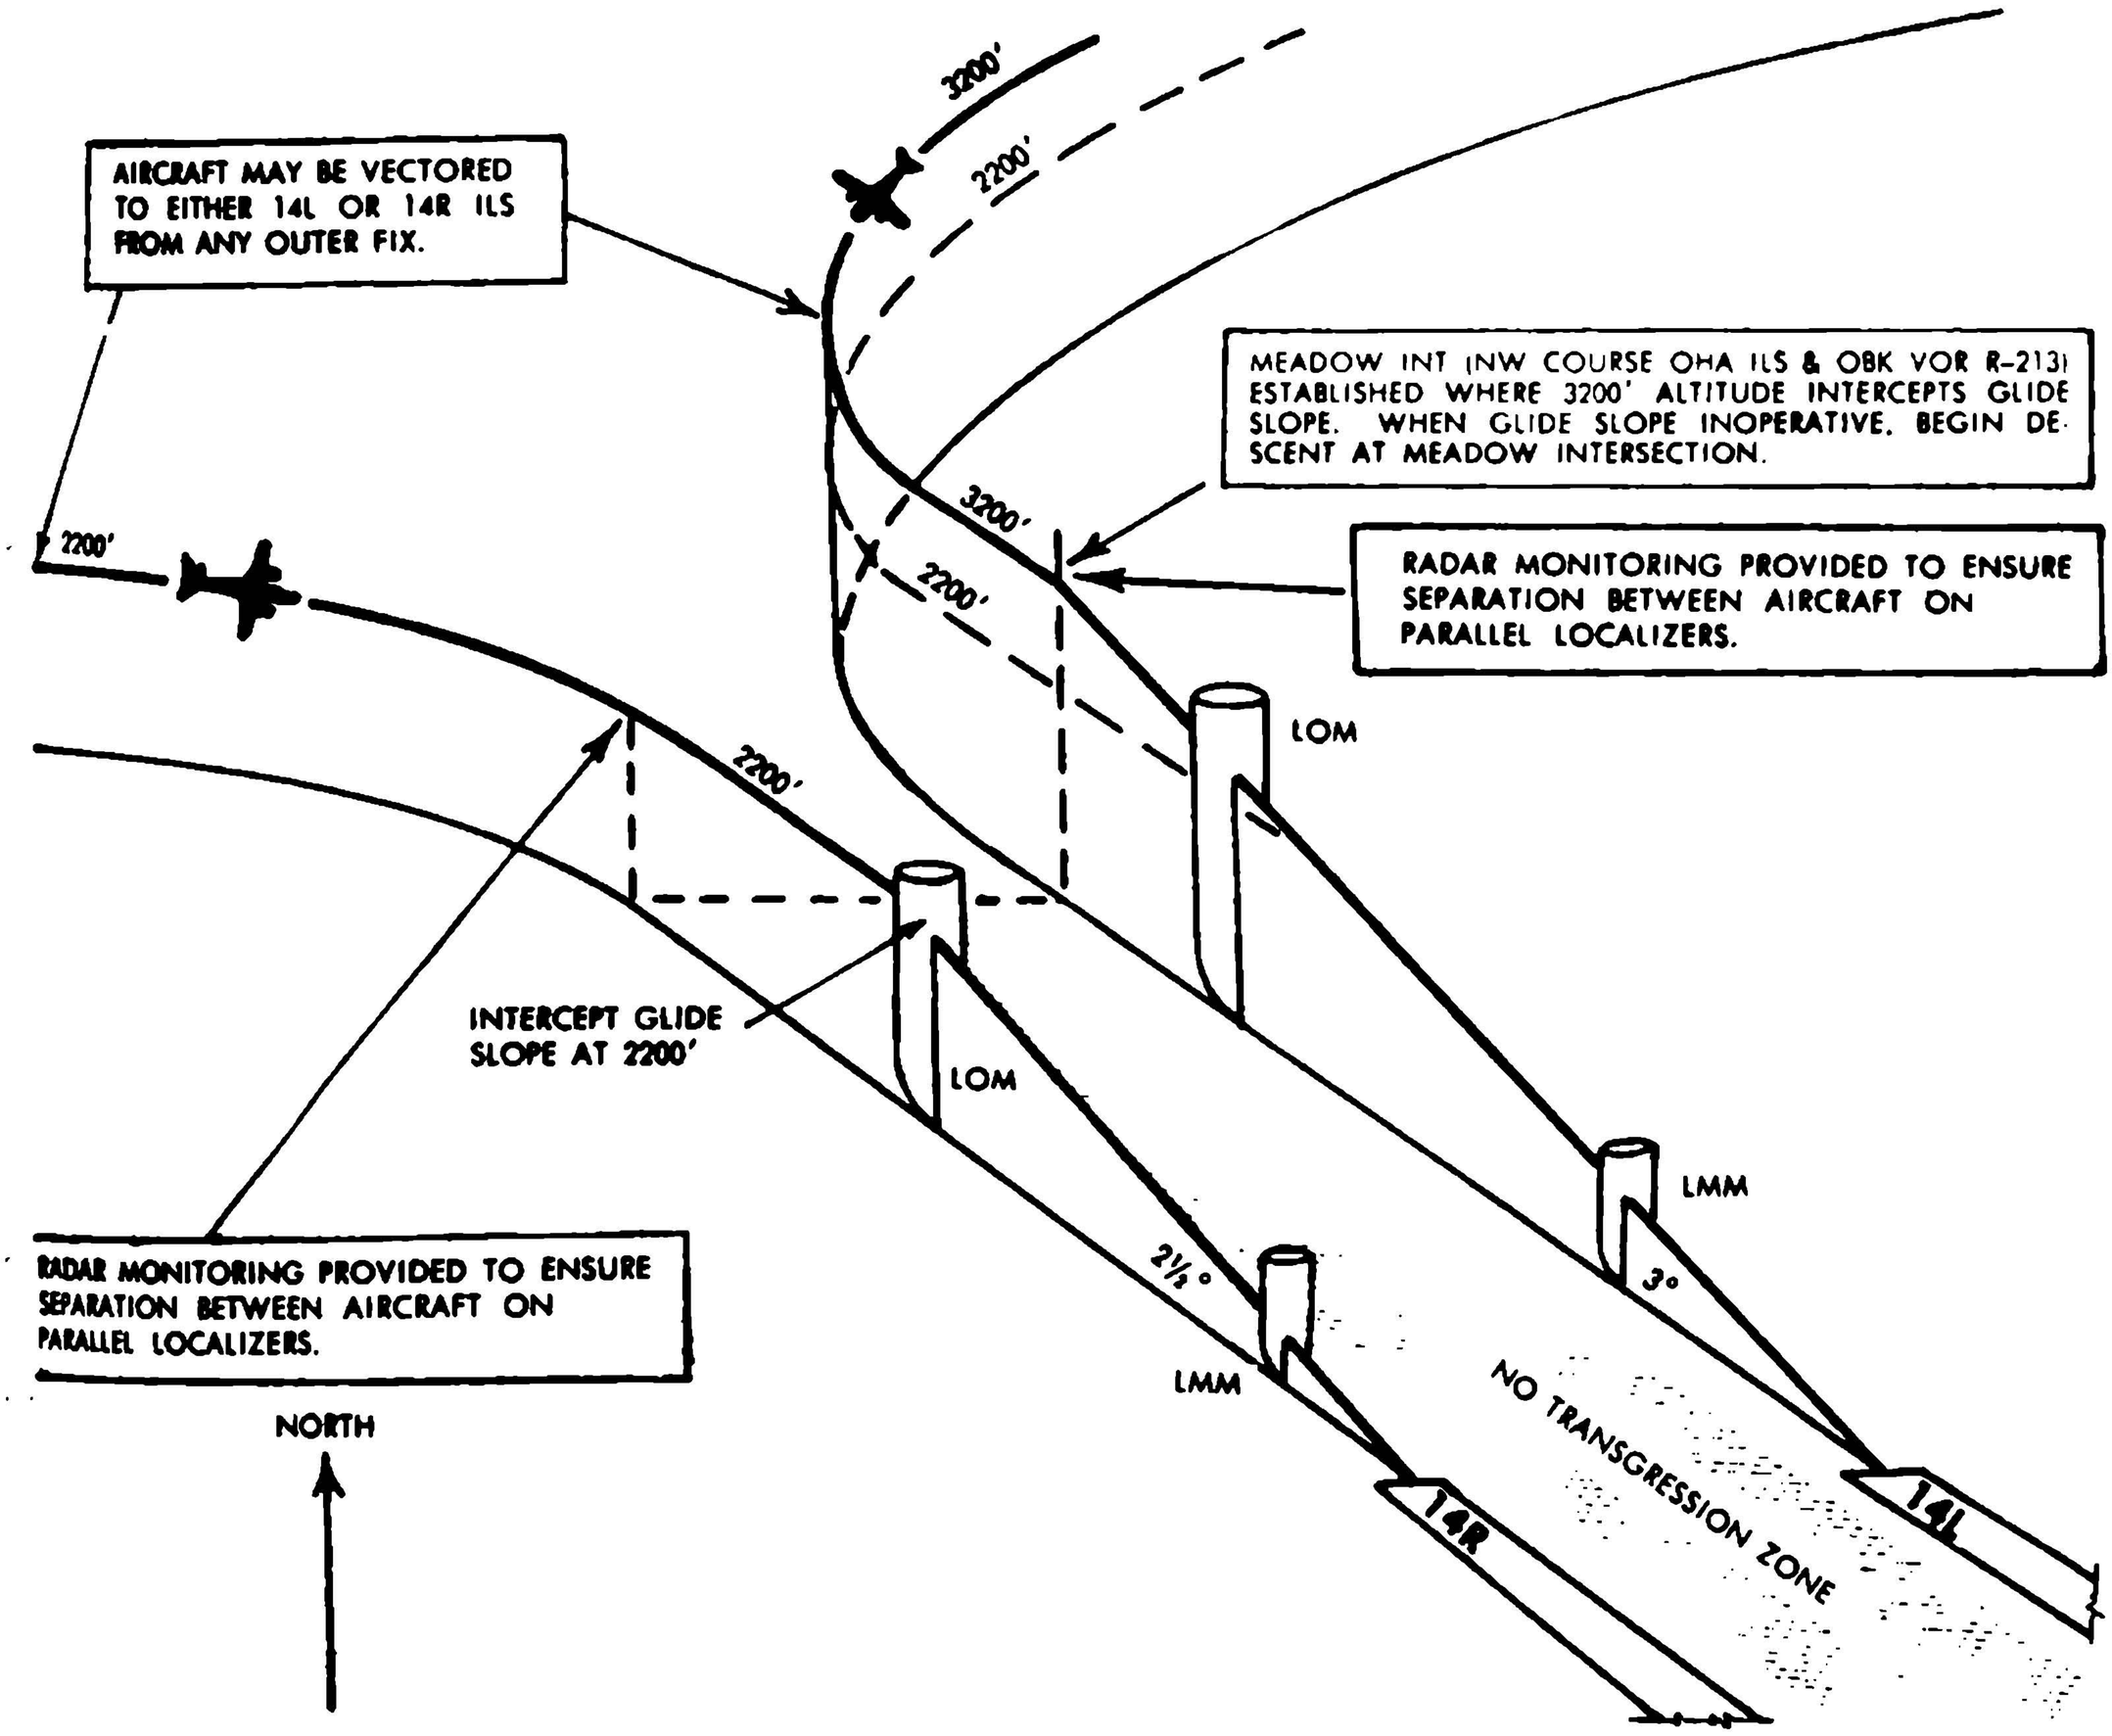
ATC Separation: Radar separation is provided between aircraft being vectored to, and while on, the same localizer course throughout the entire approach. Aircraft being vectored to Runway 14R will intercept that localizer course at 2,200 feet m.s.l. Aircraft being vectored to 14L will intercept that localizer course at 3,200 feet m.s.l., or higher. Since aircraft may be vectored to either l localizer course from any of the four outer fixes, a m mum of 1,000 feet vertical or 3 miles radar separa will be provided between the aircraft being vector opposite ILS courses during the turn-on. The appro ate ILS Intercept Altitude is maintained by the airc until intercepting the glide slope. After the turn-on until aircraft are 2.3 miles northwest of the o markers, a minimum of 1,000 feet vertical separa provided between aircraft on parallel ILS loca courses.

Localizer Interception: Aircraft will be vectored so a permit the pilot to intercept the appropriate ILS loca course at an angle not greater than 20°. After ass this final intercept heading, approach control will the aircraft for a parallel ILS approach. Subsequ the pilot will be changed over to O'Hare Tower and structed to monitor the appropriate localizer voice quency (either 109.7 or 110.1 mc). When glide s receiver or ground glide slope transmitter is inopera the pilot will begin descent from 3,200 feet for 14L Meadow Intersection or descend from 2,200 feet for at the LOM. When glide slope is out or not receiv radar fix in lieu of Meadow Intersection will be pro upon pilots request or aircraft equipped with ILS VOR will start descent on 14L upon identificati Meadow Intersection.

Radar Monitoring: All turn-ons and final approaches radar monitored regardless of weather conditions. M tor controllers will issue advisory information and trol instructions as may be necessary to insure that craft on final approach remain within an area 1,5 either side of the localizer course. Since the pri responsibility for navigation rests with the pilot, advi information and control instructions issued on the izer voice frequency are limited to those necessa insure separation between aircraft. Pilots need acknowledge transmissions made by the monito troller on localizer voice frequency unless spec requested to do so.

A "no transgression zone" 3,510 feet wide is e lished equidistant between the centerlines of each izer course and displayed on the monitor radar s Should an aircraft on final approach deviate from and enter the "no transgression zone," the monitor troller will issue instructions as are necessary to alter course of that aircraft. Concurrently, immediate a will be taken by the controller monitoring the adj localizer course to cause any aircraft in potential co with the intruding aircraft to alter its flight path

Missed Approach: The missed approach procedure veloped for either runway is designed to provide se tion from the adjacent runway. The pilot may be structed to execute the missed approach procedure at time during the approach.



AIRCRAFT MAY BE VECTORED TO EITHER 14L OR 14R ILS FROM ANY OUTER FIX.

SPECIAL AIR TRAFFIC RULES (VFR OR VFR CONDITIONS)

EFFECTIVE DECEMBER 10, 1964

Prior to conducting flight operations in the area shown, pilots are required to obtain information about operating altitudes of high speed special activities conducted in the area. Normally, special activities will use not more than two altitude levels. Contact Crestview Radio, Eglin AFB RAPCON, Tallahassee Radio, or Pensacola Radio. Information may be obtained by radio or telephone. This special rule is in effect sunrise to sunset Monday through Saturday.

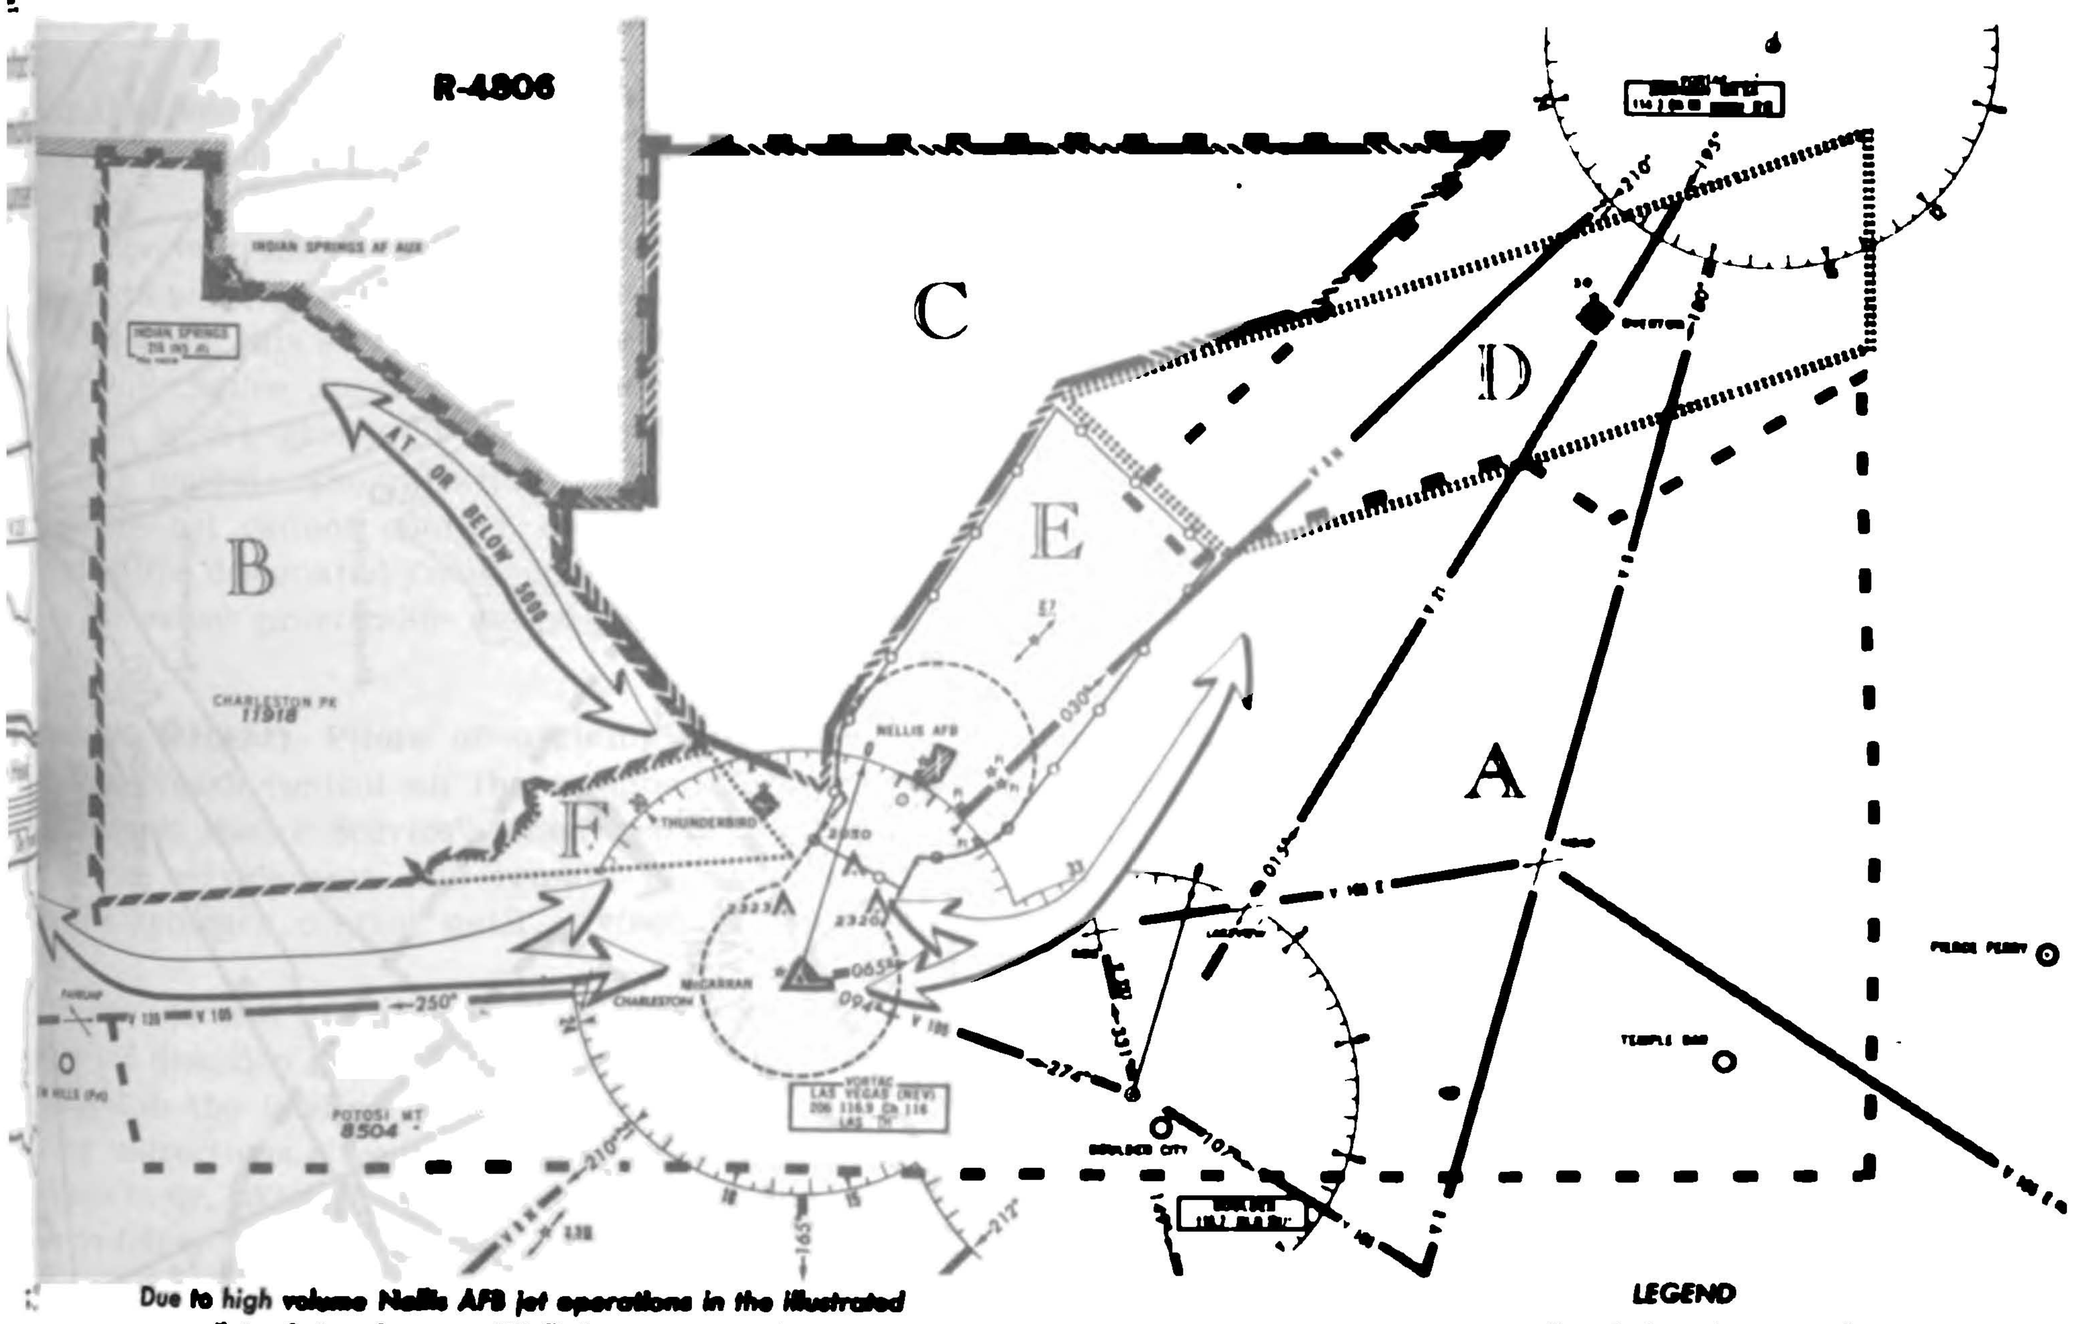
LAS VEGAS TERMINAL AREA NOTICE
LAS VEGAS, NEVADA



Due to high volume Nellis AFB jet operations in the illustrated area pilots of aircraft not on IFR flight plans operating into or through the Las Vegas area are encouraged to:

1. *Avoid areas of jet concentration by following suggested routings shown by arrows, at appropriate altitudes and,*
2. a. *Arriving – contact Las Vegas Approach Control on 121.1, 125.9, 284.6 or 353.6 mcs, for radar advisories when inbound prior to reaching a point approximately 30 miles from Las Vegas or if not practical, contact Las Vegas Radio for in-flight advisories.*

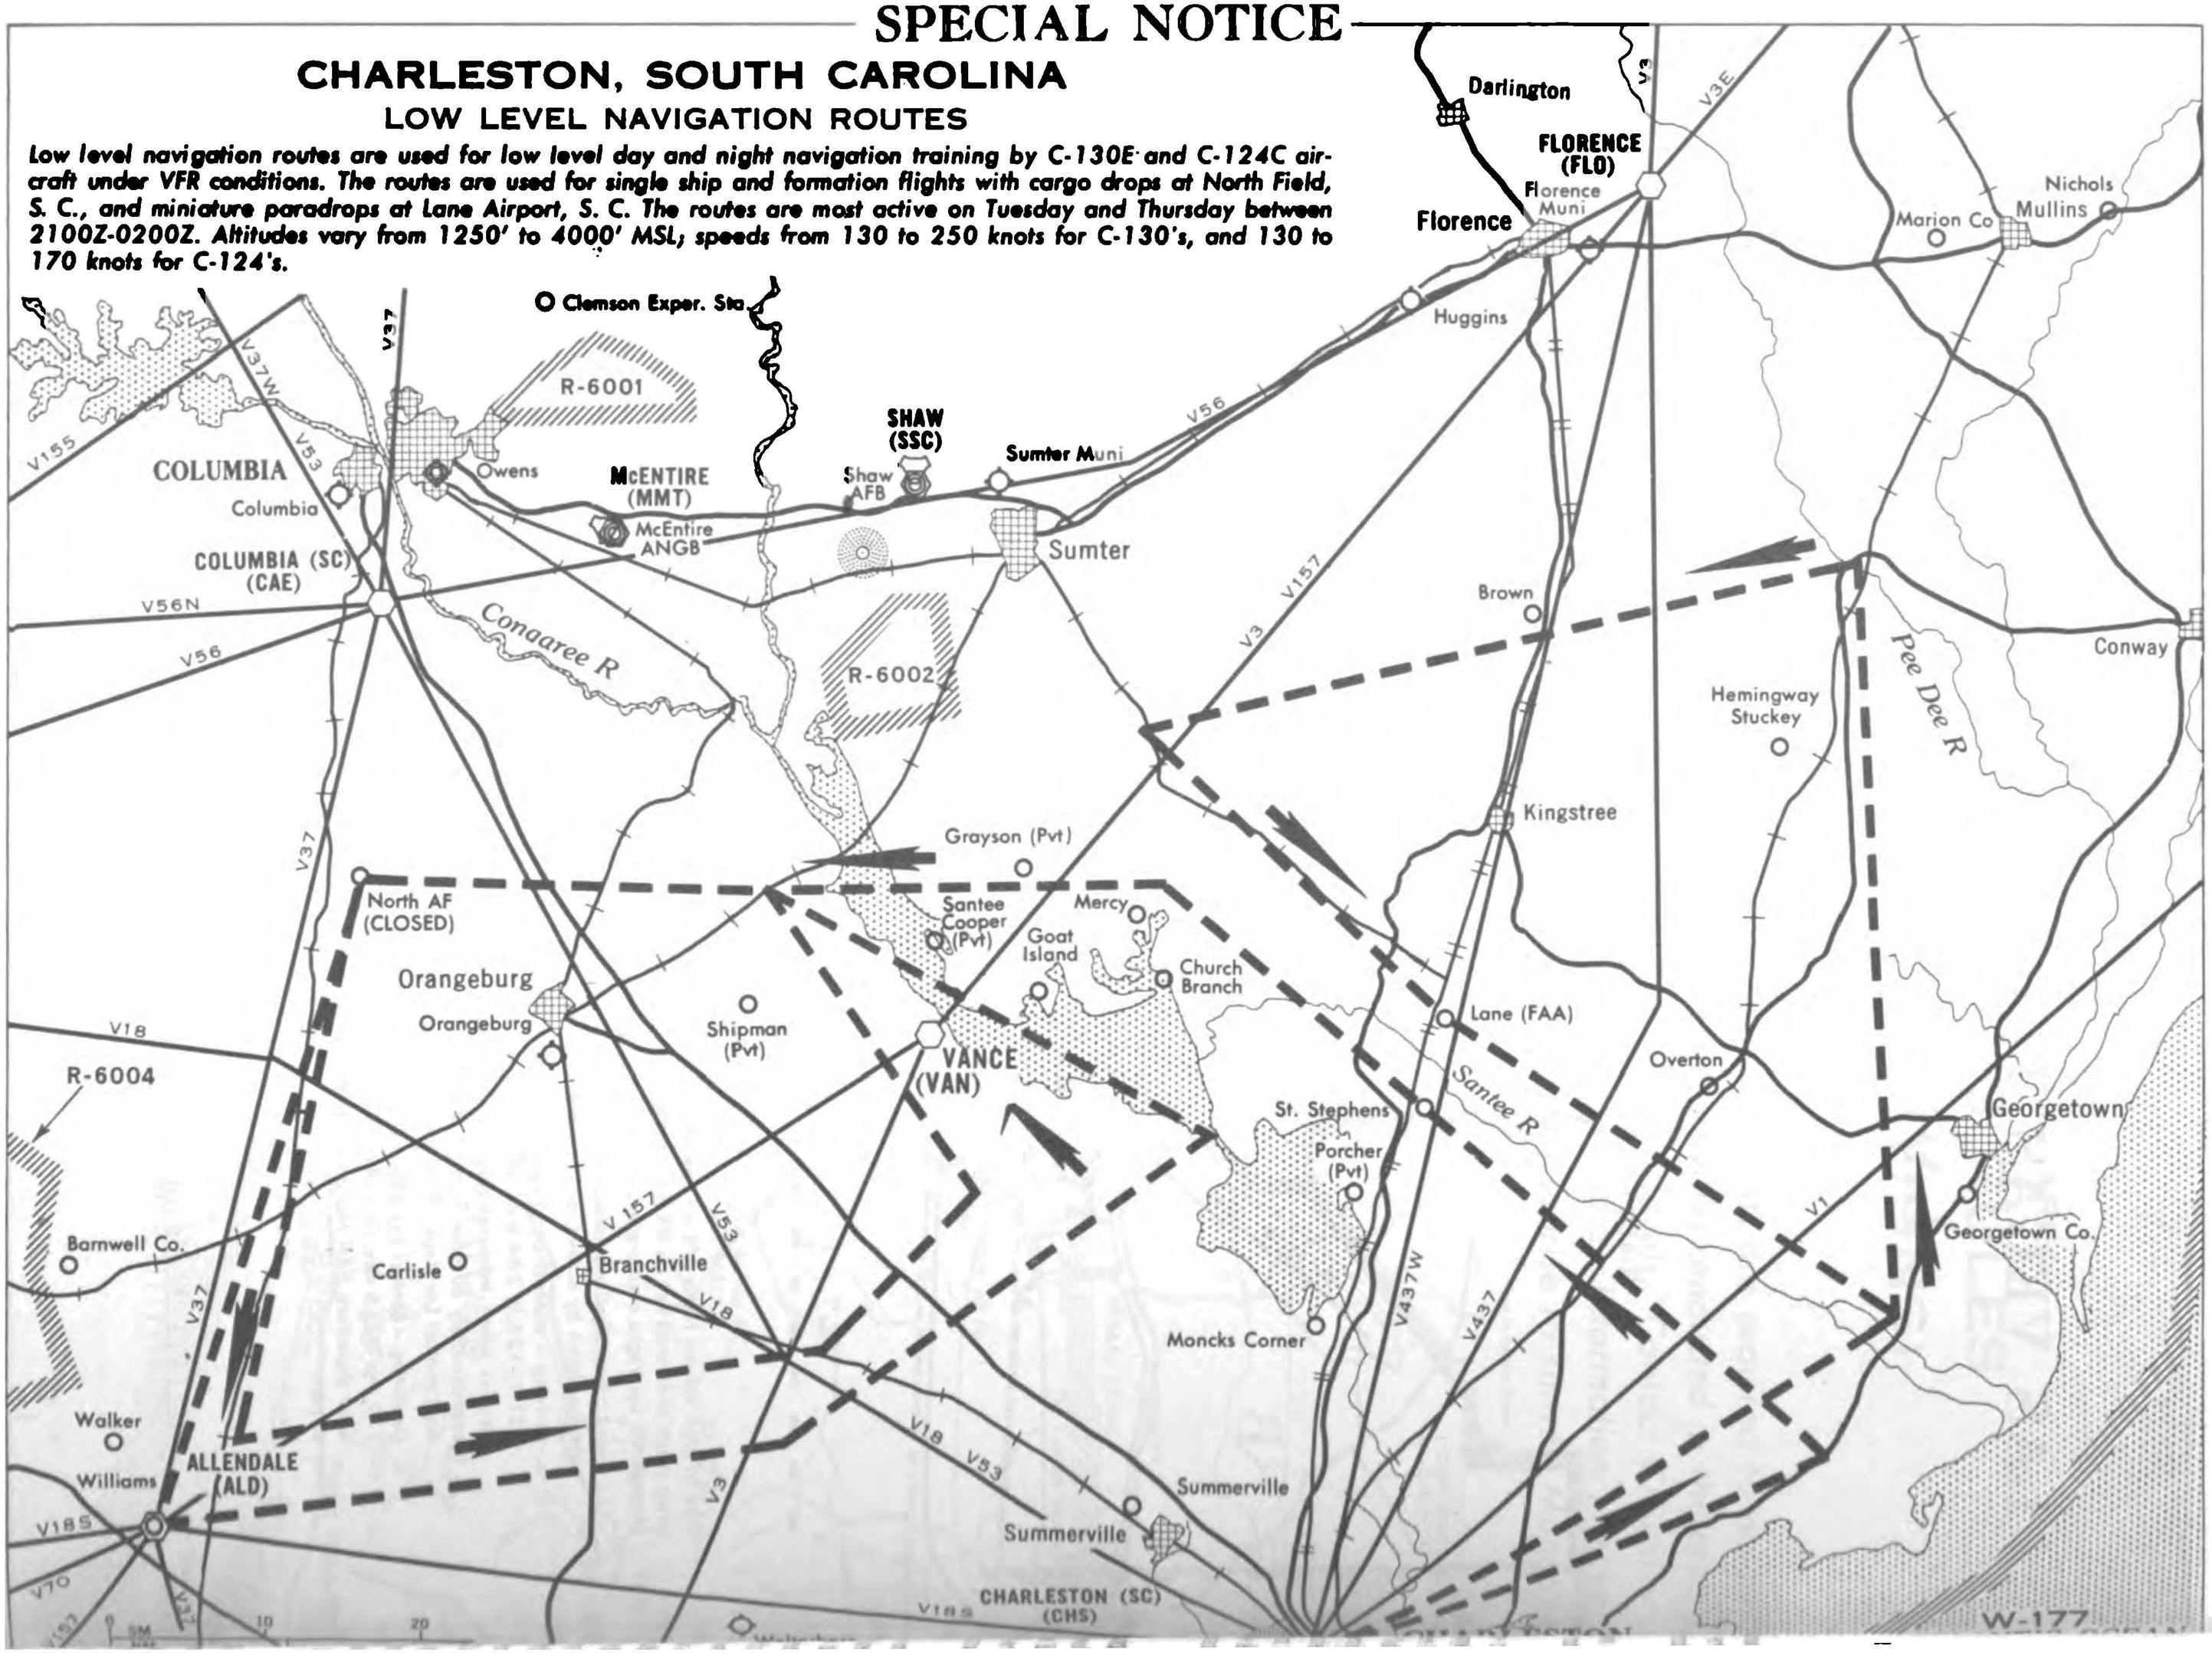
   b. *Departing – contact Las Vegas Departure Control on 119.4 or 335.5 mcs, for radar advisories immediately after departure from McCarran Field or Thunderbird Airport.*

SPECIAL NOTICE

CHARLESTON, SOUTH CAROLINA

LOW LEVEL NAVIGATION ROUTES

Low level navigation routes are used for low level day and night navigation training by C-130E and C-124C aircraft under VFR conditions. The routes are used for single ship and formation flights with cargo drops at North Field, S. C., and miniature paradrops at Lane Airport, S. C. The routes are most active on Tuesday and Thursday between 2100Z-0200Z. Altitudes vary from 1250′ to 4000′ MSL; speeds from 130 to 250 knots for C-130's, and 130 to 170 knots for C-124's.



EXPANDED RADAR SERVICE FOR ARRIVING AND DEPARTING FLIGHTS IN TERMINAL AREAS

'ertain approach control facilities are providing ex-nded radar service for arriving and departing flights hin their terminal areas. These services are designed

1. Aid pilots to see and avoid other traffic by pro-ing radar traffic information on possible conflicting ffic, and

2. Improve traffic flow by giving specific routes or dings to properly sequence arrivals.

'ations where this service is provided are listed at the l of this Notice together with information on the ignated service area and frequency to be used. Air-ft with limited communication equipment who desire service but cannot contact approach or departure trol on the designated frequencies will be given serv-to the extent practicable on frequencies available to pilot.

RRIVING AIRCRAFT: Pilots of arriving aircraft should tact approach control on the assigned frequency/ies l "Request Radar Service" when reaching the perim-r of the service area and remain in communication h the approach control until advised to contact the er.

Approach control will advise pilots of the runway to be d, wind direction and velocity, and traffic information. establish the landing sequence, pilots will be given ding instructions if required and/or specific routes or dings to fly. When a pilot reports he has the aircraft is to follow in sight, he will be directed to follow it. en a pilot of an IFR flight, operating in basic VFR ather conditions, is instructed to follow a preceding craft he will be cleared for a "visual approach." This arance may be issued whether or not the IFR flight is erating within the control zone. With a "visual ap-ach" clearance, the pilot operating on an IFR flight n in VFR conditions may deviate from the prescribed trument approach procedure and proceed to the air-t with visual reference to the surface. Radar service ll be terminated when aircraft are told to contact the er and the tower will assign a landing sequence mber.

EPARTING AIRCRAFT: Departing VFR aircraft desiring ffic information should "Request Radar Service" on tial contact with ground control and advise proposed ection of flight. Following takeoff, the tower will ad-e when to contact departure control and the frequency be used.

When radar contact is established, departure control ll provide traffic information until radar contact is lost or the flight has reached the perimeter of the service area. The pilot will be advised when radar service is terminated.

TRAFFIC INFORMATION: Standard radar separation will be provided between aircraft operating in accordance with Instrument Flight Rules until such time as the aircraft is sequenced and the pilot sees the aircraft he is to follow. Standard radar separation between VFR or between VFR and IFR aircraft will not be provided; instead, traffic information will be issued to the appropriate aircraft prior to the time less than 3 nmi exists between one identified VFR flight and another identified flight, either VFR or IFR. Traffic information on other observed but unidentified radar targets will be issued to the extent controller workload permits. Pilots may request radar vectors to avoid reported traffic and vectors will be given to the extent possible consistent with controller workload.

Pilot participation in this program is not mandatory but is strongly urged since the success of the program is largely dependent on full pilot participation.

THESE PROCEDURES ARE NOT TO BE INTERPRETED AS RELIEVING PILOT OF THEIR RESPONSIBILITIES TO SEE AND AVOID OTHER TRAFFIC OPERATING IN BASIC VFR WEATHER CONDITIONS, TO MAINTAIN APPROPRIATE TERRAIN AND OBSTRUCTION CLEARANCE, OR TO REMAIN IN WEATHER CONDITIONS EQUAL TO OR BETTER THAN THE MINIMA REQUIRED BY FAR 91.105. WHENEVER COMPLIANCE WITH AN ASSIGNED ROUTE OR HEADING IS LIKELY TO COMPROMISE SAID PILOT RESPONSIBILITY RESPECTING TERRAIN AND OBSTRUCTION CLEARANCE AND WEATHER MINIMA, APPROACH CONTROL SHOULD BE SO ADVISED AND A REVISED CLEARANCE OR INSTRUCTION OBTAINED.

LOCATIONS AT WHICH THE ABOVE RADAR SERVICE IS PROVIDED

John F. Kennedy Intl Airport, N.Y.

EFFECTIVE DATE: 18 AUGUST 1962

Area Within Which Service is Provided: Approximately 25 nautical mile radius of John F. Kennedy Intl Airport exclusive of LaGuardia, Newark, and Floyd Bennett NAS control zones. **Arrival Frequencies:** Aircraft flying to the airport, contact approach control on 120.8 mc. Aircraft not equipped for two-way communication on 120.8 mc should transmit 122.7 mc and listen on 120.8 mc. **Departure Frequencies:** N and W bound 123.9 mc or 269.4 mc: all others 121.1 mc or 269.4 mc.

Houston International Airport, Tex.

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 nmi from the airport. **Arrival Frequencies:** Aircraft flying to the airport on headings of 189° thru 037° contact approach control on 118.3 mc or 379.1 mc. Those flying headings of 038° thru 188° use 118.1 mc or 307.1 mc. Aircraft not equipped for two-way communication on those frequencies should transmit 122.5 mc and listen on the appropriate frequency specified above or a frequency/ies assigned by the facility. **Departure Frequencies:** 123.7 mc or 290.2 mc.

El Paso International Airport, Texas and Biggs AFB, Texas

EFFECTIVE DATE: 1 SEPTEMBER 1962

Area Within Which Service is Provided: At least 25 mi from the airports. **Arrival Frequencies:** Aircraft should use 118.7 mc or 307.0 mc. Aircraft not equipped for two-way communications on those frequencies should transmit 122.7 mc and listen on the appropriate listed frequency. **Departure Frequencies:** The tower will advise pilots of departing VFR flights who have requested the service when to contact departure control and the frequency to be used.

Castle AFB Terminal Area Merced, Calif.

EFFECTIVE DATE: 1 JUNE 1963

AREA WITHIN WHICH SERVICE IS PROVIDED: 20 mi radius of Castle AFB, 4000 feet and below. Aircraft entering this area or, departing from airports within this area should contact Castle approach on 118.9 mcs, 137.65 mcs or 294.5 mcs. Aircraft not equipped for two-way communications an 118.9 mcs should transmit on 122.5 mcs and receive on 118.9 mcs or 114.2 mcs.

Los Angeles International Airport, California

EFFECTIVE DATE: 22 SEPTEMBER 1964

Area within which service is provided: 25 nmi. **Arrival fr** 045–224 degrees inbound, 119.3 or 381.6 mc. 225–044 grees inbound, 124.9 or 260.0 mc. If not so equipp trans 122.7 mc and guard above freq or LAX VOR. **parture Freq:** tower, 118.9 mc. then departure control 125.2 or 385.4 mc when outbound 225–045 degrees, 12 or 363.2 mc, 045–225 degrees.

Weir-Cook, Indianapolis, Indiana

EFFECTIVE DATE: 14 SEPTEMBER 1964

Area within which service is provided: 20 nmi, 4000' a below. **Arrival Freq:** 118.5 mc. **Departure freq:** ground cont 121.9 mc then Indianapolis Departure Radar Serv 121.3 mc. Enroute aircraft contact Indianapolis Termi Radar Service, 118.5 mc.

Logan International Airport, Boston, Mass.

EFFECTIVE DATE: 17 FEBRUARY 1965

Area in which service is provided: Approximately 25 n tical mile radius of Logan International Airport. **rival frequencies:** Aircraft flying to the airport on headi of 035° through 140° should use the frequencies 12 or 281.5 mcs. Those flying headings of 141° thro 034° use 120.6 or 263.1 mcs. Aircraft not so equip should transmit on 122.5 mcs. and listen on the app priate frequency. **Departure frequencies:** 119.1 or 343.6 m

Friendship Intl Airport, Baltimore, Maryland

EFFECTIVE DATE: 11 February 1965

AREA IN WHICH SERVICE IS PROVIDED: Approximately mi radius. **Arrival freq:** In bound on 101° thru 281° · 121.1 mc or 360.8 mc; inbound on 282° thru 100° · 125.9 mc or 307.9 mc. **Departure freq:** 120.4 or 381.4 when advised by tower.

MILITARY AERIAL REFUELING TRACKS

ilitary aircraft conduct refueling operations throughout the continental United States normally between 12,000 feet MSL and FL 240 on an IFR flight plan at assigned altitude(s). Refueling aircraft have right of way over other aircraft in accordance with FAR 91.67(c)

OIL BURNER ROUTES

MILITARY LOW-LEVEL OPERATION "OIL BURNER": The USAF and the U.S. Navy conduct low-level navigational/bombing training flights in jet aircraft in both VFR and IFR weather conditions along the routes shown in the following pages. Operations are contained within 10 statute miles on either side of the centerline except that on the VFR segments they will be contained within 5 statute miles of the centerline. When route widths shown on the chart are less than those indicated above, the operation will be confined to the route width shown. Aircraft will operate at the altitudes specified on the route charts. Near the end of the low-level navigation portion of the route, aircraft will conduct simulated bomb release maneuvers within a "Bomb Run Corridor" at and between the altitudes shown. "Short Look" and "Lay Down" bomb runs are generally conducted from 4,000 to 6,000 feet MSL "Long Look" bomb runs are generally conducted from 18,000 to 21,000 feet MSL. On some route segments when the weather conditions are 3,000 feet ceiling and 5 miles' visibility or better, aircraft may descend to an altitude of not less than 500 feet above terrain in daylight hours or 800 feet above terrain during hours of darkness. Flights are conducted only during the times specified for each route. The current operational status of a particular route is included in scheduled weather broadcasts or may be obtained by calling a Flight Service Station near the route. Revised information is underlined.

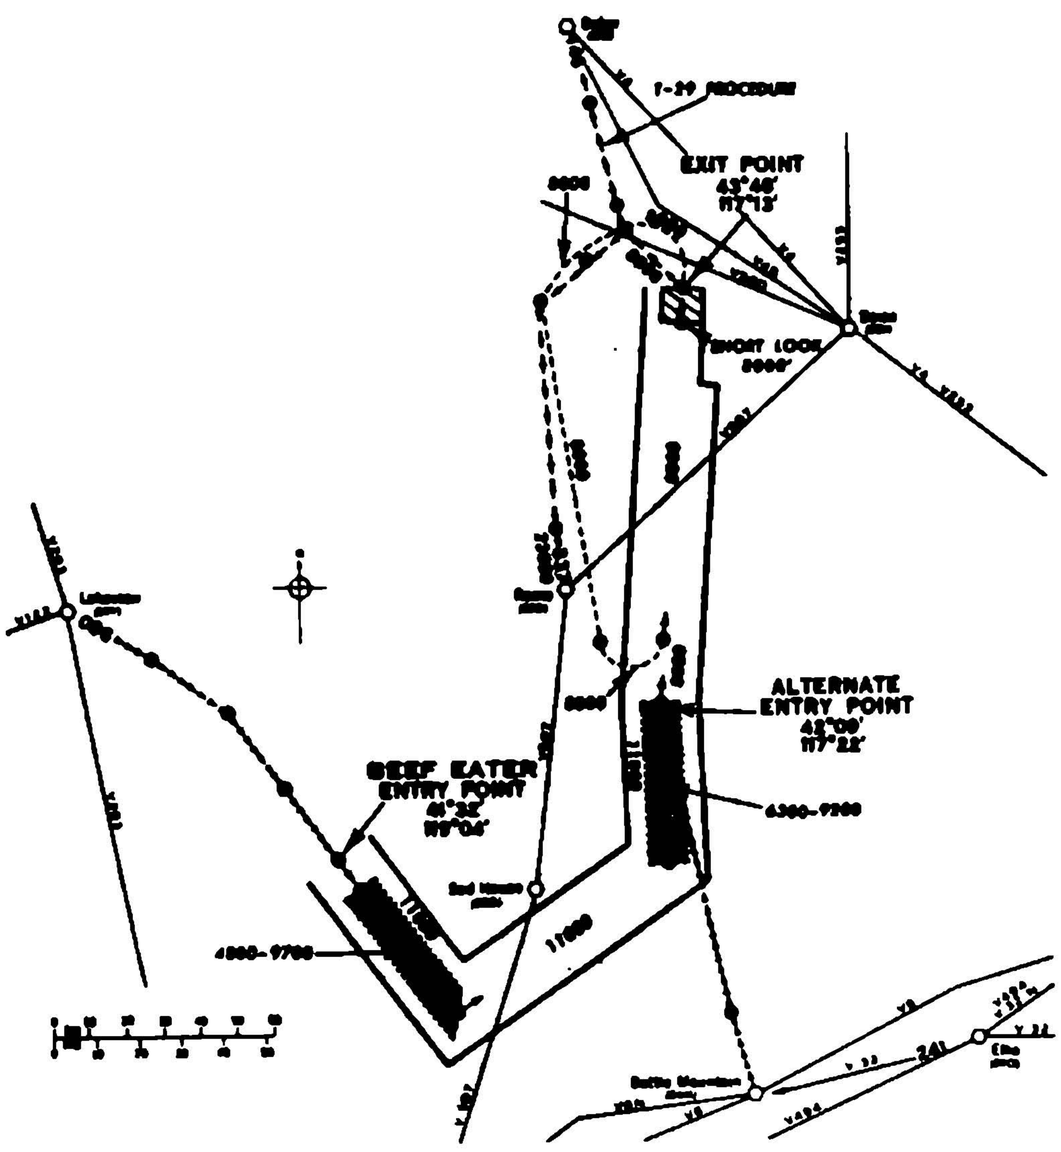
OIL BURNER ROUTES

NEVADA/OREGON

BEEF EATER

Effective May 3, 1964

Aircraft shall cross the Lakeview, Ore. VORTAC (reporting point) at FL 230, or as assigned by ARTCC; then maintain assigned altitude via the Lakeview 096° radial until 22 NM east of the Lakeview VORTAC (42°-20'N, 120°04'W); then descend direct to cross 42°07'N, 119°39'W at or below FL 230; then descend direct to cross 41°49'N, 119°21'W at or above 16,000' MSL; then descend direct to cross the entry point of the low level route at 41°32'N, 119°04'W at 11,000' MSL, then 11,000' MSL direct 40°55'N, 118°27'W, then 11,000' MSL direct 41°31'N, 117°20'W, then 11,000'. MSL direct 42°09'N, 117°22'W; then descend to cross 42°26'N, 117°20'W at 8000' MSL, then 8000' MSL direct 43°40'N, 117°13'30''W.



Short Look—After passing 43°40'N, 117°13'30''W aircraft shall maintain 8000' MSL thru the bomb run corridor (5 SM either side of centerline from 43°40'N, 117°13'30''W to 43°48'N, 117°13'W). After exiting the route at 43°48'N, 117°13'W aircraft shall maintain 8000' MSL direct 44°03'N, 117°31'W; then climb direct to cross 43°55'N, 117°44'W (reporting point—Beef Eater 1) at 10,000' MSL; then climb direct to cross 43°45'N, 117°-59'W at or above 14,000' MSL; then climb direct to cross 42°51'N, 117°54'W at FL 230, then maintain FL 230 via the Rome 337° radial to the Rome, Oregon. VOR.

Re-Entry—After exiting the route at 43°48'N, 117°13' aircraft shall maintain 8000' MSL direct 44°03'N, 11 31'W, then 8000' MSL direct 43°45'N, 117°59'W, th 8000' MSL direct 42°24'N, 117°41'W, then 8000' MSL re-enter the route via direct 42°26'N, 117°20'W.

VFR and Contour—If the encountered weather conditio along the route are equal to or better than ceiling 300 visibility 5 miles, the pilot may descend VFR and opera between the VFR altitudes indicated on the chart betwe the following points: From 41°25'N, 118°57'W to 4 55'N, 118°27'W and from 41°31'N, 117°20'W to 42°09' 117°22'W. During daylight hours some VFR operatio will be flown 800' above the immediate terrain. VF operations will not be conducted during the hours darkness. The lower VFR altitude shown on the cha is the minimum altitude that will be reached on ea route segment during daylight hours.

Alternate Entry—Aircraft shall cross the Elko VORT 241/54 DME fix (Battle Mountain VOR) (reporti point) at FL 230 or as assigned by ARTCC, then mai tain assigned altitude direct 40°55'N, 117°01'W; th descend direct to enter the route at 42°09'N, 117°22' at 11,000' MSL.

Route Width—The route width from 43°25'N, 117°15' to 43°48'N, 117°13'W is reduced to 5 SM on the east si of the centerline.

T-29 Procedure—Aircraft shall cross the Elko, Nevad VORTAC 241/54 (Battle Mountain VOR) (reporti point) as assigned by the ARTCC; then proceed via t alternate entry route to 43°48'N, 117°13'W exit poi of the bomb run corridor; then maintain 8,000' MS direct 44°03'N, 117°31'W; then climb direct to cro 44°08'N, 117°33'W at or below 10,000' MSL; then dire via Baker, Oregon, VORTAC 146 radial to cross Bak 146/19 (44°32'N, 117°42'W) at 14,000' MSL or as a signed by the ARTCC; then maintain assigned altitu direct Baker VORTAC (44°51'N, 117°48'W).

Hours of Operation—24 hours daily, 7 days a week.

ARKANSAS/MISSOURI

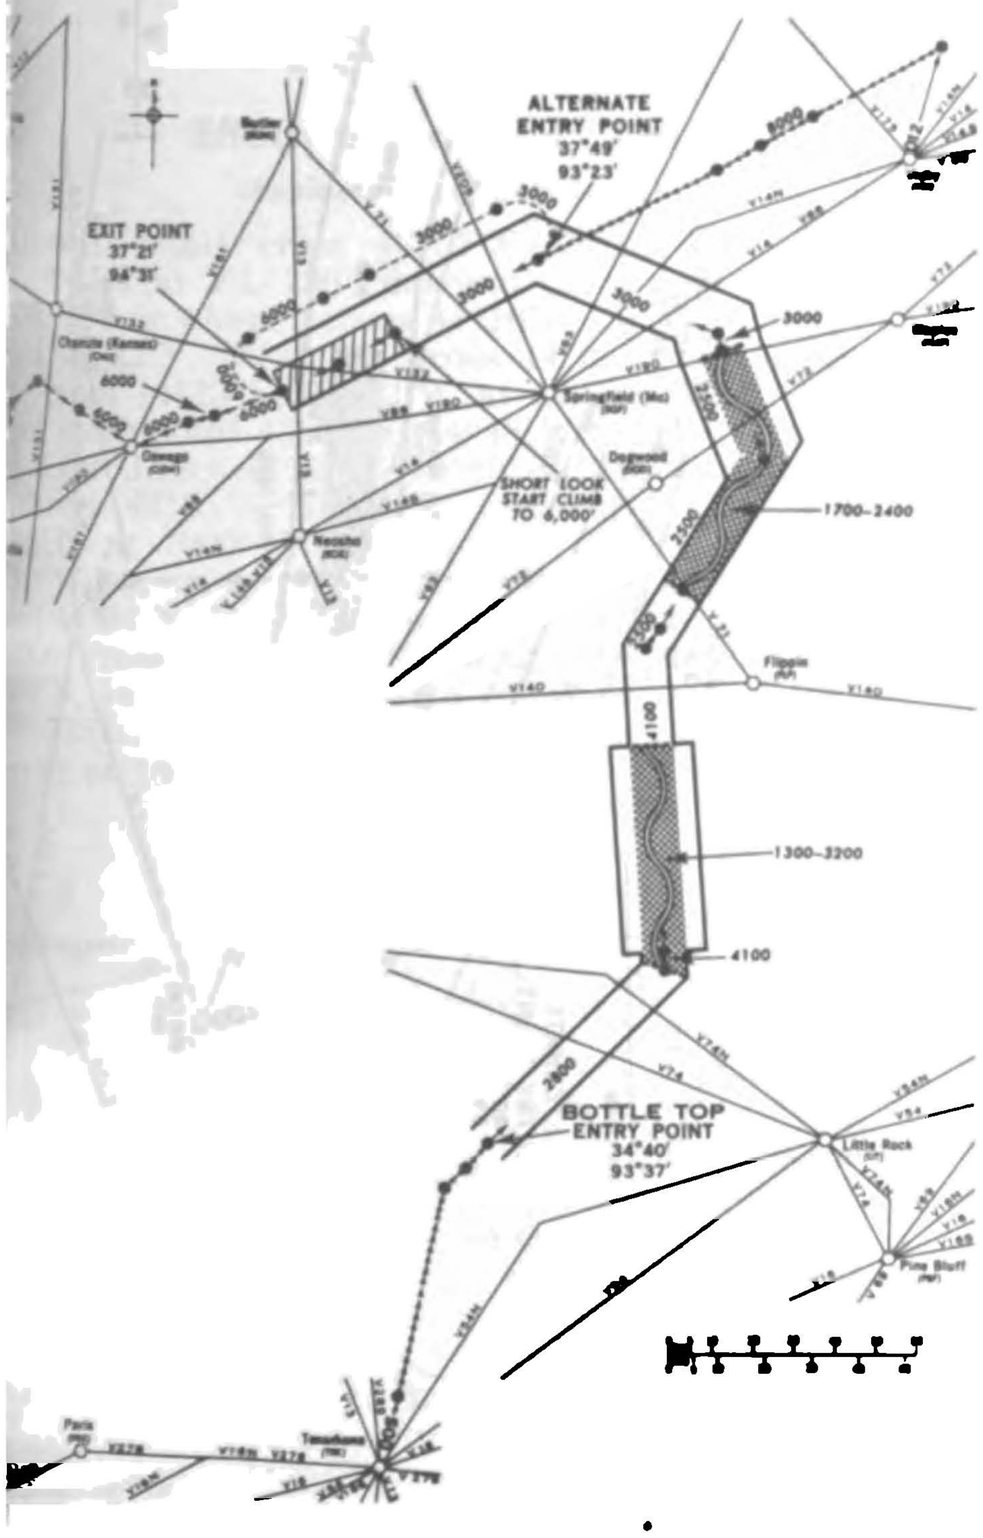
BOTTLE TOP

November 15, 1964

Aircraft shall cross the Texarkana, Ark. VORTA 005/15 at FL 190 or as assigned by ATC; then pr ceed outbound on the 005° radial descending so as cross 34°31'N, 93°48'W, at 6000' MSL; direct descendi so as to cross 34°35'N, 93°43'W, at 4000' MSL; th direct so as to cross the route entry point 34°40' 93°37'W at 2800' MSL, then 2800' MSL direct 35°17' 92°51'W; then climb direct so as to cross 35°21'N, 9 51'W, at 4100' MSL, then 4100' MSL direct to 36°26' 92°55'W; then descend direct so as to cross 36°30' 92°52'W, at 2500' MSL, then 2500' MSL direct 37°05' 92°23'W, then 2500' MSL direct 37°30'N, 92°34'W; th climb direct so as to cross 37°33'N, 92°35'W at 3 MSL, then 3000' MSL direct 37°49'N, 93°23'W, then 3 MSL turn lef direct 37°33'30''N, 94°01'W.

Short Look—After passing 37°33'30''N, 94°01'W, aircraft shall climb so as to cross 37°27'N, 94°16'W, at 6000' MSL, maintain 6000' MSL thru the bomb run corridor 5 SM either side of centerline from 37°33'30''N, 94°-01'W, to 37°21'N, 94°31'W). After exiting the route at 37°21'N, 94°31'W maintain 6000' MSL direct 37°16'N, 95°49'W, then 6000' MSL direct 37°14'N, 94°56'W, then 6000' MSL direct Oswego, Kans. VOR, maintain 6000' MSL direct 37°16'N, 95°28'W; then start climb to FL 230 direct 37°22'N, 95°42'W; turn left continuing climb direct 37°17'N, 95°52'W; direct cross 37°13'N, 95°53'W at 6,000' MSL; direct cross Bartlesville, Okla. at FL 230.

Re-Entry—After completing the initial Short Look bomb run, aircraft that are scheduled to execute an additional bomb run shall, after exiting the route at 37°21'N, 94°-31'W, maintain 6000' MSL, turn right to 37°32'N, 94°-31'W, then 6000' MSL direct 37°41'N, 94°20'W; then descend so as to cross 37°46'N, 94°08'W at 3000' MSL direct to 38°00'N, 93°34'W, then 3000' MSL turn right to 37°49'N, 93°23'W, thence via the published route.



Alternate Entry—Aircraft shall cross the Vichy, Mo. VORTAC 012/25 at 15,000' MSL or as assigned by ATC. Descend direct so as to cross 38°19'N, 92°08'W at 8000' MSL; then at 8000' MSL direct to 38°13'N, 92°22'W; then descend so as to cross 38°08'N, 92°34''W at 4000' MSL; then continue descent so as to cross 37°49'N, 93°23'W at 3000' MSL. Thence via published route.

Route Width—The route width from 34°40'N, 93°37'W to 35°21'N, 92°51'W and from 36°05'N, 92°53'W to 37°-06'N, 92°23'W is reduced to 5 SM either side of centerline and 5 SM on the south side of centerline from 37°33'N, 92°35'W to 37°21'N, 94°31'W.

Hours of Operation—0100Z to 1400Z, 7 days per week.

KANSAS/NEBRASKA/SOUTH DAKOTA

BULL RING

Effective March 1 thru August 27, 1965

Aircraft shall cross the Sioux Falls VORTAC 269/55 (43°46'N, 98°02'W) at FL 230 or as assigned by ARTC;

FR and Contour—If the encountered weather conditions ng the route are equal to or better than ceiling 3000', bility 5 miles, the pilot may descend VFR and operate reen the VFR altitudes indicated on the chart be-en the following points: From 35°17'N, 92°51'W to 5'N, 92°53'W and from 36°38'N, 92°45'W to 37°30'N, 4'W. During daylight hours, some VFR operations be flown 800' above the immediate terrain. VFR rations will not be conducted during the hours of ness. The lower VFR altitude shown is the minimum tude that will be reached on each route segment dur-daylight hours.
